- The EBCM disables the Antilock Brake System (ABS)/Traction Control System (TCS)/Electronic Stability Control (ESP) for the duration of the ignition cycle.
- The multi function display (MFD) displays the ABS Fault message.
- The multi function display (MFD) displays the Traction Ctrl Off message.
- The multi function display (MFD) displays the Stability Ctrl Off message.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The EBCM automatically clears the history DTC when a current DTC is not detected in

100 consecutive drive cycles.
- The DTC can be cleared using a scan tool.

DTC Descriptor

DTC C0558 00: Calibration Data Not Programmed

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit/System Description

The electronic brake control module (EBCM) must be calibrated/programmed or has an internal fault and requires replacement.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is between 9 and 16 volts.

Conditions for Setting the DTC

The EBCM has not been calibrated or has an internal fault.

Action Taken When the DTC Sets

- The EBCM disables the ABS and the TCS for the duration of the ignition cycle
- The ABS fault indicator on the driver information centre (DIC) is activated.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- The EBCM automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.
- The DTC can be cleared using a scan tool.

DTC Descriptor

DTC C0561 71: CAN-Bus Invalid Data

Circuit/System Description

The electronic brake control module (EBCM) receives messages from the engine control module (ECM), and the transmission control module (TCM) over GMLAN which are needed to perform ESP or TCS functions.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 8 volts.

Conditions for Setting the DTC

The EBCM receives an invalid message from either the ECM or TCM over GMLAN which causes EBCM to deactivate TCS, ESP and EBD.

Action Taken When the DTC Sets

- The EBCM disables the Traction Control System (TCS)/Electronic Stability Control (ESP) for the duration of the ignition cycle.
- A multi function display (MFD) message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

DTC Descriptors

DTC C0565 47: VIN Not Programmed (Vehicle Identification Number)

DTC C0565 71: VIN (Vehicle Identification Number) Invalid Serial Data Received

Circuit/System Description

When the EBCM is replaced, software and calibrations are flash programmed into the EBCM.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 10 volts.

Conditions for Setting the DTC

C0565 47

VIN is not programmed into the EBCM.

C0565 71

Wrong VIN is programmed into the EBCM.

Action Taken When the DTC Sets

- The EBCM disables the Antilock Brake System (ABS)/Traction Control System (TCS)/Electronic Stability Control (ESP) for the duration of the ignition cycle.
- A DIC message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The EBCM clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

DTC C0899

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC C0899 00: Power Supply Circuit Low Voltage

Circuit Description

The electronic brake control module (EBCM) monitors the voltage level available for system operation. A low voltage condition prevents the system from operating correctly.

Conditions for Running the DTC

- The ignition is ON.
- The vehicle speed is greater than 8 km/h (5 mph).

Conditions for Setting the DTC

One of the following conditions exists for 0.72 seconds:

- During initialization or when the system is inactive, the system voltage is less than 9.6 volts.
- During the system operation, the system voltage is less than 9.3 volts.

Action Taken When the DTC Sets

- The EBCM disables the Antilock Brake System (ABS)/Traction Control System (TCS)/Electronic Stability Control (ESP)/Electronic Brake Distribution (EBD) for the duration of the ignition cycle.
- The multi function display (MFD) displays the ABS Fault message.
- The multi function display (MFD) displays the Traction Ctrl Off message.
- The multi function display (MFD) displays the Stability Ctrl Off message.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC can be cleared using a scan tool.

Diagnostic Aids

- Test the charging system. Refer to Charging System Test .
- Possible causes of this DTC are the following conditions:
  - A charging system malfunction
  - Too much battery draw
  - A weak battery
  - A faulty system ground

- Control Module References

DTC C0900

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC C0900 00: Power Supply Circuit High Voltage

Circuit Description

The electronic brake control module (EBCM) monitors the voltage level available for system operation. If the voltage level is too high, damage may result in the system. When the EBCM detects a high voltage condition, the EBCM turns OFF the system relay which removes battery voltage from the solenoid valves and pump motor.

Conditions for Running the DTC

- The ignition is ON.
- The vehicle speed is greater than 8 km/h (5 mph).

Conditions for Setting the DTC

One of the following conditions exists for 0.72 seconds:

- During initialization or when the system is inactive, the system voltage is greater than 16.8 volts.
- During the system operation, the system voltage is greater than 16.7 volts.

Action Taken When the DTC Sets

- The EBCM disables the Antilock Brake System (ABS)/Traction Control System (TCS)/Electronic Stability Control (ESP)/Electronic Brake Distribution (EBD) for the duration of the ignition cycle.
- The multi function display (MFD) displays the ABS Fault message.
- The multi function display (MFD) displays the Traction Ctrl Off message.
- The multi function display (MFD) displays the Stability Ctrl Off message.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC can be cleared using a scan tool.

Diagnostic Aids

- Test the charging system. Refer to Charging System Test .
- Possible causes of this DTC are the following conditions:
  A charging system malfunction

Control Module References

Circuit/System Verification

With scan tool installed, clear the DTCs then drive the vehicle in a straight line at a speed greater than 20 km/h (13 mph).

Circuit/System Testing

1. Start the engine and allow to idle, using a scan tool check if DTC is set to current.
   If the DTC is set to current, continue.
2. Ignition OFF, disconnect the EBCM harness connector.
3. Test for less than 1.0 ohm of resistance between the ground circuit terminals and ground.
   If greater than the specified range, test the ground circuits for an open/high resistance.
4. Connect a DMM between the supply voltage circuit terminals and the ground circuit terminals.
   If 12 volts is present, replace the EBCM.
   If greater than 116 volts is present, test and repair charging system.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Electronic Brake Control Module Replacement .
- Control Module References .

DTC P0856

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0856: Traction Control Torque Request Signal Message Counter Incorrect

Circuit/System Description

The electronic brake control module (EBCM) and the engine control module (ECM) simultaneously control the traction control. The EBCM sends a serial data message to the ECM requesting torque reduction. When certain ECM DTCs are set, the ECM will not be able to perform the torque reduction for traction control. A serial data message is sent to the EBCM indicating that traction control is not allowed.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 10 volts.

Conditions for Setting the DTC

The ECM detects a fault that prevents it from performing a traction control function and sends a serial data message to the EBCM indicating that torque reduction is not allowed.

Action Taken When the DTC Sets

- The EBCM disables the TCS for the duration of the ignition cycle.
- The ABS remains functional.
- A DIC message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The electronic brake control module (EBCM) clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

These DTCs are an indicator that the ECM receives an invalid message from the EBCM , and does not necessarily indicate a fault is present with the EBCM. This DTC should not be used as a fault indicator, but rather as a symptom to assist in the diagnosis of these other systems.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Verify that no DTCs are set in the ECM.

If DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.

Symptoms - Antilock Brake System

Important: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle, before using the Symptom Tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control module(s) can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to ABS Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the antilock brake system. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Inspect the master cylinder reservoir for the correct brake fluid level.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- ABS Indicator Malfunction.
- StabiliTrak Indicator Malfunction.

StabiliTrak Indicator Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	--	1	B2745	--
Ground	--	1	--	--
1. Traction Control Indicator Malfunction				

Circuit/System Description

The traction control system (TCS) switch is a normally open switch that closes when the switch is activated. When activated, the switch grounds the TCS signal circuit. The body control module (BCM) converts the signal into serial data, which is used by the electronic brake control module (EBCM) to enable/disable the TCS.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, with a scan tool command the IPC display test ON and OFF. The StabiliTrak indicator should turn ON and OFF.
   - If the indicator does not turn ON and OFF, replace the IPC.
2. Observe the scan tool BCM Traction Control Switch parameter while pressing and releasing the traction control switch. The reading should change between Active and Inactive.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the traction control switch.
2. Test for less than 1 ohm between the ground circuit terminal 2 and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Traction Control Switch parameter is Inactive.
   - If not the specified value, test the signal circuit terminal 8 for a short to ground.
4. Install a 3A fused jumper wire between the signal circuit terminal 8 and the ground circuit terminal 2. Verify the scan tool Traction Control Switch parameter is Active.
   - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance.
5. If all circuits test normal, test or replace the traction control switch. If the DTC resets, replace the BCM.

Component Testing

1. Ignition OFF, disconnect the harness connector at the traction control switch.
2. Test for infinite resistance between the signal terminal 8 and the ground terminal 2 with the switch in the open position.
   - If not the specified value, replace the traction control switch.
3. Test for less than 3 ohms between the signal terminal 8 and the ground terminal 2 with the switch in the closed position.
   - If greater than the specified range, replace the traction control switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for BCM replacement, setup, and programming

ABS Indicator Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The instrument panel cluster (IPC) illuminates the antilock brake system (ABS) indicator during the IPC bulb check or when the electronic brake control module (EBCM) detects a fault and sends a serial data message to the IPC commanding the indicator ON.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Antilock Brake System | Repair Instructions | **Document ID: 1979872**

Antilock Brake System Automated Bleed Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Important: Before performing the Antilock Brake System Automated Bleed Procedure, first perform a pressure bleed of the base brake system. Refer to Hydraulic Brake System Bleeding . The automated bleed procedure is recommended when one of the following conditions exist:

- Base brake system bleeding does not achieve the desired pedal height or feel.
- Extreme loss of brake fluid has occurred.
- Air ingestion is suspected in the secondary circuits of the hyraulic modulator assembly.

1. The Antilock Brake System Automated Bleed Procedure uses a scan tool to cycle the system solenoid valves and run the pump in order to purge any air from the secondary circuits. These circuits are normally closed off and are only opened during system initialisation at vehicle start up and during ABS operation. The automated bleed procedure opens these secondary circuits and allows any air trapped in these circuits to flow out toward the brake calipers.

Performing the Automated Bleed Procedure

Notice: The Auto Bleed Procedure may be terminated at any time during the process by pressing the EXIT button. No further Scan Tool prompts pertaining to the Auto Bleed procedure will be given. After exiting the bleed procedure, relieve bleed pressure and disconnect bleed equipment per manufacturers instructions. Failure to properly relieve pressure may result in spilled brake fluid causing damage to components and painted surfaces.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove all four wheels. Refer to Tire and Wheel Removal and Installation .
3. Inspect the brake system for leaks and visual damage. Refer to Symptoms - Hydraulic Brakes , repair or replace components as needed.
4. Lower the vehicle.
5. Inspect the battery state of charge. Refer to Battery Inspection/Test .
6. Install a scan tool.
7. Turn the key to the ignition ON, engine OFF position.
8. With the scan tool, establish communications with the ABS system. Select Special Functions. Select Automated Bleed from the Special Functions menu.
9. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
10. Following the directions given on the scan tool, pressure bleed the base brake system. Refer to Hydraulic Brake System Bleeding .

11. Follow the scan tool directions until the desired brake pedal height is achieved.
12. If the bleed procedure is aborted, a malfunction exists. Perform the following steps before resuming the bleed procedure:
    - If a DTC is detected, refer to Diagnostic Trouble Code (DTC) List - Vehicle and diagnose the appropriate DTC.
    - If the brake pedal feels spongy, perform the conventional brake bleed procedure again. Refer to Hydraulic Brake System Bleeding .
13. When the desired pedal height is achieved, press the brake pedal to inspect for firmness.
14. Lower the vehicle.
15. Remove the scan tool.
16. Install the tyre and wheel assemblies. Refer to Tire and Wheel Removal and Installation .
17. Inspect the brake fluid level. Refer to Master Cylinder Reservoir Filling .
18. Road test the vehicle while inspecting that the pedal remains high and firm.

Brake Pressure Modulator Valve Assembly Replacement (RHD)

Removal Procedure

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Caution: For safety reasons, the brake pressure modulator valve assembly must not be repaired, the complete unit must be replaced. With the exception of the EBCM, no screws on the brake pressure modulator valve assembly may be loosened. If screws are loosened, it will not be possible to get the brake circuits leak-tight and personal injury may result.

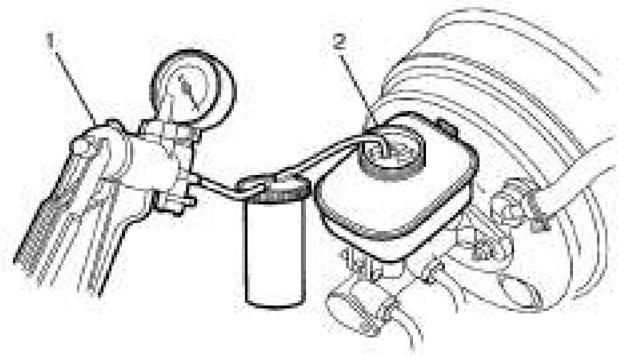
Important: If the electronic brake control module (EBCM) or brake pressure modulator valve (BPMV) is to replaced under manufacturer's warranty, do not disassemble the EBCM/BPMV assembly. If the EBCM or BPMV is faulty, replace the EBCM/BPMV assembly.

Important: The BPMV is not a separate serviceable component. If the BPMV is faulty, replace the EBCM/BPMV as an assembly.

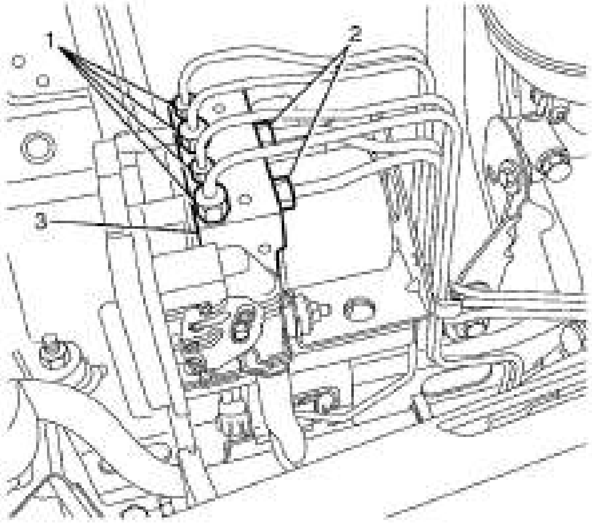
1. Turn the key to the ignition OFF position.

   Important: The area around the EBCM/BPMV assembly must be free from loose dirt to prevent contamination of disassembled ABS components.

2. Clean the BPMV and brake pipes.
3. Place a clean suitable container under the BPMV.
4. Remove the master cylinder reservoir cap.



5. Siphon the brake fluid out of the master cylinder reservoir (2) using a hand vacuum pump (1).



Important: Record the location of all brake pipes to the EBCM/BPMV assembly as an aid during installation.

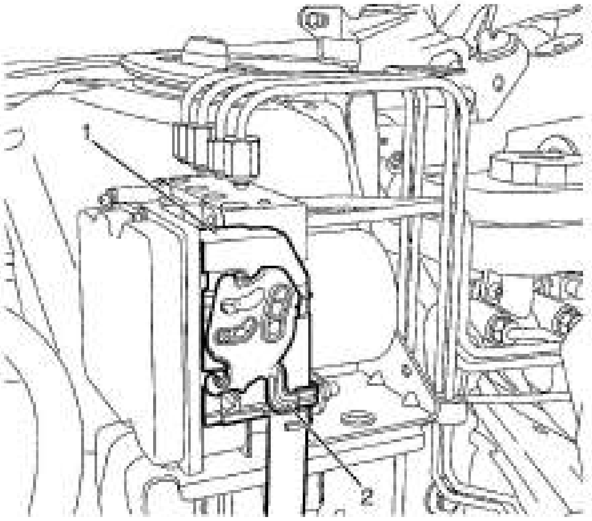
6. Remove the two master cylinder brake pipes (3) from the BPMV (1).

Important: Install a rubber cap or plug to the master cylinder brake pipes (3) in order to prevent fluid loss and contamination.

7. Plug the master cylinder brake pipes (3).
8. Remove the four wheel brake pipes (2) from the BPMV (1).

Important: Install a rubber cap or plug to the wheel brake pipes (2) in order to prevent fluid loss and contamination.

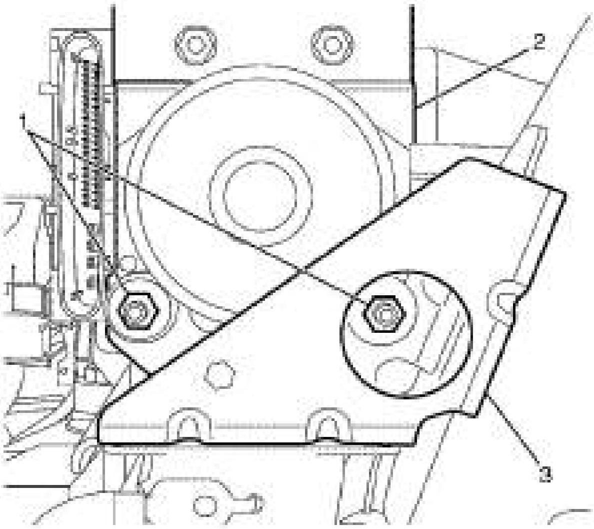
9. Plug the wheel brake pipes (2).
10. Clean any brake fluid spillage from the BPMV (1).



11. Rotate the EBCM connector tab (2) up to the unlocked position.

Notice: To prevent equipment damage, never connect or disconnect the wiring harness connection from the EBCM with the ignition switch in the ON position.

12. Disconnect the EBCM electrical connector (1) and position out of the way.



13. Remove the EBCM/BPMV assembly to EBCM/BPMV assembly bracket retaining nuts (1).
14. Remove the EBCM/BPMV assembly (2) from the EBCM/BPMV assembly bracket (3).

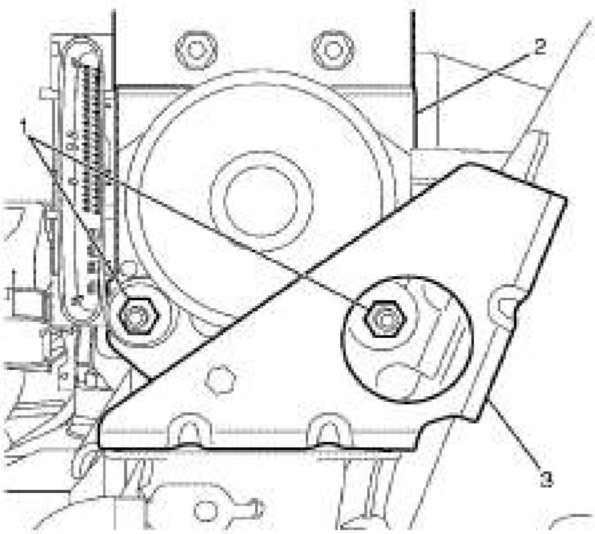
Installation Procedure

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



Caution: For safety reasons, the brake pressure modulator valve assembly must not be repaired, the complete unit must be replaced. With the exception of the EBCM, no screws on the brake pressure modulator valve assembly may be loosened. If screws are loosened, it will not be possible to get the brake circuits leak-tight and personal injury may result.

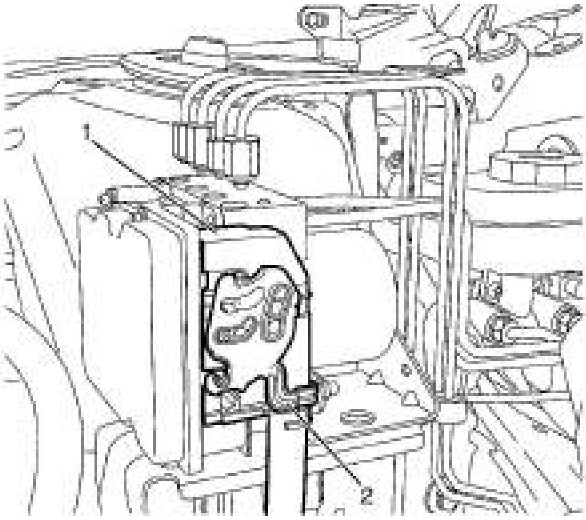
Important: Make sure that the rubber isolators are installed on the EBCM/BPMV assembly (2). The isolators protect the EBCM/BPMV assembly (2) from vehicle vibrations.

1. Install the EBCM/BPMV assembly (2) to the EBCM/BPMV assembly bracket (1).

   Notice: Refer to Fastener Notice in the Preface section.

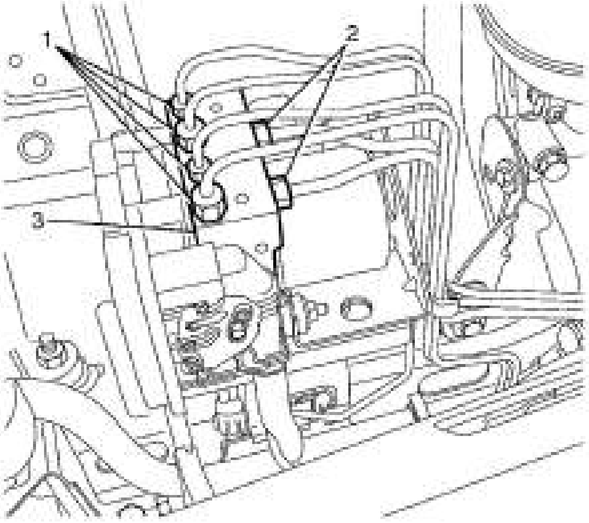
2. Install the EBCM/BPMV assembly to EBCM/BPMV assembly bracket retaining nuts (2).

   Tighten
   Tighten the nuts to 8 N·m (71 lb in).



Notice: To prevent equipment damage, never connect or disconnect the wiring harness connection from the EBCM with the ignition switch in the ON position.

3. Connect the EBCM electrical connector (1) to the EBCM (3).
4. Rotate the EBCM connector tab (2) to the locked position.



Caution: The brake pipes must be fully installed to the brake pipe mounting retainers on the frame. Failure to properly retain the brake pipes may cause the pipes to contact the frame and/or the transmission resulting in possible loss of brake fluid and personal injury.

Caution: Make sure brake pipes are correctly connected to BPMV. If brake pipes are switched by mistake Inlet vs. Outlet, wheel lockup will occur and personal injury may result.

Important: If a new BPMV is being installed, remove the shipping plugs from the valve openings.

5. Remove the cap or plug from the wheel brake pipes (2) and install the wheel brake pipes (2) to the BPMV (1) using the locations recorded during the removal procedure.

   Tighten
   Tighten the wheel brake pipes to 15 Nm (11 lb ft).

6. Remove the cap or plug from the master cylinder brake pipes (3) and install the two master cylinder brake pipes (3) to the BPMV (1) using the locations recorded during the removal procedure.

   Tighten
   Tighten the master cylinder brake pipes to 15 Nm (11 lb ft).

7. Fill and bleed the hydraulic brake system. Refer to Master Cylinder Reservoir Filling and Hydraulic Brake System Bleeding .
8. Perform the Auto Bleed Procedure. Refer to Antilock Brake System Automated Bleed Procedure .
9. Perform the System Check-Vehicle. Refer to Diagnostic System Check - Vehicle .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Antilock Brake System | Repair Instructions | Document ID: 1974817

Electronic Brake Control Module Replacement (RHD)

Removal Procedure

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

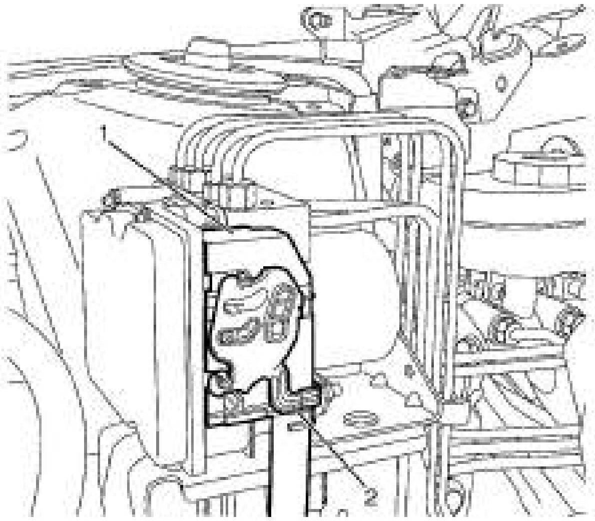
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Important: If the electronic brake control module (EBCM) or brake pressure modulator valve (BPMV) is to replaced under manufacturer's warranty, do not disassemble the EBCM/BPMV assembly. If the EBCM or BPMV is faulty, replace the EBCM/BPMV as an assembly.

Important: The area around the electronic brake control module (EBCM) must be free from loose dirt to prevent contamination of dissembled ABS components.

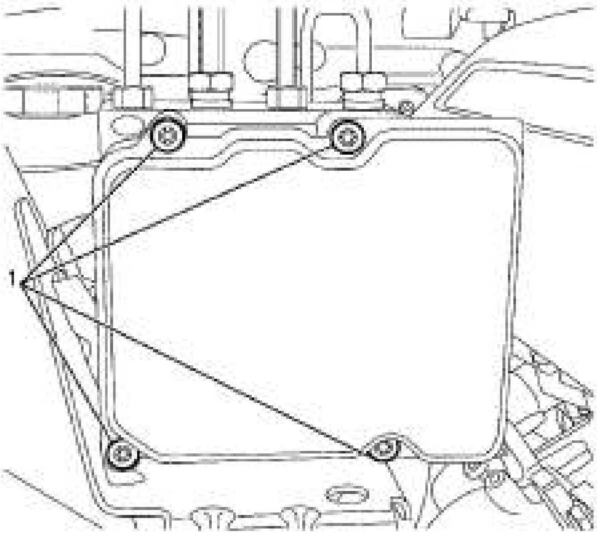
1. Turn the key to the ignition OFF position.



2. Remove the EBCM/BPMV assembly. Refer to Brake Pressure Modulator Valve Assembly Replacement .
3. Clean the EBCM/BPMV assembly.
4. Rotate the EBCM connector tab (2) up to the unlocked position.

Notice: To prevent equipment damage, never connect or disconnect the wiring harness connection from the EBCM with the ignition switch in the ON position.

5. Disconnect the EBCM electrical connector (1) and position out of the way.

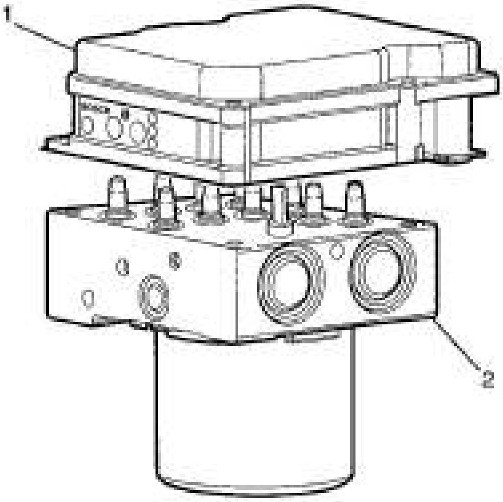


Important: EBCM to BPMV retaining screws are a single use only component. NEW EBCM to BPMV retaining screws must be installed whenever the EBCM to BPMV retaining screws are removed.

6. Remove the EBCM to BPMV retaining screws (1) and discard.

   Discard the screws.

7. Clean the surface of the EBCM/BPMV assembly.



Important: The EBCM (1) cannot be repaired. If faulty, the EBCM (1) must be replaced.

8. Separate the EBCM (1) from the BPMV (2).

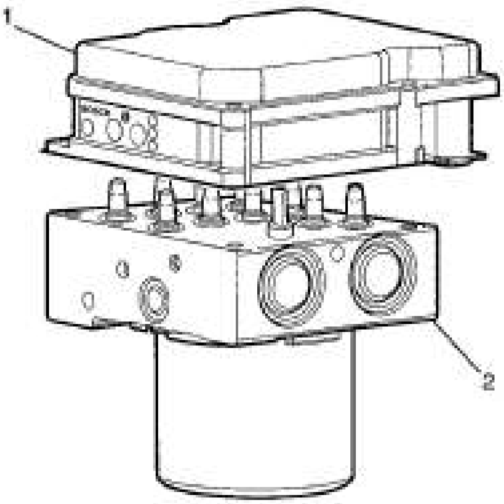
Installation Procedure

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



Important: The seal is not available as a spare part and the mating surfaces cannot be mechanically reworked. If the seal or mating surfaces are damaged the EBCM/BPMV assembly must be replaced.

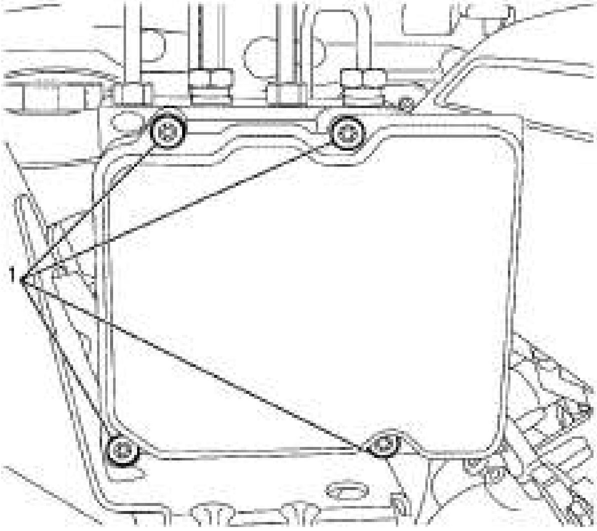
1. Inspect the EBCM (1) to BPMV (2) mating surfaces and seal.
2. Clean the seal surface of the BPMV.

Important: Make sure the coils for the solenoid valves are aligned correctly. If they are not correctly aligned the EBCM (1) must be replaced.

Important: Make sure the contact pins of the hydraulic pump are aligned correctly.

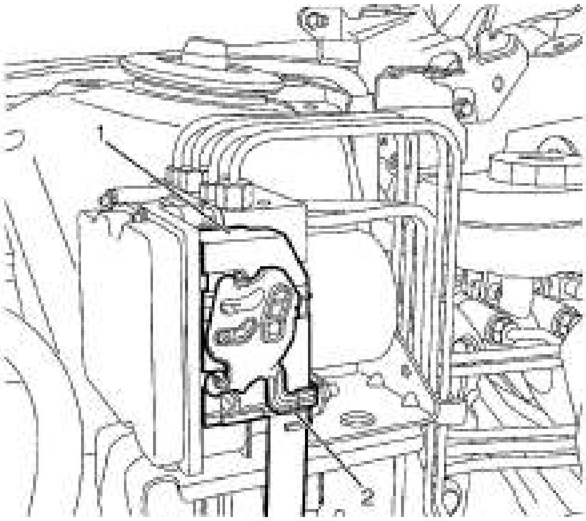
3. Install the EBCM (1) to the BPMV (2).

Notice: Refer to Fastener Notice in the Preface section.



4. Install the NEW EBCM to BPMV retaining screws.

   Tighten
   Tighten the EBCM to BPMV screws in sequence 8 Nm (71 lb in).



Notice: To prevent equipment damage, never connect or disconnect the wiring harness connection from the EBCM with the ignition switch in the ON position.

5. Connect the EBCM electrical connector (1) to the EBCM (3).
6. Rotate the EBCM connector tab (2) to the locked position.
7. Use the scan tool in order to clear any DTCs.

8. Perform the Auto Bleed Procedure. Refer to Antilock Brake System Automated Bleed Procedure .
9. If installing a new EBCM it is necessary to program the EBCM. Refer to Service Programming System (SPS) .
10. Perform the System Check-Vehicle. Refer to Diagnostic System Check - Vehicle .
11. Recalibrate the brake pedal position sensor. Refer to Stop Lamp Switch Adjustment .

Front Wheel Speed Sensor Reluctor Wheel Replacement

The front wheel speed sensor tone wheels are integral with the hub and bearing assemblies. If a front wheel speed sensor tone wheel needs replacement, you must replace the entire hub and bearing assembly. Refer to Front Wheel Bearing and Hub Replacement.

Front Wheel Speed Sensor Replacement

The front wheel speed sensors are integral with the hub and bearing assemblies. If a front wheel speed sensor needs replacement, you must replace the entire hub and bearing assembly. Refer to Front Wheel Bearing and Hub Replacement.

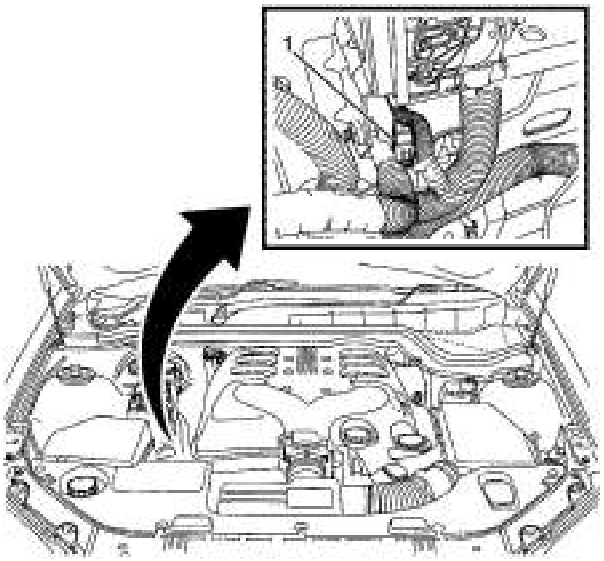
Front Wheel Speed Sensor Wiring Harness Replacement

Removal Procedure - Right

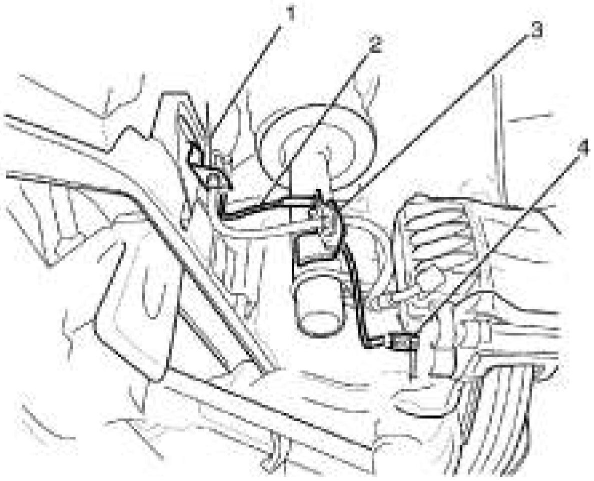
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Disconnect the wheel speed sensor jumper harness electrical connector (1).
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the right hand front wheel. Refer to Tire and Wheel Removal and Installation .



4. Disconnect the wheel speed sensor jumper harness electrical connector (4).
5. Detach the wheel speed sensor jumper harness (2) from the brake hose/wheel speed sensor jumper harness bracket (1).
6. Detach the wheel speed sensor jumper harness (2) from the front strut mounting bracket (3).

   Important: Note the routing of the wheel speed sensor jumper harness (2).

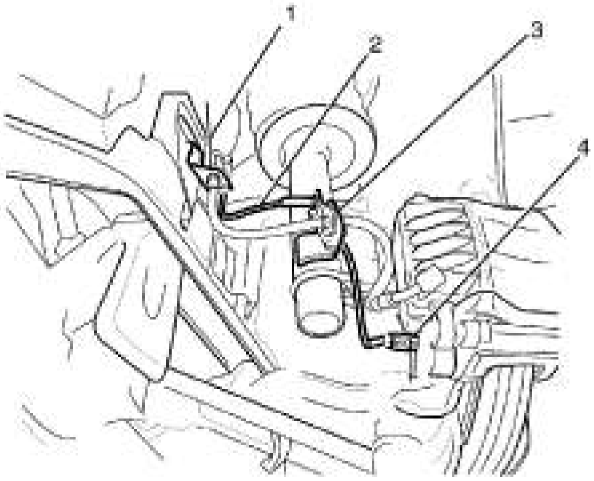
7. Remove the wheel speed sensor jumper harness (2) from the vehicle.

Installation Procedure - Right

Caution: Refer to Safety Glasses Caution in the Preface section.

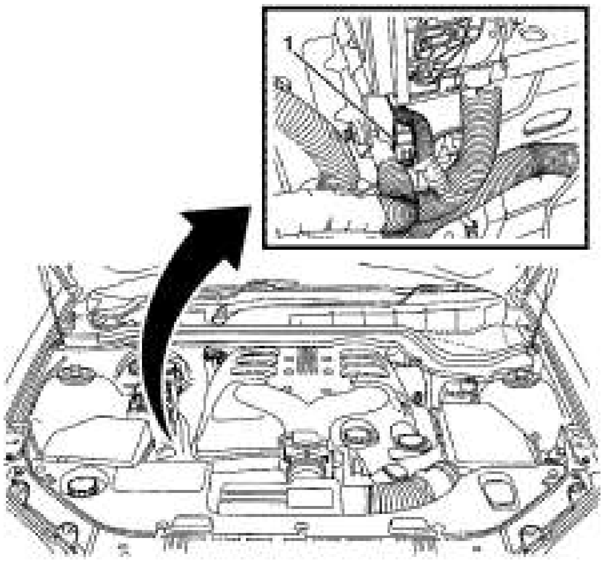
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



Important: Make sure the routing of the wheel speed sensor jumper harness (2) is secured and routed in its original location.

1. Install the wheel speed sensor jumper harness (2) to the vehicle.
2. Attach the wheel speed sensor jumper harness (2) from the front strut mounting bracket (3).
3. Attach the wheel speed sensor jumper harness (2) to the brake hose/wheel speed sensor jumper harness bracket (1).
4. Connect the wheel speed sensor jumper harness electrical connector (4).
5. Install the right hand front wheel. Refer to Tire and Wheel Removal and Installation .
6. Lower the vehicle.



7. Connect the wheel speed sensor jumper harness electrical connector (1).
8. Use the scan tool in order to clear any DTCs.

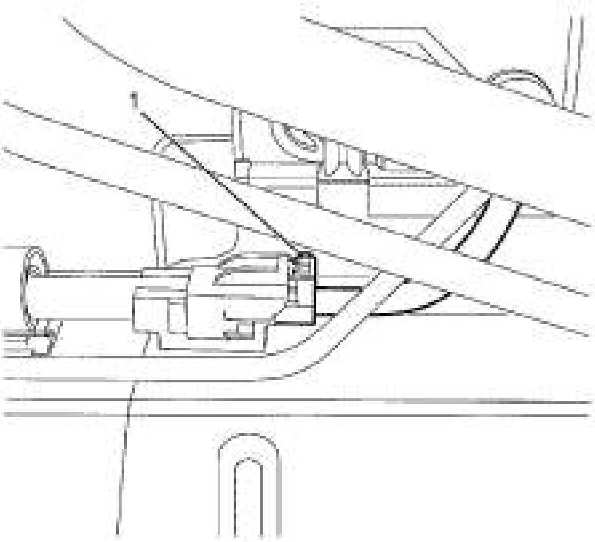
9. Perform the System Check-Vehicle. Refer to Diagnostic System Check - Vehicle .

Removal Procedure - Left

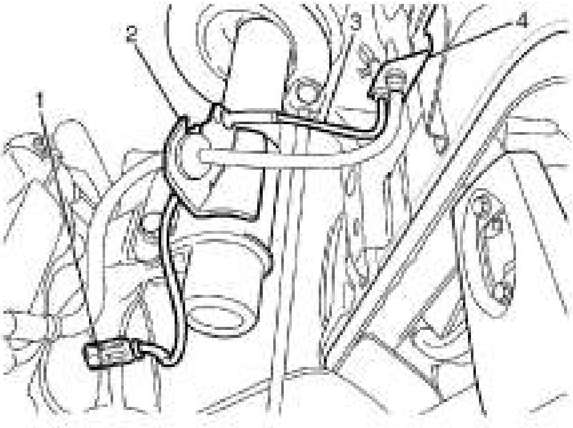
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine, or Air Cleaner Assembly Replacement for 6.0L engine.
2. Disconnect the wheel speed sensor jumper harness electrical connector (1).
3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Remove the left hand front wheel. Refer to Tire and Wheel Removal and Installation .



5. Disconnect the wheel speed sensor jumper harness electrical connector (1).
6. Detach the wheel speed sensor jumper harness (3) from the brake hose/wheel speed sensor jumper harness bracket (4).
7. Detach the wheel speed sensor jumper harness (3) from the front strut mounting bracket (2).

   Important: Note the routing of the wheel speed sensor jumper harness (3).

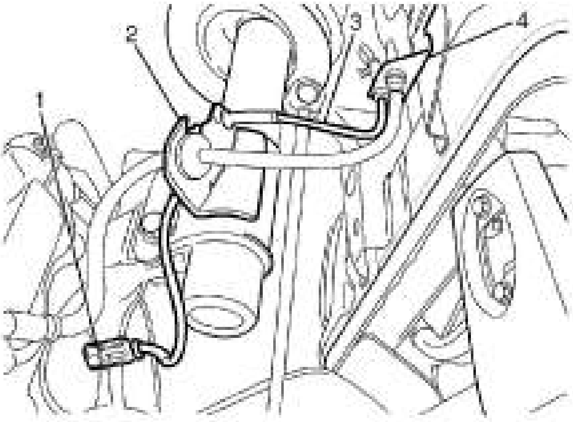
8. Remove the wheel speed sensor jumper harness (3) from the vehicle.

Installation Procedure - Left

Caution: Refer to Safety Glasses Caution in the Preface section.

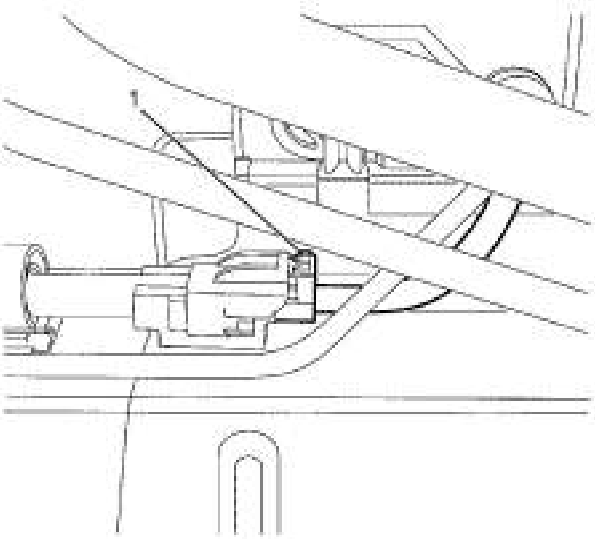
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



Important: Make sure the routing of the wheel speed sensor jumper harness (3) is secured and routed in its original location.

1. Install the wheel speed sensor jumper harness (3) to the vehicle.
2. Attach the wheel speed sensor jumper harness (3) from the front strut mounting bracket (2).
3. Attach the wheel speed sensor jumper harness (3) to the brake hose/wheel speed sensor jumper harness bracket (4).
4. Connect the wheel speed sensor jumper harness electrical connector (1).
5. Install the left hand front wheel. Refer to Tire and Wheel Removal and Installation .
6. Lower the vehicle.



7. Connect the wheel speed sensor jumper harness electrical connector (1).
8. Install the air cleaner assembly. Refer to Air Cleaner Assembly Replacement for 3.6L engine,

or Air Cleaner Assembly Replacement for 6.0L engine.

9. Use the scan tool in order to clear any DTCs.
10. Perform the System Check-Vehicle. Refer to Diagnostic System Check - Vehicle .

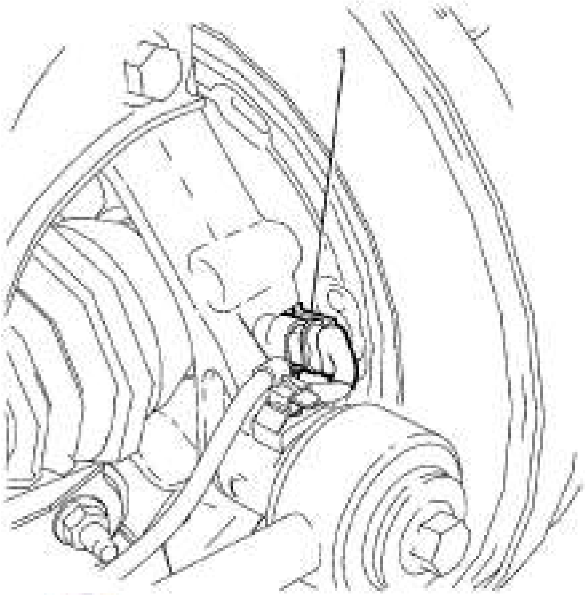
Rear Wheel Speed Sensor Replacement

Removal Procedure

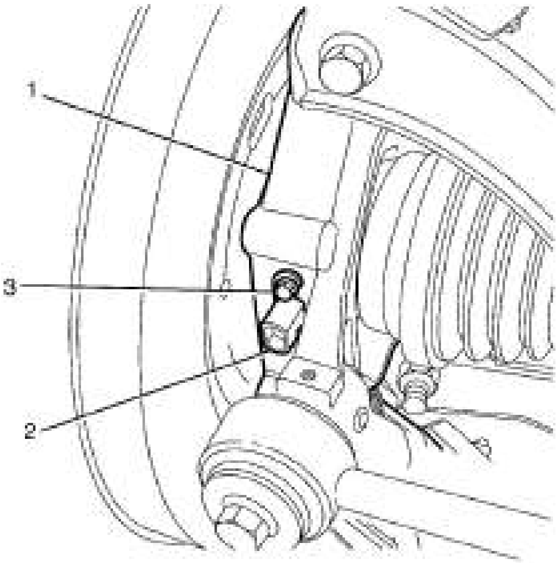
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .
3. Disconnect the wheel speed sensor electrical connector (1).



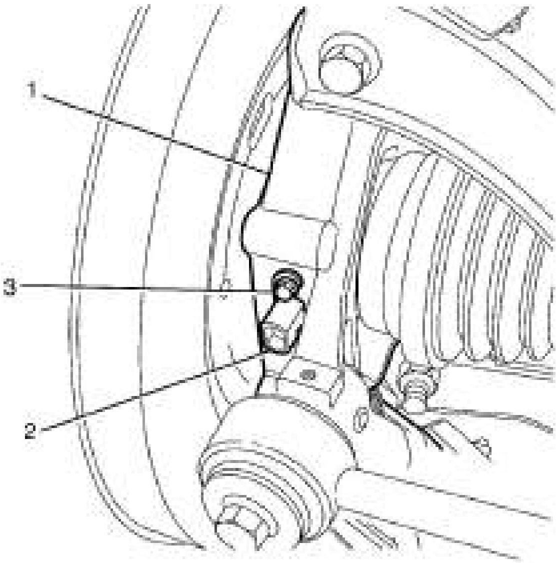
4. Remove the wheel speed sensor to knuckle retaining bolt (3).
5. Remove the wheel speed sensor (2) from the knuckle (1).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

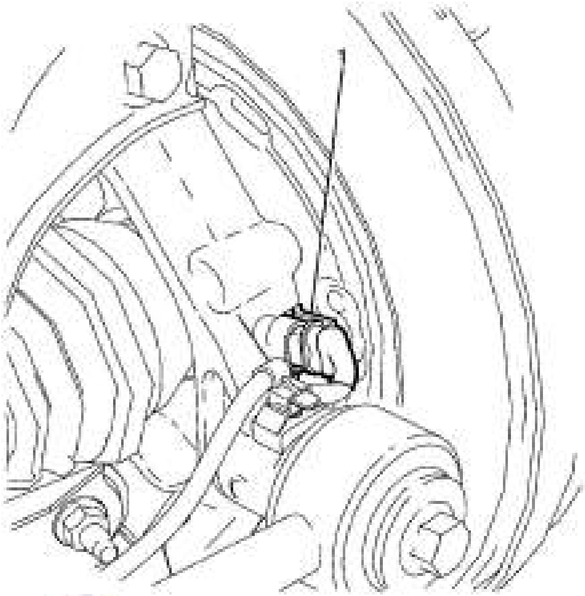


1. Install the wheel speed sensor (2) to the knuckle (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the wheel speed sensor to knuckle retaining bolt (3).

   Tighten
   Tighten the bolt to 7 Nm (62 lb in).



3. Connect the wheel speed sensor jumper harness electrical connector (1).
4. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
5. Lower the vehicle.

Rear Wheel Speed Sensor Ring Replacement

The rear wheel speed sensor tone wheels are integral with the hub and bearing assemblies. If a rear wheel speed sensor tone wheel needs replacement, you must replace the entire hub and bearing assembly. Refer to Rear Wheel Bearing and Hub Replacement .

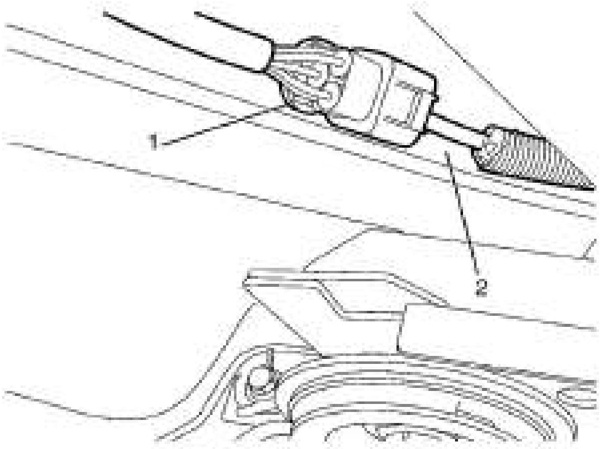
Rear Wheel Speed Sensor Wiring Harness Replacement

Removal Procedure

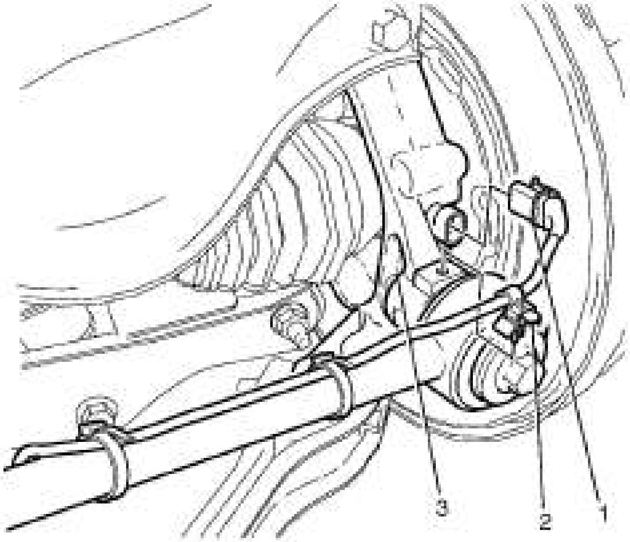
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

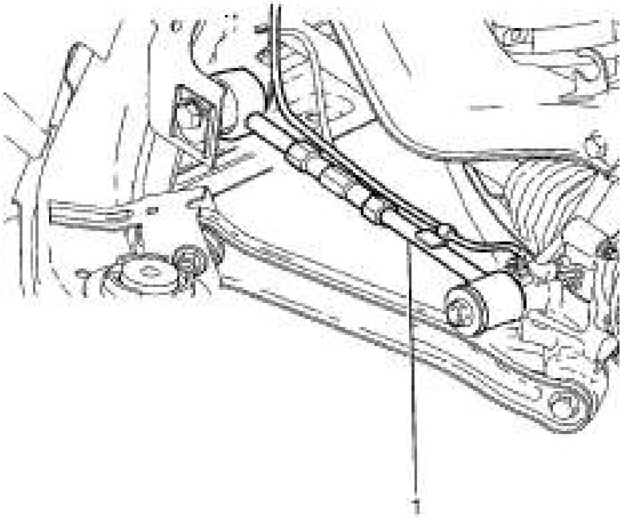
Caution: Refer to Brake Dust Caution in the Preface section.



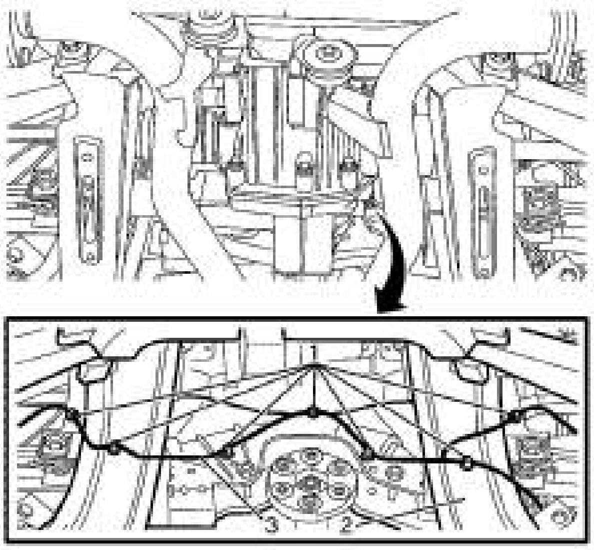
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .
3. Disconnect the wheel speed sensor jumper harness electrical connector (1).
4. Detach the electrical connector (1) from the right hand rail (2).



5. Disconnect the left rear and right rear wheel speed sensor electrical connectors (1).
6. Detach the wheel speed sensor wiring harness mounting clip (2) from the left rear and right rear knuckles (3).



7. Detach the wheel speed sensor wiring harness mounting clip (1).



8. Detach the wheel speed sensor wiring harness mounting clips (1) from the rear suspension subframe (2).

   Important: Note the routing of the wheel speed sensor jumper harness (3).

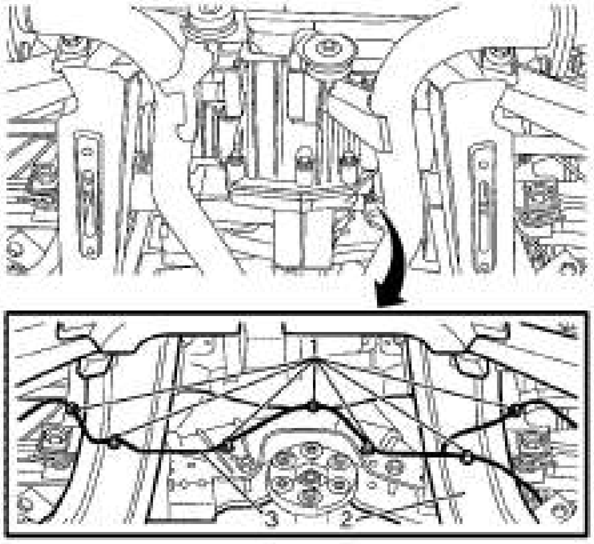
9. Remove the wheel speed sensor jumper harness (2) from the vehicle.

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

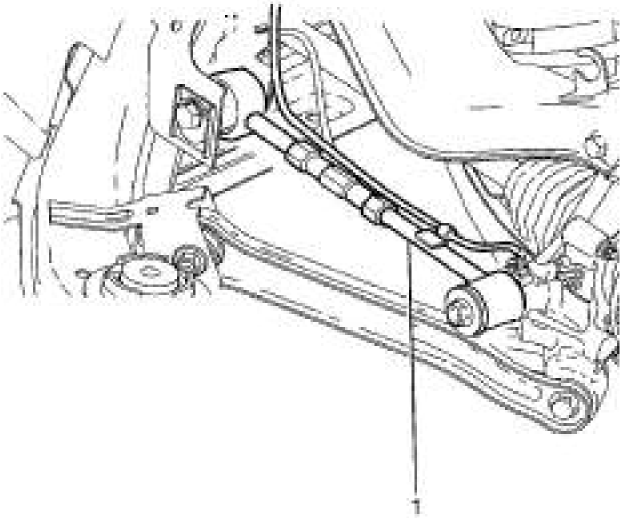
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

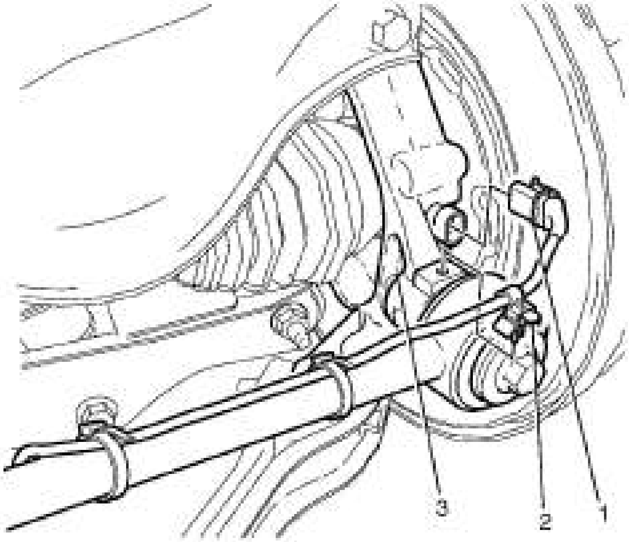


Important: Make sure the routing of the wheel speed sensor jumper harness (3) is routed in its original location.

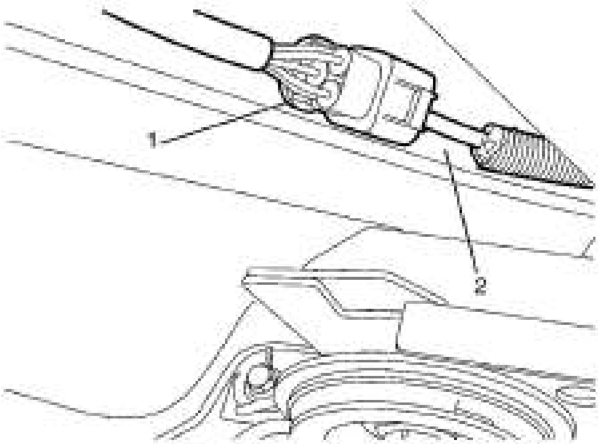
1. Install the wheel speed sensor jumper harness (3) to the vehicle.
2. Attach the wheel speed sensor wiring harness mounting clips (1) to the rear suspension subframe (2).



3. Attach the wheel speed sensor wiring harness mounting clip (1).



4. Connect the left rear and right rear wheel speed sensor electrical connectors (1).
5. Attach the wheel speed sensor wiring harness mounting clip (2) to the left rear and right rear knuckles (3).



6. Attach the electrical connector (1) to the right hand rail (2).
7. Connect the wheel speed sensor jumper harness electrical connector (1).
8. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
9. Lower the vehicle.
10. Use the scan tool in order to clear any DTCs.
11. Perform the System Check-Vehicle. Refer to Diagnostic System Check - Vehicle ..

Steering Angle Sensor Centering

The steering angle sensor does not require centering often. Centering of the steering angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Steering gear replacement
- Steering column replacement
- Steering angle sensor replacement
- Intermediate shaft replacement
- Electronic brake control module (EBCM) replacement
- Collision or other physical damage

The steering angle sensor centering procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align the front wheels forward.
2. Set the transmission in the PARK position.
3. Turn the ignition switch ON, with the engine OFF.
4. Clear any DTCs that may be set.
5. Select Steering Angle Sensor Centering in the EBCM Special Functions list.
6. Follow the scan tool directions to complete the centering procedure.

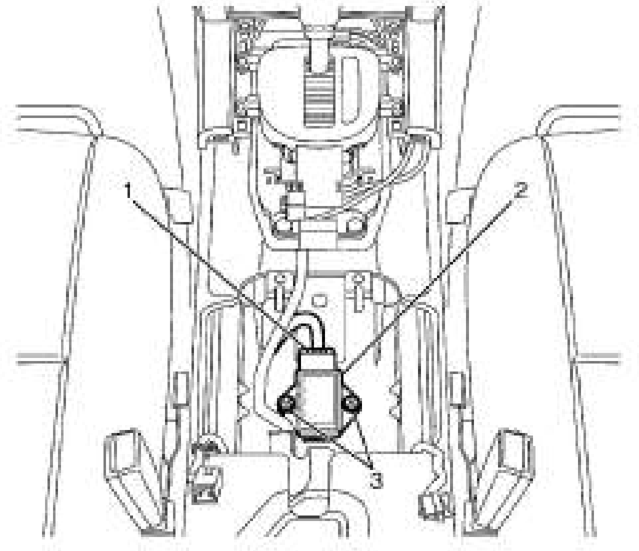
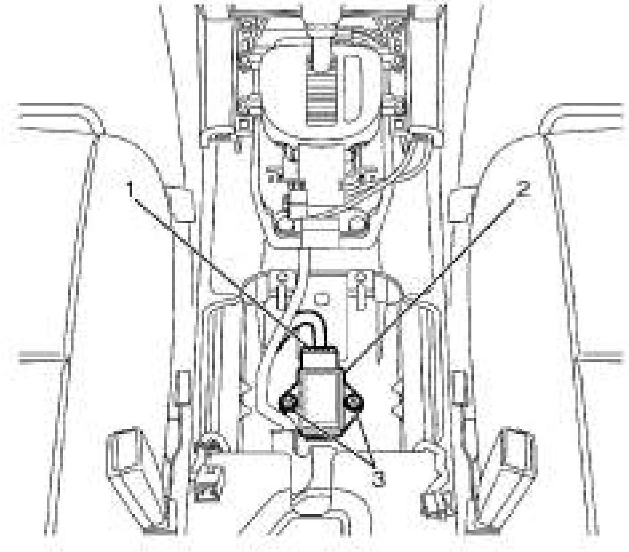
Vehicle Yaw Sensor with Vehicle Lateral Accelerometer Replacement (RHD)

Removal Procedure



1. Turn the key to the ignition OFF position.
2. Remove the center console. Refer to Front Floor Console Replacement .
3. Disconnect the yaw rate sensor/lateral accelerometer sensor electrical connector (1).
4. Remove the yaw rate sensor/lateral accelerometer sensor to yaw rate sensor/lateral accelerometer mounting bracket retaining nuts (3).
5. Remove the yaw rate sensor/lateral accelerometer sensor (2) from the vehicle.

Installation Procedure



1. Install the yaw rate sensor/lateral accelerometer sensor (2) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the yaw rate sensor/lateral accelerometer sensor to yaw rate sensor/lateral accelerometer mounting bracket retaining nuts (3).

   Tighten
   Tighten the nuts to 9 Nm (80 lb in).

3. Connect the yaw rate sensor/lateral accelerometer sensor electrical connector (1).
4. Install the center console. Refer to Front Floor Console Replacement .

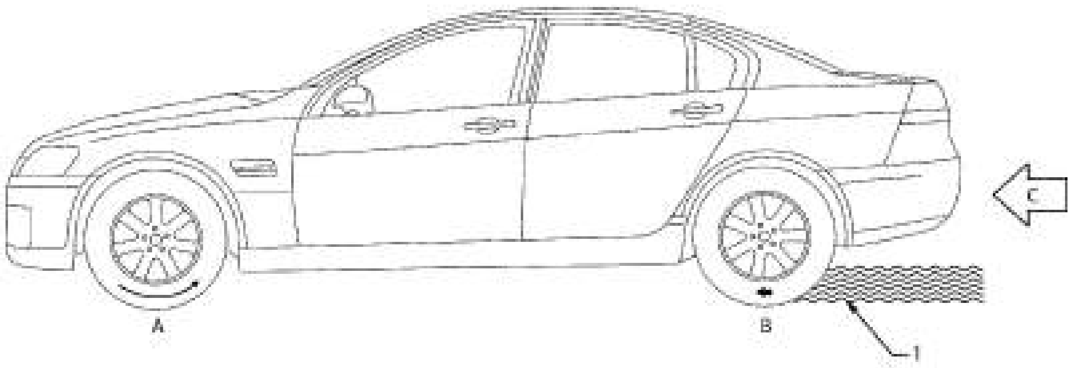
ABS Description and Operation (SWBRHD)

Definition of Longitudinal Wheel Slip

Longitudinal wheel slip is a loss of adhesion between the tyres and the road surface. This occurs when the vehicle is moving in a straight ahead direction and the braking or acceleration forces applied to a tyre exceeds the amount of adhesion available to that tyre.



- At 0 percent slip, the front tyre rolls freely (A).
- At 100 percent slip, the rear wheel locks-up (B) as the weight of the vehicle pushes the non-rotating tyre along the road surface (C). When the wheels are locked-up, the vehicle's kinetic energy (forward motion) is converted into thermal energy (heat) between the tyre and the road surface (1). This will result in an unstable and inefficient braking due to the effect of the following factors:
  - Asphalt, cement, gravel or dirt road surfaces provide different degree of tyre adhesion.
  - Oil puddles, ice spots or other contaminants that cause a sudden change in the road surface condition.
  - Wet, dry, smooth, rough road surface conditions affect tyre adhesion.

When none of the wheels are locked during braking, the brakes work by converting kinetic energy (forward motion of the vehicle) into thermal energy (heat). The friction between the stationary brake pad and the rotating disc as it slides past the pad convert the motion of the wheel and tyre into heat. The brake disc is designed to work like a heat sink, and absorbs as much as 80% of the heat generated during stopping. The brake disc is cooled as it spins through the air on the way to the next stop. The friction surfaces between the brake pads and the brake disc are designed to provide a stable and controlled braking action. Therefore, a vehicle that is braked without locking the wheel will stop in a shorter distance while maintaining directional stability and steering capability. Maximum braking efficiency is achieved when a wheel lock slip is prevented.

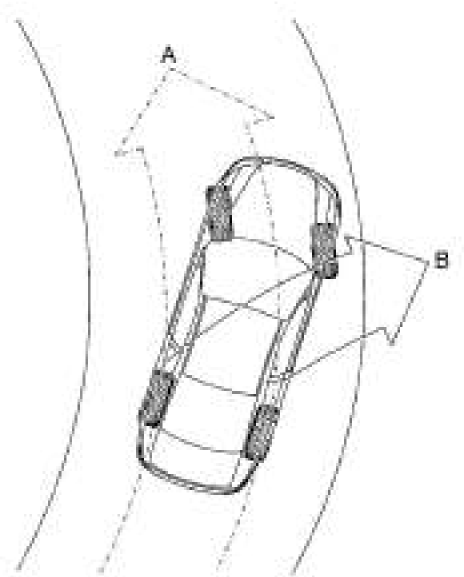
Definition of Lateral Wheel Slip

Lateral wheel slip is the loss of adhesion between the tyres and the road surface, which occurs when the vehicle is cornering or when too much engine torque is applied to the vehicle and the following forces applied to the tyres exceeds the amount of adhesion available to that tyre:

- Cornering forces.
- Acceleration force.
- Braking force.

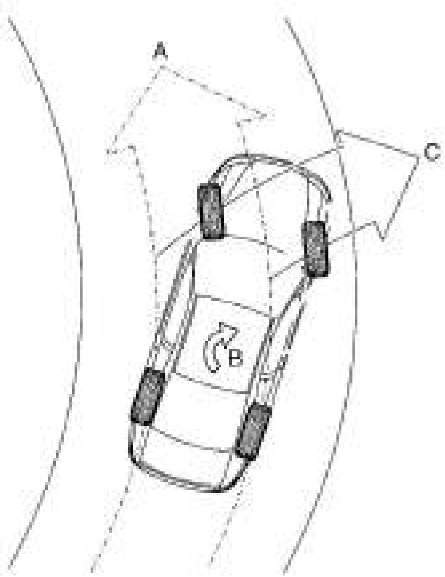
In addition, steering control depends upon tyre adhesion. A locked wheel in a 100 percent slip condition delivers poor braking and directional control.

The front tyre direction (A) has minimal steering effect while the vehicle skids in direction (B). The tyres must regain their adhesion before steering control is restored to the vehicle.



Definition of Understeer

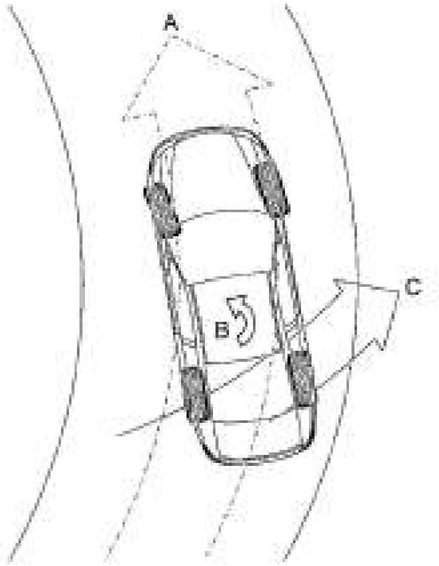
When the vehicle is cornering (A) at high speed or when the vehicle encounters a slippery road surface, the vehicle understeers when the cornering, braking or acceleration forces applied to the tyres exceeds the adhesion available between the tyres and the road surface.



Under this condition, the vehicle spins (B) with the front of the vehicle sliding in direction (C).

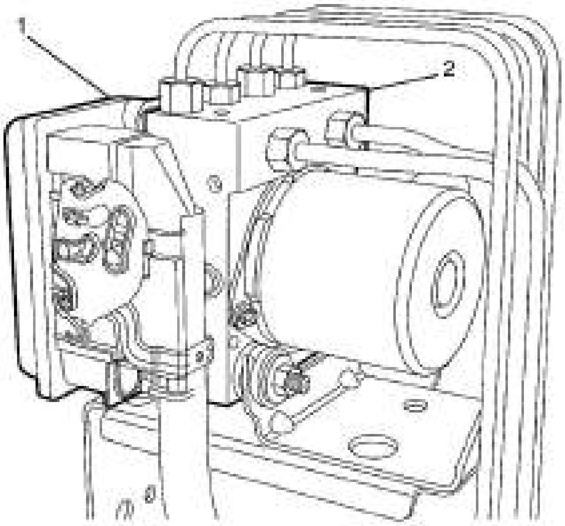
Definition of Oversteer

When the vehicle is cornering (A) at high speed or when the vehicle encounters a slippery road surface, the vehicle oversteers when the cornering, braking or acceleration forces applied to the tyres exceeds the adhesion available between the tyres and the road surface.



Under this condition, the vehicle spins (B) with the rear of the vehicle sliding in direction (C).

Electronic Brake Control Module



The Electronic Brake Control Module (EBCM) (1) is the control centre of the antilock braking system-traction control system with electronic stability program (ABS-TCS/ESP). It is integrated with the Brake Modulator Assembly (2) to form one assembly.

Electronic Brake Control Module Inputs

The EBCM constantly monitors and evaluates input signals from the following:

- Wheel speed sensors.
- Yaw-rate sensors.
- Steering angle sensor.
- Stop lamp switch.
- Ignition on input.
- Battery voltage.
- Serial data communication circuit.

Electronic Brake Control Module Outputs

Based on the inputs received, the EBCM sends output signals to the following:

- Instrument cluster multi-function display (MFD).
- Diagnostic link connector.
- Hydraulic modulator solenoid valves.
- Hydraulic modulator pump motor.

- Serial data communication circuit.

Electronic Brake Control Module Self-test Initialisation Sequence

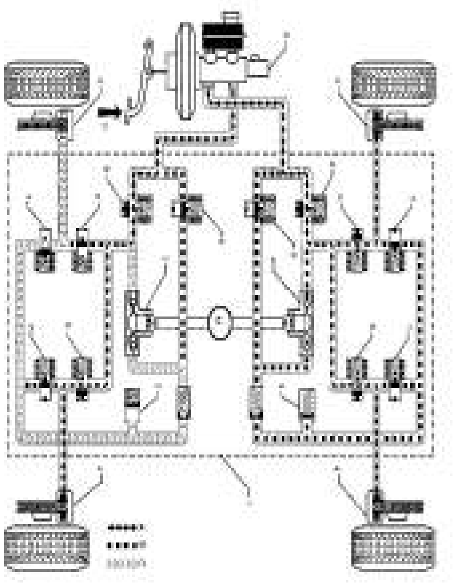
When the ignition is switched on, the EBCM constantly performs a self-test that detects and isolates ABS-TCS/ESP faults. In addition, the EBCM performs on Self-test Initialisation Sequence for each ignition cycle. This Initialisation Sequence commences when the vehicle reaches approximately 15 km/h.

Important: The Initialisation Sequence may be heard and felt while it is taking place, which is considered part of the normal system operation.

During the Initialisation Sequence, the EBCM sends a control signal to the hydraulic modulator to cycle each of the solenoid valves as well as operate the pump motor to check for correct component operation. If the pump or any solenoid valves fail to operate, the EBCM sets a diagnostic trouble code (DTC).

When the vehicle speed exceeds 15 km/h, the EBCM continuously monitors the ABS-TCS/ESP by comparing the logical sequence of input and output signals with the normal operating parameters stored in the EBCM. If any of the input or output signals are outside the normal operating parameters, the EBCM sets the DTC.

Brake Pressure Modulator Valve



(1) Brake pressure modulator valve
(2) Return Pump
(3) Accumulator
(4) Brake Caliper
(5) Brake Master Cylinder
(6) Inlet Valves

(7) Outlet Valves
(8) Isolating Solenoid Valve
(9) Priming Solenoid Valve
(a) Normal (conventional) brake fluid pressure
(b) Stopped brake fluid pressure flow (solenoid valve closed)
(c) Pump generated brake fluid pressure flow
(d) Brake pedal applied
(m) Motor

Important: The illustration shows the brake pressure modulator valve components while in ABS pressure reducing phase. Refer to this illustration for the following hydraulic components.

The brake pressure modulator valve (BPMV) assembly (1) modulates the brake fluid pressure (A) based on the control signal sent by the electronic brake control module (EBCM).

To allow individual control of each wheel brake fluid circuit, a four-channel circuit configuration with a front/rear split is used. Each of the brake fluid circuits are hydraulically isolated, which enables continued braking ability if a leak develops in any of the brake fluid circuits. The BPMV components consist of the following:

- Two return pumps (2) - Each pump draws excess brake fluid from the accumulators (3) and brake calipers (4) allowing the hydraulic modulator to return brake fluid to the brake master cylinder (5) against brake fluid pressure (C) during the ABS-TCS/ESP pressure reducing phase. In addition, the return pump applies pressure to the brake calipers during the ABS brake intervention phase.
- One electric motor (M) - The electric motor drives the return pump.
- Two accumulators - The accumulators store the excess brake fluid during the ABS-TCS/ESP pressure reducing phase that enables the hydraulic modulator to apply instant pressure reduction.
- Four inlet valves (6) - At rest position, each inlet valve allows brake fluid pressure to be applied to the brake callipers. When active, each inlet valve isolates a brake calliper from the brake master cylinder.
- Four outlet valves (7) - At rest position, each outlet valve isolates a brake calliper from the accumulator and return pump. When active, each outlet valve directs excess brake fluid to the accumulator and return pump that allows pressure reduction.
- Two isolating solenoid valves (8) - The isolating solenoid valves isolate the rear brake fluid circuits from the brake master cylinder which prevents the return of the brake fluid to the brake master cylinder during TCS operation.
- Two rear priming valves (9) - Allow brake fluid to be drawn from the brake master cylinder into the hydraulic pump during TCS operation.

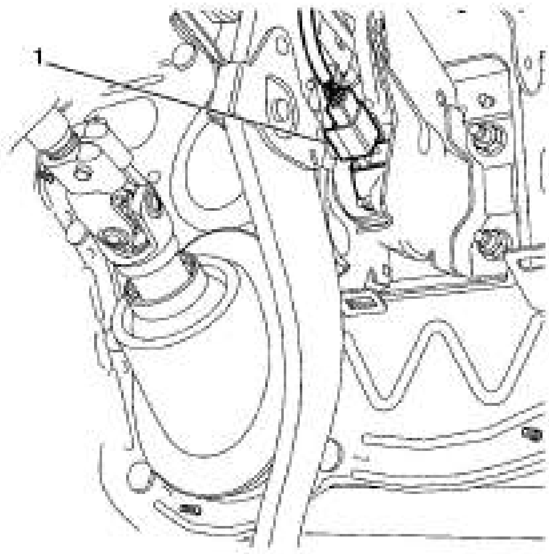
Wheel Speed Sensor

Active wheel speed sensors are fitted to this vehicle. Active wheel speed sensors are direction sensitive.

The wheel speed sensor receives a 12-volt power supply voltage from the electronic brake control module (EBCM). The wheel speed sensor contains an integrated circuit containing a magneto-resistive bridge. Wheel rotation changes the positioning of the tone wheel and the wheel speed sensor's magnetic field and varies the magneto-resistive bridge resistance. The wheel speed sensor's integrated circuit modifies and amplifies the varying resistance into a direct current (DC) square wave signal. Therefore as the wheel spins, the wheel speed sensor changes the voltage and current level output signal to the EBCM. The wheel speed sensor always has a current flow on the output signal circuit to complete the wheel speed sensor's ground path and for EBCM diagnostics. The EBCM uses the frequency of the square wave signal to calculate the wheel speed.

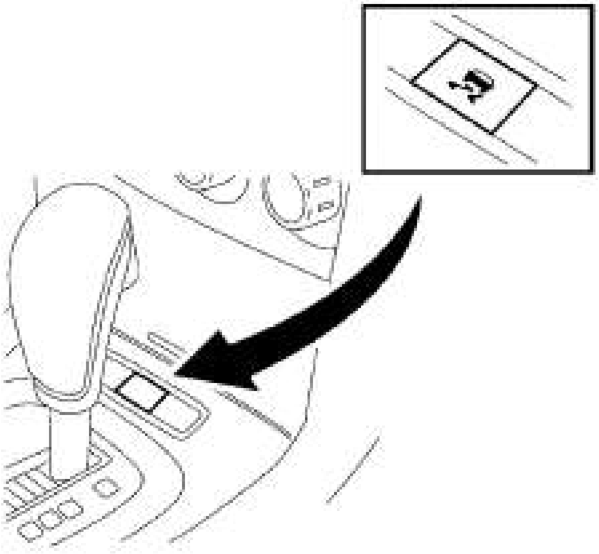
Brake Pedal Position Sensor

The brake pedal position sensor (1) is a normally open switch that closes when the brake pedal is depressed.



The electronic brake control module (EBCM) uses the stop lamp switch signal voltage to determine when the brake pedal is depressed.

Electronic Stability Program (ESP) Switch



The ESP switch incorporates traction control (TCS) which is part of a multi function centre console switch assembly and is located in the console as shown above.

The ESP switch is a momentary contact switch that sends a ground output signal to the body control module (BCM).

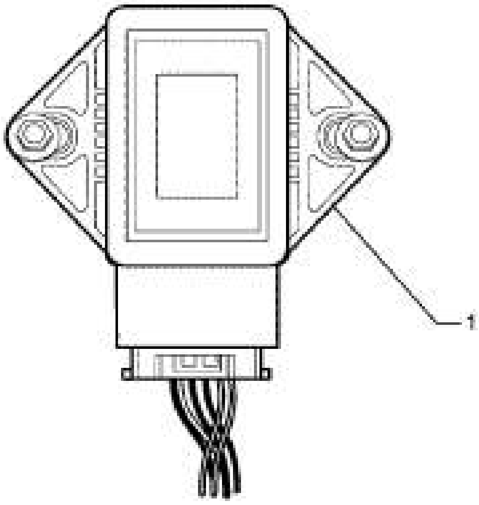
The BCM sends a signal to the EBCM via the serial data bus to perform the following functions:

- Pressing the ESP switch once deactivates both TCS and ESP for the duration of that ignition cycle. ABS will still function normally when the TCS and ESP is deactivated.
- Pressing the ESP switch again when the TCS and ESP is deactivated, activates the TCS and ESP.
- Pressing the ESP switch for more than 60 seconds will be interpreted as a short circuit. Consequently, a DTC will be logged and the TCS and ESP will be deactivated for the duration of that ignition cycle.

If there are no current TCS/ESP DTC's logged, the ESP activates at the next ignition cycle.

Yaw Rate Sensor

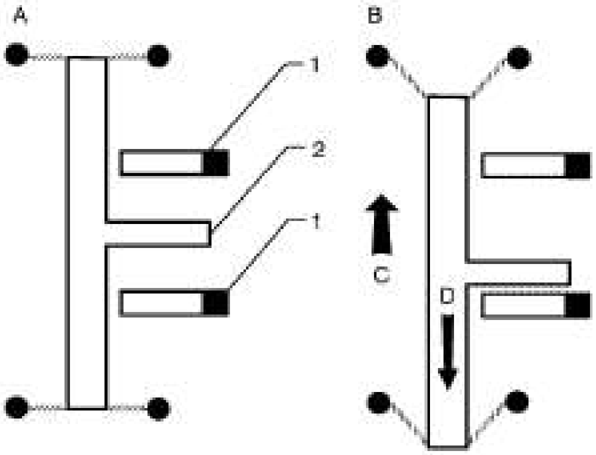
The yaw-rate sensor assembly (1) comprises of a yaw-rate sensor and a lateral acceleration sensor.



- The yaw-rate sensor produces a signal output voltage that corresponds to a vehicle rotation around its vertical axis.
- The lateral acceleration sensor produces a signal output voltage that corresponds to a vehicle lateral acceleration.

The EBCM uses the output signal voltage of the yaw-rate sensor and the acceleration sensor in conjunction with the wheel speed sensor signal output voltage and serial data output signal of the steering angle sensor, to support the calculation of actual vehicle behavior as compared to the driver intended direction.

Lateral Acceleration Sensor



Important: This illustration represents the lateral acceleration sensor in symbolic form, which aims to show the operation of the acceleration sensor in a simplified manner.

The lateral acceleration sensor consists of the following components:

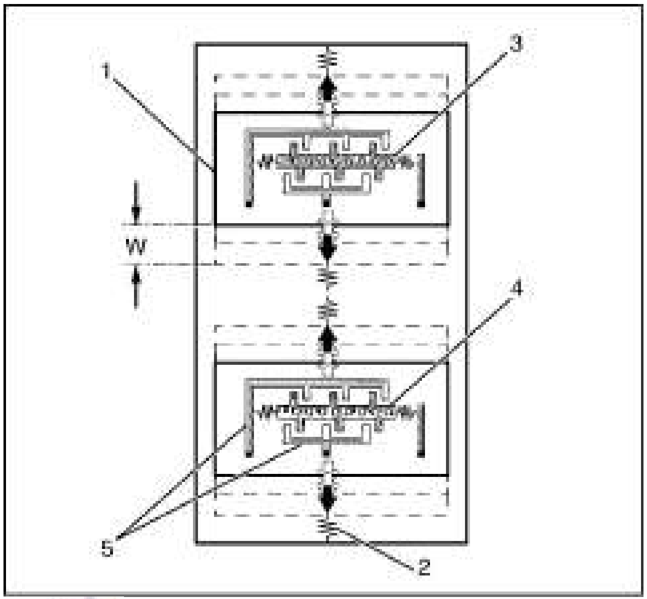
- Differential capacitors connected to the fixed side plates (1).
- Mass plate (2) suspended by springs (3) about its centre of mass, which moves in response to vehicle lateral acceleration.

When the vehicle is stationary (View A), the distance between the mass plate and the 2 side plates are equal. Therefore, the capacitance between the 2 capacitors is the same and the acceleration sensor signal voltage is zero.

As the vehicle accelerates (View B), the side plates move with the vehicle (C) while the mass plate, which is suspended by springs tends to move in the opposite direction. Therefore, the distance between the side plates and the mass plates changes in proportion to the level of acceleration.

This changes the capacitance between the 2 capacitors causing the acceleration sensor to produce a signal voltage with an amplitude proportional to the movement of the mass plates.

Yaw Rate Sensor



Important: This illustration represent the yaw rate sensor in symbolic form, which shows the operation of the yaw rate sensor in a simplified manner.

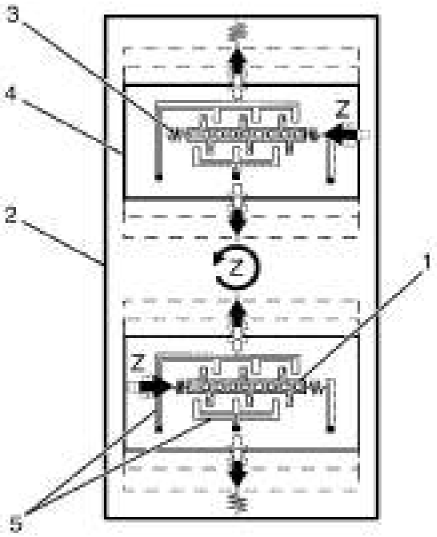
The yaw-rate sensor consists of the following components:

- Two oscillating plates (1) suspended by springs (2) around its center of mass.
- An acceleration sensor (3) incorporated within the oscillating plates.
- Permanent magnets, which project magnetic field to the oscillating plates.

While in the presence of a magnetic field, electric current is applied to the oscillating plates, which causes the plates to move at a constant amplitude (W).

When the vehicle is driving in a straight-ahead direction and there are not lateral forces applied to the acceleration sensors, the distance between the mass plates (4) and the side plates of the acceleration sensors are equal (5). Therefore, the capacitance between the capacitors are the same and the acceleration sensor signal voltage is zero.

When the vehicle rotates around its vertical axis, the following situation occurs.

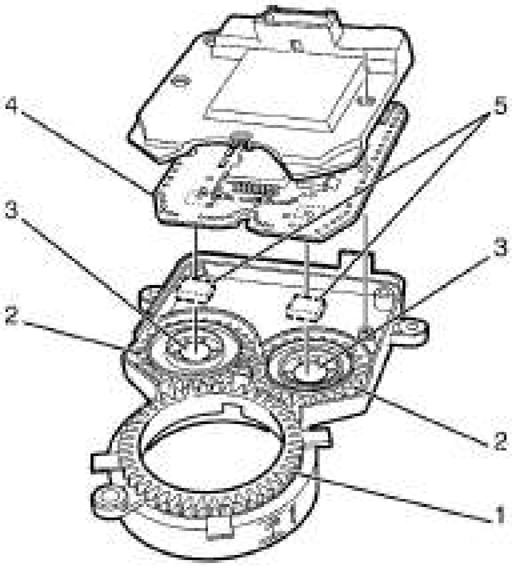


- With the exception of the mass plates (1), the yaw-rate sensor (2), which is firmly attached to the vehicle rotates with the vehicle (Z).
- The mass plates, which are suspended by springs (3) and moves along with the oscillating plates (4), tend to float in its current position while the fixed side plates (5) rotate with the vehicle. Therefore, the distance between the fixed side plates and the mass plates of the acceleration sensor changes in proportion to the level of vehicle rotation around its vertical axis.
- This changes the capacitance between the capacitors causing the acceleration sensor to produce a signal voltage with an amplitude proportional to the movement of the mass plates.

The evaluation circuit of the yaw-rate sensor compares and evaluates the output signal of both acceleration sensors to calculate the level of vehicle rotation around its vertical axis.

Steering Angle Sensor

The steering angle sensor provides a signal output that represents the steering wheel degree of rotation. The EBCM uses this information to calculate the driver intended driving direction. The steering angle sensor contains:



- Gear Wheel (1).
- Measuring Gears (2).
- Measuring Gear Magnets (3).
- Evaluation Circuit (4).
- Anisotropic Magneto Resistive (AMR) Integrated Circuit (IC) (5).

The anisotropic magneto resistive integrated circuit (AMRIC) (1) comprises of eight AMR elements (2) which are configured to form two Wheatstone bridges (3).

A
A
180°
90°
0°
90°
180°
270°
360°

One of the Wheatstone bridges (4) is 45 degrees offset from the other to enable the AMR IC to produce sine (5) and cosine (6) output signal.

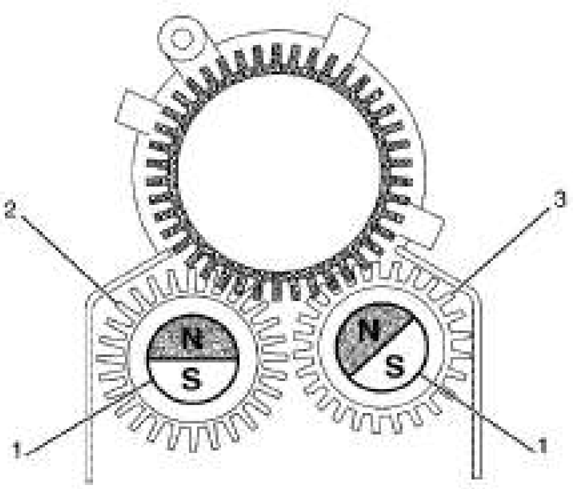
The AMR elements change resistance that corresponds to the changes in the angle of magnetic field projected to the AMR IC, regardless of the polarity of the magnetic field.

The evaluation circuit of the steering angle sensor evaluated and combines the output signal of the AMR IC to produce two identical linear output (A) that represents the 360 degrees angular rotation of the magnetic field.

The omni polarity of the AMR elements limits the signal output range of a single AMR IC from 0-180 degrees.

Steering Angle Sensor Layout

To increase the output signal range of the steering angle sensor, and enable it to produce an output signal that can represent the ±760 degrees of steering wheel rotation, two AMR ICs are fitted to the steering angle sensor.

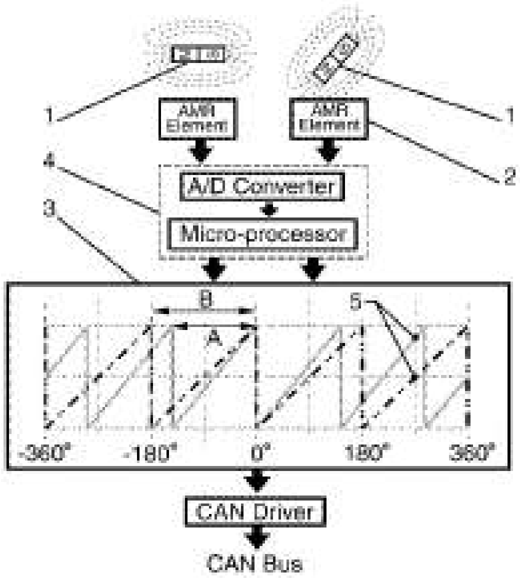


The magnets (1) that project magnetic fields to the AMR ICs are mounted on the primary measuring gear (2) and secondary measuring gear (3).

The secondary gear has two less teeth when compared against the primary measuring gear. This causes the measuring gears to rotate at a different ratio.

Steering Angle Sensor Operation

The angular orientation of the magnetic fields produced by the measuring gear magnets (1) corresponds to the degree of steering wheel angular position.



This magnetic field changes the resistance value of the AMR elements, which enable the AMR ICs (2) to produce a pair of signal outputs (3).

The difference in the rotational ratio between the measuring gears causes the signal output of the second AMR IC (A) to be shorter in range when compared against the signal output of the first AMR IC (B).

The evaluation circuit (4) compares and evaluates this difference, and the rate of change between the output signals of the AMR ICs, at parallel points (5) to calculate that precise steering wheel angular position.

Antilock Brake System Operation

The antilock braking system (ABS) prevents wheel lock-up during hard or emergency braking by modulating the brake fluid pressure applied to the appropriate wheels. The ABS cycles through the following phases when the electronic brake control module (EBCM) detects the beginning of the wheel lock-up:

- Maintaining pressure.
- Reducing pressure.
- Increasing pressure.

Important: The following are conditions that may be experienced when the ABS is active and are considered normal:

- During ABS controlled braking, the braking pressure of the affected wheel is automatically adjusted to prevent wheel lock-up, regardless of pressure applied to the brake pedal.

- A series of rapid pulsations are felt through the brake pedal. These pulsations occur as solenoid valves within the hydraulic modulator changes position to modulate the brake hydraulic pressure.
- A ticking or popping noise in the hydraulic modulator occurs as the hydraulic modulator solenoid valves cycle rapidly to modulate the hydraulic brake pressure.
- Intermittent chirping noises may be heard as the tyres approach slipping on dry pavement.
- Electric motor and pump noise and rapid brake pedal pulsation caused by the operation of the hydraulic modulator pump during the ABS reducing or increasing pressure phase or the EBCM self-test.

ABS Phase - Maintaining Pressure

The EBCM closes the inlet valve and keeps the outlet valve closed in order to isolate the system when wheel slip occurs. This maintains the pressure steady on the brake so that the hydraulic pressure does not increase or decrease.

ABS Phase - Reducing Pressure

The EBCM decreases the pressure to individual wheels during a deceleration when wheel slip occurs. The inlet valve is closed and the outlet valve is opened. The excess fluid is stored in the accumulator until the return pump can return the fluid to the master cylinder.

ABS Phase - Increasing Pressure

The EBCM increases the pressure to individual wheels during a deceleration in order to reduce the speed of the wheel. The inlet valve is opened and the outlet valve is closed. The increased pressure is delivered from the master cylinder.

Electronic Brake-Force Distribution System

The electronic brake-force distribution (EBD) system is part of the ABS software programmed into the electronic brake control module (EBCM). It is designed to replace the rear brake proportioning valve in reducing rear wheel slip during moderate braking.

The EBD system utilises the existing ABS active controls to regulate the vehicle's rear brake fluid pressure. This enables the EBD system to provide dynamic front to rear brake proportioning under various vehicle loads, driving manoeuvres, or road conditions.

In some situations, when the EBD system is activated, a brake pedal height drop of approximately 10 mm will be experienced when the driver varies the brake pedal pressure while performing brake stops. This is caused by the hydraulic modulator performing an adjustment on the rear brake fluid pressure and is considered normal.

EBD System Keep Alive Function

The EBD system plays an important role in vehicle stability during braking. For this reason, the EBD system has a Keep Alive Function integrated in its software. When the EBCM detects a fault in the ABS, depending on the type of fault, certain parts of the system are kept alive. This allows the EBD system to apply some rear wheel brake proportioning even under certain ABS faults.

Traction Control System

The traction control system (TCS) utilises the active braking controls in the ABS and the engine torque reduction function of the engine management system to prevent longitudinal wheel spin during vehicle acceleration.

When drive wheel slip is noted while the brake is not applied, the EBCM will enter traction control mode.

First, the EBCM requests the ECM to reduce the amount of torque to the drive wheels via the requested torque signal circuit. The ECM reduces torque to the drive wheels by retarding spark timing and turning off fuel injectors. The ECM reports the amount torque delivered to the drive wheels via the delivered torque signal circuit.

If the engine torque reduction does not abolish drive wheel slip, the EBCM will actively apply the drive wheel brakes. During traction control braking, hydraulic pressure in each drive wheel circuit is controlled to prevent the drive wheels from slipping. The master cylinder isolation valve closes in order to isolate the master cylinder from the rest of the hydraulic system. The prime valve then opens in order to allow the pump to accumulate brake fluid in order to build hydraulic pressure for braking. The drive wheel inlet and outlet solenoid valves then open and close in order to perform the following functions:

- Pressure increase.
- Pressure hold.
- Pressure decrease.

If at any time during TCS mode the brakes are manually applied, the brake switch sends a signal to the EBCM to exit the TCS brake intervention mode and allow for manual braking.

Electronic Stability Program

The electronic stability program (ESP) is designed to provide optimum vehicle stability and steering control during high speed cornering or when driving on a slippery road surface.

Yaw rate is the rate of rotation about the vehicle's vertical axis. The VSES is activated when the EBCM determines that the desired yaw rate does not match the actual yaw rate as measured by the yaw rate sensor.

The desired yaw rate is calculated from the following parameters:

- The position of the steering wheel.
- The speed of the vehicle.
- The lateral, or sideways acceleration of the vehicle.

The difference between the desired yaw rate and the actual yaw rate is the yaw rate error, which is a measurement of oversteer or understeer. If the yaw rate error becomes too large, the EBCM attempts to correct the vehicle's yaw motion by applying differential braking to the appropriate wheel. The amount of differential braking applied to the left or right front wheel is based on both the yaw rate error and side slip rate error.

The VSES activations generally occur during aggressive driving, in turns or on bumpy roads without much use of the accelerator pedal. When braking during VSES activation, the pedal pulsations feel different than the ABS pedal pulsations. The brake pedal pulsates at a higher frequency during

VSES activation.

The ESP incorporates the following components:

- Steering angle sensor to determine driver steering input, which the EBCM uses to support the calculation of intended vehicle direction.
- Yaw rate sensor to measure vehicle rotation around its vertical axis, which the EBCM uses to support the calculation of actual vehicle behaviour.
- Active braking and engine torque reduction functionality of the TCS to prevent wheel spin.

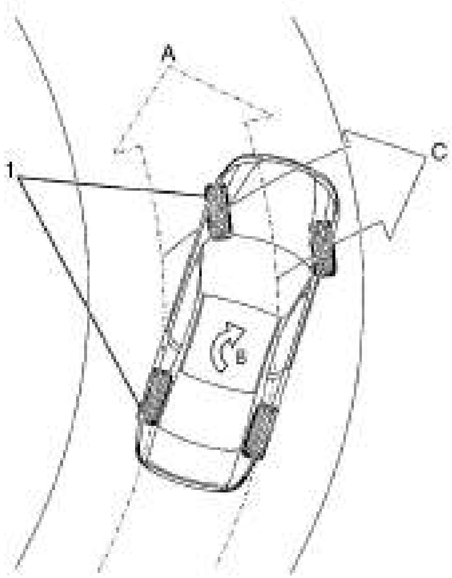
When the ESP detects a lateral wheel slip or when the calculated vehicle direction deviates from the actual vehicle direction, the ESP utilises the engine torque reduction functionality and the active braking controls in the ABS-TCS to stabilise and steer the vehicle to the correct direction.

ESP Engine Torque Reduction

The ESP monitors the wheel speed sensor, yaw-rate sensor and the steering angle sensor to determine lateral wheel slip. When the ESP detects a lateral wheel slip, the ESP initially utilises the torque reduction functionality of the TCS and sends a serial data communication signal to the engine control module (ECM) requesting engine torque reduction. In addition, if the ESP still detects a lateral wheel slip, the ESP applies active brake intervention.

ESP Brake Intervention

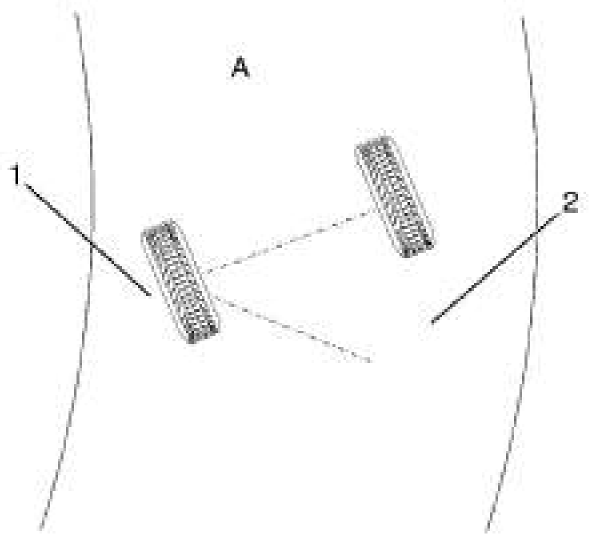
The ESP applies active brake intervention when the EBCM receives the following input signals and determines the vehicle is beginning to understeer.



- The steering angle sensor sends a signal to the EBCM the driver intends to steer in direction (A).
- The yaw rate sensor detects the vehicle begins to spin (B) with the front of the vehicle

beginning to slide in direction (C).

The ESP uses the existing active braking control in the ABS-TCS to apply a calculated braking force to one or both inner wheels (1) of the vehicle to stabilise and steer the vehicle to the intended direction.



Important: Applying brake-force to the inner wheel (1) slows down the inner side of the vehicle, which induces the vehicle to rotate on its vertical axis (A).

The EBCM monitors and compares signals from the yaw-rate sensor, steering angle sensor and each wheel speed sensor to determine wheel slip. If the EBCM detects the beginning of a vehicle understeer condition, the EBCM sends the following signal to the hydraulic modulator to:

- Close the front and rear isolating valves.
- Open the front and rear prime valves.
- Close the front right and rear right inlet valves.
- Operate the hydraulic modulator pump.

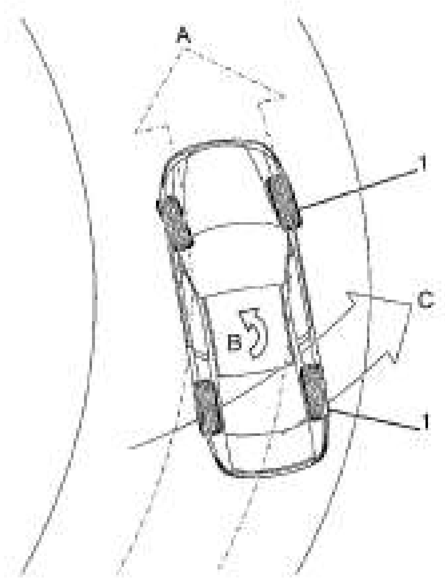
This results in the following actions:

- The rear isolation valve is closed to isolate the rear brake fluid circuits from the master cylinder and prevent the brake fluid returning to the brake master cylinder when the hydraulic pump builds-up the brake fluid pressure.
- The front right and rear right inlet valves are closed to isolate the right wheel hydraulic circuits, allowing the hydraulic modulator to supply brake fluid pressure only to the left wheels.
- The rear priming valve is open to allow fluid to be drawn from the master cylinder into the hydraulic pump.

- The hydraulic pump applies appropriate brake fluid pressure to the left brake callipers to steer the vehicle to the intended direction.
- The hydraulic modulator modulates the front left and rear left inlet valves and outlet valves to assist in obtaining maximum road surface traction in the same manner as in the TCS Mode.

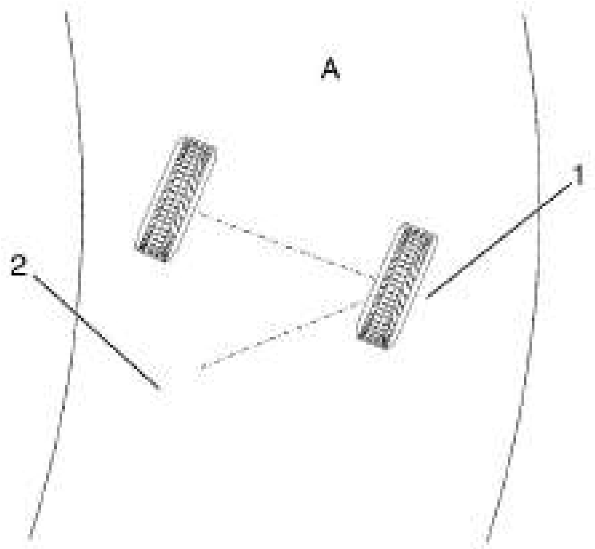
Important: If at any time during the ESP Mode the brakes are manually applied, the brake switch sends a signal to the EBCM to exit the ESP Brake Intervention Mode and allow normal braking.

The ESP applies active brake intervention when the EBCM receives the following input signals and determines the vehicle is beginning to oversteer.



- The steering angle sensor sends a signal to the EBCM the driver intends to steer in direction (A).
- The yaw-rate sensor detects the vehicle begins to spin (B) with the rear of the vehicle beginning to slide in direction (C).

The ESP uses the existing active braking control in the ABS-TCS to apply a calculated braking force to one or both outer wheels (1) of the vehicle to stabilise and steer the vehicle to the intended direction.



Applying brake-force to the outer wheel (1) slows down the outer side of the vehicle, which induces the inner wheel to rotate on its vertical axis (A).

The EBCM monitors and compares signals from the yaw-rate sensor, steering angle sensor and each wheel speed sensor to determine wheel slip. If the EBCM detects the beginning of a vehicle oversteer condition, the EBCM sends the following signal to the hydraulic modulator to:

- Close the front and rear isolating valves.
- Open the front and rear prime valves.
- Close the front right and rear right inlet valves.
- Operate the hydraulic modulator pump.

This results in the following actions:

- The rear isolation valve is closed to isolate the rear brake fluid circuits from the master cylinder and prevent the brake fluid returning to the brake master cylinder when the hydraulic pump builds-up the brake fluid pressure.
- The front left and rear left inlet valves are closed to isolate the right wheel hydraulic circuits, allowing the hydraulic modulator to supply brake fluid pressure only to the left wheels.
- The rear priming valves are open to allow fluid to be drawn from the master cylinder to the hydraulic pump.
- The hydraulic pump applies appropriate brake fluid pressure to the left brake callipers to stern the vehicle to the intended direction.
- The hydraulic modulator modulates the front right and rear right inlet valves and outlet valves to assist in obtaining maximum road surface traction in the same manner as in the TCS Mode.

Important: If at any time during the ESP Mode the brakes are manually applied, the brake switch sends a signal to the EBCM to exit the ESP Brake Intervention Mode and allow normal braking.

Diagnostic Starting Point - Disc Brakes

Begin the disc brake system diagnosis with Diagnostic Starting Point - Hydraulic Brakes in Hydraulic Brakes. The use of the Diagnostic Starting Point will lead to the identification of the correct procedure for diagnosing the system and where the procedure is located.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Diagnostic Information and Procedures | **Document ID: 1977641**

Brake Caliper Inspection (LWB SWB)

Caution: Refer to Brake Dust Caution in the Preface section.

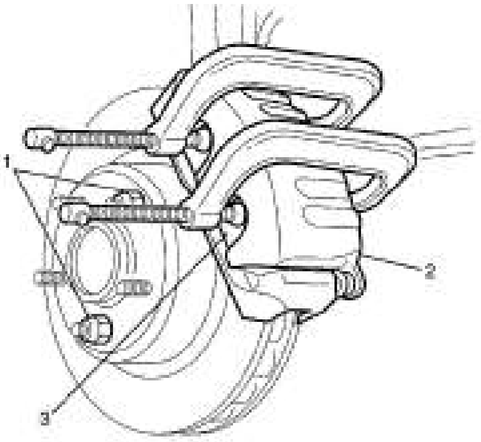
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

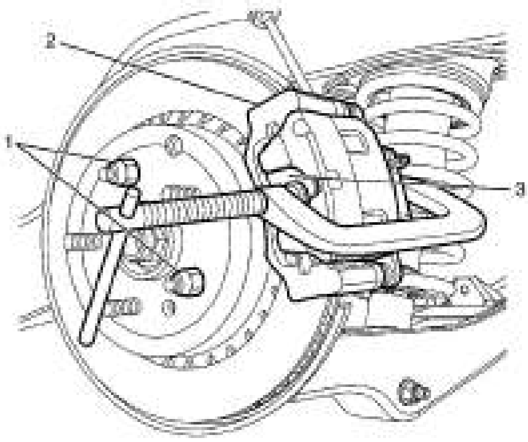
1. Inspect the fluid level in the master cylinder reservoir.
    - If the brake fluid level is midway between the maximum--fill level and the minimum allowable level, no brake fluid needs to be removed from the master cylinder reservoir before proceeding.

      Important: DO NOT completely empty the master cylinder reservoir or remove any brake lines otherwise complete bleeding of the braking system will be necessary.

      Important: DO NOT re use the removed fluid.

    - If the brake fluid level is higher than midway between the maximum--fill level and the minimum allowable level, syphon the brake fluid to the midway point using a hand vacuum pump before proceeding.
2. Remove wheels. Refer to Tire and Wheel Removal and Installation in Tires and Wheels.





3. Install 2 wheel nuts (1) in reverse to opposite wheel studs to retain the brake disc to the hub.

   Important: Position the ends of the G-clamps against the rear of the brake caliper (2) and against the outboard brake pad (3).

4. Install large G-clamps over the body of the brake caliper (3).

   Important: The movement of a brake caliper piston into a brake caliper bore should be smooth and even. If a brake caliper piston is frozen or difficult to bottom out, the brake caliper requires overhaul or replacement.

5. Inspect for smooth and complete travel of the brake caliper piston/s, into the brake caliper bore/s:

   Tighten the G-clamp/s until the brake caliper piston/s bottom out in the brake caliper bore/s.

6. Remove the G-clamp/s from the brake caliper (2).
7. Grasp the brake caliper (2) and try to move the brake caliper (2) up or down.

   The brake caliper (2) should not have too much freeplay.

8. Grasp the brake caliper (2) and try to move the brake caliper in and out.

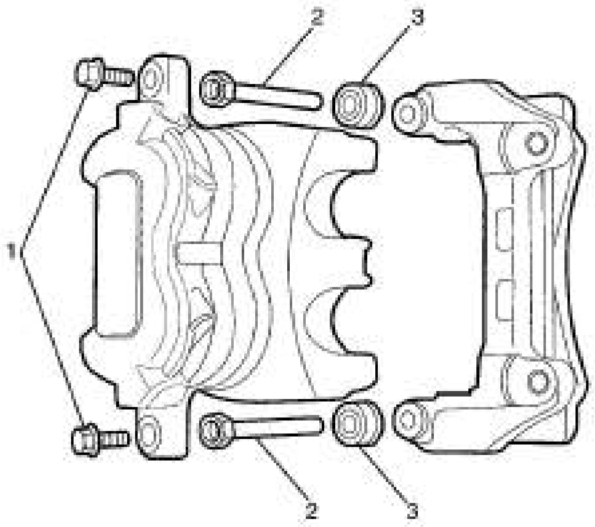
   The brake caliper (2) should slide smoothly with minimal force.

   Important: DO NOT disconnect the hydraulic brake flexible hose from the brake caliper.

9. Remove the brake caliper. Refer to Front Brake Rotor Replacement or Rear Brake Rotor Replacement in Disc Brakes.

   Notice: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

10. Inspect the brake caliper to knuckle retaining bolts for the following:
    - Bent or damaged brake caliper to knuckle retaining bolts.
    - Binding.
    - Corrosion.
    - Seizing in the knuckle.
11. If any of the conditions listed are found, replace the brake caliper to knuckle retaining bolts.

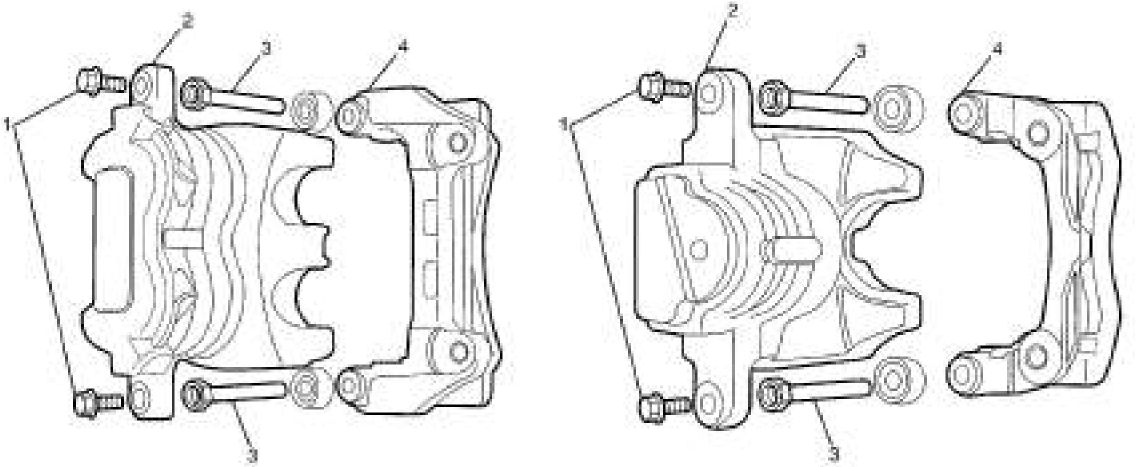


12. Remove the brake caliper lower guide pin retaining bolts (1).
13. Inspect the brake caliper slide pins (2) gently pull the brake caliper slide pins (2) outward

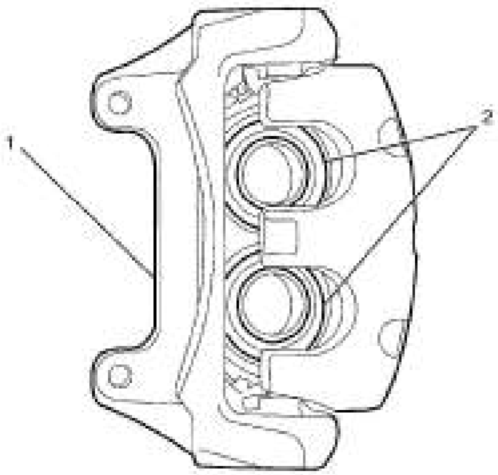
without disengaging the slides from the boot), then push inward, and inspect for the following:

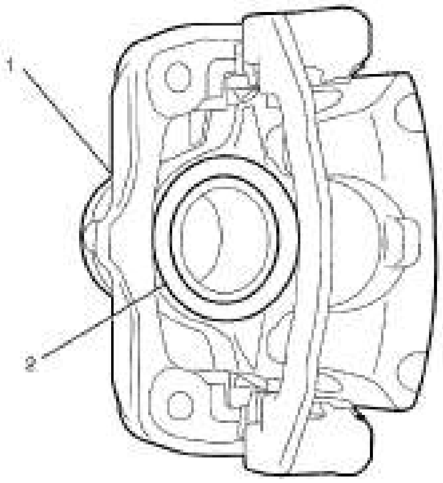
- Bent or damaged brake caliper guide pin retaining bolts (1).
- Bent or damaged brake caliper guide pins (2).
- Binding.
- Corrosion.
- Seizing.

14. If any of the conditions listed are found, replace the brake caliper guide pins (2).
15. Inspect the brake caliper boots (3) for the following:
    - Missing brake caliper boots (3).
    - Cracked or torn brake caliper boots (3).
16. If any of the conditions listed are found, replace the brake caliper boots (3).



17. Inspect the brake caliper (2) and brake caliper anchor plate (4) for the following:
    - Bent or damaged brake caliper anchor plate (4).
    - Too much brake caliper guide pin (3) play in the brake caliper anchor plate (4).
    - Too much brake caliper guide bolt (1) play in the brake caliper (2).
    - Corrosion.
    - Cracks.
    - Damage.
    - Too much Wear.
18. If any of the conditions listed are found, replace the brake caliper (2).





19. Inspect the brake caliper piston dust boot seals (2) for cracks, tears, cuts, deterioration and/or incorrect seating in the brake caliper (1). If any of these conditions are present, the brake caliper requires overhaul or replacement.
20. Inspect for brake fluid leakage around the brake caliper piston dust boot seals (2) and on the brake pads. If there is any evidence of brake fluid leakage, overhaul or replace the brake caliper (1).

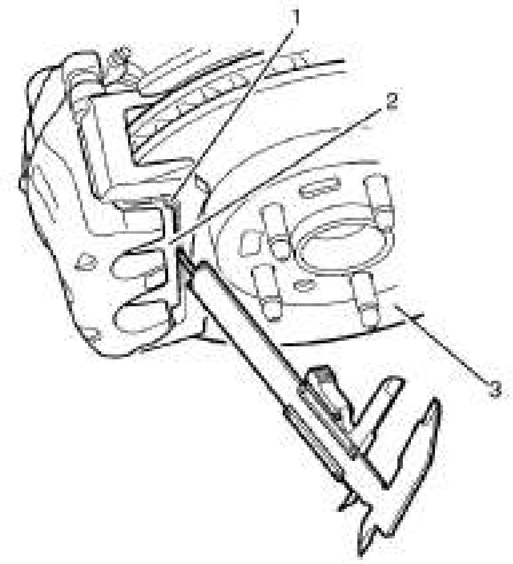
Brake Pad Inspection (LWB SWB)

Caution: Refer to Safety Glasses Caution in the Preface section.

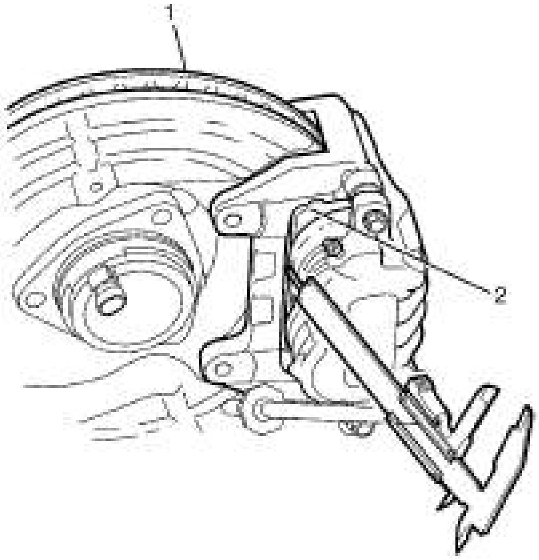
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front wheels. Refer to Tire and Wheel Removal and Installation .
3. Carry out a visual inspection of the front brake assemblies.
4. With the aid of an assistant or a brake pedal holding bar, apply and hold the foot brake.



5. Using a vernier caliper gauge, on the outer brake pad backing plate (2), take note of the measurement from the brake pad backing plate (2) to the brake disc (1), as shown in the diagram.



6. Using a vernier caliper gauge, on the inner brake pad (2), take note of the measurement from the brake pad backing plate (2) to the brake disc (1), as shown in the diagram
7. Replace the pads if .
   - Either reading is 10 mm or less (this equates to 3 mm lining material remaining on the brake pad).
   - If there is more than 2 mm variation between the inner and outer brake pad reading, this may indicate that the caliper is partially sticking.

Brake Rotor Assembled Lateral Runout Measurement

Tools Required

- J 26900-12 Dial Indicator
- J 26900-13 Magnetic Indicator Base
- J 23738-A Hand Vacuum Pump

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Important:

- Brake disc assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between 10,000 [dash] 20,000 km (6,200 [dash] 12,400 mi).
- Brake disc thickness variation MUST be inspected BEFORE inspecting for assembled LRO. Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement .

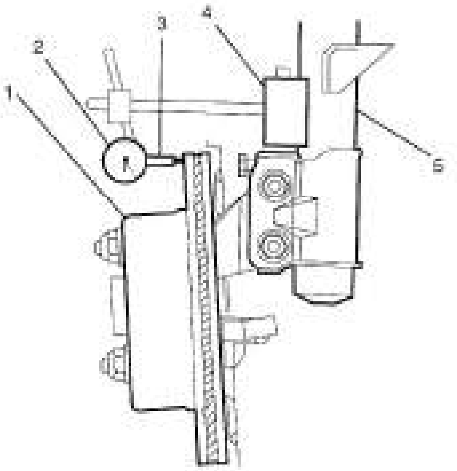
1. Matchmark the position of the brake disc to the wheel studs.

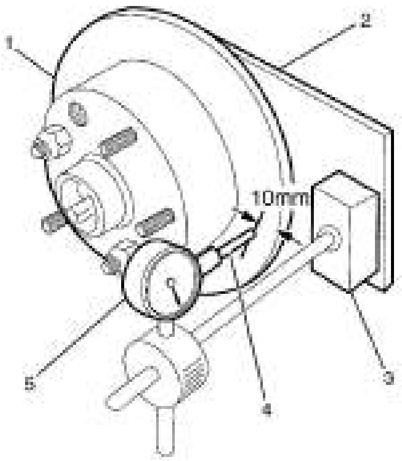
   Important: Whenever the brake disc has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake disc mating surfaces. Failure to do this may result in too much assembled LRO of the brake disc, which may lead to brake pulsation.

2. Inspect the mating surface of the hub/axle flange and the brake disc to make sure that there is no corrosion, foreign particles, rust, or debris. If the wheel hub/axle flange and/or brake disc mating surfaces exhibit these conditions, perform the following steps:
   - 2.1. Remove the brake disc from the vehicle. Refer to Front Brake Rotor Replacement or Rear Brake Rotor Replacement .
   - 2.2. Clean any rust or corrosion from the mating surface of the hub/axle flange.
   - 2.3. Clean any rust or corrosion from the mating surface of the brake disc.
   - 2.4. Clean the friction surfaces of the brake disc with denatured alcohol, or an equivalent approved brake cleaner.
3. Install the disc to the hub/axle flange using the matchmark made prior to removal.

   Important: Install the wheel nuts in reverse avoid damage to the tapers.

4. Install 2 wheel nuts in reverse to opposite wheel studs to retain the brake disc to the hub.
5. Mount a dial indicator and position the indicator button so it contacts the brake disc friction surface at a 90 degree angle, approximately 10 mm (3/8 in) from the outer edge of the brake disc.





Important: The dial indicator's magnetic mounting base (4) must be securely mounted to the front strut unit (5).

- To measure the front brake disc assembled LRO (View A), set up a dial indicator (2) on a magnetic mounting base (4) and attach to the front strut unit (5) above the brake disc (1).

Important: The dial indicator's magnetic mounting base (3) must be securely mounted to the dial indicator plate (2).

- To measure the rear brake disc assembled LRO (View B), bolt the dial indicator plate (2) to the brake caliper attaching points on the rear knuckle. Set up a dial indicator (4) on a magnetic mounting base (3) and attach to the dial indicator plate (2). Refer to Dial Indicator Plate in Special Tools for dial indicator plate details.

6. Measure and record the assembled LRO of the brake disc:
   - 6.1. Rotate the brake disc until the lowest reading is displayed on the indicator dial, then set the dial to zero.
   - 6.2. Rotate the brake disc until the highest reading is displayed on the dial.
   - 6.3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
   - 6.4. Measure and record the amount of assembled LRO.
7. Compare the brake disc assembled LRO to the following specification:

   Specification

   - Front brake disc maximum allowable assembled lateral runout: 0.05 mm (0.002 in).
   - Rear brake disc maximum allowable assembled lateral runout: 0.05 mm (0.002 in).
8. If the brake disc assembled LRO measurement exceeds the specification, refer to Brake Rotor Assembled Lateral Runout Correction .
9. If the brake disc assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the brake disc in place before removing the wheel nuts.

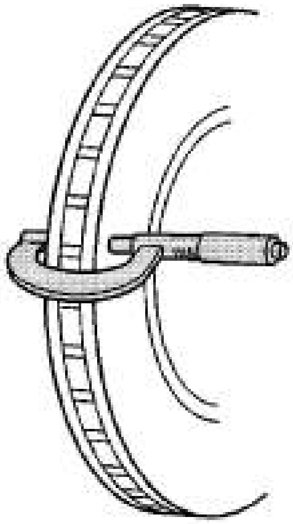
Brake Rotor Surface and Wear Inspection

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle in General Information.
2. Remove the wheels. Refer to Tire and Wheel Removal and Installation in Tires and Wheels.
3. Clean the friction surfaces of the brake disc with denatured alcohol, or an equivalent approved brake cleaner.
4. Inspect the friction surfaces of the brake disc for the following Braking Surface Conditions:
    - Heavy rust and/or pitting
    - Light surface rust can be removed with an abrasive disc. Heavy surface rust and/or pitting must be removed by refinishing the brake disc.
    - Cracks and/or heat spots
    - Too much blueing, discoloration
5. If the friction surfaces of the brake disc exhibit one or more of the Braking Surface Conditions, the brake disc requires refinishing or replacement.



6. Using a micrometer calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the scoring depth of any grooves present on the brake disc friction surfaces.
7. Compare the groove scoring depth recorded to the following specification:

Specification
Brake disc maximum allowable scoring: 1.50 mm (0.060 in).

8. If the brake disc scoring depth exceeds the specification, or if too much scoring is present,

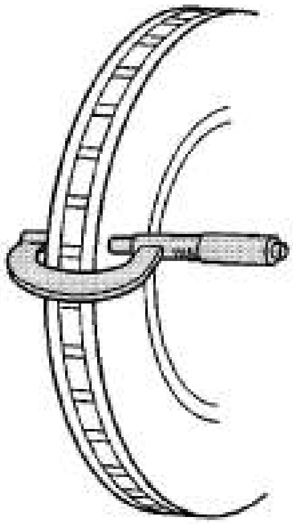
the brake disc requires refinishing or replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Diagnostic Information and Procedures | **Document ID: 1977623**

Brake Rotor Thickness Measurement

Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle in General Information.
2. Remove the wheels. Refer to Tire and Wheel Removal and Installation in Tires and Wheels.
3. Clean the friction surfaces of the brake disc with denatured alcohol, or an equivalent approved brake cleaner.



4. Using a micrometer calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the thickness of the brake disc at 4 points, evenly spaced around the brake disc.
5. Make sure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the brake disc, about 13 mm (½ in), for each measurement.
6. Compare the lowest thickness measurement recorded to the following specification:

Specification - Front

- Brake disc minimum allowable thickness after refinishing: 28.75 mm (1.13 in).
- Brake disc discard thickness: 28 mm (1.1 in)

Specification - Rear

- Brake disc minimum allowable thickness after refinishing: 20.75 mm (0.82 in)
- Brake disc discard thickness: 20 mm (0.80 in)

7. If the lowest thickness measurement of the brake disc is above the minimum allowable thickness after refinishing specification, the brake disc may be able to be refinished, depending upon surface and wear conditions which may be present.
8. If the lowest thickness measurement of the brake disc is at or below the minimum allowable

thickness after refinishing specification, the brake disc may not be refinished.

9. If the lowest thickness measurement of the brake disc is at or below the discard thickness specification, the brake disc requires replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Diagnostic Information and Procedures | **Document ID: 1977624**

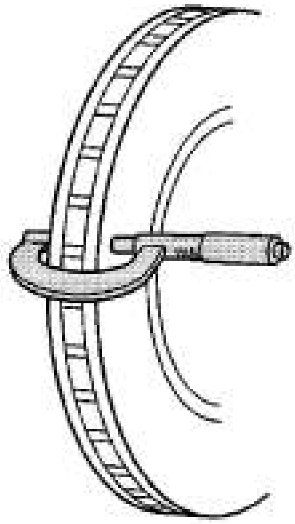
Brake Rotor Thickness Variation Measurement

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle in General Information.
2. Remove the wheels assembly. Refer to Tire and Wheel Removal and Installation in Tires and Wheels.
3. Clean the friction surfaces of the brake disc with denatured alcohol, or an equivalent approved brake cleaner.



4. Using a micrometer calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the thickness of the brake disc at 4 points, evenly spaced around the brake disc.
5. Make sure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the brake disc, about 13 mm (½ in), for each measurement.
6. Calculate the difference between the highest and lowest thickness measurements recorded to obtain the amount of thickness variation.
7. Compare the thickness variation measurement to the following specification:

Specification
Brake disc maximum allowable thickness variation: 0.02 mm (0.001 in).

Important: Whenever a brake disc is refinished or replaced, the assembled lateral runout (LRO) of the brake disc must be measured to make sure optimum performance of the disc brakes.

8. If the brake disc thickness variation measurement exceeds the specification, the brake disc

requires refinishing or replacement.

Brake Pad and Rotor Burnishing

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

Important: Burnishing the brake pads and brake discs is necessary whenever the brake discs have been refinished or replaced, and/or whenever the brake pads have been replaced to make sure that the braking surfaces are correctly prepared.

1. Select a smooth road with little or no traffic.
2. Accelerate the vehicle to 70 km/h (43 mph).

Important: Use care to avoid overheating the brakes while performing this step as it may adversely affect the heating characteristics of the NEW brake pad material.

Important: DO NOT allow the brakes to lock.

3. Using moderate pressure, apply the brakes to bring the vehicle to a stop.
4. Repeat steps 2 and 3 until approximately 20 stops have been completed. Allow sufficient cooling periods of no less than 500 metres between stops in order to correctly burnish the brake pads and brake discs.

Brake Rotor Assembled Lateral Runout Correction - Indexing

Important: Brake disc thickness variation MUST be inspected BEFORE inspecting for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.

Important: Brake disc and hub indexing is required so the minimum installed brake disc runout is achieved. Brake disc and hub indexing involves aligning the point of maximum runout on the hub with the point of least runout on the brake disc.

Important: The procedure is to be used when installing NEW brake discs or brake discs that have been removed for any reason and where the brake disc to hub matching is not evident.

The procedure consists of three parts:

- Clean Mating Surfaces.
- Indexing Brake Disc to Hub. If these measurements are not within specification, go to Hub Runout Inspection.
- Hub Runout Inspection.

Clean Mating Surfaces

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

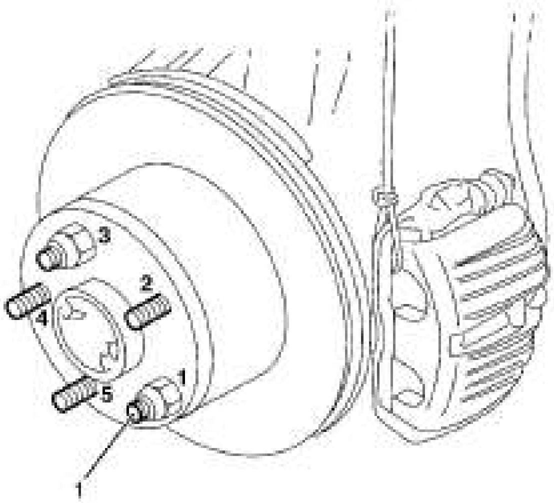
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove wheels. Refer to Tire and Wheel Removal and Installation.
3. Remove the brake caliper. Refer to Front Brake Rotor Replacement or Rear Brake Rotor Replacement.
4. Make sure that brake disc and hub mating surfaces are free from dirt, corrosion, etc. If required, use fine emery paper to clean surfaces.

Indexing Brake Disc to Hub - Front

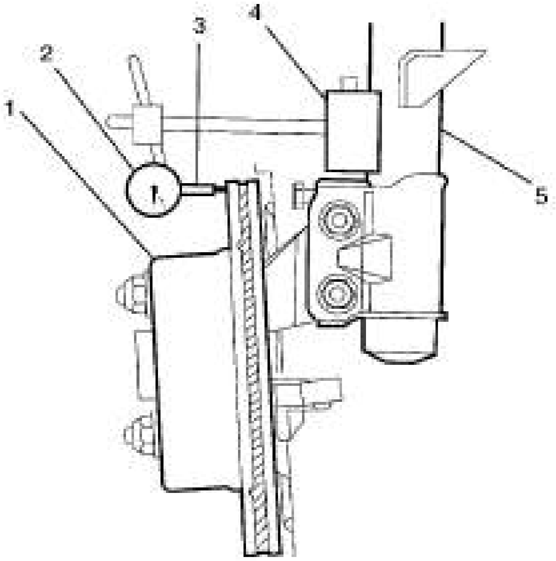
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Install 2 wheel nuts in reverse to opposite wheel studs to retain the brake disc to the hub.
2. Number each of the wheel stud holes on the front surface of the brake disc from 1 to 5.
3. Place a chalk mark on the end of the wheel stud adjacent to the number "1" hole (1).



4. Set up a dial indicator (2) on a magnetic base (4) and attach to the front strut unit (5) above the brake disc (1).
5. Position the pointer (3) about 10 mm (3/8 in), from the outer edge of the disc.

Important: The number of divisions between the points of minimum and maximum runout on the dial indicator is the total indicated runout.

6. Rotate the brake disc (1) and note the points of minimum and maximum runout on the dial indicator (2).

Important: If the lowest assembled disc runout achieved is more than 0.05 mm (50 micron), then the hub runout should be inspected as detailed in the Hub Runout procedure.

7. Record the figure together with the number on the brake disc aligned with the chalk-marked stud.
8. Remove and reinstall the brake disc with hole number '2' over the marked stud. Repeat Steps 4 to 7. This procedure is to be repeated for all 5 hole positions.

Specification
The maximum assembled brake disc and hub runout at brake disc outer diameter equals 0.05 mm.

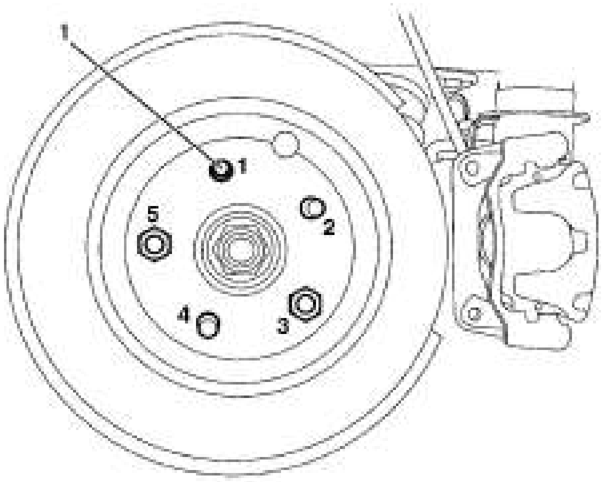
9. Mount the brake disc to the hub in the stud position which recorded the least amount of runout.

Index Brake Disc to Hub - Rear

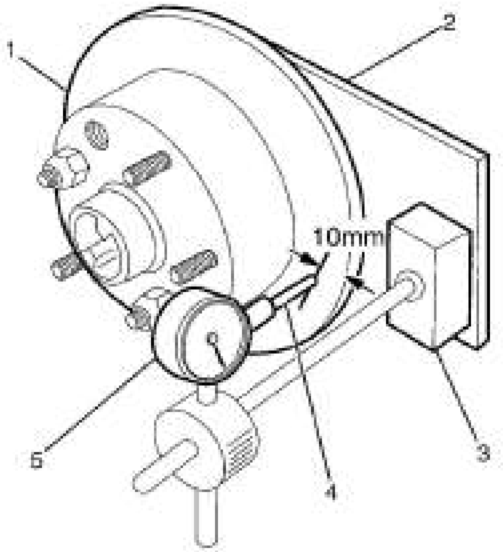
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Install 2 wheel nuts in reverse to opposite wheel studs to retain the brake disc to the hub.
2. Number each of the wheel stud holes on the front surface of the brake disc from 1 to 5.
3. Place a chalk mark on the end of the wheel stud adjacent to the number "1" hole (1).
4. Bolt the dial indicator plate (3) to the brake caliper attaching points on the rear knuckle. Refer to Dial Indicator Plate in Special Tools for dial indicator plate details.



5. Set up a dial indicator (1) on a magnetic mounting base (2) and attach to the dial indicator plate (3).
6. Position the pointer (4) about 10 mm (3/8 in), from the outer edge of the brake disc (5).

   Important: The number of divisions between the points of minimum and maximum runout on the dial indicator is the total indicated runout.

7. Carefully rotate the brake disc and note the points of minimum and maximum runout on the dial indicator.

   Important: If the lowest assembled brake disc runout achieved is more than 0.05 mm (50 micron), then the trunnion hub runout should be inspected as detailed in the Hub Runout procedure.

8. Record this figure together with the number on the brake disc aligned with the chalk-marked stud.
9. Remove and reinstall brake disc with hole number 2 over the marked stud and repeat Step 4. This procedure is to be repeated for all 5 hole positions.

   Specification
   Maximum assembled brake disc and hub runout at brake disc outer diameter [dash] rear brake disc: 0.05 mm

   Mount the brake disc to the hub in the stud position which recorded the least amount of runout.

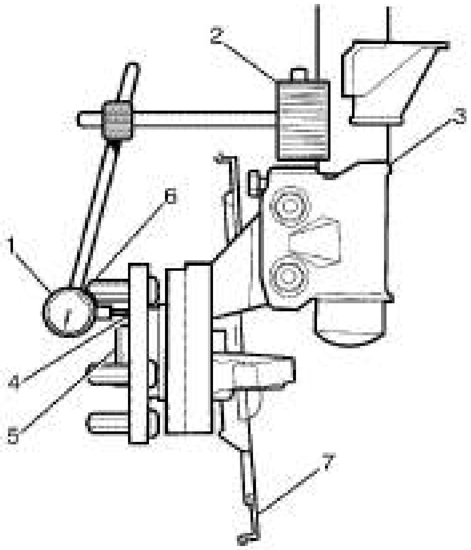
Hub Runout Inspection - Front

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

1. Clean the front hub face with fine emery paper.



2. Locate the dial indicator magnetic base (2) on the front strut unit (3) and position the pointer (4) on the hub face midway between the spigot (5) and the studs (6).

   Important: For this inspection to be performed with 100 percent accuracy, a flat parallel surface plate attached to the hub should be used. However, measuring runout between spigot (5) and the studs (6) should yield adequate results.

   Important: The number of divisions between the points of minimum and maximum runout on the dial indicator (1) is the total indicated runout.

3. Rotate the hub by the hub spigot (5) (to avoid loading the bearing) and note the points of minimum and maximum runout on the dial indicator (1).

   Important: The maximum runout at hub face-front hub is 0.025 mm.

4. If the runout measured in Step 3 exceeds 0.025 mm (25 micron), replace the hub unit. Refer to Front Wheel Bearing and Hub Replacement.

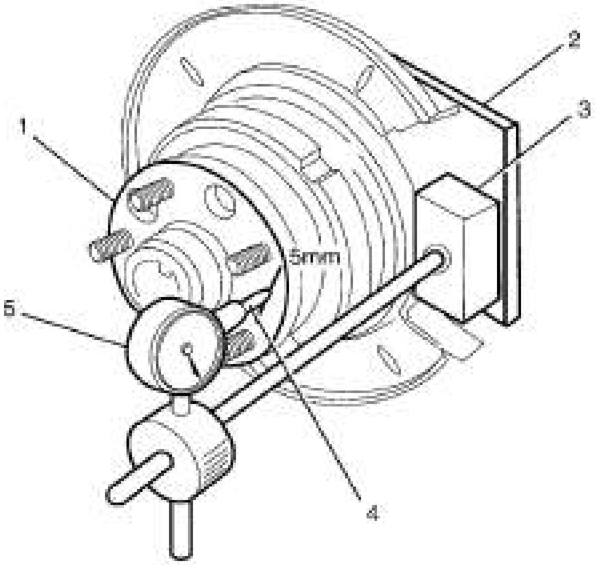
Hub Runout Inspection - Rear

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

1. Clean the hub face by rubbing lightly with fine emery paper.



2. Set up a dial indicator (5) on a magnetic base (3) and attach to the pre-fabricated mounting plate (2).
3. Position the pointer (4) on the hub face 5 mm (0.2 in) from the edge of the hub (1).

Important: For this inspection to be performed with 100 percent accuracy, a flat parallel surface plate attached to the hub should be used. However, measuring runout on the hub face 5 mm (0.2 in) from the edge of the hub (1) should yield adequate results.

Important: The number of divisions between the points of minimum and maximum runout on the dial indicator (5) is the total indicated runout.

4. Rotate the hub by the wheel studs and note the points of minimum and maximum runout on the dial indicator (5).
5. If the runout measured in Step 3 exceeds 0.025 mm (25 micron), replace the hub assembly.

Specification
Maximum hub total indicated runout (TIR): 0.25 mm

Brake Rotor Assembled Lateral Runout Correction

Important:

- Brake disc thickness variation MUST be inspected BEFORE inspecting for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement .
- Brake disc assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between 4 800-11 300 km (3,000-7,000 mi). Refer to Part 2 in Brake Rotor Assembled Lateral Runout Correction - Indexing .

Review the following acceptable methods for bringing the brake disc assembled LRO to within specifications. Determine which method to use for the vehicle being repaired.

- The indexing method of correcting assembled LRO is most effective when the LRO specification is only exceeded by a relatively small amount: 0.025-0.127 mm (0.001-0.005 in). Indexing is used to achieve the best possible match of high spots to low spots between related components. Refer to Brake Rotor Assembled Lateral Runout Correction - Indexing .
- The on-vehicle brake lathe method is used to bring the LRO to within specifications through compensating for LRO while refinishing the brake disc. Refer to Brake Rotor Assembled Lateral Runout Correction - On Vehicle Lathe .

If the assembled LRO cannot be corrected using these methods, then other components must be suspected as causing and/or contributing to the LRO concern.

Brake Rotor Assembled Lateral Runout Correction - On Vehicle Lathe

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Important:

- Brake disc thickness variation must be inspected before inspecting for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.
- Brake disc assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between 10 000-20 000 km (6,213-12,427 mi). Refer to Brake Rotor Assembled Lateral Runout Measurement.
- Before refinishing a brake disc, the brake disc must first be inspected for adequate thickness to allow the brake disc to be refinished and remain above the minimum allowable thickness after refinish specification. Refer to Brake Rotor Thickness Measurement.

1. Make sure that the brake caliper and brake caliper anchor plate that are already being supported, are clear from contacting any rotating components, such as the brake disc.
2. Remove the dial indicator and the wheel nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake disc to make sure that there are no foreign particles or debris remaining.
4. Set up the lathe, following the manufacturer's instructions.
5. Refinish the brake disc, following the brake lathe manufacturer's instructions.
6. After each successive cut, inspect the brake disc thickness. Refer to Brake Rotor Thickness Measurement.
7. If at any time the brake disc exceeds the minimum allowable thickness after refinish specification, the brake disc must be replaced. After replacing the brake disc, proceed to step 10.
8. After refinishing the brake disc, use the following procedure in order to obtain the desired non-directional finish:
    8.1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.

    8.2. Using moderate pressure, apply the non-directional finish:

    - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120 grit aluminum oxide sandpaper.
    - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150 grit aluminum oxide sandpaper.

    8.3. After applying a non-directional finish, clean each friction surface of the brake disc with denatured alcohol, or an equivalent approved brake cleaner.
9. Remove the lathe from the vehicle.
10. Measure the assembled LRO of the brake disc. Refer to Brake Rotor Assembled Lateral Runout Measurement.
11. If the brake disc assembled LRO measurement still exceeds the maximum allowable

specification, refer to Brake Rotor Assembled Lateral Runout Correction.

12. If the brake disc assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the brake disc in place before removing the dial indicator and the wheel nuts.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Repair Instructions | **Document ID: 1992519**

Brake Rotor Refinishing

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Important:

- The brake discs do not require refinishing as part of routine brake system service. NEW brake discs do not require refinishing.
- DO NOT refinish brake discs in an attempt to correct the following conditions:
  - Brake system noise - squeal, growl, groan
  - Uneven and/or premature brake pad wear
  - Superficial or cosmetic corrosion/rust of the brake disc friction surface
  - Scoring of the brake disc friction surface less than the maximum allowable specification
- Before refinishing a brake disc, the brake disc must first be inspected for adequate thickness to allow the brake disc to be refinished and remain above the minimum allowable thickness after refinish specification. Refer to Brake Rotor Thickness Measurement.
- Brake discs should only be refinished if they have adequate thickness to be refinished and if one or more of the following conditions exist:
  - Thickness variation in excess of the maximum allowable specification.
  - Too much corrosion/rust and/or pitting.
  - Cracks and/or heat spots.
  - Too much blueing, discoloration.
  - Scoring of the brake disc surface in excess of the maximum allowable specification.
- Brake discs may need to be refinished as part of the process for correcting brake disc assembled lateral runout (LRO) that exceeds the maximum allowable specification.

Important: Whenever the brake disc has been separated from the hub/axle flange, clean any rust or contaminants from the hub/axle flange and the brake disc mating surfaces. Failure to do this may result in increased assembled LRO of the brake disc, which may lead to brake pulsation.

1. Clean any rust or corrosion from the mating surface of the hub/axle flange.
2. Clean any rust or corrosion from the mating surface and mounting surface of the brake disc.
3. Inspect the mating surfaces of the hub/axle flange and the brake disc to make sure that there are no foreign particles or debris remaining.
4. Mount the brake disc to the brake lathe according to the lathe manufacturer's instructions, ensuring that all mounting attachments and adapters are clean and free of debris.
5. Make sure that any vibration dampening attachments are securely in place.
6. With the brake lathe running, slowly bring in the cutting tools until they just contact the brake disc friction surfaces.
7. Observe the witness mark on the brake disc. If the witness mark extends approximately three-quarters or more of the way around the brake disc friction surface on each side, the brake disc is correctly mounted to the lathe.
8. If the witness mark does not extend three-quarters or more of the way around the brake

disc, re-mount the brake disc to the lathe.

9. Following the brake lathe manufacturer's instructions, refinish the brake disc.
10. After each successive cut, inspect the brake disc thickness. Refer to Brake Rotor Thickness Measurement.
11. If at any time the brake disc exceeds the minimum allowable thickness after refinish specification, the brake disc must be replaced.
12. After refinishing the brake disc, use the following procedure in order to obtain the desired non-directional finish:
    12.1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish

    12.2. Using moderate pressure, apply the non-directional finish:

    - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120 grit aluminum oxide sandpaper.
    - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150 grit aluminum oxide sandpaper.

    12.3. After applying a non-directional finish, clean each friction surface of the brake disc with denatured alcohol, or an equivalent approved brake cleaner.
13. Remove the brake disc from the brake lathe.
14. Measure the assembled LRO of the brake disc to make sure optimum performance of the disc brakes. Refer to Brake Rotor Assembled Lateral Runout Measurement.
15. If the brake disc assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to Brake Rotor Assembled Lateral Runout Correction.

Front Brake Caliper Overhaul (LWB SWB)

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

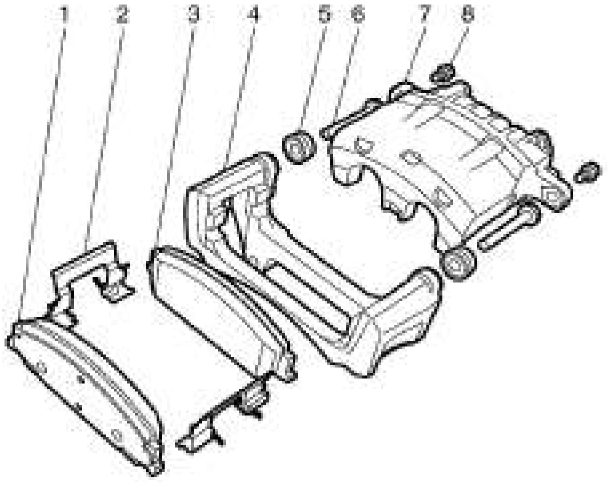
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Disassembly Procedure

Important:

- Replace all the components included in the repair kit used to service the brake caliper.
- Lubricate the rubber parts with brake fluid conforming to specification to make assembly easier. Refer to Brake System Specifications for correct brake fluid specification.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- The torque values specified are for dry, non-lubricated fasteners.
- Perform the service operations on a clean bench, free from all mineral oil materials.

1. Remove the brake caliper from the vehicle. Refer to Front Brake Caliper Replacement.
2. Drain the brake fluid from the brake caliper.



Important: To remove the guide pin bolts (8) use a suitable tool to hold the flat section on the guide pins (6) whilst loosening the guide pin retaining bolts (8).

3. Remove the guide pin retaining bolts (8).
4. Separate the brake caliper housing (7) from the brake caliper anchor plate (4).

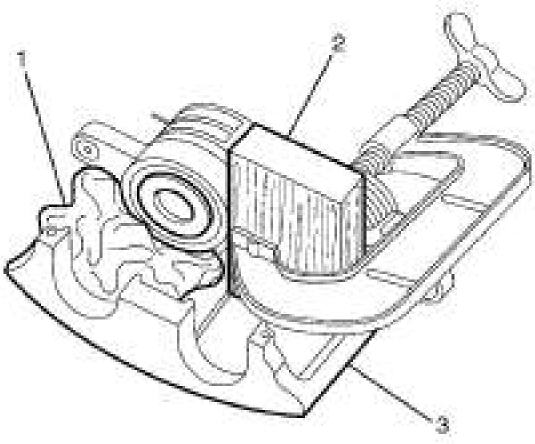
5. Remove the brake pads (1 and 3).
6. Remove the retainer clips (2).
7. Withdraw the guide pins (6) and dust boots (5) from the brake caliper anchor plate (4).

   Separate the dust boots (5) from the guide pins (6).

   Caution: Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.

   Notice: Use clean cloths to pad interior of caliper housing during piston removal. Use just enough air to ease the pistons out of the bores. If the pistons are blown out, even with the padding provided, it may be damaged.

   Important: Observe the pistons coming out of the bores. If one of the pistons appears to be seized, STOP applying air pressure.



8. Remove the brake caliper pistons by directing low pressure compressed air into the brake caliper inlet hole.

   If one of the pistons appears to be seized, perform the following steps:

   8.1. Place a 25 mm (1 in) block of wood between the brake caliper and the brake caliper piston that was moving freely.

   Important: Position the ends of the G-clamp against the rear of the brake caliper and against the 25 mm (1 in) block of wood.

   8.2. Install a large G-clamp over the body of the brake caliper.
   8.3. Remove the brake seized caliper piston by directing low pressure compressed air into the brake caliper inlet hole.

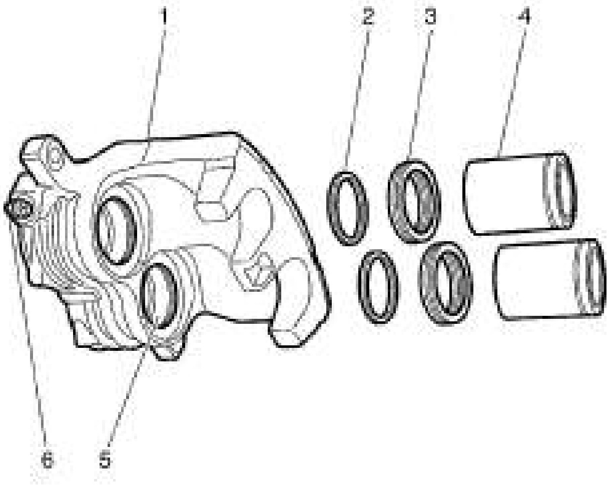
  8.4. Remove the G-clamp from the brake caliper.

  8.5. Remove the block of wood from the brake caliper.

9. Install clean workshop cloths (1) to pad the interior of the brake caliper (3) between the remaining brake caliper piston and the body of the brake caliper (3).
10. To cover the open brake caliper bore place a 25 mm (1 in) block of wood (2) between the body of the brake caliper (3) and the brake caliper dust boot seal.

Important: Position the ends of the G-clamp against the rear of the brake caliper (3) and against the 25 mm (1 in) block of wood (2).

11. Install a large G-clamp over the body of the brake caliper (1).
12. Remove the brake caliper piston by directing low pressure compressed air into the brake caliper inlet hole.
13. Remove the G-clamp form the brake caliper (3).
14. Remove the block of wood (2) from the brake caliper (3).



Important: Use a small wooden or plastic tool to avoid damage to the brake caliper (1).

Important: Brake caliper seals are single use components only and must be discarded after removal.

15. With the brake caliper pistons (4) removed, remove the brake caliper piston dust boot seal (3) from the brake caliper (1).

    Discard the brake caliper piston dust boot seal (3).

16. Remove the brake caliper piston seal (2) from the brake caliper (1).

    Discard the brake caliper piston seal (2).

17. Remove the brake caliper bleeder valve (6).
18. Inspect the brake caliper anchor plate guide surfaces for corrosion and wear.

Replace the brake caliper assembly if damaged or worn.

19. Clean the brake caliper piston bores (5) with denatured alcohol, or equivalent.

Important: DO NOT use abrasives to clean the brake caliper assembly.

20. Clean the brake caliper pistons (4) with denatured alcohol, or equivalent.
21. Clean the brake caliper bleeder valve (6).
22. Dry the brake caliper piston bores (5) with non-lubricated, filtered air.
23. Dry the brake caliper pistons (4) with non-lubricated, filtered air.
24. Dry the brake caliper bleeder valve (6) with non-lubricated, filtered air.
25. Inspect the brake caliper bores (5) for cracks, scoring, pitting, too much corrosion.

If cracks, scoring, pitting, and too much corrosion are present in the brake caliper bores (5), replace the brake caliper assembly.

26. Inspect the brake caliper pistons (4) for cracks, scoring, and/or damage.

If cracks, scoring, and/or damage are present in the brake caliper pistons (4), replace the brake caliper pistons (4) if any of these conditions exist.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

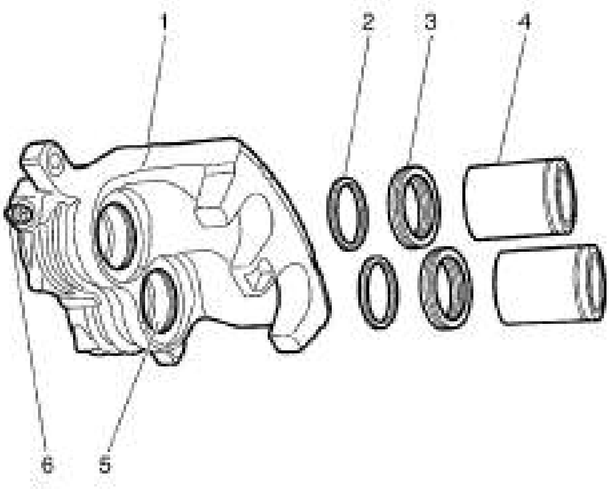
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Assembly Procedure

Important:

- Replace all the components included in the repair kit used to service the brake brake caliper.
- Lubricate the rubber parts with brake fluid conforming to specification to make assembly easier. Refer to Brake System Specifications for correct brake fluid specification.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- The torque values specified are for dry, non-lubricated fasteners.
- Perform the service operations on a clean bench, free from all mineral oil materials.

Notice: Refer to Fastener Notice in the Preface section.



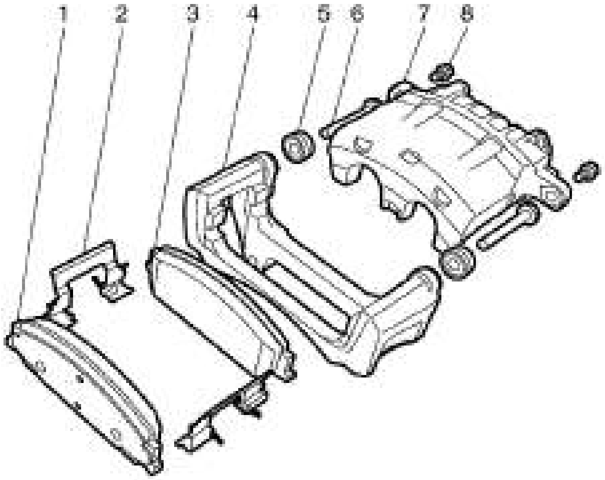
1. Install the brake caliper bleeder valve (6).

   Tighten
   Tighten the bleeder valve to 12 Nm (106 lb in).

2. Lubricate the NEW brake caliper piston seals (2) with brake fluid conforming to specification, from a clean, sealed brake fluid container. Refer to Brake System Specifications for correct brake fluid specification.

   Important: When installing, make sure the brake caliper piston seals (2) are not twisted.

3. Install the brake caliper piston seals (2) into the seal grooves in the brake caliper bores (5).
4. Lubricate the brake caliper bores (5) and pistons (4) with brake fluid.
5. Install the brake caliper pistons (4) into the caliper bores (5).
6. Install the NEW brake caliper piston dust boot seals (3) over the brake caliper pistons (4).
7. Complete the following for both brake caliper piston dust boot seals (3).
   - 7.1. Fully seat the brake caliper piston dust boot seal (4) into the brake caliper (1).
   - 7.2. Make sure the brake caliper piston dust boot seal (4) is correctly seated into the groove in the brake caliper bore (5).



8. Lubricate the guide pins (6) with silicone grease, such as Dow Corning No. 44 or equivalent.
9. Install guide pins (6) into the brake caliper anchor plate (4).

   Do not fit the two guide pin boots (5) at this stage.

   Important: To install the guide pin bolts (8) use an open-end spanner to hold the flat section on the guide pins (6) whilst installing the guide pin bolts (8).

10. Install the brake caliper (7) to the brake caliper anchor plate (4) and install NEW guide pin bolts (8).

    Tighten
    Tighten the guide pin bolts to 42 Nm (31 lb ft).

    Important: Make sure that the brake caliper (7) and guide pins (6) slide in and out easily from the brake caliper anchor plate (4). If any binding is evident, then steps 8 and 9 must be repeated.

11. Detach the brake caliper (7) from the brake caliper anchor plate (4) and install the NEW guide pin boots (5) to the guide pins (6).
12. Install the brake pad retainers (2) to the brake caliper anchor plate (4).

    Important: The brake pads (1 and 3) are marked as inner and outer only. Failure to install the front brake pads (1 and 3) in their correct position will cause the brake pads (1 and 3) not to seat correctly in the brake caliper (7).

13. Install the brake pads (1 and 3) to the brake caliper anchor plate (4).

    Important: Remove all excess air from the guide pin boot (5) and make sure that each guide pin boot (5) is correctly located in the grooves in the guide pin (6) and brake caliper anchor plate (4).

14. Assemble the brake caliper (7) and brake caliper anchor plate (4) together.

15. Install the brake caliper assembly to the vehicle. Refer to Front Brake Caliper Replacement.

Front Brake Caliper Replacement (RHD)

Removal Procedure

Tools Required

J 23738-A Hand Vacuum Pump.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

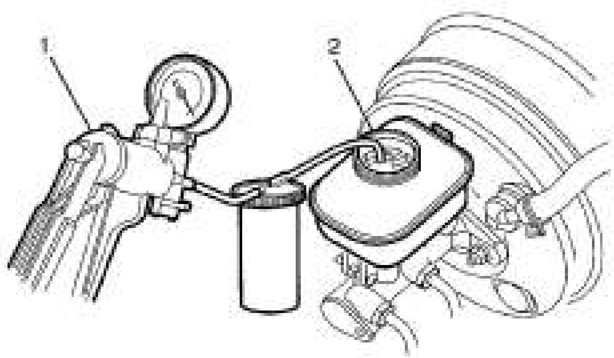
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



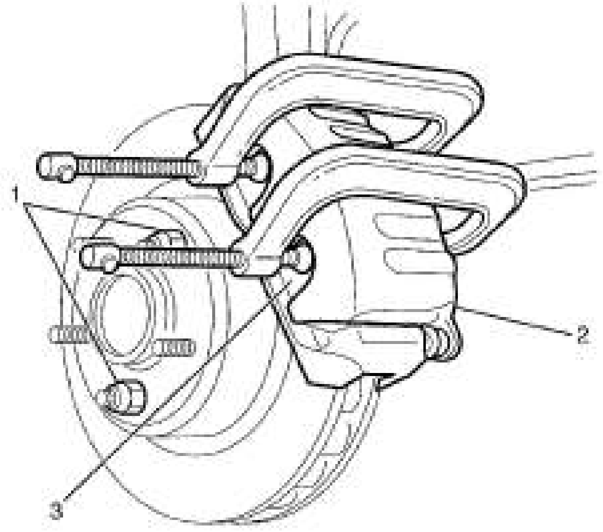
1. Inspect the fluid level in the master cylinder reservoir (2).
   - If the brake fluid level is midway between the maximum fill level and the minimum allowable level, no brake fluid needs to be removed from the master cylinder reservoir (2) before proceeding.

Important: DO NOT completely empty the master cylinder reservoir (2) or remove any brake lines otherwise complete bleeding of the braking system will be necessary.

Important: DO NOT re use the removed fluid.

- If the brake fluid level is higher than midway between the maximum fill level and the minimum allowable level, syphon the brake fluid to the midway point using a hand vacuum pump (1) before proceeding.

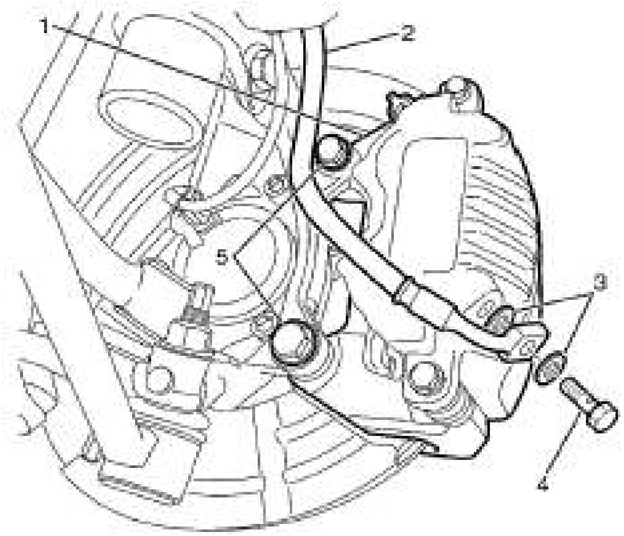
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the front wheels. Refer to Tire and Wheel Removal and Installation .



4. Install two wheel nuts (1) in reverse to opposite wheel studs to retain the brake disc to the hub.

Important: Position the ends of the G-clamps against the rear of the brake caliper (2) and against the outboard brake pad (3).

5. Install large G-clamps over the body of the brake caliper (2).
6. Tighten the G-clamps evenly until the brake caliper pistons bottom in each brake caliper bore.
7. Remove the G-clamps from the brake caliper (2).
8. Place a drain tray beneath the brake caliper assembly.



9. Remove the brake hose to brake caliper banjo retaining bolt (4).

   Important: Install a rubber cap or plug on the exposed brake hose end in order to prevent fluid loss and contamination.

10. Separate the brake hose to brake caliper banjo retaining bolt (4) from the brake hose (2).

    Important: Copper brake hose sealing washers become work hardened due to the heat generated with brake applications and will not reseal. Install NEW copper brake hose sealing washers (3) whenever the brake hose to brake caliper banjo retaining bolt (4) is removed.

11. Remove the two copper brake hose sealing washers (3). The copper brake hose sealing washers (3) may be stuck to the brake caliper (1) and/or the brake hose (2).

    Discard the washers.

    Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

    Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

12. Remove the brake caliper anchor plate to knuckle retaining bolts (5)

    Discard the bolts.

    Clean the bolt holes.

13. Remove the brake caliper assembly (1).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

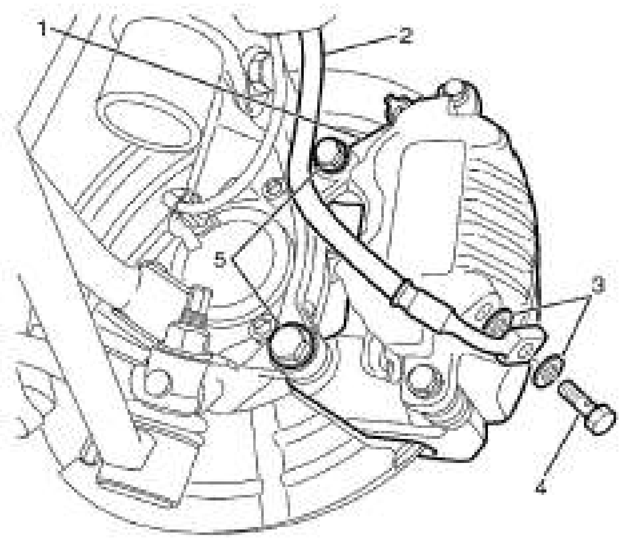
Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

1. Clean the brake caliper anchor plate to steering knuckle mounting surfaces.
2. Check the serviceability of the brake pads. Refer to Brake Pad Inspection .

Important: The brake pads (4) are marked as inner and outer only. Failure to install the brake pads (4) in their correct position will cause the brake pads (4) not to seat correctly in the brake caliper (1).

3. Install the existing or NEW brake pads as required.
4. Press the inner brake pad by using a suitable tool to make sure the brake caliper pistons bottom in each brake caliper bore.
5. Position the brake caliper assembly over the brake disc.

Notice: Refer to Fastener Notice in the Preface section.



6. Install the NEW brake caliper anchor plate to knuckle retaining bolts (5).

Tighten
Tighten the bolts to 60 Nm +120° (44 lb ft +120°).

Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

Important: Install NEW copper brake hose sealing washers (3).

7. Install the brake hose (2) to brake caliper banjo retaining bolt (4) and NEW copper brake hose sealing washers (3) to the brake caliper (1).

   Tighten
   Tighten the banjo bolt to 35 Nm (25 lb ft).

8. Bleed the braking system. Refer to Hydraulic Brake System Bleeding .
9. Remove the wheel nuts retaining the brake disc to the hub.
10. Install the front wheels. Refer to Tire and Wheel Removal and Installation .
11. Lower the vehicle to the ground.
12. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
13. Slowly release the brake pedal.
14. Repeat steps 12 and 13 until a firm brake pedal apply is obtained. This will correctly seat the brake caliper pistons and brake pads.
15. Fill the master cylinder reservoir to the correct level. Refer to Master Cylinder Reservoir Filling .
16. Burnish (bed in) the brake pads and brake discs if required. Refer to Brake Pad and Rotor Burnishing .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Repair Instructions | **Document ID: 1974953**

Front Brake Rotor Replacement (RHD)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

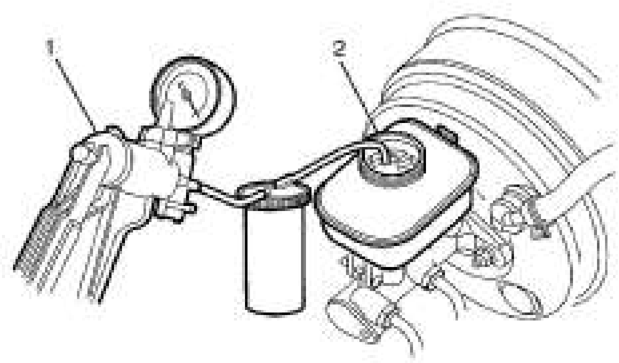
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



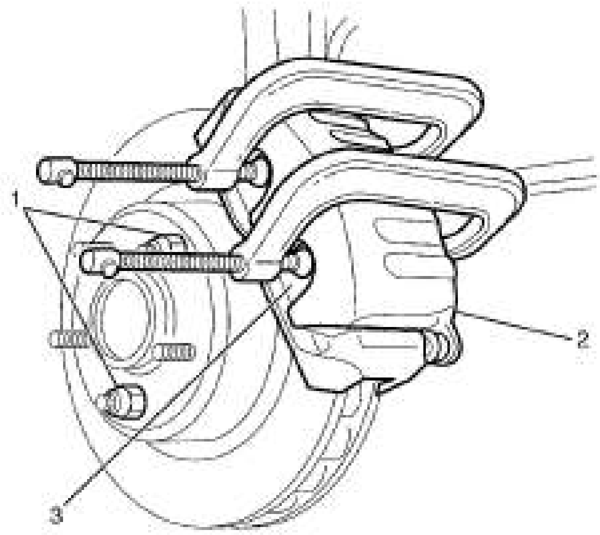
1. Inspect the fluid level in the brake master cylinder reservoir (2).
   - If the brake fluid level is midway between the maximum-fill level and the minimum allowable level, no brake fluid needs to be removed from the master cylinder reservoir (2) before proceeding.

Important: DO NOT completely empty the master cylinder reservoir (2) or remove any brake lines otherwise complete bleeding of the braking system will be necessary.

Important: DO NOT re use the removed fluid.

- If the brake fluid level is higher than midway between the maximum-fill level and the minimum allowable level, syphon the brake fluid to the midway point using a hand vacuum pump (1) before proceeding.

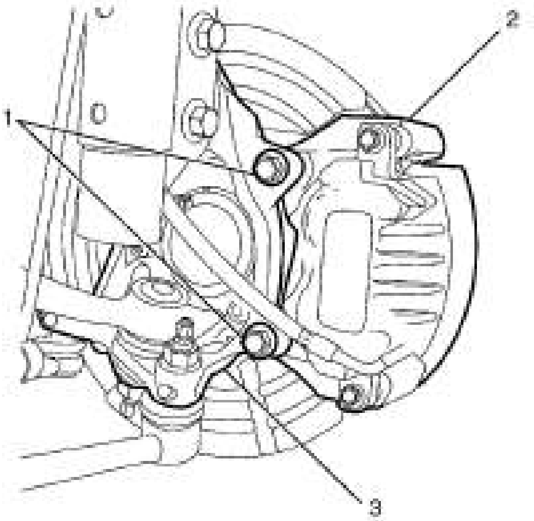
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the front wheels. Refer to Tire and Wheel Removal and Installation .



4. Install two wheel nuts (1) in reverse to opposite wheel studs to retain the brake disc to the hub.

   Important: Position the ends of the G-clamps against the rear of the brake caliper (2) and against the outboard brake pad (3).

5. Install large G-clamps over the body of the brake caliper (2).
6. Tighten the G-clamps evenly until the brake caliper pistons bottom out in each brake caliper bore.
7. Remove the G-clamps from the brake caliper (2).



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

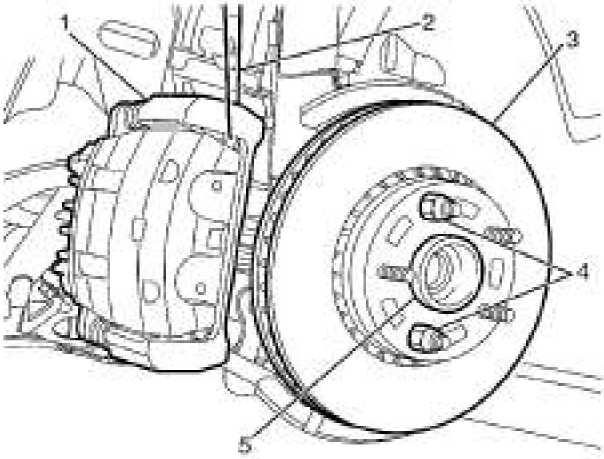
8. Remove the brake caliper anchor plate to knuckle retaining bolts (1).

   Discard the bolts.

   Clean the bolt holes.

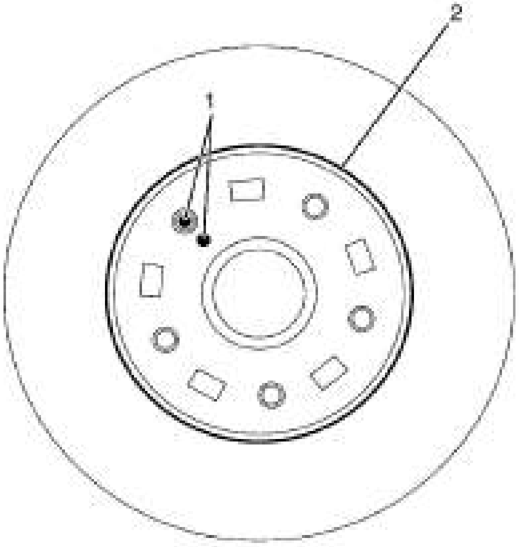
   Important: DO NOT disconnect the hydraulic brake flexible hose from the brake caliper otherwise complete bleeding of the braking system will be necessary.

9. Remove the brake caliper (2) from the steering knuckle (3).



Notice: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

10. Support the brake caliper (1) with heavy mechanic's wire, or equivalent (2).
11. Remove the two wheel nuts (4) retaining the brake disc (3) to the hub (5).



Important: The brake disc to hub relationship is indexed during production. Mark the relationship of the brake disc to a wheel stud end for installation to minimise the potential of brake shudder.

Important: If the brake disc is being removed to be machined or replaced to rectify brake shudder, or if brake disc to hub matching is not evident, the brake disc to the hub must be indexed. Refer to Brake Rotor Assembled Lateral Runout Correction - Indexing .

12. Matchmark the position of the brake disc (2) to the wheel studs (1).
13. Remove the brake disc (2).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

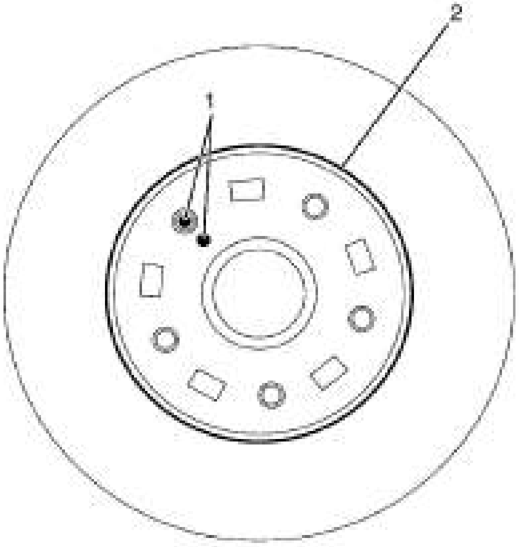
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

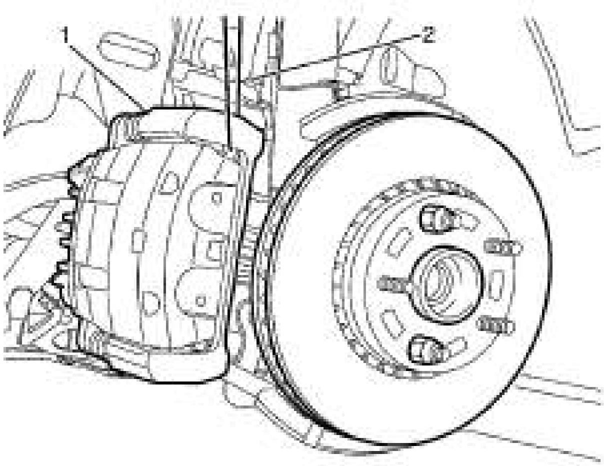
Important: Whenever the brake disc has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake disc mating surfaces. Failure to do this may result in too much assembled lateral runout (LRO) of the brake disc, which may lead to brake pulsation.

1. Clean any rust or corrosion from the mating surface of the hub/axle flange and mounting surface of the brake disc.
2. Inspect the mating surfaces of the hub/axle flange and the brake disc to make sure that there are no foreign particles or debris remaining.

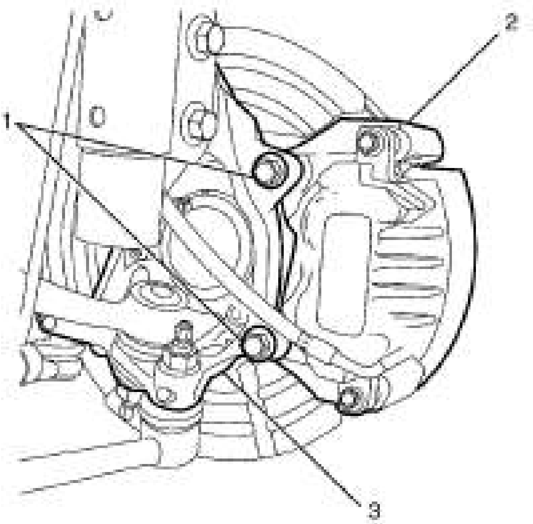


Important: Use the matchmark (1) made prior to removal for correct orientation to the flange.

3. Install the brake disc (2) to the hub/axle flange.
4. If the brake disc (2) was removed and installed as part of a brake system repair, measure the assembled lateral runout (LRO) of the brake disc (2) to make sure optimum performance of the disc brakes. Refer to Brake Rotor Assembled Lateral Runout Measurement .
5. If the brake disc (2) assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to Brake Rotor Assembled Lateral Runout Correction .



6. Remove the heavy mechanic's wire, or equivalent support (2) from the brake caliper (1).



Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

7. Install the brake caliper assembly (2) to the steering knuckle (3).

   Notice: Refer to Fastener Notice in the Preface section.

8. Install the NEW brake caliper anchor plate to knuckle retaining bolts (1).

   Tighten
   Tighten the bolts to 60 Nm +120° (44 lb ft +120°).

9. Install the front wheels. Refer to Tire and Wheel Removal and Installation .
10. Lower the vehicle to the ground.
11. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
12. Slowly release the brake pedal.
13. Repeat steps 11 and 12 until a firm brake pedal is obtained. This will correctly seat the brake caliper pistons and brake pads.
14. Fill the master cylinder reservoir to the correct level. Refer to Master Cylinder Reservoir Filling .
15. If the brake disc was refinished or replaced, or if new brake pads were installed, burnish the brake pads and brake discs. Refer to Brake Pad and Rotor Burnishing .

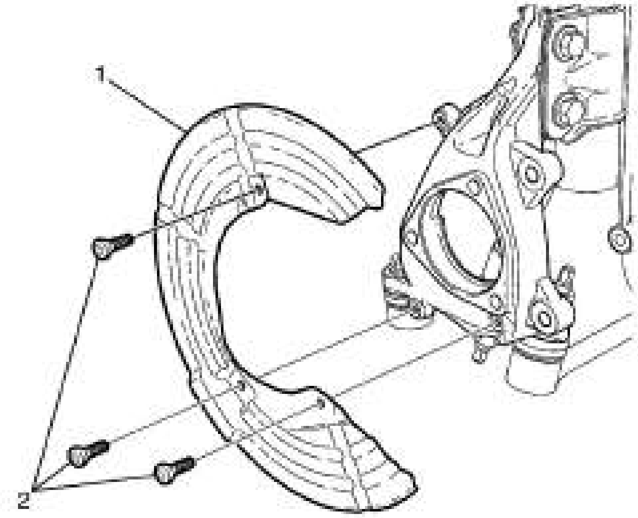
Front Brake Shield Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

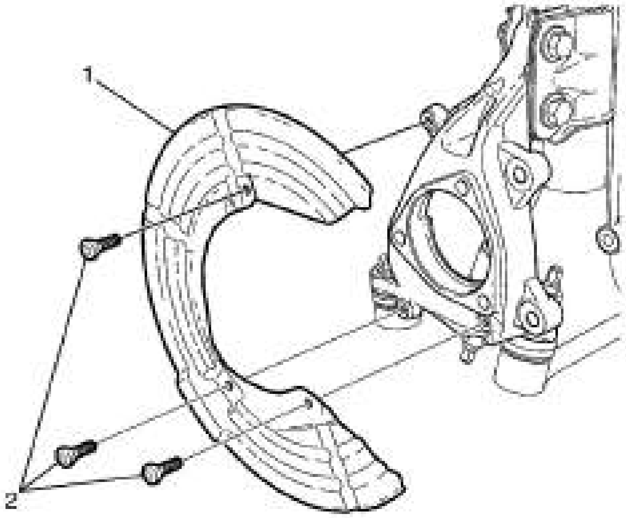
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front wheel. Refer to Tire and Wheel Removal and Installation .
3. Remove the front wheel hub assembly. Refer to Front Wheel Bearing and Hub Replacement .



4. Remove the brake disc splash shield to steering knuckle retaining bolts (2).
5. Remove the brake disc splash shield (1).

Installation Procedure



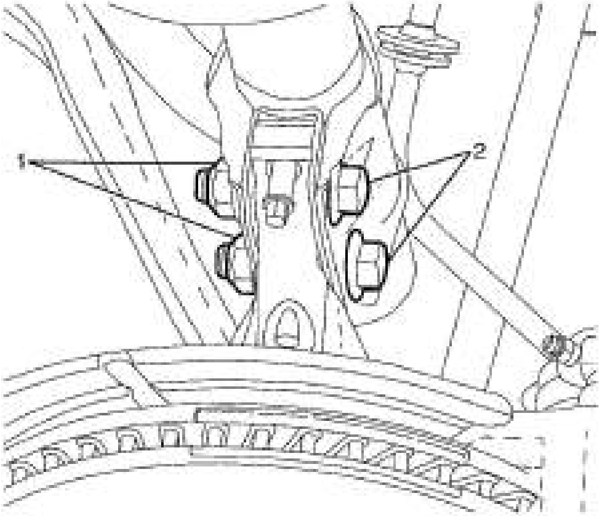
1. Install the brake disc splash shield (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the brake disc splash shield to steering knuckle retaining bolts (2).

   Tighten
   Tighten the nut to 9 Nm (89 lb in).

3. Install the front wheel hub assembly. Refer to Front Wheel Bearing and Hub Replacement .



Important: If the steering knuckle has been replaced, the end-float measurement must be inspected.

4. Install the front wheel. Refer to Lifting and Jacking the Vehicle .
5. Remove the safety stands.
6. Lower the vehicle to the ground.
7. Bounce the vehicle several times to settle the suspension.
8. Inspect and adjust the wheel alignment. Refer to Wheel Alignment Measurement .
9. Tighten the strut assembly to steering knuckle retaining bolts (2) and nuts (1).

   Tighten
   Tighten the bolts a first pass to 85 N·m (63 lb in).

   Tighten
   Tighten the bolts a second pass to 100 N·m (74 lb in).

   Tighten
   Tighten the bolts an additional 90 degrees.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Repair Instructions | Document ID: 1974928

Front Disc Brake Pads Replacement (RHD)

Removal Procedure

Tools Required

J 23738-A Hand Vacuum Pump.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

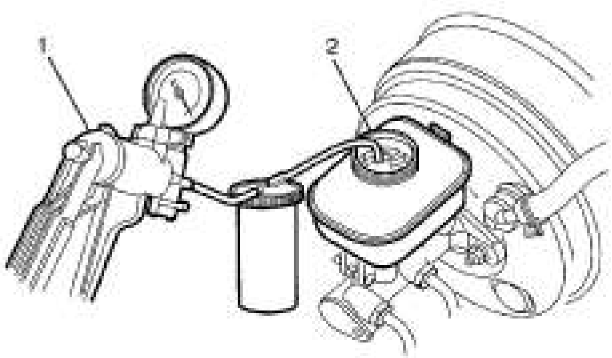
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



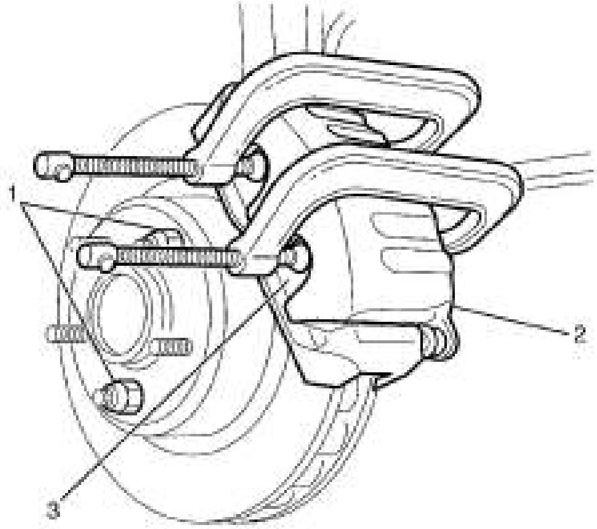
1. Inspect the fluid level in the master cylinder reservoir (2).
   - If the brake fluid level is midway between the maximum fill level and the minimum allowable level, no brake fluid needs to be removed from the master cylinder reservoir (2) before proceeding.

Important: DO NOT completely empty the master cylinder reservoir (2) or remove any brake lines otherwise complete bleeding of the braking system will be necessary.

Important: DO NOT re use the removed fluid.

- If the brake fluid level is higher than midway between the maximum fill level and the minimum allowable level, using a hand vacuum pump (1) syphon the brake fluid to the midway point before proceeding.

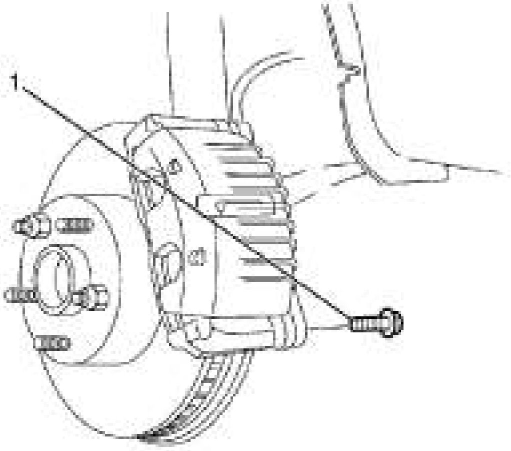
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the front wheels. Refer to Tire and Wheel Removal and Installation .



4. Install two wheel nuts (1) in reverse to opposite wheel studs to retain the brake disc to the hub.

   Important: Position the ends of the G-clamps against the rear of the brake caliper (2) and against the outboard brake pad (3).

5. Install large G-clamps over the body of the brake caliper (2).
6. Tighten the G-clamps evenly until the brake caliper pistons bottom out in each brake caliper bore.
7. Remove the G-clamps from the brake caliper (2).



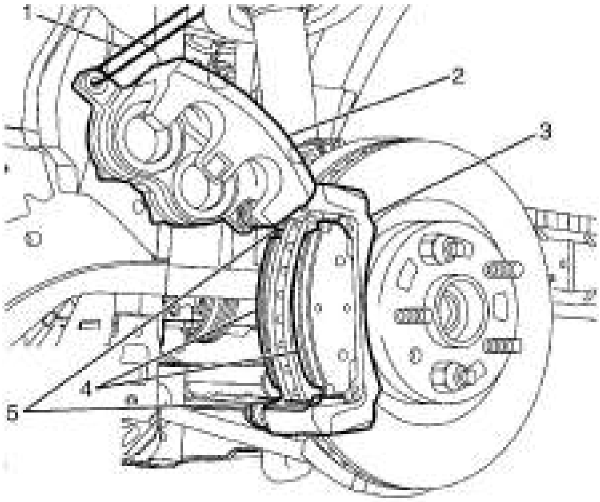
Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure the bolt hole is thoroughly cleaned and all micro-encapsulated thread sealant is removed.

8. Remove the brake caliper lower guide pin bolt (1).

   Discard the bolt.

   Clean the bolt hole.



Notice: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

Important: DO NOT disconnect the brake hose from the brake caliper (2).

9. Pivot the brake caliper (2) upward and secure with heavy mechanics wire (1), or equivalent.
10. Remove the brake pads (4) from the brake caliper anchor plate (3).
11. Remove the brake pad retainers (5) from the brake caliper anchor plate (3).
12. Clean the brake pad brake pad retainer surfaces of the brake caliper anchor plate (3).

Important: Inspect the brake caliper guide pins for freedom of movement and the condition of the guide pin boots. This is achieved by moving the guide pins inboard and outboard within the brake caliper anchor plate (3) bores, without disengaging the slides from the boots.

13. Inspect the brake caliper guide pins and boots for the following conditions:
    - Restricted brake caliper guide pin movement.
    - Too much brake caliper guide pin play in the brake caliper anchor plate (3).
    - Seized or binding brake caliper guide pins.
    - Split or torn boots.
14. If any of the conditions listed are found, overhaul or replace the brake caliper (2).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

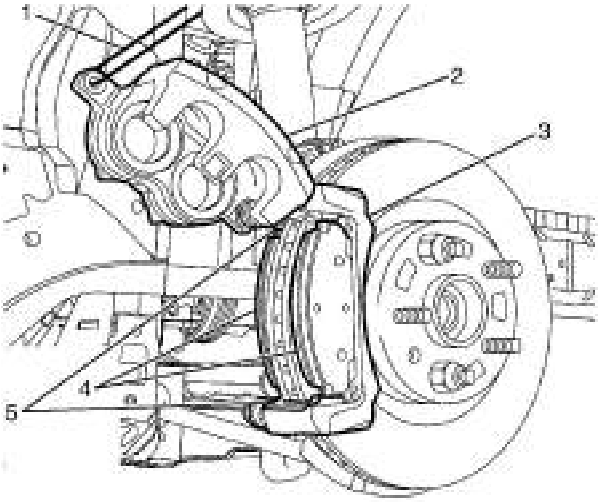
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Clean the piston to brake pad contact faces as required.



2. Install the new brake pad retainers (5) to the brake caliper anchor plate (3).

   Important: The brake pads (4) are marked as inner and outer only. Failure to install the brake pads (4) in their correct position will cause the brake pads (4) not to seat correctly in the brake caliper (2).

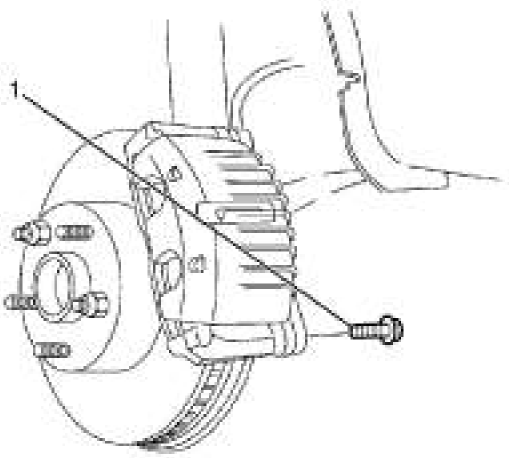
3. Install the brake pads (4) to the brake caliper anchor plate (3).

   Important: Make sure the brake hose is correctly located in its mounting bracket.

   Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

4. Remove the mechanics wire or equivalent (1), and rotate the brake caliper (2) into position over the brake pads (4) and to the brake caliper anchor plate (3).

   Notice: Refer to Fastener Notice in the Preface section.



5. Install the NEW lower brake caliper guide pin to brake caliper anchor plate retaining bolt (1).

   Tighten
   Tighten the bolt to 42 Nm (31 lb ft).

6. Remove the wheel nuts retaining the brake disc to the hub.
7. Install the front wheels. Refer to Tire and Wheel Removal and Installation .
8. Lower the vehicle to the ground.
9. With the engine off, gradually apply the brake pedal approximately 2/3 of its travel distance.
10. Slowly release the brake pedal.
11. Repeat steps 9 and 10 until a firm brake pedal is obtained. This will correctly seat the brake caliper pistons and brake pads.
12. Fill the master cylinder reservoir to the correct level. Refer to Master Cylinder Reservoir Filling .
13. Burnish (bed in) the brake pads and brake discs. Refer to Brake Pad and Rotor Burnishing .

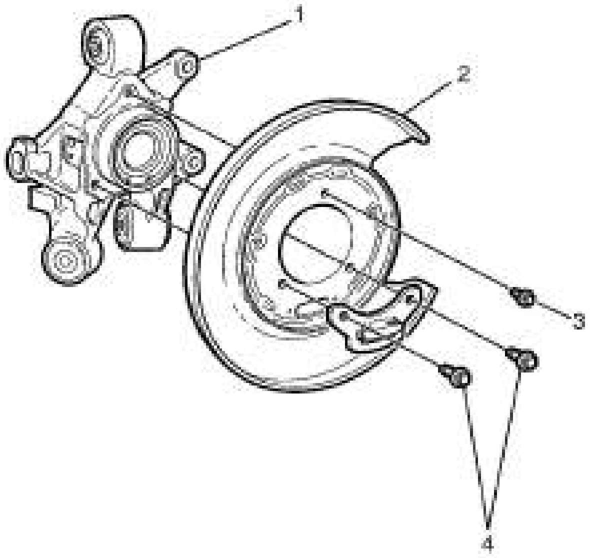
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Repair Instructions | **Document ID: 1992486**

Rear Disc Brake Backing Plate Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

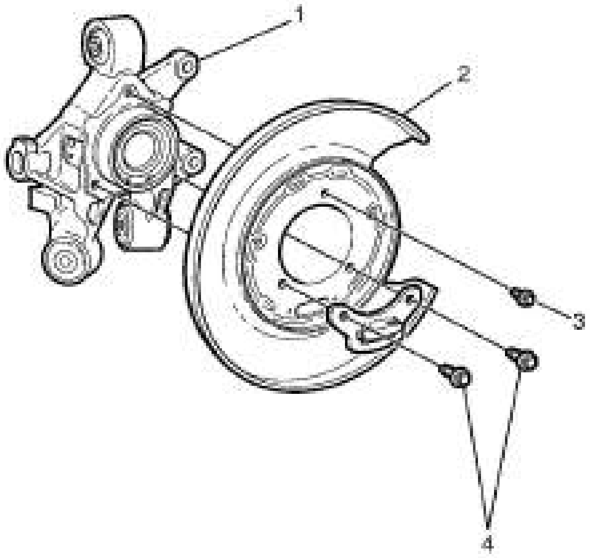
1. Remove the wheel hub and knuckle assembly. Refer to Knuckle Replacement.
2. Remove the wheel hub. Refer to Rear Wheel Bearing and Hub Replacement.



3. Remove the disc brake backing plate to knuckle retaining bolts (3 and 4).
4. Remove the disc brake backing plate (2) from the knuckle (1).

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



1. Install the disc brake backing plate (2) to the knuckle (1).
2. Install the upper disc brake backing plate to knuckle retaining bolt (3).

   Tighten
   Tighten the bolts to 60 Nm (44 lb ft).

3. Install the lower disc brake backing plate to knuckle retaining bolts (4).

   Tighten
   Tighten the bolts to 130 Nm (96 lb ft).

4. Install the wheel hub. Refer to Rear Wheel Bearing and Hub Replacement.
5. Install the wheel hub and knuckle assembly. Refer to Knuckle Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Repair Instructions | **Document ID: 1992478**

Rear Brake Caliper Overhaul (LWB SWB)

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

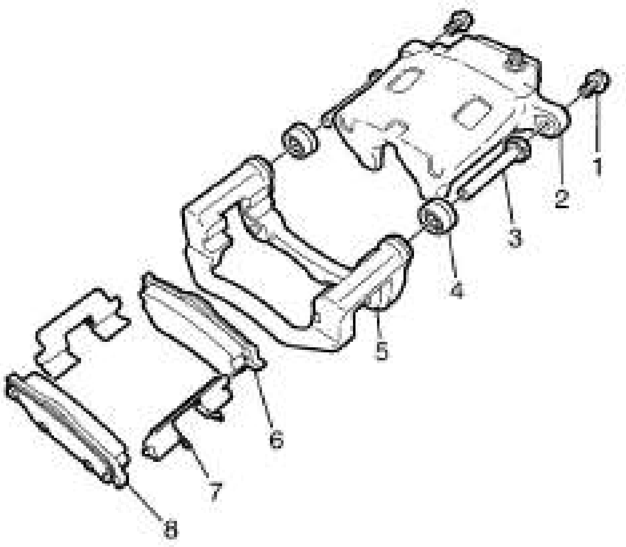
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Disassembly Procedure

Important:

- Replace all the components included in the repair kit used to service the brake caliper.
- Lubricate the rubber parts with brake fluid conforming to specification to make assembly easier. Refer to Brake System Specifications for correct brake fluid specification.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- The torque values specified are for dry, non-lubricated fasteners.
- Perform the service operations on a clean bench, free from all mineral oil materials.

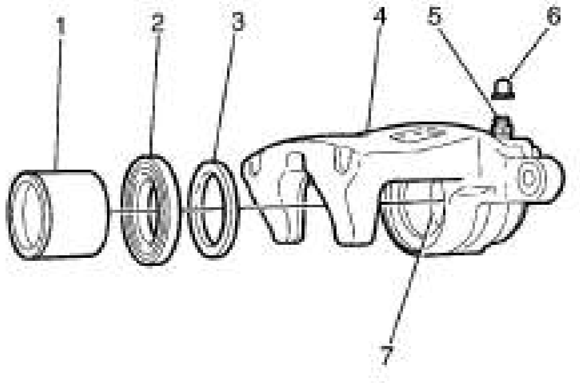
1. Remove the brake caliper from the vehicle. Refer to Rear Brake Caliper Replacement.
2. Drain the brake fluid from the brake caliper.



Important: To remove the guide pin bolts (1) use a suitable tool to hold the flat section on the guide pins (3) whilst loosening the guide pin bolts (1).

3. Remove the guide pin retaining bolts (1).
4. Separate the brake caliper housing (2) from the brake caliper anchor plate (5).

5. Remove the brake pads (6 and 8).
6. Remove the retainer clips (7)
7. Withdraw the guide pins (3) and dust boots (4) from the brake caliper anchor plate (5).
8. Separate the dust boots (4) from the guide pins (3).



Caution: Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.

Notice: Use clean cloths to pad interior of caliper housing during piston removal. Use just enough air to ease the pistons out of the bores. If the pistons are blown out, even with the padding provided, it may be damaged.

9. Install clean cloths to pad the interior of the caliper (4) between the caliper piston (1) and the caliper (4).
10. Carefully remove the brake caliper piston (1) by directing low pressure compressed air into the brake caliper (1) inlet hole.

Important: Use a small wooden or plastic tool to avoid damage to the brake caliper (4).

Important: Brake caliper seals are single use components only and must be discarded after removal.

11. With the brake caliper piston (1) removed, remove the brake caliper piston dust boot seal (2) from the brake caliper (4).

    Discard the brake caliper piston dust boot seal (2).

12. Remove the brake caliper piston seal (3) from the brake caliper (4) and discard the brake caliper piston seal (3).

    Discard the brake caliper piston seal (3).

13. Remove the brake caliper bleeder valve cap (6).
14. Remove the brake caliper bleeder valve (5).
15. Inspect the brake caliper anchor plate guide surfaces for corrosion and wear. Replace the brake caliper assembly if damaged or worn.
16. Clean the brake caliper piston bore (7) with denatured alcohol, or equivalent.

    Important: DO NOT use abrasives to clean the brake caliper piston (1).

17. Clean the brake caliper piston (1) with denatured alcohol, or equivalent.
18. Clean the brake caliper bleeder valve (5)
19. Dry the brake caliper piston bore (7) with non-lubricated, filtered air.
20. Dry the brake caliper piston (1) with non-lubricated, filtered air.
21. Dry the brake caliper bleeder valve (5) with non-lubricated, filtered air.
22. Inspect the brake caliper bore (7) for cracks, scoring, pitting, too much corrosion.
23. If light corrosion is present in the brake caliper bore (7), attempt to remove the imperfection with a fine emery paper. If the imperfection cannot be removed, replace the brake caliper assembly.
24. If cracks, scoring, pitting, and too much corrosion are present in the brake caliper bore (7), replace the brake caliper assembly.
25. Inspect the brake caliper piston (1) for cracks, scoring, and/or damage, replace the brake caliper piston (1) if any of these conditions exist.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

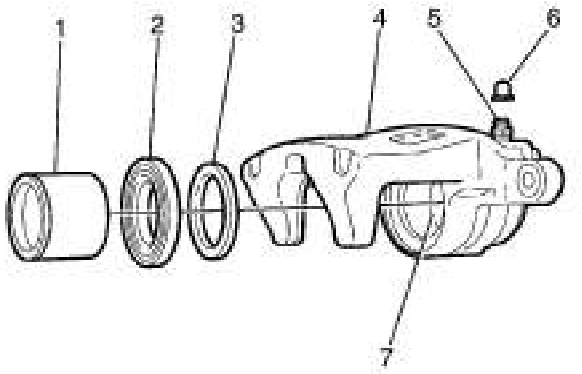
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Assembly Procedure

Important:

- Replace all the components included in the repair kit used to service the brake caliper.
- Lubricate the rubber parts with brake fluid conforming to specification to make assembly easier. Refer to Brake System Specifications for correct brake fluid specification.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- The torque values specified are for dry, non-lubricated fasteners.
- Perform the service operations on a clean bench, free from all mineral oil materials.

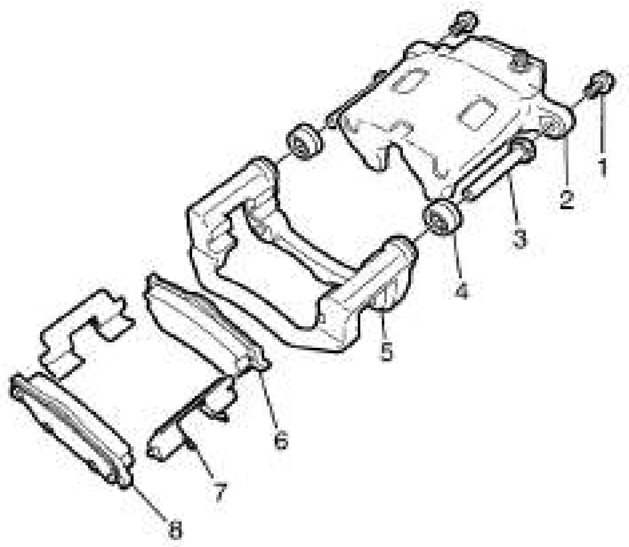
Notice: Refer to Fastener Notice in the Preface section.



1. Install the brake caliper bleeder valve (6) to the brake caliper (4).

   Tighten
   Tighten the brake caliper bleeder valve when dry 12 Nm (106 lb in).

2. Install the brake caliper bleeder valve cap (7) to the brake caliper bleeder valve (6).
3. Lubricate the NEW brake caliper piston seal (3) with brake fluid conforming to specification, from a clean, sealed brake fluid container. Refer to Brake System Specifications for correct brake fluid specification.
4. Install the lubricated brake caliper piston seal (3) into the seal groove in the brake caliper bore (7). Make sure the brake caliper piston seal (3) is not twisted.
5. Lubricate the brake caliper bore (7) and the brake caliper piston (1) with brake fluid.
6. Install the brake caliper piston (1) into the brake caliper bore (7).
7. Install the NEW brake caliper piston dust boot seal (2) over the brake caliper piston (1).
8. Complete the following for the brake caliper piston dust boot seal (2).
   - 8.1. Fully seat the brake caliper piston dust boot seal (2) into the brake caliper (4).
   - 8.2. Make sure the brake caliper piston dust boot seal (2) is correctly seated into the groove in the brake caliper bore (7).



9. Lubricate the guide pins (1) with silicone grease, such as Dow Corning No. 44 or equivalent.
10. Install guide pins (1) into the brake caliper anchor plate (5).

    Do not fit the two guide pin boots (2) at this stage.

11. Install the brake caliper (4) to the brake caliper anchor plate (5) and install NEW guide pin bolts (3).
12. Use an open-end spanner to hold the guide pin flat section, tighten the NEW guide pin bolts (3) to the correct torque.

    Tighten
    Tighten the guide pin bolt to 42 Nm (31 lb ft).

    Important: Make sure that the brake caliper and guide pins slide in and out easily from the brake caliper anchor plate. If any binding is evident, then steps 9-12 must be repeated.

13. Detach the brake caliper (4) from the brake caliper anchor plate (5) and install the NEW guide pin boots (4) to the guide pins (3).

    Important: Remove all excess air from the guide pin boot and make sure that each guide pin boot is correctly located in the guide pin and brake caliper anchor plate grooves.

14. Assemble the brake caliper (4) and brake caliper anchor plate (5) together.
15. Install the brake pads. Refer to Rear Disc Brake Pads Replacement.
16. Install the brake caliper to the vehicle. Refer to Rear Brake Caliper Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Repair Instructions | Document ID: 1974944

Rear Brake Caliper Replacement (RHD)

Removal Procedure

Tools Required

J 23738-A Hand Vacuum Pump.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

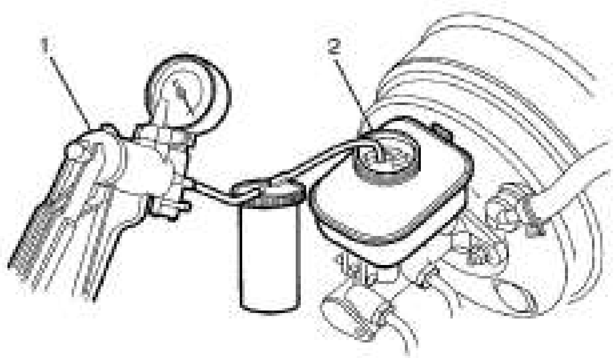
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



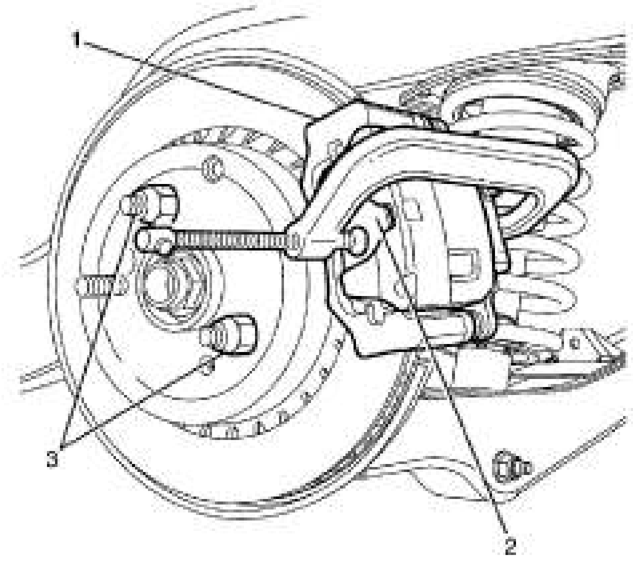
1. Inspect the fluid level in the brake master cylinder reservoir (2).
    - If the brake fluid level is midway between the maximum [dash] fill level and the minimum allowable level, no brake fluid needs to be removed from the master cylinder reservoir (2) before proceeding.

Important: DO NOT completely empty the master cylinder reservoir (2) or remove any brake lines otherwise complete bleeding of the braking system will be necessary.

Important: DO NOT re use the removed fluid.

- If the brake fluid level is higher than midway between the maximum [dash] fill level and the minimum allowable level, using a hand vacuum pump (1) syphon the brake fluid to the midway point before proceeding.

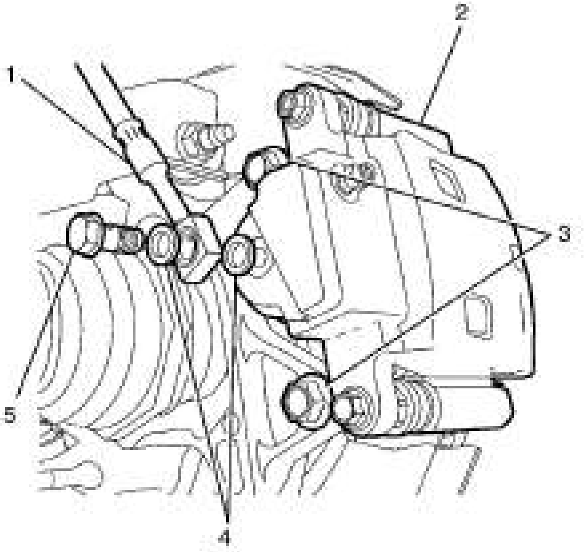
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the front wheels. Refer to Tire and Wheel Removal and Installation .



4. Install two wheel nuts (3) in reverse to opposite wheel studs to retain the brake disc to the hub.

Important: Position the ends of the G-clamp against the rear of the brake caliper (1) and against the outboard brake pad (2).

5. Install a large G-clamp over the body of the brake caliper (1).
6. Tighten the G-clamp until the brake caliper piston bottoms out in the brake caliper bore.
7. Remove the G-clamps from the brake caliper (1).
8. Place a drain tray beneath the brake caliper assembly.



9. Remove the brake hose to brake caliper banjo retaining bolt (5).

   Important: Install a rubber cap or plug on the exposed brake hose end in order to prevent fluid loss and contamination.

10. Separate the brake hose to brake caliper banjo retaining bolt (5) from the brake hose (1).

    Important: Copper brake hose sealing washers become work hardened due to the heat generated with brake applications and will not reseal. Install NEW copper brake hose sealing washers (4) whenever the brake hose to brake caliper banjo retaining bolt (5) is removed.

11. Remove the two copper brake hose sealing washers (4). The copper brake hose sealing washers (4) may be stuck to the brake caliper (2) and/or the brake hose (1).

    Discard the sealing washers.

    Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

    Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

12. Remove the brake caliper anchor plate to knuckle retaining bolts (3).

    Discard the bolts.

    Clean the bolt holes.

13. Remove the brake caliper assembly (2) from the vehicle.

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

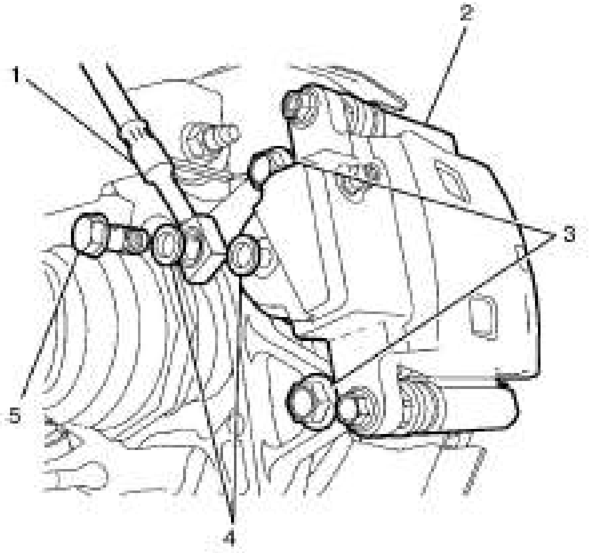
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Clean the brake caliper anchor plate to steering knuckle mounting surfaces.
2. Check the serviceability of the brake pads. Refer to Brake Pad Inspection .

Important: The inner brake pads are marked as left and right side only.

3. Install the existing or NEW brake pads as required.
4. Press the inner brake pad by using a suitable tool to make sure the brake caliper piston bottoms out in the brake caliper bore.
5. Position the brake caliper assembly over the brake disc.

Notice: Refer to Fastener Notice in the Preface section.



6. Install the NEW brake caliper anchor plate to knuckle retaining bolts (3).

Tighten
Tighten the bolt to 110 Nm (81 lb ft).

Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

7. Install the brake hose (1) to brake caliper banjo retaining bolt (5) and NEW copper sealing washers (4) to the brake caliper (2).

   Tighten
   Tighten the banjo bolt to 35 Nm (26 lb ft).

8. Bleed the braking system. Refer to Hydraulic Brake System Bleeding .
9. Remove the wheel nuts retaining the brake disc to the hub.
10. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
11. Lower the vehicle to the ground.
12. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
13. Slowly release the brake pedal.
14. Repeat steps 12 and 13 until a firm brake pedal is obtained. This will correctly seat the brake caliper pistons and brake pads.
15. Fill the master cylinder reservoir to the correct level. Refer to Master Cylinder Reservoir Filling .
16. Burnish (bed in) the brake pads and brake discs if required. Refer to Brake Pad and Rotor Burnishing .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Disc Brakes | Repair Instructions | Document ID: 1974955

Rear Brake Rotor Replacement (RHD)

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

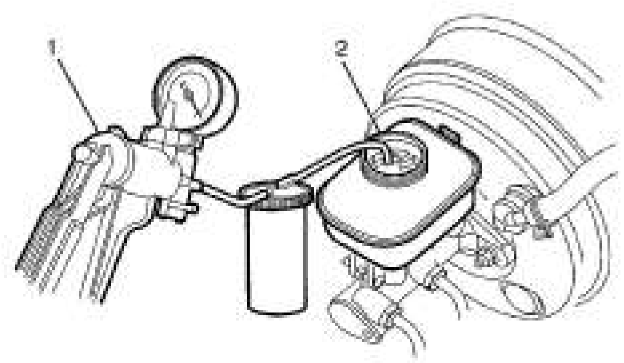
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



1. Inspect the fluid level in the brake master cylinder reservoir (2).
    - If the brake fluid level is midway between the maximum fill level and the minimum allowable level, no brake fluid needs to be removed from the master cylinder reservoir (2) before proceeding.

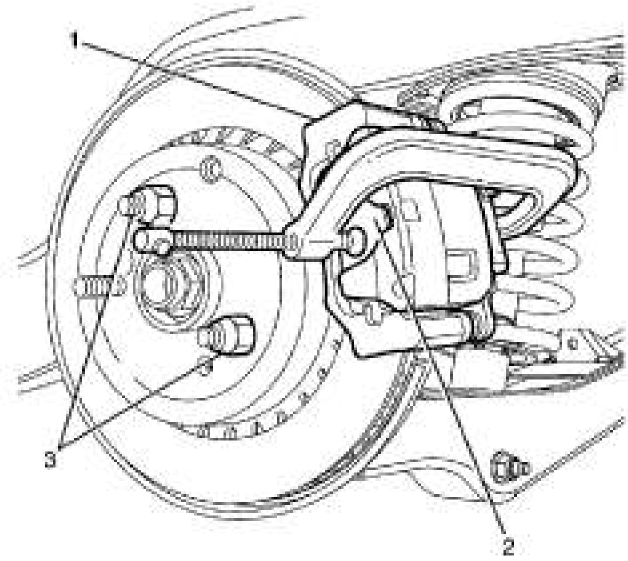
Important: DO NOT completely empty the master cylinder reservoir (2) or remove any brake lines otherwise complete bleeding of the braking system will be necessary.

Important: DO NOT re use the removed fluid.

- If the brake fluid level is higher than midway between the maximum fill level and the minimum allowable level, syphon the brake fluid to the midway point using a hand vacuum pump (1) before proceeding.

Important: Make sure the park brake is fully released.

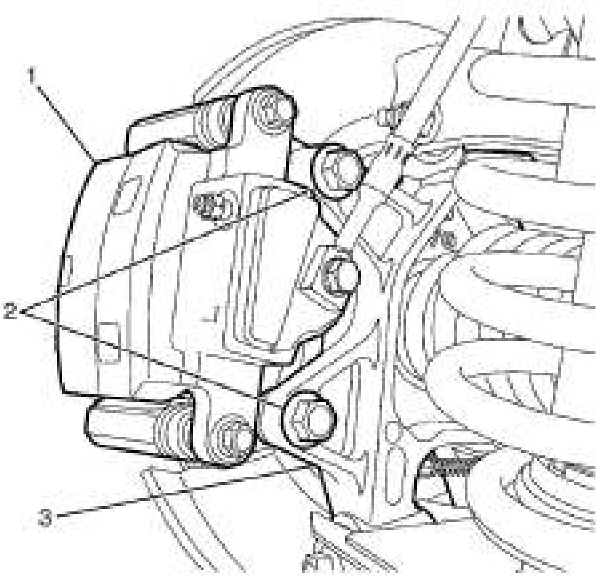
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .



4. Install two wheel nuts in reverse (3) to opposite wheel studs to retain the brake disc to the hub.

Important: Position the ends of the G-clamp against the rear of the brake caliper (1) and against the outboard brake pad (2).

5. Install large G-clamp over the body of the brake caliper (1).
6. Tighten the G-clamp until the brake caliper piston bottoms out in the brake caliper bore.
7. Remove the G-clamp from the brake caliper (1).



Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure all the bolt holes are thoroughly cleaned and all micro-encapsulated thread sealant is removed.

8. Remove the brake caliper anchor plate to knuckle retaining bolts (1).

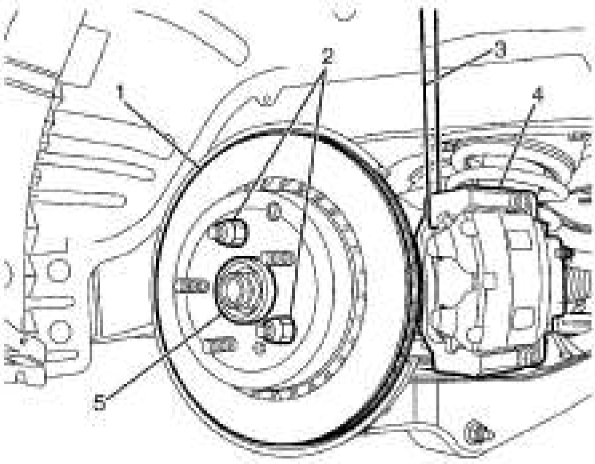
   Discard the bolts.

   Clean the bolt holes.

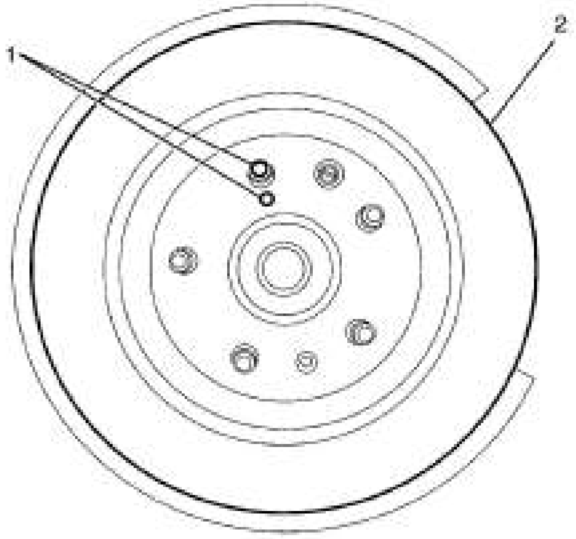
   Important: DO NOT disconnect the hydraulic brake flexible hose from the brake caliper otherwise complete bleeding of the braking system will be necessary.

9. Remove the brake caliper (2) from the knuckle (3).

   Notice: Refer to Brake Caliper Notice in the Preface section.



10. Support the brake caliper (1) with heavy mechanic's wire, or equivalent (2).
11. Remove the two wheel nuts (4) retaining the brake disc (3) to the hub (5).



Important: The brake disc to hub relationship is indexed during production. Mark the relationship of the brake disc to a wheel stud end for installation to minimise the potential of brake shudder.

Important: If the brake disc is being removed to be machined or replaced to rectify brake shudder, or if brake disc to hub matching is not evident, the brake disc to the hub must be indexed. Refer to Brake Rotor Assembled Lateral Runout Correction - Indexing .

12. Matchmark the position of the brake disc (2) to the wheel studs (1).
13. Remove the brake disc (2).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

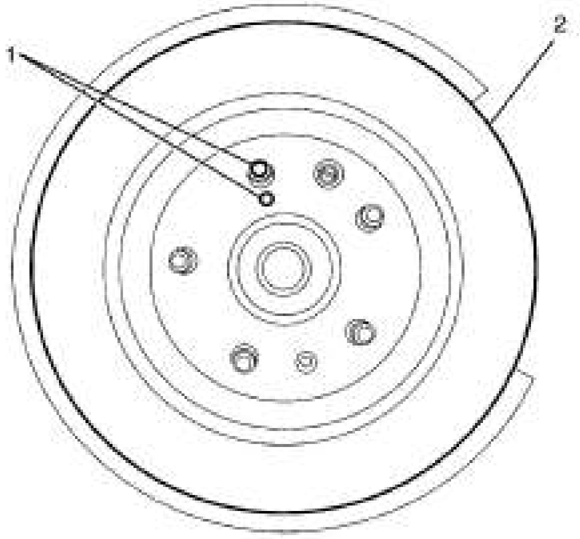
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

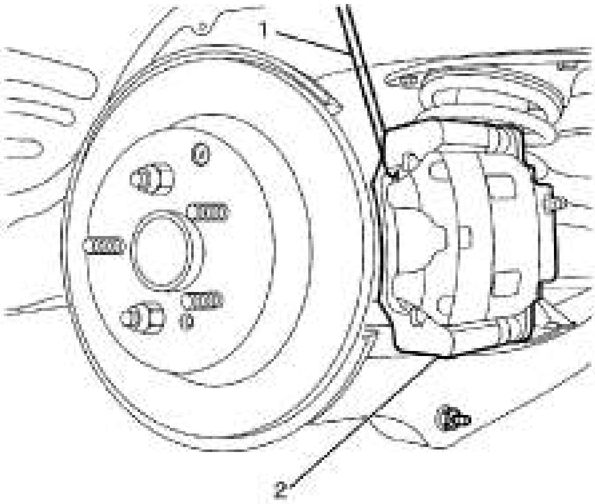
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Important: Whenever the brake disc has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake disc mating surfaces. Failure to do this may result in too much assembled lateral runout (LRO) of the brake disc, which may lead to brake pulsation.

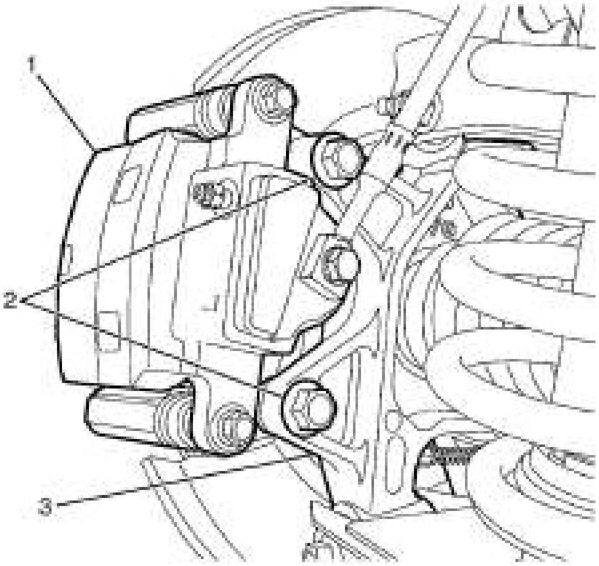
1. Clean any rust or corrosion from the mating surface of the hub/axle flange and mounting surface of the brake disc.
2. Inspect the mating surfaces of the hub/axle flange and the brake disc to make sure that there are no foreign particles or debris remaining.



3. Install the brake disc (2) to the hub/axle flange. Use the matchmark (1) made prior to removal for correct orientation to the flange.
4. If the brake disc was removed and installed as part of a brake system repair, measure the assembled lateral runout (LRO) of the brake disc to make sure optimum performance of the disc brakes. Refer to Brake Rotor Assembled Lateral Runout Measurement .
5. If the brake disc assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to Brake Rotor Assembled Lateral Runout Correction .



6. Remove the heavy mechanic's wire or equivalent support (2) from the brake caliper (1).



Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

7. Install the brake caliper assembly (1) to the knuckle (3).

Notice: Refer to Fastener Notice in the Preface section.

8. Install the NEW brake caliper anchor plate to knuckle retaining bolts (2).

Tighten
Tighten the bolts to 110 Nm (82 lb ft).

9. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
10. Lower the vehicle to the ground.
11. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
12. Slowly release the brake pedal.
13. Repeat steps 11 and 12 until a firm brake pedal is obtained. This will correctly seat the brake caliper pistons and brake pads.
14. Fill the master cylinder reservoir to the correct level. Refer to Master Cylinder Reservoir Filling .
15. If the brake disc was refinished or replaced, or if new brake pads were installed, burnish the brake pads and brake discs. Refer to Brake Pad and Rotor Burnishing .

Rear Disc Brake Pads Replacement (RHD)

Removal Procedure

Tools Required

J 23738-A Hand Vacuum Pump.

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

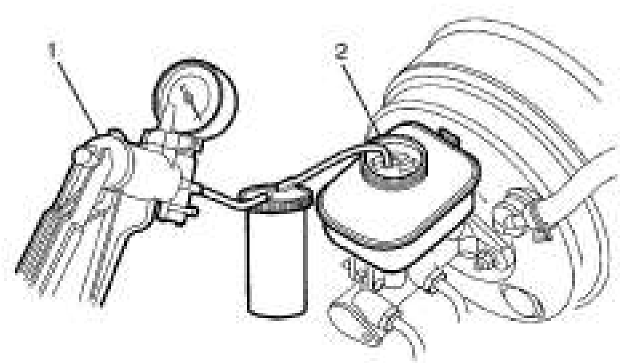
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



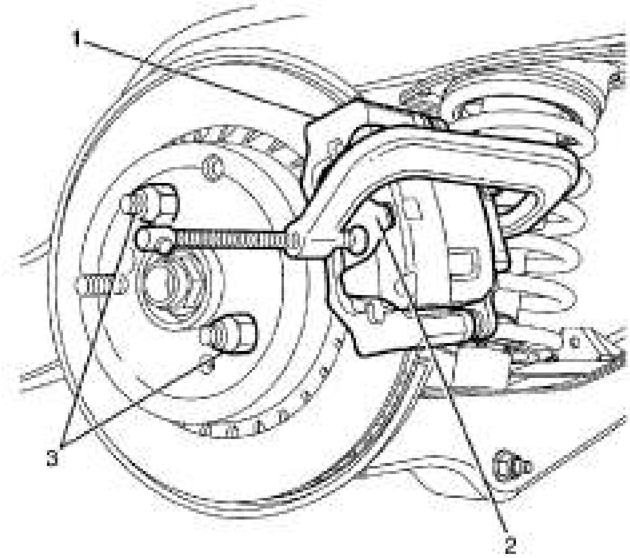
1. Inspect the fluid level in the master cylinder reservoir (2).
    - If the brake fluid level is midway between the maximum fill level and the minimum allowable level, no brake fluid needs to be removed from the master cylinder reservoir (2) before proceeding.

Important: DO NOT completely empty the master cylinder reservoir (2) or remove any brake lines otherwise complete bleeding of the braking system will be necessary.

Important: DO NOT re use the removed fluid.

- If the brake fluid level is higher than midway between the maximum fill level and the minimum allowable level, syphon the brake fluid to the midway point using a hand vacuum pump (1) before proceeding.

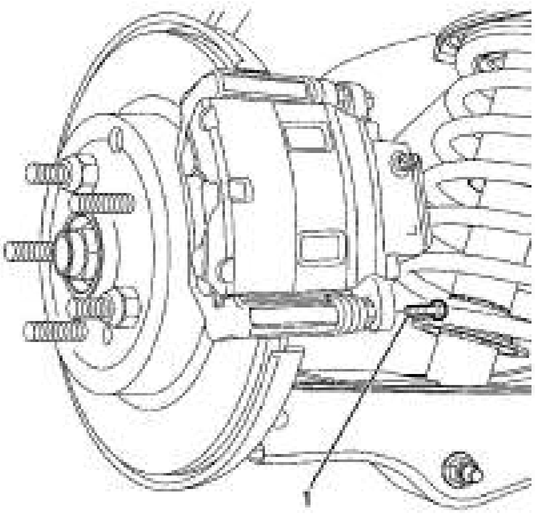
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove rear wheels. Refer to Tire and Wheel Removal and Installation .



4. Install two wheel nuts (3) in reverse to opposite wheel studs to retain the brake disc to the hub.

Important: Position the ends of the G-clamp against the rear of the brake caliper (1) and against the outboard brake pad (2).

5. Install a large G-clamp over the body of the brake caliper (1).
6. Tighten the G-clamp until the brake caliper piston bottoms out in the brake caliper bore.
7. Remove the G-clamp from the brake caliper (1).



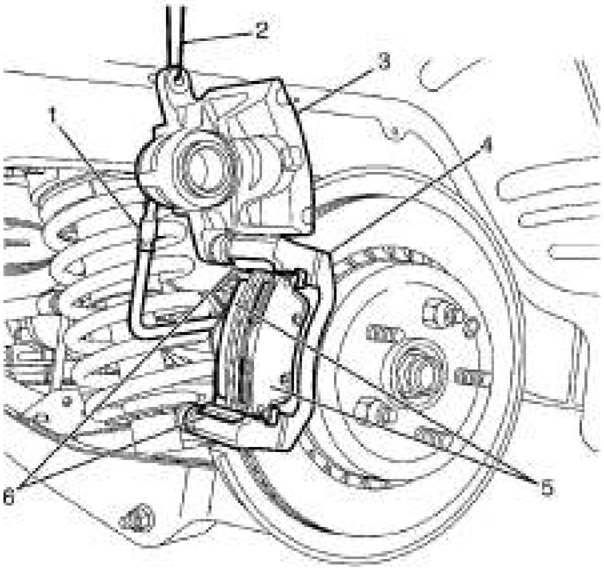
Important: Bolts with micro-encapsulated thread sealant must be discarded after removal.

Important: Make sure the bolt hole is thoroughly cleaned and all micro-encapsulated thread sealant is removed.

8. Remove the brake caliper lower guide pin bolt (1).

   Discard the bolt.

   Clean the bolt hole.



Notice: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

Important: DO NOT disconnect the brake hose (1) from the brake caliper (3).

9. Pivot the brake caliper (3) upward and secure with heavy mechanics wire (2), or equivalent.
10. Remove the brake pads (5) from the brake caliper anchor plate (4).
11. Remove the brake pad retainers (6) from the brake caliper anchor plate (4).
12. Clean the brake pad retainer mating surfaces of the brake caliper anchor plate (4).

Important: Inspect the brake caliper guide pins for freedom of movement and the condition of the guide pin boots. This is achieved by moving the guide pins inboard and outboard within the brake caliper anchor plate (4) bores, without disengaging the slides from the boots.

13. Inspect the brake caliper guide pins and boots for the following conditions:
    - Restricted brake caliper guide pin movement.
    - Too much brake caliper guide pin play in the brake caliper anchor plate (4).
    - Seized or binding brake caliper guide pins.
    - Split or torn boots.
14. If any of the conditions listed are found, overhaul or replace the brake caliper (3).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

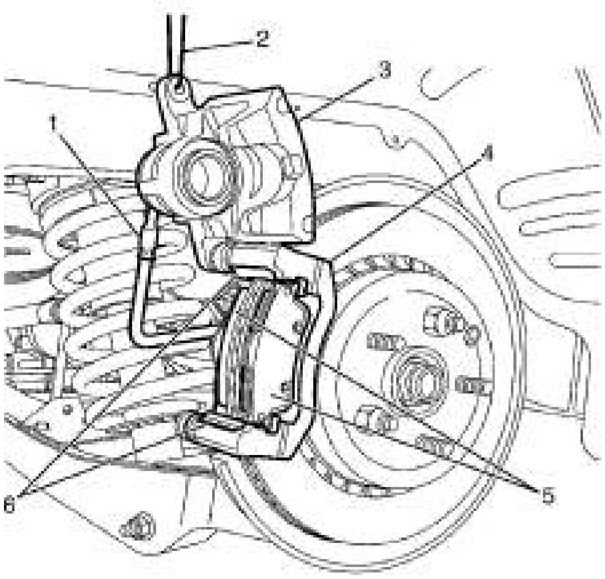
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Thoroughly clean both piston to brake pad contact faces as required.



2. Install the brake pad retainers (6) to the brake caliper anchor plate (4).

   Important: The brake pads (5) are marked as left hand inner and right hand inner and must only be fitted to their respective positions to optimise brake pad life and performance.

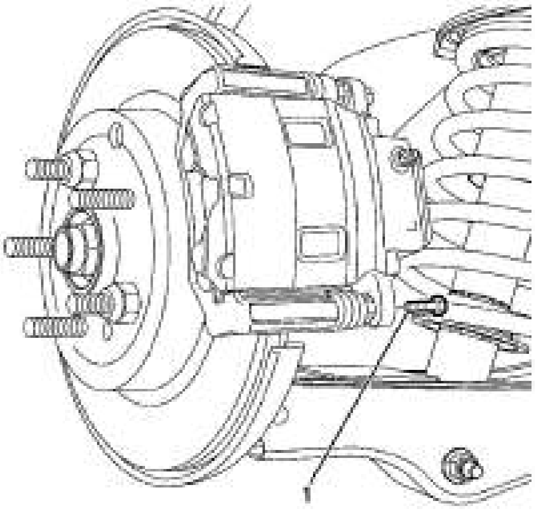
3. Install the brake pads (5) to the brake caliper anchor plate (4).

   Notice: Make sure the brake hose is not twisted or kinked after installation. Damage to the hose could result.

4. Remove the mechanics wire or equivalent (2), and rotate the brake caliper (3) into position over the brake pads (5) and to the brake caliper anchor plate (4).

   Make sure the brake hose (1) is correctly located in its mounting bracket.

   Notice: Refer to Fastener Notice in the Preface section.



5. Install the NEW lower brake caliper guide pin bolt (1).

   Tighten
   Tighten the bolt to 42 Nm (31 lb ft).

6. Remove the wheel nuts retaining the brake disc to the hub.
7. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
8. Lower the vehicle to the ground.
9. With the engine off, gradually apply the brake pedal approximately 2/3 of its travel distance.
10. Slowly release the brake pedal.
11. Repeat steps 9 and 10 until a firm brake pedal is obtained. This will correctly seat the brake caliper pistons and brake pads.
12. Fill the master cylinder reservoir to the correct level. Refer to Master Cylinder Reservoir Filling .
13. Burnish (bed in) the brake pads and brake discs. Refer to Brake Pad and Rotor Burnishing .

Disc Brake System Description and Operation (LWB SWB)

System Component Description

The disc brake system consists of the following components:

Brake Pads: Applies mechanical output force from the hydraulic brake calipers to friction surfaces of brake discs.

Brake Discs: Uses mechanical output force applied to friction surfaces from the brake pads to slow speed of tyre and wheel assembly rotation.

Brake Caliper Anchor Plate: Provides mounting for the hydraulic brake caliper and secures the brake caliper firmly in correct relationship to the brake disc. Enables a sliding motion of the brake caliper to the brake pads when mechanical output force is applied and the reaction of the brake caliper anchor plate pulls the outer pad against the disc. The forces of the pads on each side of the disc are therefore equal.

Brake Caliper: The brake caliper incorporates either twin (front) or a single hydraulic piston (rear), each with a fluid seal. When hydraulic pressure is applied, a mechanical output force on the piston applies the inner pad against the disc. When the hydraulic pressure is released, the piston fluid seal/s retracts the piston/s a small amount, allowing the moving parts to relax sufficiently for the pads to remain in close proximity to the disc without dragging. Adjustment for wear is automatic.

System Operation

Mechanical output force is applied from the hydraulic brake caliper pistons to the inner brake pads. As the pistons press the inner brake pads outward, the brake calipers draw the outer brake pads inward. This allows the output force to be equally distributed. The brake pads apply the output force to the friction surfaces on both sides of the brake discs, which slows the rotation of the tyre and wheel assemblies. The correct function of both the brake pad and brake anchor plate is essential for even distribution of braking force.

Brake Fluid Level Switch

(1) Master Cylinder Assembly
(2) Master Cylinder Reservoir
(3) Brake Fluid level Switch
(4) Brake Fluid level Switch Electrical Connector

Diagnostic Starting Point - Hydraulic Brakes

Begin the hydraulic brake system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC C0126

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC C0126 00: Low Brake Fluid Indicated

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Fluid Level Signal	C0126 00	1	1	--
Park Brake Signal	1	1	1	--
Ground	--	1	--	--
1. Brake Warning Indicator Malfunction				

Circuit/System Description

The brake fluid level switch monitors the level of brake fluid in the master cylinder. When the instrument panel cluster (IPC) sees the brake fluid level switch input closed, it turns ON the Red Brake Warning indicator and sends a serial data message to the electronic brake control module (EBCM) that the brake fluid level is low.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

- Low brake fluid is detected.
- A short to ground exists on the signal circuit.

Action Taken When the DTC Sets

- The EBCM disables the antilock brake system (ABS)/traction control system (TCS) dynamic rear proportion (DRP) and vehicle stability enhancement system (VSES).
- A DIC message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The EBCM clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Component Connector End Views

Description and Operation

Brake Warning System Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Inspect for proper brake fluid level, the fluid level should be at or above the proper level.
   If low, refer to Brake Fluid Loss.
2. Ignition ON, observe the scan tool IPC Brake Fluid Level Switch parameter. The reading should be OFF.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the brake fluid level switch.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for 4.8 - 5.2 volts between the 5 volt reference circuit terminal 1 and ground.
   If less than the specified range, test the 5 volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the IPC.

If greater than the specified range, test the 5 volt reference circuit for a short to voltage. If the circuit tests normal, replace the IPC.

4. If all circuits test normal, test or replace the brake fluid level switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Brake Fluid Level Indicator Switch Replacement
- Control Module References for IPC replacement, setup, and programming

Brake Warning Indicator Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Fluid Level Signal	C0126 00	1	1	--
Park Brake Signal	1	1	1	--
Ground	--	1	--	--
1. Brake Warning Indicator Malfunction				

Circuit/System Description

The instrument panel cluster (IPC) sees the brake fluid level switch input opens and illuminates the Red Brake Warning indicator. The body control module (BCM) sees the park brake switch input grounded, it sends a serial data message to the IPC requesting illumination of the Red Brake Warning indicator.

Description and Operation

Brake Warning System Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections

- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify the park brake is released and the brake fluid is at or above the proper level.

   If low, refer to Brake Fluid Loss.
2. Command the IPC display test with a scan tool, the warning indicator should turn ON.

   If the red brake warning indicator does not illuminate, replace the IPC.
3. Ignition ON, observe the scan tool BCM Park Brake Switch parameter while applying and releasing the park brake. The parameter should cycle between Active and Inactive.

   If the parameter does not cycle between the specified values, refer to Park Brake Switch Malfunction.
4. Observe the scan tool IPC Brake Fluid Level Switch parameter. The reading should be OFF.

   If not the specified value, refer to Brake Fluid Level Switch Malfunction.

Circuit/System Testing

Park Brake Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the park brake switch.
2. Ignition ON, verify the scan tool BCM Park Brake Switch parameter is Inactive.

   If not the specified value, test the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the BCM.
3. Install a 3A fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool BCM Park Brake Switch parameter is Active.

   If not the specified value, test the signal circuit for a short to voltage or an open/high resistance.
4. If all circuits test normal, test or replace the park brake switch.

Brake Fluid Level Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the brake fluid level switch.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for 4.8 - 5.2 volts between the 5 volt reference circuit terminal 1 and ground.

   If less than the specified range, test the 5 volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the IPC.

   If greater than the specified range, test the 5 volt reference circuit for a short to voltage. If the circuit tests normal, replace the IPC.
4. If all circuits test normal, test or replace the brake fluid level switch.

Component Testing

Park Brake Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the park brake switch.
2. Test for infinite resistance between the signal terminal A and ground with the park brake released.

   If less than the specified value, replace the park brake switch.
3. Test for less than 1 ohm between the signal terminal A and ground with the park brake applied.

   If greater than the specified range, replace the park brake switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Brake Fluid Level Indicator Switch Replacement
- Parking Brake Indicator Switch Replacement
- Control Module References for BCM and IPC replacement, setup, and programming

Brake Fluid Loss

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes s
2	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis . Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	1. Separate the master cylinder from the vacuum brake booster. DO NOT disconnect any brake pipes. Refer to Master Cylinder Replacement . 2. Inspect the rear of the master cylinder for a brake fluid leak. 3. Inspect for brake fluid in the vacuum brake booster. Did you find a brake fluid leak?	Go to Step 5	Go to Diagnostic Starting Point - Hydraulic Brakes
5	Replace the brake master cylinder and the vacuum brake booster. Refer to Master Cylinder Replacement and Power Vacuum Brake Booster Replacement Hydraulic Brakes. Did you complete the replacement?	Go to Step 6	--
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle to confirm correct operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to Step 2	System OK

Brake Pedal Excessive Effort

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis. Did you find and correct a condition?	Go to Step 4	Go to Step 3
3	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis. Did you find and correct a condition?	Go to Step 4	Go to Diagnostic Starting Point - Hydraulic Brakes
4	Road test the vehicle to confirm correct operation. Refer to Brake System Vehicle Road Test. Is the condition still present?	Go to Step 2	System OK

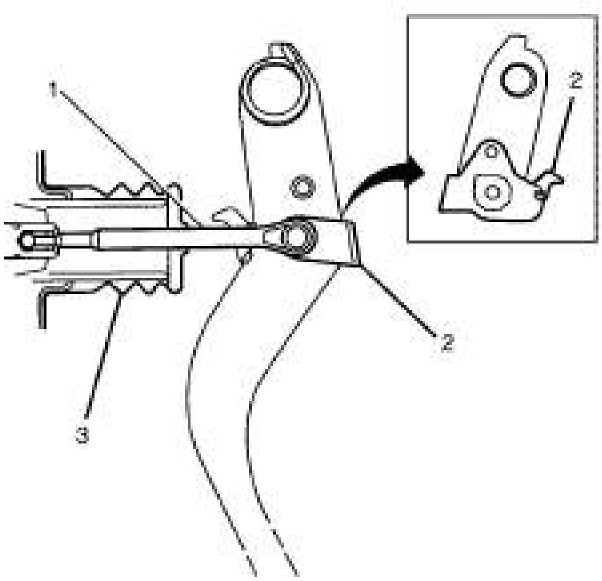
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | **Document ID: 1978576**

Brake Pedal Excessive Travel

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect for correct brake pedal travel. Refer to Brake Pedal Travel Measurement and Inspection . Is the brake pedal travel distance within the acceptable limits?	Go to Step 5	Go to Step 3
3	1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. • For the brake pedal pushrod component inspection, refer to Brake Pedal Pushrod Inspection . • Inspect the brake pedal bushings for greater than desired wear and/or damage and inspect the brake pedal for a misaligned, bent, and/or damaged condition. 2. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Refer to the following procedures as necessary. • Brake Pedal Assembly Replacement • Power Vacuum Brake Booster Replacement . Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to Step 4	Go to Step 5
4	Inspect for correct brake pedal travel. Refer to Brake Pedal Travel Measurement and Inspection . Is the brake pedal travel distance within the acceptable limits?	Go to Step 8	Go to Step 5
5	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis . Did you find and correct a condition?	Go to Step 8	Go to Step 6
6	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to Step 8	Go to Step 7
7	Inspect the brake assist system for correct operation. Refer to Symptoms - Hydraulic Brakes . Did you find and correct a condition?	Go to Step 8	Go to Diagnostic Starting Point - Hydraulic Brakes
	Road test the vehicle to confirm correct operation. Refer to Brake System Vehicle Road Test .		

8	Is the condition still present?	Go to Step 2	System OK

Brake Pedal Pushrod Inspection (RHD)



1. Disconnect the brake pedal pushrod (1) from the brake pedal. Refer to Brake Pedal Assembly Replacement.
2. Inspect the brake pedal pushrod eyelet bushing (2), for cracks and/or greater than desired wear.
3. Reposition the pedal pushrod boot (3) toward the front of the vehicle to expose as much of the pedal pushrod (1) as possible.
4. Inspect the brake pedal pushrod (1) for straightness.
5. If the brake pedal pushrod eyelet bushing (2) exhibited cracks and/or greater than desired wear, then the bushing requires replacement.
6. If the brake pedal pushrod (1) is not straight, then the pushrod requires replacement.
7. Return the pedal pushrod boot (3) to its original position on the pedal pushrod (1).
8. Connect the brake pedal pushrod (1) to the brake pedal. Refer to Brake Pedal Assembly Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | **Document ID: 1993479**

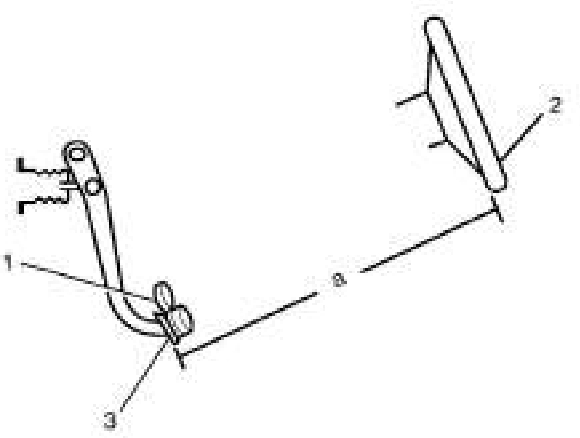
Brake Pedal Travel Measurement and Inspection

Tools Required

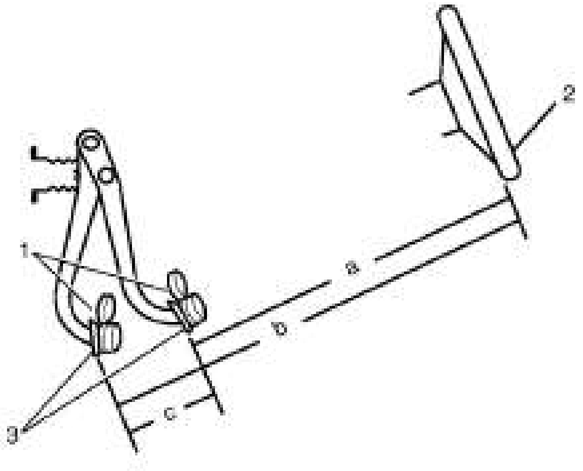
J 28662 Brake Pedal Effort Gauge.

> **Important:** With the ignition OFF and the brakes cool, apply the brakes three to five times or until the brake pedal effort increases significantly, in order to deplete the vacuum brake booster power reserve.

1. Deplete the vacuum brake booster power reserve.



2. Install the J 28662 (1) to the brake pedal (3).
3. Measure and record the distance (a) from the brake pedal (3) to the rim of the steering wheel (2); note the points of measurement.



4. Apply and maintain a force of 445 N (100 lb) to the brake pedal, as indicated on the J 28662 (1).
5. While maintaining 445 N (100 lb) of force to the brake pedal (3), measure and record the distance (b) from the same point on the brake pedal (3) to the same point on the rim of the steering wheel (2).
6. Release the brake pedal (3) and repeat steps 4 and 5 to obtain a second measurement.
7. Average the first and second measurements recorded for the two braking applications.
8. Subtract the initial unapplied distance (a), from the average applied distance (b) to obtain the brake pedal travel measurement (c).

   Specification
   Maximum brake pedal travel[dash]measured with the ignition OFF, vacuum brake booster power assist depleted, and the brakes cool: 90 mm (3.54 in).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | Document ID: 1978592

Brake Pipe and Hose Inspection

Caution: Refer to Safety Glasses Caution in the Preface section.

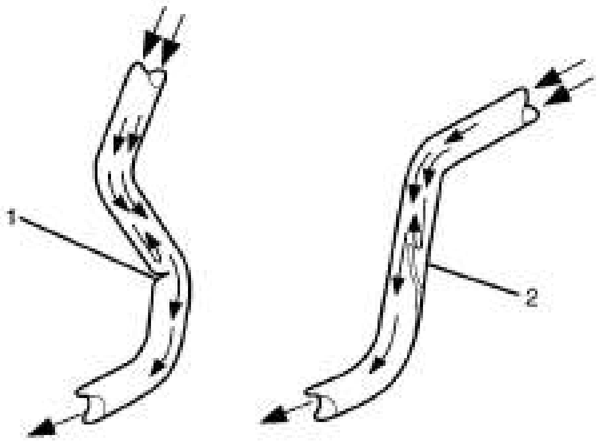
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Visually inspect all of the brake pipes for the following conditions:
   - Kinks, incorrect routing, missing or damaged retainers
   - Leaking fittings, greater than desired corrosion
2. If any of the brake pipes exhibited any of the conditions listed, then the identified pipe, or pipes, require replacement.
3. Make sure that the vehicle axles are correctly supported at ride height in order to maintain the correct relationship of the flexible brake hoses to the chassis.



4. Visually inspect all of the flexible brake hoses for the following conditions:
   - Kinks (1), incorrect routing, twists, chafing, missing or damaged retainers
   - Leaking connections, perished, cracked, blistered, brittle or bulging hoses
5. If any of the flexible brake hoses exhibited any of the conditions listed, then the identified flexible brake hose, or hoses require replacement.
6. Squeeze the flexible brake hoses with firm finger pressure to inspect for soft spots (2), indicating an internal restriction. Inspect the entire length of each flexible brake hose.
7. If any of the flexible brake hoses were found to have soft spots (2), then the identified flexible brake hose, or hoses require replacement.

Brake Pulsation

Test Description

The numbers below refer to the step numbers on the diagnostic table:

2. Suspension components that are not operating correctly may cause a disturbance to the vehicle during application of the brake system.

3. Antilock brake system operation may produce feedback through the brake pedal during application of the brake system.

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect the suspension system for correct operation. Refer to Diagnostic Starting Point - Suspension General Diagnosis . Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	Inspect the antilock brake system for correct operation. Refer to Diagnostic Starting Point - Antilock Brake System . Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis . Did you find and correct a condition?	Go to Step 6	Go to Diagnostic Starting Point - Hydraulic Brakes
6	Road test the vehicle in order to confirm correct operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to Step 2	System OK

Brake System External Leak Inspection

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. In order to inspect for external brake fluid leaks, first inspect the fluid level in the master cylinder.

   While a slight brake fluid level drop can be considered a normal condition due to brake lining wear, a very low level may indicate a brake fluid leak in the hydraulic system.

2. If the fluid level is abnormally low, adjust the brake fluid level. Refer to Master Cylinder Reservoir Filling.
3. Start the engine and allow it to idle.
4. Apply constant, moderate foot pressure to the brake pedal.

   If the brake pedal gradually falls away while under foot pressure, there may be a brake fluid leak.

5. Turn the ignition OFF .
6. Visually inspect the following brake system components for brake fluid leaks, greater than desired corrosion, and damage. Give particular attention to all brake pipe and flexible hose connections to make sure that there are not any slight brake fluid leaks [dash] even though the brake pedal may feel firm and hold steady:
   - Master cylinder brake pipe fittings.
   - All brake pipe connections.
   - Brake pipes.
   - Brake hoses and connections.
   - Brake calipers.
7. While slight dampness around the master cylinder reservoir can be considered acceptable, brake fluid leaking from any of the brake system components requires immediate attention. If any of these components exhibit signs of brake fluid leakage, repair or replace those components. After the repair or replacement, inspect the hydraulic brake system to make sure of correct function.

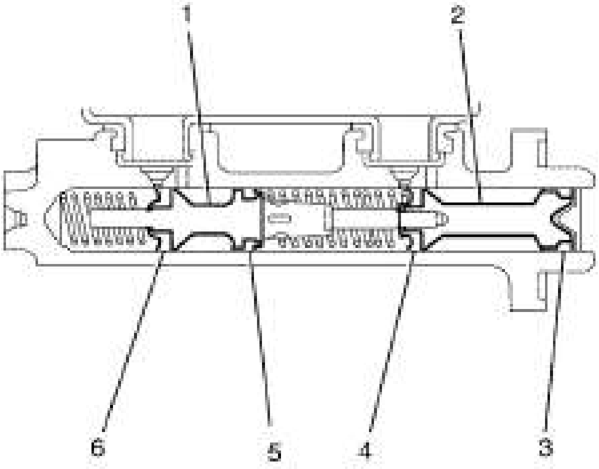
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | **Document ID: 1978589**

Brake System Internal Leak Test

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Start the engine and allow it to idle.
2. Apply light, steady pressure to the brake pedal. Observe both the brake pedal feel and travel.
3. Release the brakes and turn the ignition OFF .
4. If the brake pedal apply felt spongy, but the brake pedal travel was not greater than desired, perform the following steps:
    - 4.1. Inspect the brake system for external leaks. Refer to Brake System External Leak Inspection .
    - 4.2. Pressure bleed the brake system in order to purge any air that may be trapped in the system. Refer to Hydraulic Brake System Bleeding .



5. If the brake pedal apply did not feel spongy, but the brake pedal travel was greater than desired, perform the following steps:
    - 5.1. Loosen the master cylinder to vacuum brake booster retaining nuts.
    - 5.2. Carefully pull the master cylinder away from the vacuum brake booster just enough to inspect the mounting surface of the master cylinder.
    - 5.3. Inspect the master cylinder mounting surface at the primary piston (2) for brake fluid leaks.
6. If the master cylinder exhibits any leakage around the primary piston (2), then the primary piston primary seal (4) and/or secondary seal (3) is leaking and the master cylinder requires replacement.
7. If the master cylinder primary piston (2) does not exhibit any leakage, pressure bleed the brake system. Refer to Hydraulic Brake System Bleeding .

8. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not greater than desired, but then gradually fell, then the master cylinder requires overhaul or replacement due to an internal leak past the secondary piston (1) from the secondary piston primary seal (6) or secondary seal (5).
9. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not greater than desired, then fell slightly, then became steady again, then the brake pressure modulator valve (BPMV) may be leaking internally, and may require replacement.

Brake System Noise

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to Step 7	Go to Step 3
3	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis . Did you find and correct a condition?	Go to Step 7	Go to Step 4
4	Make sure the park brake shoes are not adjusted too tightly, possibly causing a noise under certain conditions. Are the park brake shoes adjusted too tightly?	Go to Step 5	Go to Step 6
5	1. Clean and inspect the park brake shoes for greater than desired wear and/or damage. 2. Inspect the drum portion of the brake discs for greater than desired wear, blueing discoloration, heat spots, and greater than desired radial run out. 3. If any of these conditions are present, replace the affected components. 4. Adjust the park brake system. Did you find and correct a condition?	Go to Step 7	Go to Step 6
6	Inspect the park brake system for correct operation. Refer to Park Brake System Diagnosis . Did you find and correct a condition?	Go to Step 7	Go to Diagnostic Starting Point - Hydraulic Brakes
7	Road test the vehicle in order to confirm correct operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to Step 2	System OK

Brake System Slow Release

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis. Did you find and correct a condition?	Go to Step 4	Go to Step 3
3	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis. Did you find and correct a condition?	Go to Step 4	Go to Diagnostic Starting Point - Hydraulic Brakes
4	Road test the vehicle to confirm correct operation. Refer to Brake System Vehicle Road Test. Is the condition still present?	Go to Step 2	System OK

Brake System Vacuum Source Test

Important:

- Engine temperature, accessory load, and elevation level will affect engine vacuum.
- Vacuum readings will decrease by approximately 2.7 kPa (0.8 in Hg) for every 305 m (1000 ft) of elevation above sea level.

1. Disconnect the engine vacuum hose from the vacuum brake booster check valve.
2. Install a vacuum gauge to the engine vacuum hose.
3. Start the engine and allow the engine to idle until normal operating temperatures are reached.
4. With the vehicle in PARK or NEUTRAL with the park brake on, the engine idling, and the air conditioning (A/C) system OFF, check to see if the engine vacuum reading is within the specified normal engine vacuum range.

   Specification
   47-68 kPa (14-20 in Hg)

5. Turn the ignition OFF.
6. If the engine vacuum reading is within the specified normal range, proceed to step 10.
7. If the engine vacuum reading is NOT within the specified normal range, inspect the engine vacuum hose for the following conditions.
   - Loose connection to the engine.
   - Collapse, deformation or contamination.
   - Cracks, cuts, or brittleness.
8. If any of these conditions were found with the engine vacuum hose, replace the hose, then repeat steps 2 [dash] 4.
9. If none of these conditions were found with the engine vacuum hose, then there is an engine vacuum source condition, check the engine vacuum system.
10. Remove the vacuum brake booster check valve from the booster.
11. Install the check valve to the engine vacuum hose.
12. Install the vacuum gauge to the check valve.
13. Start the engine and allow the engine to idle in park or neutral with the park brake on and with the A/C system OFF, until normal operating temperatures are reached.
14. Turn the ignition OFF.
15. Visually inspect the engine vacuum reading is maintained within the specified normal engine vacuum range.

    Specification
    47-68 kPa (14-20 in Hg)

16. If the engine vacuum reading is maintained within the specified normal range, proceed to step 18.
17. If the engine vacuum reading is NOT maintained within the specified normal range, replace the vacuum brake booster check valve, then repeat steps 11 15.
18. Inspect the vacuum brake booster check valve grommet for the following conditions:
    - Loose connection to the vacuum brake booster.
    - Deformation or contamination.
    - Cracks, cuts or brittleness.

19. If any of these conditions were found with the check valve grommet, replace the grommet.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | **Document ID: 1993476**

Brake System Vehicle Road Test

Preliminary Inspections

1. Visually inspect easily accessible brake system components for obvious damage and/or leaks which may indicate that the vehicle should not be driven until further inspections have been completed.
2. Inspect the brake fluid level in the master cylinder reservoir and top up only if necessary for brake system road testing. Refer to Master Cylinder Reservoir Filling .
3. Inspect the tyre inflation pressures and adjust as necessary.
4. Inspect the tyre tread patterns to make sure that they are the same or very similar, especially per axle.
5. Make sure that the vehicle is not loaded unevenly prior to brake system road testing.

Road Testing Procedure

Caution: Refer to Road Test Caution in the Preface section.

1. Start the engine and allow it to idle.
2. Visually inspect if the brake warning indicator remains illuminated.
3. If the brake system warning lamp remains illuminated, DO NOT proceed to test drive the vehicle until it is diagnosed and repaired. Refer to Symptoms - Hydraulic Brakes .
4. Select a smooth, dry, clean and level road or large allotment that is as free of traffic and obstacles as possible for brake system low speed road testing.
5. On a level surface, put the transmission in Park or Neutral and lightly apply the brake pedal. Observe both the pedal feel and the pedal travel.
   - If the brake pedal application felt spongy, or the pedal travel was greater than desired, DO NOT drive the vehicle until it is repaired.
   - If the brake pedal application did not feel spongy and the pedal travel was not greater than desired, proceed to step 6.
6. Release and apply the brakes.
7. While continuing to apply the brakes, shift the transmission into DRIVE or 1st, release the brakes and allow the engine to idle the vehicle away from the stopped position. Observe for a slow release of the brake system.
8. With the aid of an assistant to observe the vehicle's performance from outside of the vehicle, drive the vehicle at a low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to them, while you observe both the pedal effort and the pedal travel.
   - If the brake pedal application effort was greater than desired, or the pedal travel was greater than desired, DO NOT continue to test drive the vehicle until it is repaired.
   - If the brake pedal application effort was not greater than desired and the pedal travel was not greater than desired, proceed to step 9.
9. Drive the vehicle in the opposite direction, at the same low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to the assistant.
10. Drive the vehicle at a low speed and shift the transmission into NEUTRAL without applying the brakes. Observe for a rapid deceleration in vehicle speed, indicating possible brake drag.
11. Select a smooth, dry, clean and level road that is as free of heavy traffic as possible for brake system moderate speed road testing.
12. Drive the vehicle at a moderate speed. Observe for a pull and/or incorrect tracking of the

vehicle without the brakes applied.

13. While continuing to drive the vehicle at a moderate speed, perform several light brake applications. Observe the pedal effort and the pedal travel, observe for brake system noise, pulsation and/or brake drag.
    - If the brake pedal application effort was greater than desired, or the pedal travel was greater than desired, DO NOT continue to test drive the vehicle until it is repaired.
    - If the brake pedal application effort was not greater than desired and the pedal travel was not greater than desired, proceed to step 14.
14. While continuing to drive the vehicle at a moderate speed, perform several moderate brake applications. Observe the pedal effort and the pedal travel, observe for brake system pulsation and/or uneven braking action [dash] either side to side, or front to rear.

    A small amount of vehicle front end dip is expected during a moderate brake application.

15. If the brake pedal apply effort was greater than desired, or the pedal travel was greater than desired, DO NOT continue to test drive the vehicle until it is repaired.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | **Document ID: 1993471**

Brakes Drag

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect the brake pedal position sensor for correct adjustment to make sure that the brake pedal is fully releasing. Refer to Brake Pedal Travel Measurement and Inspection Did you find and correct a condition?	Go to Step 10	Go to Step 3
3	Inspect the park brake system for correct operation. Refer to Park Brake System Diagnosis . Did you find and correct a condition?	Go to Step 10	Go to Step 4
4	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to Step 10	Go to Step 5
5	1. Separate the vacuum brake booster pushrod from the brake pedal. Refer to Brake Pedal Assembly Replacement in Hydraulic Brakes. 2. Inspect each brake assembly to determine if the brake drag condition is still present. Do any brake assemblies still exhibit the brake drag condition?	Go to Step 7	Go to Step 6
6	Replace the brake pedal assembly. Refer to Brake Pedal Assembly Replacement . Did you complete the replacement?	Go to Step 10	--
7	1. Separate the master cylinder from the vacuum brake booster. DO NOT disconnect any brake pipes. Refer to Master Cylinder Replacement . 2. Inspect the brake assemblies to determine if the brake drag condition is still present. Do any brake assemblies still exhibit the brake drag condition?	Go to Step 10	Go to Step 8
8	Replace the vacuum brake booster. Refer to Power Vacuum Brake Booster Replacement . Did you complete the replacement?	Go to Step 10	--
9	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis	Go to	Go to Diagnostic Starting Point -

	Did you find and correct a condition?	Step 10	Hydraulic Brakes
10	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle to confirm correct operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to Step 2	System OK

Braking Action Uneven - Front to Rear

Test Description

The number below refer to the step number on the diagnostic table:

2. Suspension components that are not operating correctly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect the suspension system for correct operation. Refer to Diagnostic Starting Point - Suspension General Diagnosis. Did you find and correct a condition?	Go to Step 5	Go to Step 3
3	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis. Did you find and correct a condition?	Go to Step 5	Go to Step 4
4	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis. Did you find and correct a condition?	Go to Step 5	Go to Diagnostic Starting Point - Hydraulic Brakes
5	Road test the vehicle in order to confirm correct operation. Refer to Brake System Vehicle Road Test. Is the condition still present?	Go to Step 2	System OK

Braking Action Uneven - Pulls to One Side

Test Description

The numbers below refer to the step numbers on the diagnostic table:

2. Suspension components that are not operating correctly may cause a disturbance to the vehicle during application of the brake system.

3. Steering components that are not operating correctly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect the suspension system for correct operation. Refer to Diagnostic Starting Point - Suspension General Diagnosis. Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	Inspect the steering system for correct operation. Refer to Diagnostic Starting Point - Power Steering System. Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis. Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis. Did you find and correct a condition?	Go to Step 6	Go to Diagnostic Starting Point - Hydraulic Brakes
6	Road test the vehicle in order to confirm correct operation. Refer to Brake System Vehicle Road Test. Is the condition still present?	Go to Step 2	System OK

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | **Document ID: 1993474**

Disc Brake System Diagnosis

Test Description

The numbers below refer to the step numbers on the diagnostic table:

9. Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

10. Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

12. Disc brake disc shields/backing plates that come in contact with disc brake discs may cause brake system noise.

15. Disc brake disc thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

19. Disc brake disc thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

22. Disc brake disc assembled lateral runout (LRO) that exceeds the maximum acceptable level can lead to thickness variation.

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DISC brake system in order to determine if the DISC brake system is operating correctly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Visually inspect the brake pads for the following conditions: Refer to Brake Pad Inspection . • Lining thickness below specifications • Uneven and/or abnormal wear edge-to-edge and/or side-to-side • Looseness or damage including brake pad hardware • Evidence of contamination from an external substance Did you find any conditions to indicate a concern with any of the front and/or rear brake pad?	Go to Step 3	Go to Step 12

3	Are any of the front and/or rear brake pads contaminated?	Go to Step 8	Go to Step 4
4	Are any of the front and/or rear brake pads worn unevenly?	Go to Step 7	Go to Step 5
5	Are any of the front and/or rear brake pads and/or brake pad hardware loose or damaged?	Go to Step 7	Go to Step 6
6	1. Remove and inspect the worn brake pads for glazing, looseness, heat spots or damage. 2. Replace the worn brake pads as a complete axle set. Refer to Front Disc Brake Pads Replacement and/or Rear Disc Brake Pads Replacement . Did you complete the inspection and replacement?	Go to Step 12	--
7	**Notice:** Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. **Important:** Do NOT disconnect the hydraulic brake flex hoses from the brake calipers. 1. Remove the front and/or rear brake calipers, as appropriate, from the brake caliper anchor plates and support the brake calipers. Refer to Front Brake Rotor Replacement or Rear Brake Rotor Replacement . 2. Inspect the brake caliper anchor plate and the mounting/sliding hardware for the following conditions: • Binding or seized brake caliper slides • Worn, damaged or missing components • Loose, bent, cracked, or damaged brake caliper anchor plate 3. Replace components as required. Refer to the following procedures as required: • Front Brake Caliper Replacement . • Rear Brake Caliper Replacement . 4. Replace the unevenly-worn, loose or damaged brake pads as a complete axle set. Refer to Front Disc Brake Pads Replacement and/or Rear Disc Brake Pads Replacement . Did you complete the inspection and replacement?	Go to Step 12	--
	1. Inspect the brake calipers, brake hoses and brake pipes for evidence of an external brake fluid leak. 2. Replace any components found to be leaking brake fluid. Refer to the following procedures as required:		

8	- Front Brake Caliper Overhaul or Front Brake Caliper Replacement . - Rear Brake Caliper Overhaul or Rear Brake Caliper Replacement . - Front Brake Hose Replacement . - Rear Brake Hose Replacement . - Brake Pipe Replacement Caution . Did you find and correct the source of the leak causing contamination of the brake pads?	Go to Step 11	Go to Step 9
9	1. Inspect the wheel drive shaft outer seals for damage and evidence of a grease leak. 2. Replace any wheel drive shaft seal that is found to be leaking grease which may be the source of the contamination to the brake pads. Refer to Wheel Drive Shaft Outer Joint and Boot Replacement . Did you find and correct the source of the leak causing contamination of the brake pads?	Go to Step 11	Go to Step 10
10	1. Clean the remaining disc brake system components to remove any traces of the contaminant. **Notice:** Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. **Important:** DO NOT disconnect the hydraulic brake flex hoses from the brake calipers. 2. Remove the front and/or rear brake calipers, as appropriate, from the brake caliper anchor plates and support the brake calipers. Refer to Front Brake Rotor Replacement and/or Rear Brake Rotor Replacement . 3. Inspect the brake caliper anchor plate/sliding hardware for the following conditions: - Binding or seized hardware - Distorted, worn, damaged or missing hardware components 4. Replace the brake calipers as required. Refer to Front Brake Caliper Replacement or Rear Brake Caliper Replacement . 5. Replace the contaminated brake pads as a complete axle set. Refer to Front Disc Brake Pads Replacement and/or Rear Disc Brake Pads Replacement . Did you complete the cleaning, inspection and	Go to	--

	replacement?	Step 11	
11	Visually inspect each of the rear disc brake disc shields/backing plates for evidence of contact with the brake discs. Are any of the brake disc shields/backing plates contacting the brake discs?	Go to Step 12	Go to Step 13
12	Repair or replace the disc brake disc shields/backing plates as required. Refer to Rear Disc Brake Backing Plate Replacement . Did you complete the repair or replacement?	Go to Step 13	--
13	1. Inspect the thickness of each of the brake discs. **Important:** Make the following determination AND ANSWER the question INDIVIDUALLY for EACH brake disc. 2. Make a determination for each brake disc if the brake disc can be REFINISHED and REMAIN ABOVE the minimum requirements. Refer to Brake Rotor Thickness Measurement . Does the brake disc meet the minimum requirements for REFINISHING?	Go to Step 14	Go to Step 17
14	**Important:** Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH brake disc. Inspect each of the brake discs for thickness variation that exceeds the maximum acceptable level. Refer to Brake Rotor Thickness Variation Measurement . Does the brake disc exhibit thickness variation that exceeds the maximum acceptable level?	Go to Step 16	Go to Step 15
15	1. Inspect each of the brake discs for the following surface and wear conditions: Refer to Brake Rotor Surface and Wear Inspection . • Heavy rust and/or pitting • Cracks and/or heat spots • Too much blueing, discoloration • Deep or greater than desired scoring beyond maximum acceptable level **Important:** Make the following determination AND ANSWER the question INDIVIDUALLY for EACH brake disc.		

	2. Make a determination for each brake disc if the brake disc requires refinishing based upon the results of the inspection. If the brake disc exhibits any of the conditions listed previously, it requires refinishing. Does the brake disc require REFINISHING?	Go to Step 16	Go to Step 21
16	1. Refinish the brake disc. Refer to Brake Rotor Refinishing . 2. Inspect the brake disc thickness. Refer to Brake Rotor Thickness Measurement . Were you able to REFINISH the brake disc within the minimum requirements?	Go to Step 21	Go to Step 20
17	Is the brake disc at or below the DISCARD requirements?	Go to Step 20	Go to Step 18
18	**Important:** Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH brake disc. Inspect each of the brake discs for thickness variation that exceeds the maximum acceptable level. Refer to Brake Rotor Thickness Variation Measurement . Does the brake disc exhibit thickness variation that exceeds the maximum acceptable level?	Go to Step 20	Go to Step 19
19	1. Inspect each of the brake discs for the following surface and wear conditions: Refer to Brake Rotor Surface and Wear Inspection . • Heavy rust and/or pitting • Cracks and/or heat spots • Too much blueing, discoloration • Deep or greater than desired scoring beyond maximum acceptable level **Important:** Make the following determination AND ANSWER the question INDIVIDUALLY for EACH brake disc. 2. Make a determination for each brake disc if the brake disc requires replacement based upon the results of the inspection. If the brake disc exhibits any of the conditions listed previously, it requires replacement. Does the brake disc require REPLACEMENT?	Go to Step 20	Go to Step 21
	Important: Whenever a brake disc is replaced, the		

20	assembled lateral runout (LRO) of the brake disc must be measured to make sure optimum performance of the disc brakes. Replace the brake disc. Refer to Front Brake Rotor Replacement or Rear Brake Rotor Replacement . Did you complete the replacement?	Go to Step 23	--
21	**Important:** Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH brake disc. Inspect each of the brake discs for assembled lateral runout (LRO) that exceeds the maximum acceptable level. Refer to Brake Rotor Assembled Lateral Runout Measurement . Does the brake disc exhibit assembled LRO that exceeds the maximum acceptable level?	Go to Step 22	Go to Step 23
22	Correct the LRO for each brake disc that was determined to have LRO exceeding the maximum acceptable level. Refer to Brake Rotor Assembled Lateral Runout Correction . Did you complete the operation?	Go to Step 23	--
23	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Disc Brake System OK Return to Symptom Table	--

Hydraulic Brake Component Operation Visual Inspection

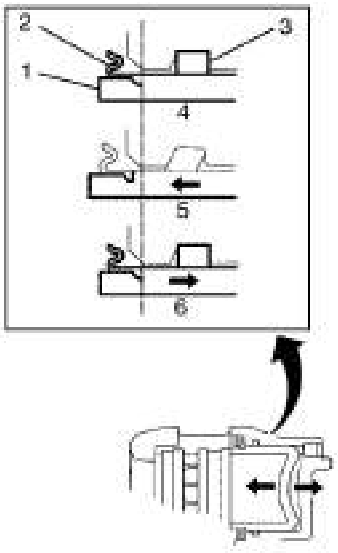
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



1. With the tyre and wheel assemblies removed and the brake rotors retained by wheel nuts, visually inspect the brake caliper piston dust boot (2) sealing area to make sure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake caliper requires overhaul or replacement.
3. While the brake system is at rest (4), observe the position of the brake caliper piston (1) in relation to the brake caliper housing.
4. Have an assistant apply and release the brake pedal several times while you observe the operation of the hydraulic brake caliper.
   - 4.1. Observe the brake caliper piston (1) for unrestricted and even movement during each apply of the brake system (5).
   - 4.2. Observe the brake caliper piston (1) for an unrestricted and even return motion during each release of the brake system (6).
5. If the brake caliper piston (1) did not exhibit unrestricted and even movement during brake

system apply and/or release, the piston square seal (3) may be worn or damaged and the brake caliper may require overhaul or replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Diagnostic Information and Procedures | **Document ID: 1990853**

Hydraulic Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the HYDRAULIC brake system in order to determine if the HYDRAULIC brake system is operating correctly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Hydraulic Brakes
2	Inspect and adjust the brake fluid level in the brake master cylinder. Refer to Master Cylinder Reservoir Filling. Was the brake fluid level low?	Go to Step 3	Go to Step 4
3	1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination: • Fluid separation, indicating two types of fluid are present - Swirled appearance - oil-based substance - Layered appearance - silicone-based substance • Fluid discoloration - Cloudy appearance - moisture - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?	Go to Step 5	Go to Step 6
4	1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination: • Fluid separation, indicating two types of fluid are present - Swirled appearance - oil-based substance - Layered appearance - silicone-based substance • Fluid discoloration - Cloudy appearance - moisture - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination.	Go to	

	Do any of the above conditions exist?	Step 5	Go to Step 12
5	1. Flush the hydraulic brake system. Refer to Hydraulic Brake System Flushing. 2. If the brake fluid WAS contaminated with an oil-based or a silicone-based fluid, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following steps. Refer to the procedures indicated. 2.1. Remove ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. 2.2. Clean out the hydraulic brake pipes using denatured alcohol, or equivalent. 2.3. Dry the brake pipes using non-lubricated, filtered air. 2.4. Repair or replace ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. • Replace the brake master cylinder reservoir cap diaphragm. • Master Cylinder Replacement • Brake master cylinder reservoir: Clean the brake master cylinder reservoir using denatured alcohol, or equivalent, then dry the reservoir using non-lubricated, filtered air, or if necessary, replace the brake master cylinder reservoir. • Front Brake Hose Replacement • Rear Brake Hose Replacement • Front Brake Caliper Overhaul or Front Brake Caliper Replacement • Rear Brake Caliper Overhaull or Rear Brake Caliper Replacement • Brake Pressure Modulator Valve Assembly Replacement 3. If the brake fluid was NOT contaminated with an oil-based fluid, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed moisture or dirt to enter the system. 4. Refill and bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding or Hydraulic Brake System Bleeding. Did you complete the operation and any required repairs and/or replacements?	Go to Step 9	--

6	1. Inspect the following hydraulic brake system components for external fluid leaks. Repair or replace any of the components found to be leaking brake fluid. Refer to the appropriate procedures: - Brake master cylinder reservoir cap diaphragm - Master Cylinder Replacement - Front Brake Hose Replacement - Rear Brake Hose Replacement - Brake Pipe Replacement - Front Brake Caliper Overhaul or Front Brake Caliper Replacement - Rear Brake Caliper Overhaul or Rear Brake Caliper Replacement - Brake Pressure Modulator Valve Assembly Replacement 2. If you repaired or replaced any of the brake system components listed, bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding or Hydraulic Brake System Bleeding. While bleeding the hydraulic brake system, observe for the following conditions: - The presence of air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder was replaced - An unrestricted and even flow of brake fluid per axle during the bleeding procedure Did you find and correct a condition?	Go to Step 7	Go to Step 12
7	Was there air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder was replaced?	Go to Step 19	Go to Step 8
8	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 9	Go to Step 10
9	Inspect the hydraulic function of the brake calipers for correct operation. Refer to Hydraulic Brake Component Operation Visual Inspection. Was the hydraulic function of the brake calipers operating correctly?	Go to Step 21	Go to Step 14
10	Was the flow of brake fluid restricted or uneven through front axle hydraulic components during the bleeding procedure?	Go to Step 13	Go to Step 11
11	Was the flow of brake fluid restricted or uneven through rear axle hydraulic components during the bleeding procedure?	Go to Step 17	--
12	Inspect the hydraulic function of the brake calipers/wheel cylinders for correct operation. Refer to Hydraulic Brake Component Operation Visual Inspection.		

	Was the hydraulic function of the brake calipers/wheel cylinders operating correctly?	Go to Step 15	Go to Step 13
13	Determine if the brake caliper is restricting the flow of brake fluid and/or not operating correctly: 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle. 2. Remove the tyre and wheel assemblies. Refer to Tire and Wheel Removal and Installation. 3. Open the suspected brake caliper bleeder valve. 4. Using a large G-clamp, compress the brake caliper piston and observe for an unrestricted flow of brake fluid and for free movement of the brake caliper piston. 5. Close the brake caliper bleeder valve. Was the flow of brake fluid unrestricted and did the brake caliper piston move freely?	Go to Step 17	Go to Step 14
14	Repair or replace any brake caliper that was not operating correctly. Refer to the appropriate procedure. • Front Brake Caliper Overhaul or Front Brake Caliper Replacement • Rear Brake Caliper Overhaul or Rear Brake Caliper Replacement Did you complete the repair and/or replacement?	Go to Step 21	--
15	Bleed the hydraulic brake system to observe for the presence of air in the system and to observe for an unrestricted and even flow of brake fluid per axle during the bleeding procedure. Refer to Hydraulic Brake System Bleeding or Hydraulic Brake System Bleeding. Was there air in the system?	Go to Step 19	Go to Step 16
16	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 21	Go to Step 17
17	1. Inspect the hydraulic brake pipes and flexible brake hoses for signs of a fluid restriction; such as being bent, kinked, pinched or damaged. Refer to Brake Pipe and Hose Inspection. 2. Replace any of the hydraulic brake pipes and/or flexible brake hoses found to be bent, kinked, pinched, or damaged. Refer to the following procedures as necessary: • Front Brake Hose Replacement • Rear Brake Hose Replacement • Brake Pipe Replacement Caution 3. If none of the hydraulic brake pipes or flexible brake hoses were visibly bent, kinked, pinched, or damaged, replace the hydraulic brake flex hose at the restricted location.		

	Did you find and correct a condition?	Go to Step 21	Go to Step 18
18	Replace the ABS brake modulator assembly, in order to correct the hydraulic brake dynamic rear proportioning mechanical operation. Refer to Brake Pressure Modulator Valve Assembly Replacement. Did you complete the replacement?	Go to Step 21	--
19	1. Inspect the hydraulic brake system components for brake fluid seepage at a seal and/or fitting location, which may have drawn air into the system. 2. Inspect the hydraulic brake system components for evidence of a recent repair, which may have introduced air into the system. 3. Repair or replace any of the components found to be installed incorrectly or seeping brake fluid. Did you find and correct a condition?	Go to Step 21	Go to Step 20
20	1. Inspect the brake master cylinder for internal fluid leaks. Refer to Brake System Internal Leak Test. 2. Repair or replace the brake master cylinder if it is found to be leaking brake fluid internally. Refer to Master Cylinder Replacement. Did you find and correct a condition?	Go to Step 21	Return to Symptom Table
21	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Hydraulic Brake System OK Return to Symptom Table	--

Symptoms - Hydraulic Brakes

Important: The following steps must be completed before using the symptom tables.

1. Perform Diagnostic System Check - Vehicle before using the brake indicator symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control module(s) can communicate via the serial data link.
2. Perform the Brake System Vehicle Road Test before using the hydraulic brake symptom tables in order to duplicate the customer's concern.
3. Review the system operation in order to familiarize yourself with the system functions. Refer to the following:
   - Brake Warning System Description and Operation
   - Hydraulic Brake System Description and Operation
   - Brake Assist System Description and Operation
   - Disc Brake System Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the brake warning system. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Brake Warning Indicator Malfunction
- Brake Pulsation
- Brake System Noise
- Braking Action Uneven - Pulls to One Side
- Braking Action Uneven - Front to Rear
- Brake Pedal Excessive Travel
- Brake Pedal Excessive Effort
- Brakes Drag
- Brake System Slow Release
- Brake Fluid Loss

Brake Fluid Level Indicator Switch Replacement

The master cylinder fluid level sensor is moulded into the master cylinder reservoir and is not serviced separately. The master cylinder fluid level sensor must be replaced with the master cylinder reservoir as an assembly. Refer to Master Cylinder Reservoir Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | Document ID: 1967135

Brake Pedal Assembly Replacement (RHD)

Removal Procedure

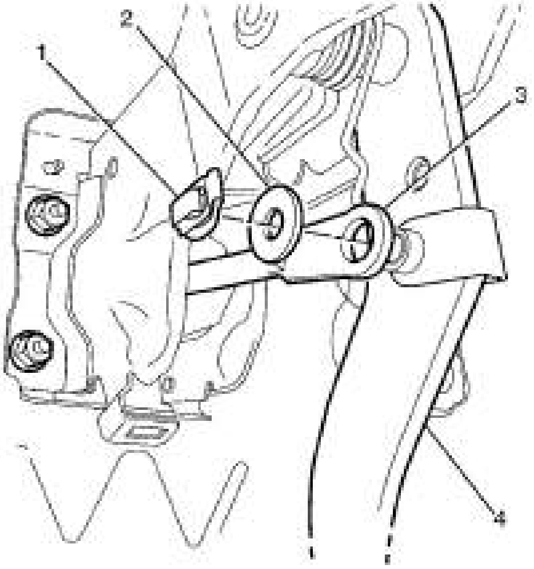
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

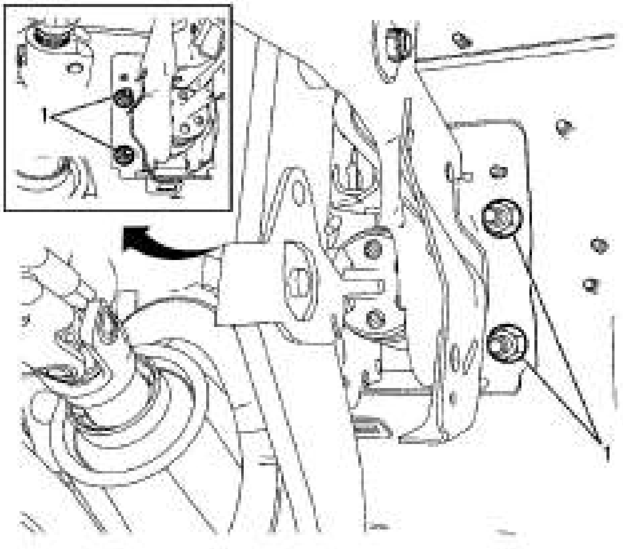
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Remove the instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement.
2. Remove the instrument panel lower right trim plate assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
3. Remove the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement.
4. Remove the master cylinder from the vehicle. Refer to Master Cylinder Replacement.
5. Remove the vacuum hose and check valve from the vacuum brake booster. Refer to Power Brake Booster Inlet Hose Replacement.
6. Remove the brake pedal position sensor. Refer to Stop Lamp Switch Replacement.



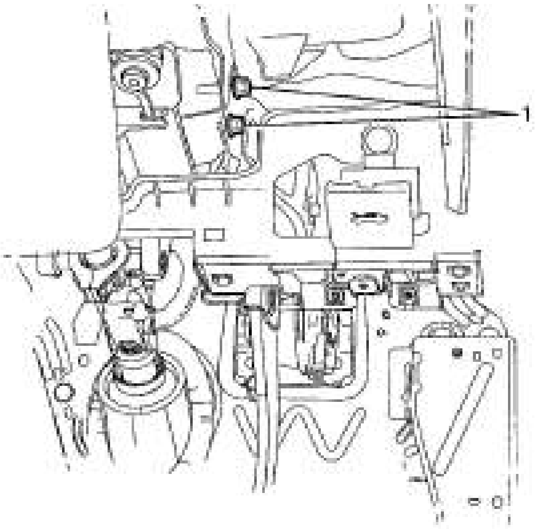
7. Remove the brake pedal pushrod retaining clip (1), washer (2) and the brake pedal pushrod (3) from the brake pedal (4).



8. Remove the vacuum brake booster to brake pedal support bracket retaining nuts (1).

Important: From the engine compartment, pull the vacuum brake booster forward to release the four studs from the bulkhead and brake pedal support bracket.

9. Remove the vacuum brake booster from the vehicle.



10. Remove the two brake pedal bracket assembly to instrument panel crossmember retaining bolts (1).

Important: Lower the brake pedal assembly rear end first to aid in removal.

11. Remove the brake pedal assembly from under the instrument panel.

Installation Procedure

Caution: Refer to Brake Fluid Caution in the Preface section.

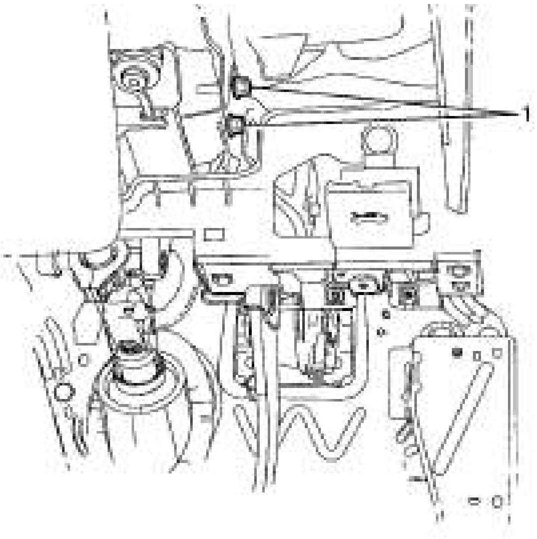
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Important: Raise the brake pedal assembly front end first to aid in installation.

1. Install the brake pedal assembly to the instrument panel crossmember.



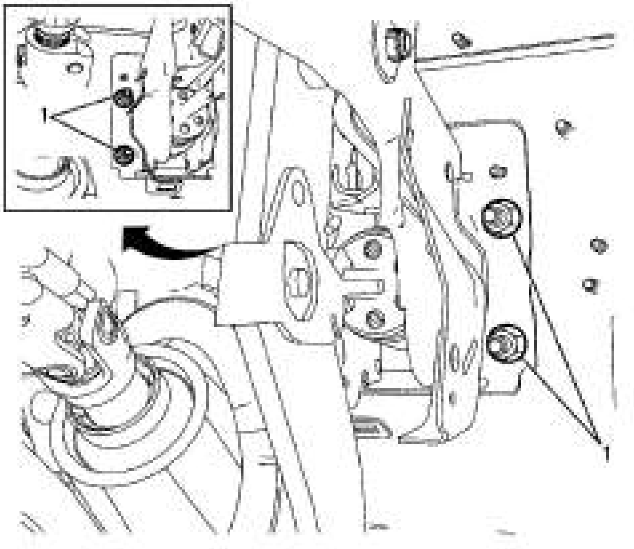
2. Install the two brake pedal bracket assembly to instrument panel crossmember retaining bolts (1).

   DO NOT fully tighten at this stage.

   Important: Make sure the vacuum brake booster's four studs are correctly located in the bulkhead and brake pedal support bracket.

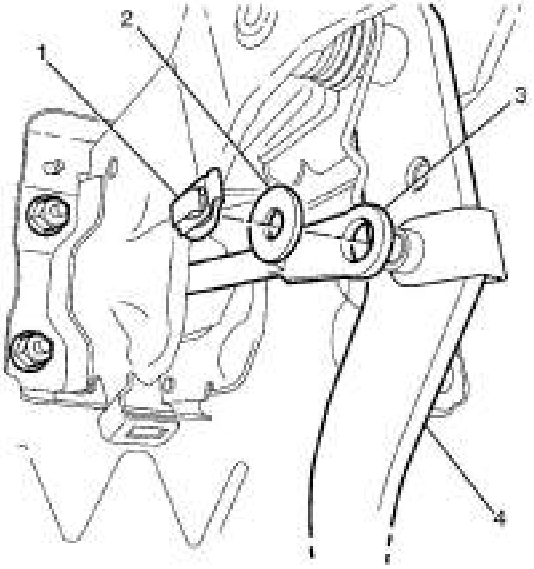
3. With the aid of an assistant install the vacuum brake booster from the engine compartment.

   Notice: Refer to Fastener Notice in the Preface section.

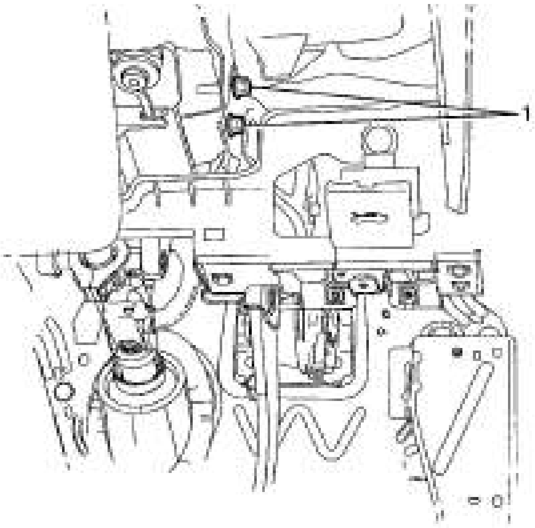


4. Install the vacuum brake booster to brake pedal support bracket retaining nuts (1).

   Tighten
   Tighten the nuts to 22 Nm (16 lb ft).



5. Install the push rod (3), washer (2) and retaining clip (1) to the brake pedal assembly (4).



6. Tighten the two brake pedal bracket assembly to cross car beam retaining bolts (1).

   Tighten
   Tighten the bolts to 23 Nm (17 lb ft).

7. Install the brake pedal position sensor. Refer to Stop Lamp Switch Replacement.
8. Install the vacuum hose and check valve to the vacuum brake booster. Refer to Power Brake Booster Inlet Hose Replacement.
9. Install the master cylinder. Refer to Master Cylinder Replacement.
10. Bleed the braking system. Refer to Hydraulic Brake System Bleeding.
11. Install the instrument panel lower trim panel retainer. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
12. Install the instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement.
13. Road test the vehicle to inspect correct brake, stop lamp and cruise control operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | Document ID: 2194827

Brake Pipe Replacement (RHD)

Tools Required

J 23738-A J 23738-A Mityvac

Master Cylinder to Brake Pressure Modulator Valve (BPMV) Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

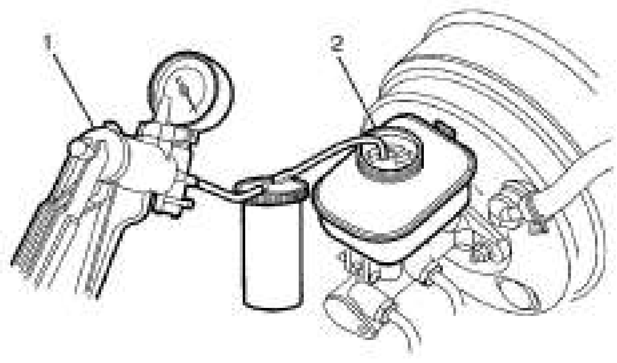
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

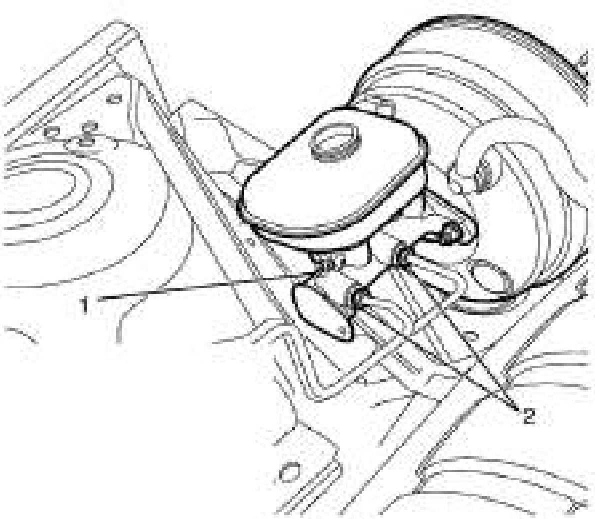
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

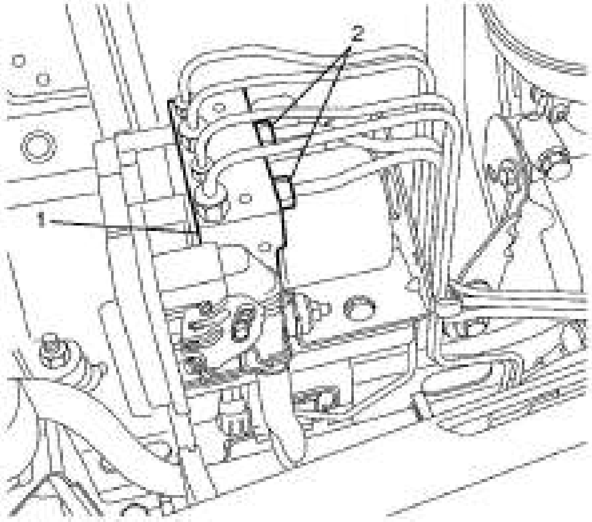
1. Clean the master cylinder, especially around the brake lines and reservoir cap.
2. Place a clean suitable container under the BPMV and master cylinder.
3. Remove the master cylinder reservoir cap.



4. Siphon the brake fluid out of the master cylinder reservoir (2) using the J 23738-A J 23738-A (1)



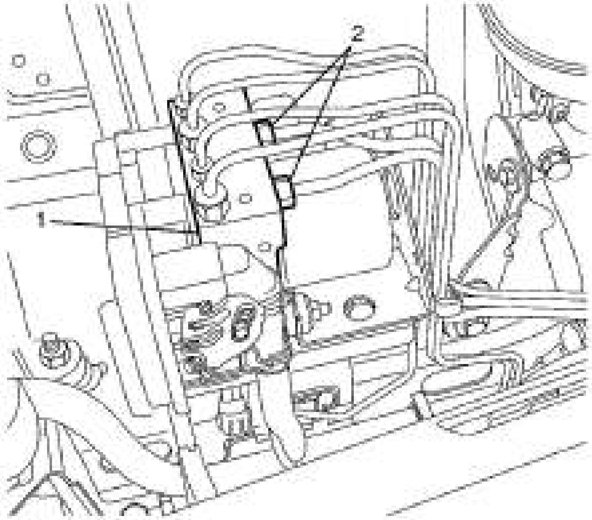
5. Remove the brake pipes (2) from the master cylinder (1).



Important: Record the location of all brake pipes to the BPMV assembly for use as an aid during installation.

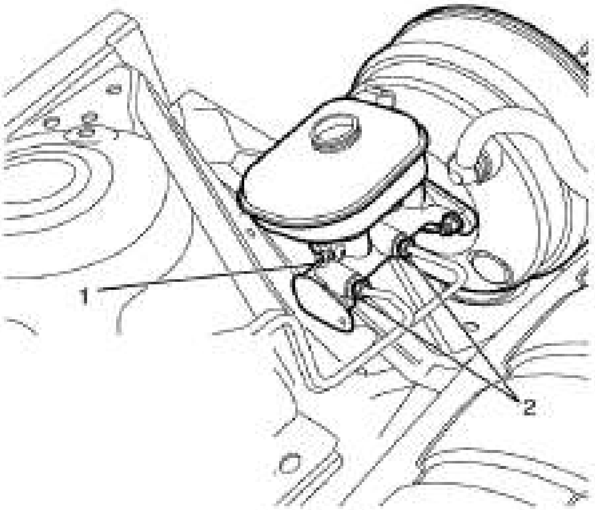
6. Remove the master cylinder brake pipes (2) from the BPMV (1).

Master Cylinder to Brake Pressure Modulator Valve (BPMV) Installation Procedure



1. Install the wheel brake pipes (2) to the BPMV (1) using the locations recorded during the removal procedure.

   Tighten
   Tighten the wheel brake pipes to 16 Nm (12 lb ft).



2. Install the brake pipes (2) to the master cylinder (1).

   Tighten
   Tighten the pipe fittings to 16 Nm (12 lb ft).

3. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake

System Bleeding

Front Brake Pipe Removal Procedure - Right

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

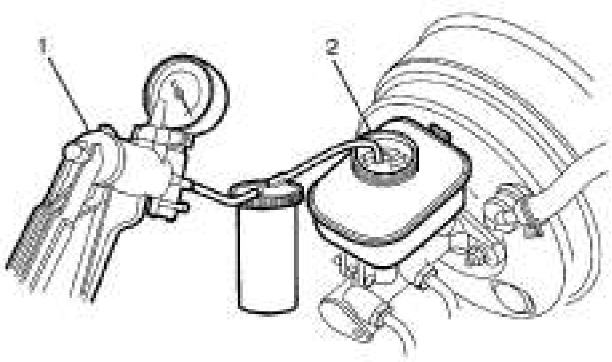
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

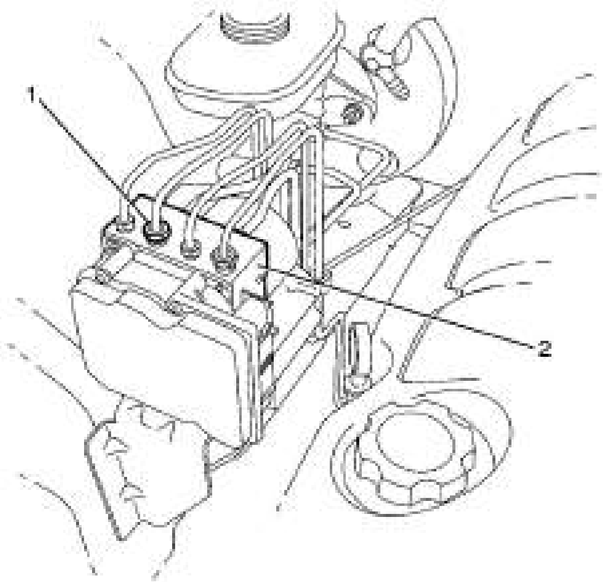
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Clean the master cylinder, especially around the brake lines and reservoir cap.
2. Place a clean suitable container under the BPMV.
3. Remove the master cylinder reservoir cap.



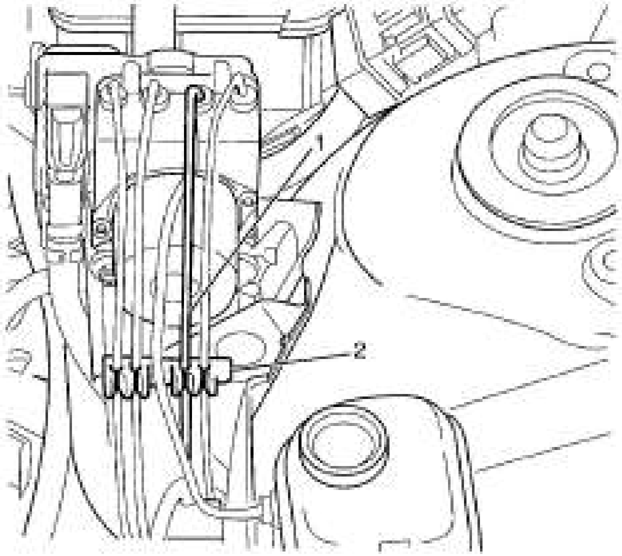
4. Siphon the brake fluid out of the master cylinder reservoir (2) using the J 23738-A J 23738-A (1)



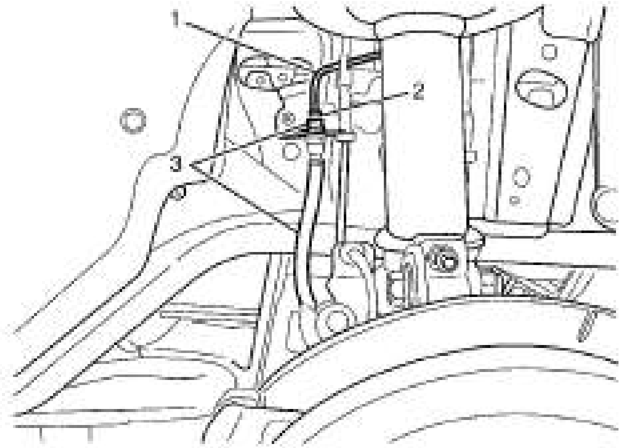
5. Disconnect the brake pipe (1) from the BPMV (2).

   Important: Install a rubber cap or plug to the BPMV (2) in order to prevent fluid loss and contamination.

6. Plug the BPMV (2).



7. Detach the brake pipe (1) from the locating clip (2).
8. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle
9. Remove the right front wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation
10. Remove the right splash guard. Refer to Wheelhouse Splash Shield ReplacementWheelhouse Splash Shield Replacement



11. Clean all dirt and foreign material from the brake hose and the brake pipe fittings (2 and 3).

    Important: Hold the brake hose (3) with a suitable tool whilst disconnecting the brake pipe fitting (2) to prevent damage to the brake pipe (1).

12. Disconnect the brake pipe fitting (2) from the brake hose (3).

    Important: Install a rubber cap or plug to the exposed brake hose fitting end in order to prevent brake fluid loss and contamination.

13. Plug the brake hose (3).
14. Remove the brake pipe (1).

Front Brake Pipe Installation Procedure - Right

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

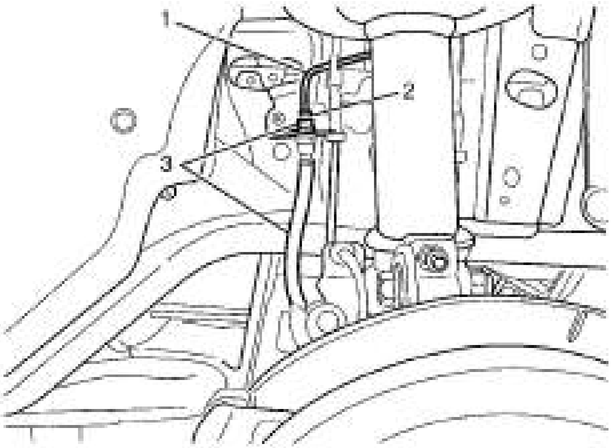
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

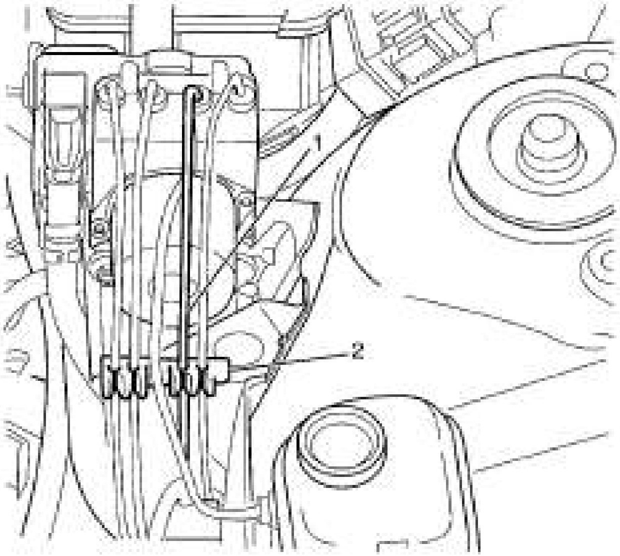
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



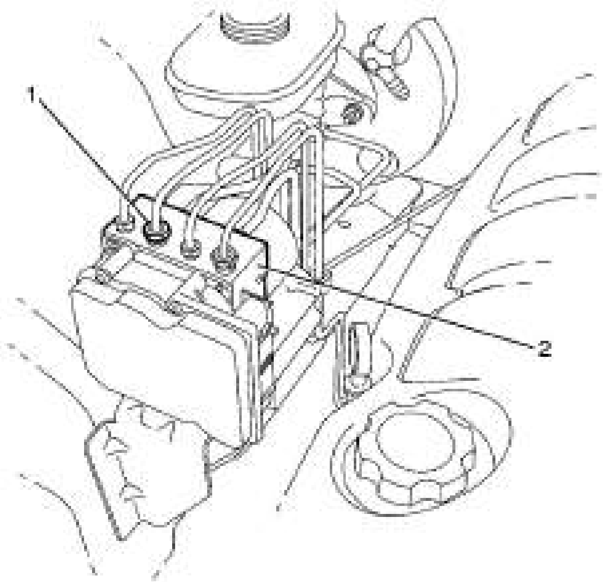
1. Install the brake pipe (1) to the vehicle.
2. Remove the rubber cap or plug from the brake hose (3).
3. Connect the brake pipe fitting (2) to the brake hose (3).

   Do not fully tighten at this stage.

4. Lower the vehicle.



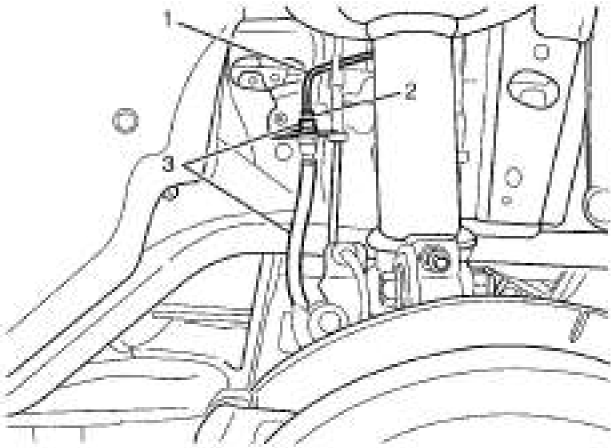
5. Attach the brake pipe (1) to the locating clip (2).



6. Remove the rubber cap or plug from the BPMV (2).
7. Install the brake pipe (1) to the BPMV (2).

   Do not fully tighten at this stage.

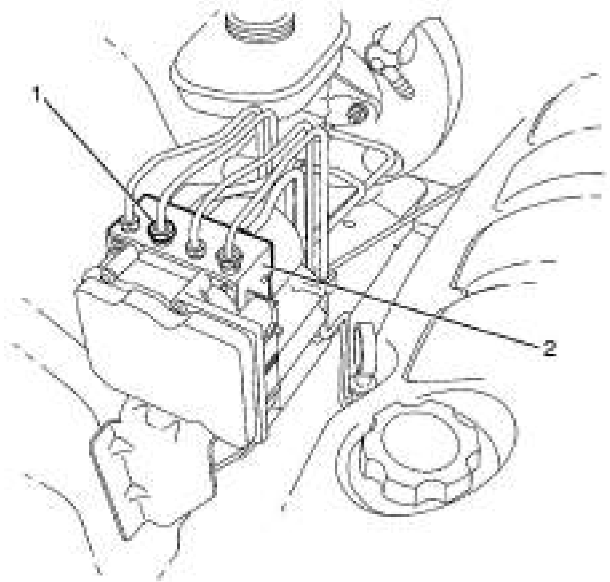
   Notice: Refer to Fastener Notice in the Preface section.



Important: Hold the brake hose (3) with a suitable tool whilst connecting the brake pipe fitting (2) to prevent damage to the brake pipe (1).

8. Tighten the brake pipe fitting (2) to the brake hose (3)

Tighten
Tighten the brake pipe fitting to 16 Nm (12 lb ft).



9. Tighten the brake pipe fitting (1) to the BPMV (2).

   Tighten
   Tighten the brake pipe fitting to 16 Nm (12 lb ft).

10. Install the right splash guard. Refer to Wheelhouse Splash Shield ReplacementWheelhouse Splash Shield Replacement
11. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding

Front Brake Pipe Removal Procedure - Left

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

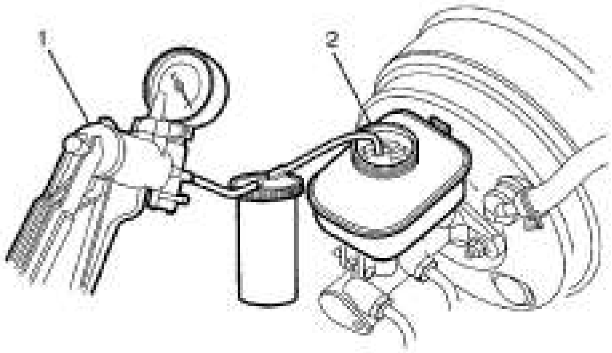
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

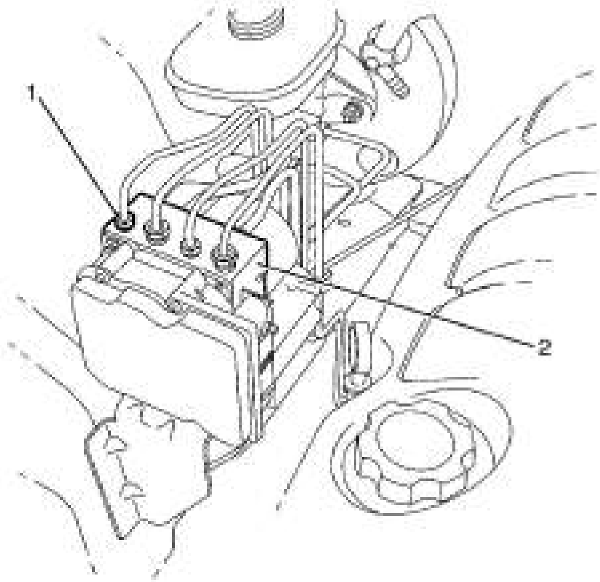
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Clean the master cylinder, brake lines and reservoir cap.

2. Place a clean suitable container under the Brake Pressure Modulator Valve (BPMV).
3. Remove the master cylinder reservoir cap.



4. Siphon the brake fluid out of the master cylinder reservoir (2) using the J 23738-A J 23738-A (1)



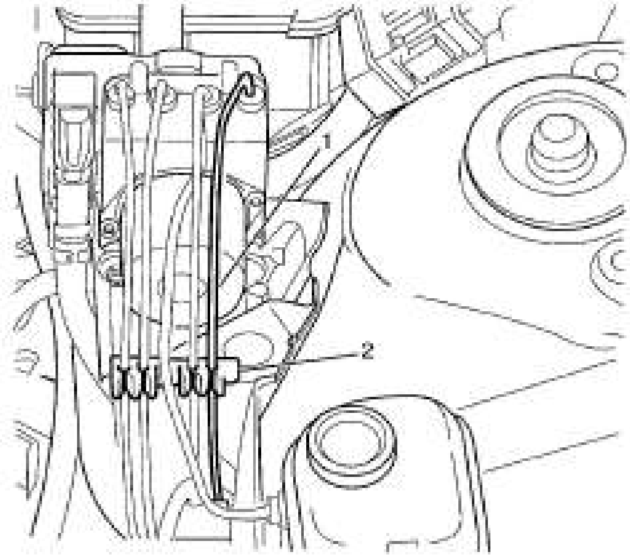
5. Disconnect the brake pipe (1) from the BPMV (2).

   Important: Install a rubber cap or plug to the BPMV (2) in order to prevent fluid loss and contamination.

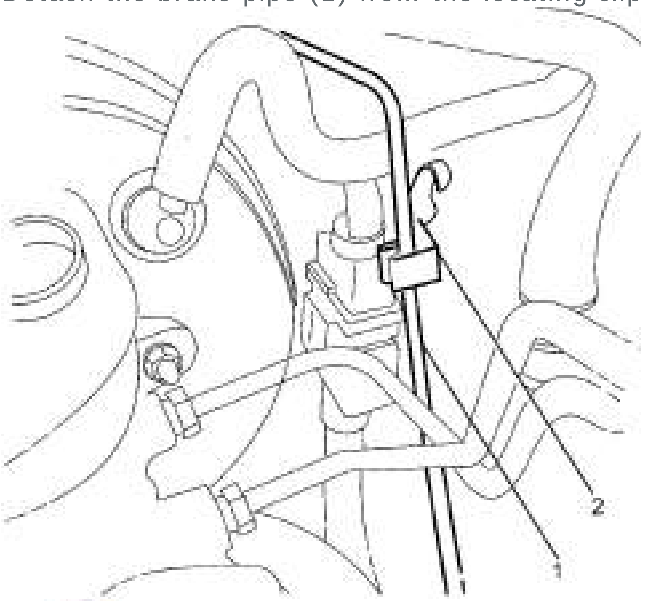
6. Plug the BPMV (2).
7. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle
8. Remove the engine. Refer to Engine ReplacementEngine Replacement for 3.6L or Engine

ReplacementEngine Replacement for 6.0L.

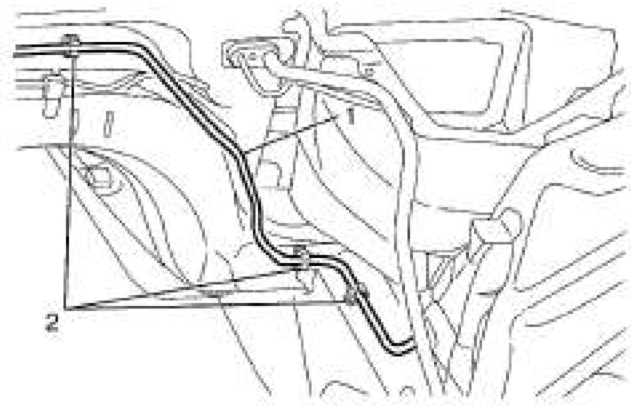
9. Remove the heat shields in the engine bay.
10. Remove the sound proofing trim from the bulkhead.



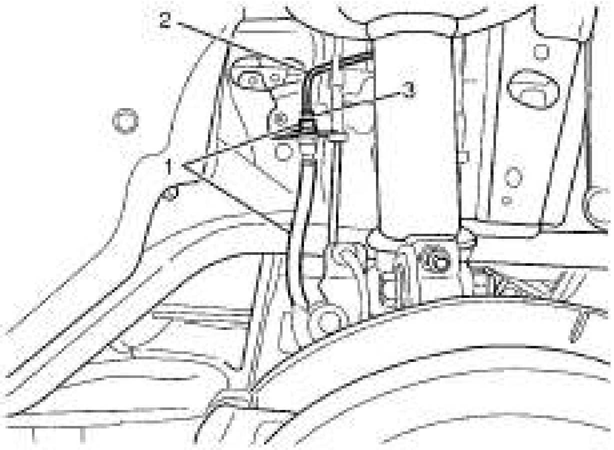
11. Detach the brake pipe (1) from the locating clip (2).



12. Detach the brake pipe (1) from the locating clip (2).



13. Detach the brake pipe (1) from the locating clips (2).



14. Clean all dirt and foreign material from the brake hose and the brake pipe fittings (1 and 3).

Important: Hold the brake hose (1) with a suitable tool whilst disconnecting the brake pipe fitting (3) to prevent damage to the brake pipe (2).

15. Disconnect the brake pipe fitting (3) from the brake hose (1).

Important: Install a rubber cap or plug to the exposed brake hose (1) in order to prevent brake fluid loss and contamination.

16. Plug the brake hose (1).
17. Remove the left splash guard. Refer to Wheelhouse Splash Shield ReplacementWheelhouse

Splash Shield Replacement

18. Remove the brake pipe (2) from the vehicle.

Front Brake Pipe Installation Procedure - Left

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

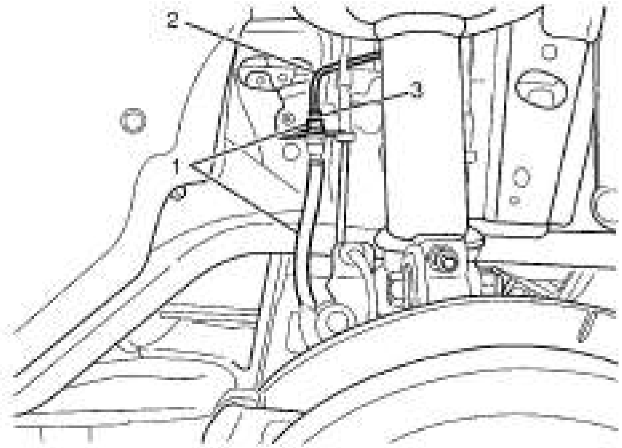
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

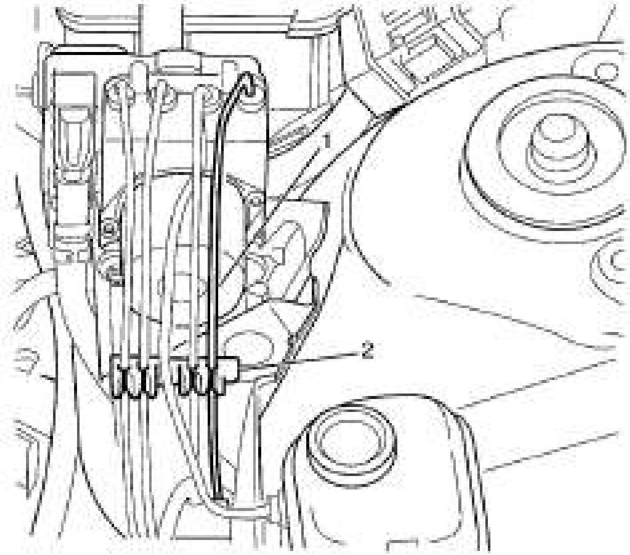
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

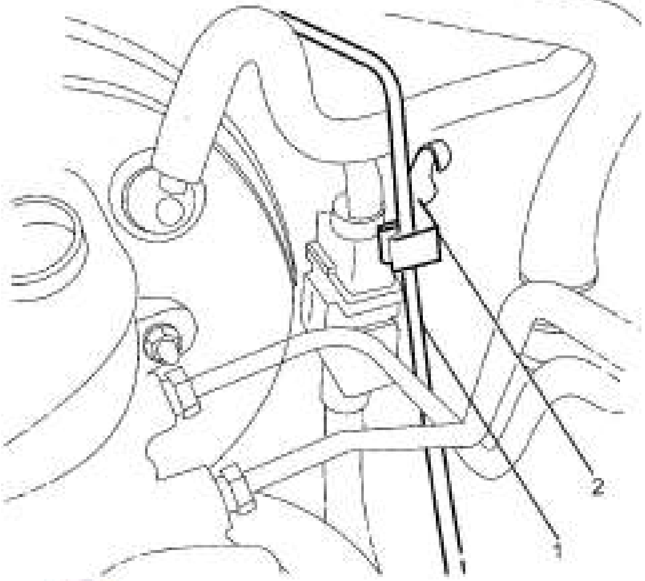
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



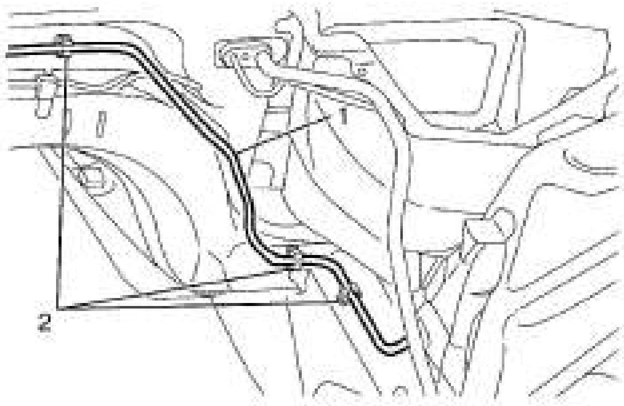
1. Install the brake pipe (2) to the vehicle.
2. Remove the rubber cap or plug from the brake hose (1).
3. Connect the brake pipe (2) to the brake hose (1).
4. Lower the vehicle.



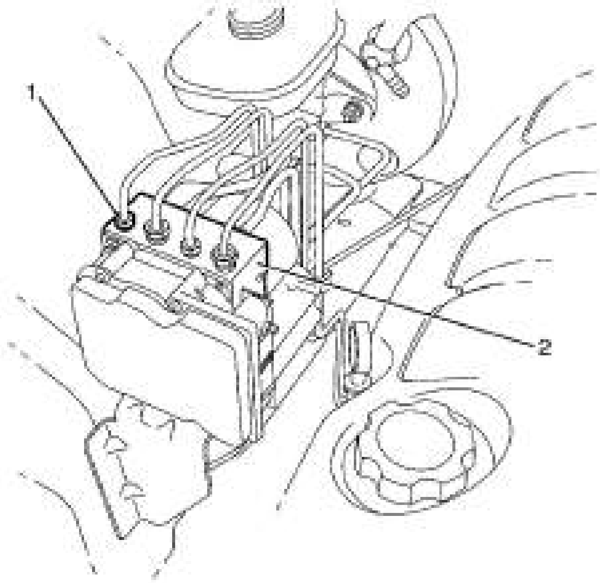
5. Attach the brake pipe (1) to the locating clip (2).



6. Attach the brake pipe (1) to the locating clip (2).



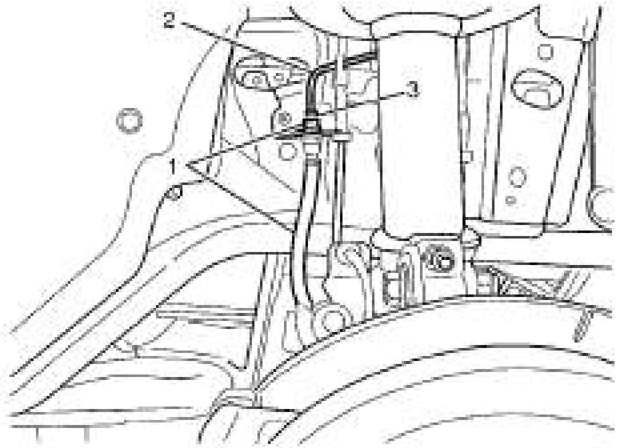
7. Attach the brake pipe (1) to the locating clips (2).



8. Remove the rubber cap or plug from the BPMV (2).
9. Install the brake pipe (1) to the BPMV (2).

   Do not fully tighten at this stage.

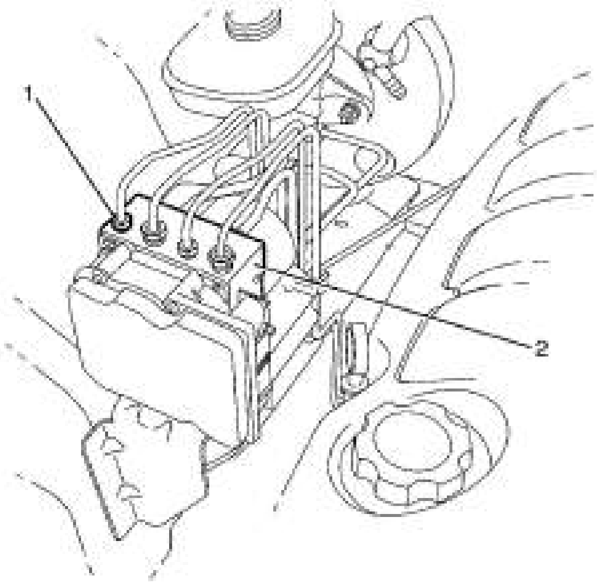
   Notice: Refer to Fastener Notice in the Preface section.



Important: Hold the brake hose (1) with a suitable tool whilst connecting the brake pipe fitting (3) to prevent damage to the brake pipe (2).

10. Tighten the brake pipe fitting (3) to the brake hose (1)

Tighten
Tighten the brake pipe fitting to 16 Nm (12 lb ft).



11. Tighten the brake pipe fitting (1) to the BPMV (2)

Tighten

Tighten the brake pipe fitting to 16 Nm (12 lb ft).

12. Install the sound proofing trim to the bulkhead.
13. Install the heat shields to the engine bay.
14. Install the engine. Refer to Engine ReplacementEngine Replacement for 3.6L or Engine ReplacementEngine Replacement for 6.0L.
15. Install the left splash guard. Refer to Wheelhouse Splash Shield ReplacementWheelhouse Splash Shield Replacement
16. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding

Intermediate Brake Pipe Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

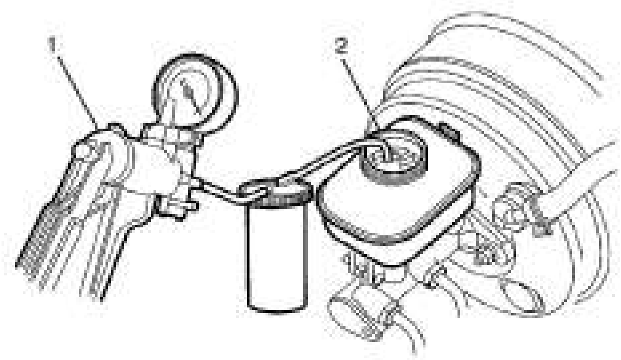
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

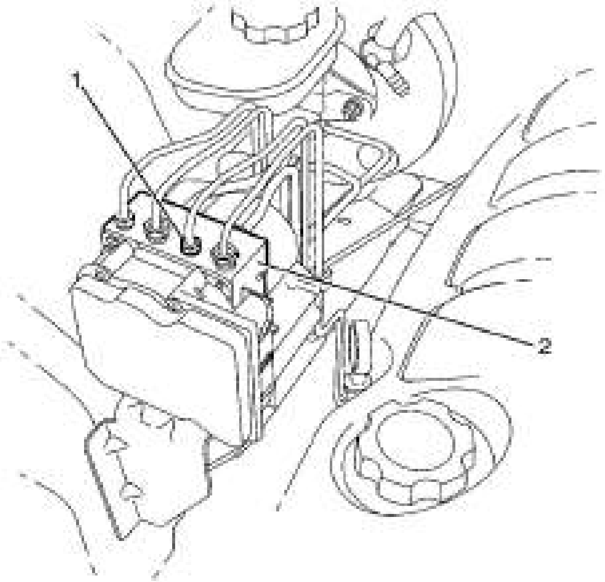
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Clean the master cylinder, brake lines and reservoir cap.
2. Place a clean suitable container under the Brake Pressure Modulator Valve (BPMV).
3. Remove the master cylinder reservoir cap.



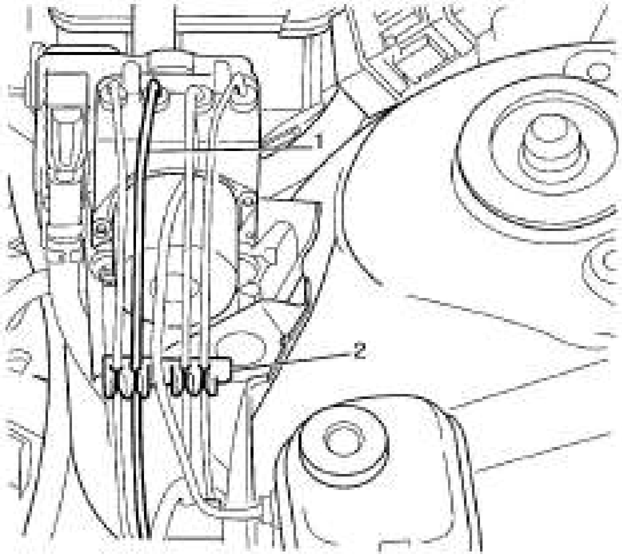
4. Siphon the brake fluid out of the master cylinder reservoir (2) using the J 23738-A J 23738-A (1)



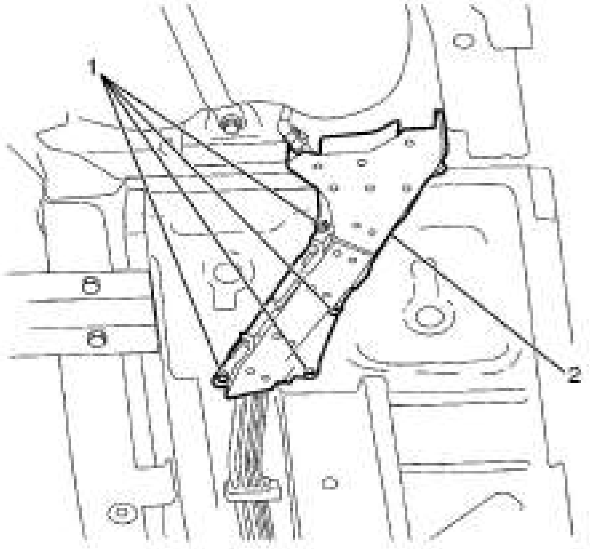
5. Disconnect the brake pipe (1) from the BPMV (2).

Important: Install a rubber cap or plug to the BPMV (2) in order to prevent fluid loss and contamination.

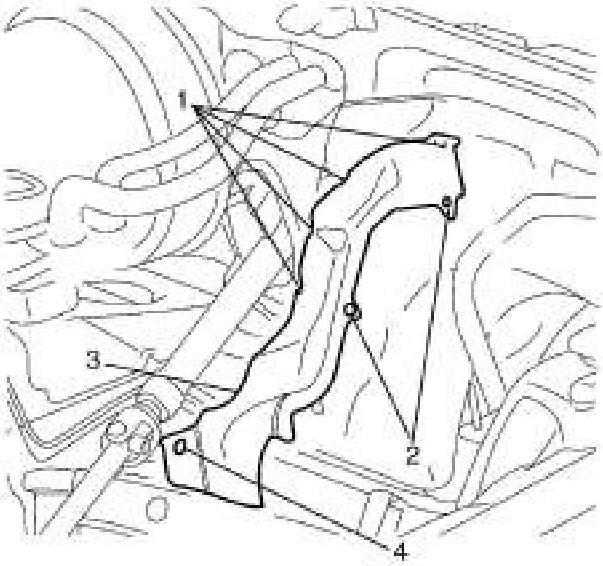
6. Plug the BPMV (2).



7. Detach the brake pipe (1) to the locating clip (2).
8. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle



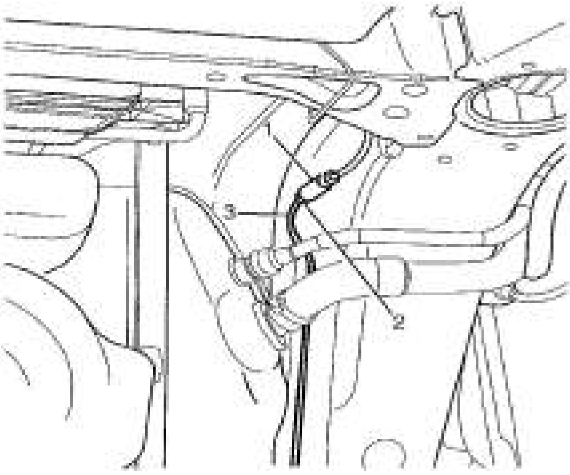
9. Remove the brake and fuel pipe splash shield to chassis retaining nuts (1).
10. Remove the brake and fuel pipe splash shield (2).
11. Remove the front heat shield. Refer to Exhaust Front Heat Shield ReplacementExhaust Front Heat Shield Replacement
12. Remove the engine. Refer to Engine ReplacementEngine Replacement for 3.6L or Engine ReplacementEngine Replacement for 6.0L.



Important: The brake and fuel pipe protector shield (3) is retained by rivets (2). These rivets (2) must be drilled out during removal and replaced as per the installation procedure.

13. Remove the brake and fuel pipe heat shield to bulkhead retaining rivets (2).
14. Remove the brake and fuel pipe heat shield to bulkhead retaining bolt (4).
15. Detach the brake and fuel pipe heat shield clips (1).

16. Remove the brake and fuel pipe protector shield (2).
17. Remove the rear subframe. Refer to Rear Frame ReplacementRear Frame Replacement

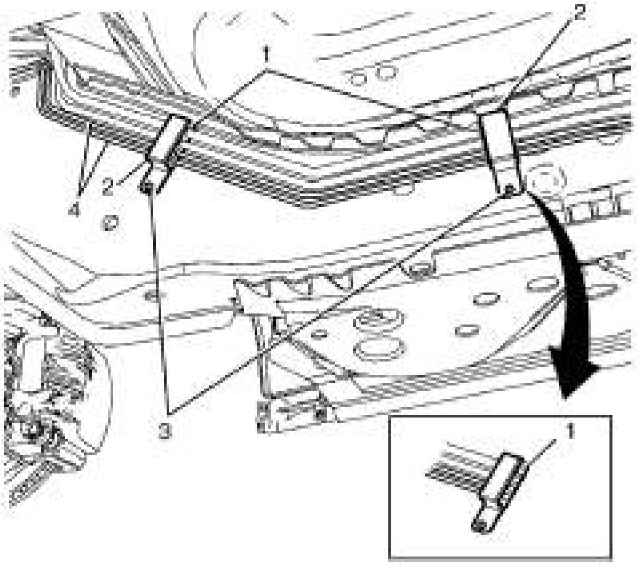


Important: Hold the brake pipe union (1) with a suitable tool whilst disconnecting the brake pipe fitting (2) to prevent damage to the intermediate brake pipe (3).

18. Disconnect the intermediate brake pipe (3) from the brake pipe union (1).

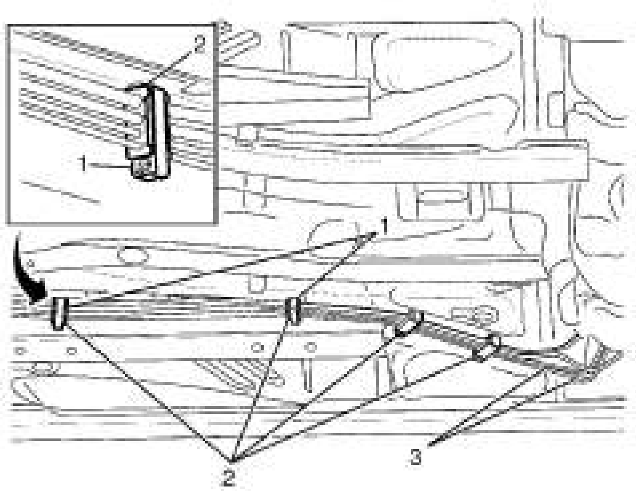
Important: Install a rubber cap or plug to the brake pipe union (1) in order to prevent brake fluid loss and/or contamination.

19. Plug the brake pipe union (1).



Important: The brake and fuel pipe retaining brackets (2) are retained by rivets (3). These rivets (3) must be drilled out during removal and replaced as per the installation procedure.

20. Remove the brake and fuel pipe retaining bracket to chassis retaining rivets (3).
21. Remove the brake and fuel pipe retaining brackets (2).
22. Remove the brake pipes (4) from the brake and fuel pipe retaining bracket rubber insulators (1).



Important: Use a suitable tool to open the brake and fuel pipe retaining brackets (2) by detaching the brake and fuel pipe retaining bracket (2) clip.

23. Open the brake and fuel pipe retaining brackets (2).
24. Remove the brake pipe (1) from the brake and fuel pipe retaining bracket rubber insulators (3).

Intermediate Brake Pipe Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

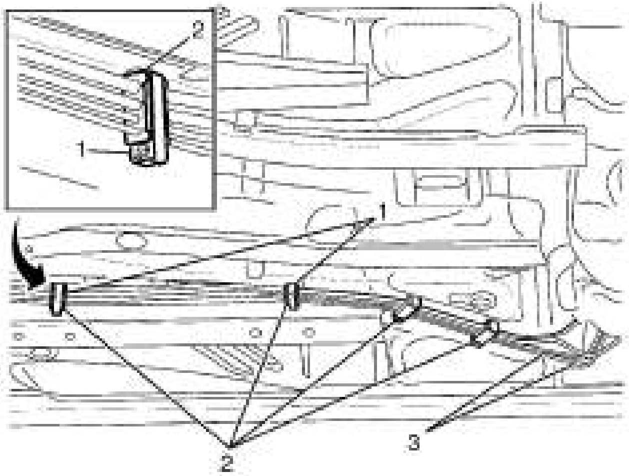
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

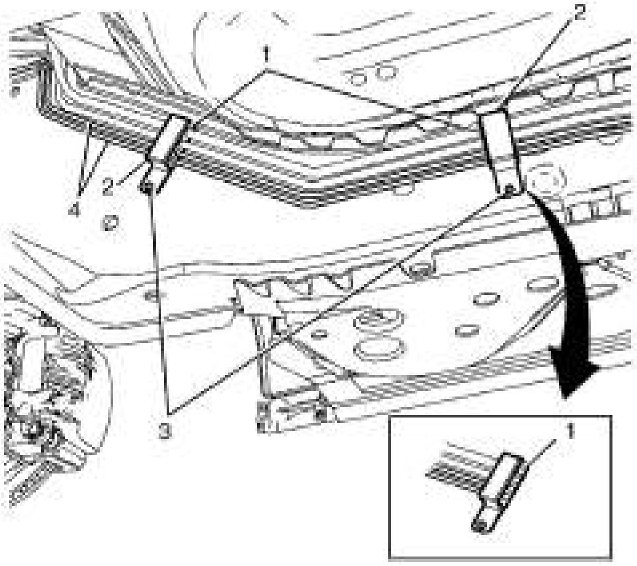
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

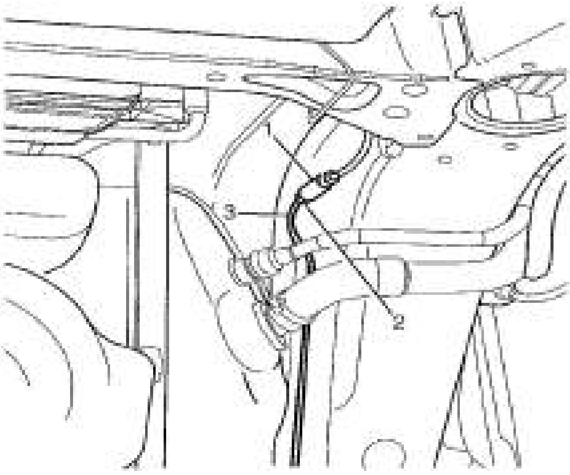
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



1. Install the brake pipes (3) to the brake and fuel pipe retaining bracket rubber insulators (2).
2. Close the brake and fuel pipe retaining brackets (1).

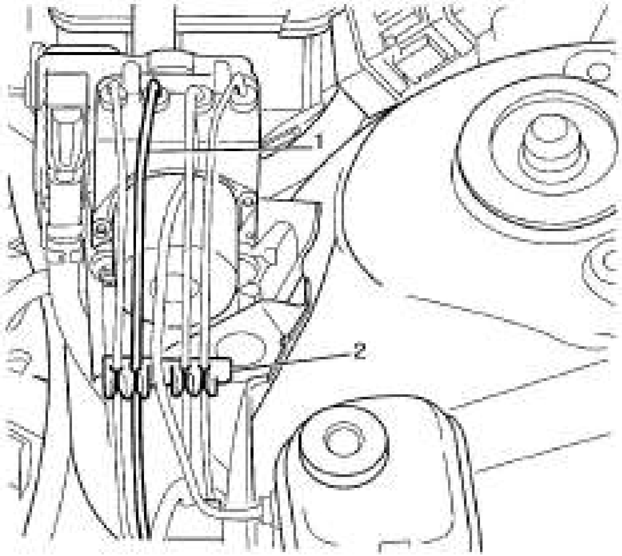


3. Install the brake pipes (4) to the two brake and fuel pipe retaining bracket rubber insulators (1).
4. Install the two brake and fuel pipe retaining brackets (2).
5. Install the NEW brake and fuel pipe retaining bracket to chassis retaining rivets (3).
6. Remove the rubber cap or plug from the brake pipe union.

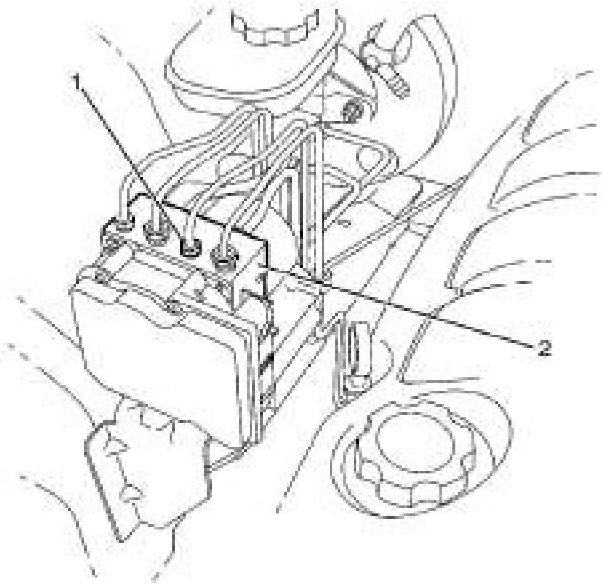


Important: Hold the brake pipe union (1) with a spanner whilst connecting the brake pipe fitting (2) to prevent damage to the brake pipe (3).

7. Connect the brake pipe (1) to the brake pipe union (2).

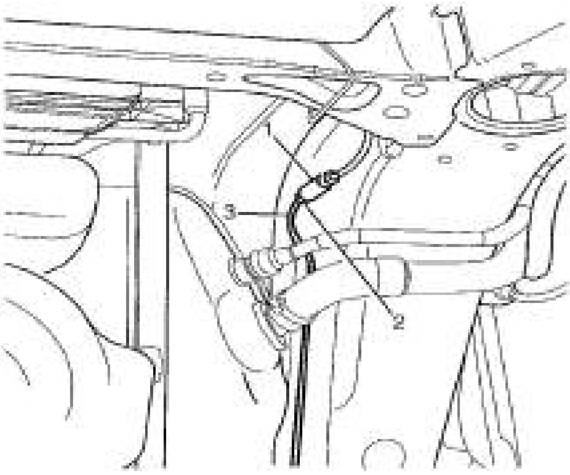


8. Attach the brake pipe (1) to the locating clip (2).



9. Remove the rubber cap or plug from the BPMV (2).
10. Install the brake pipe (1) to the BPMV (2).

Notice: Refer to Fastener Notice in the Preface section.

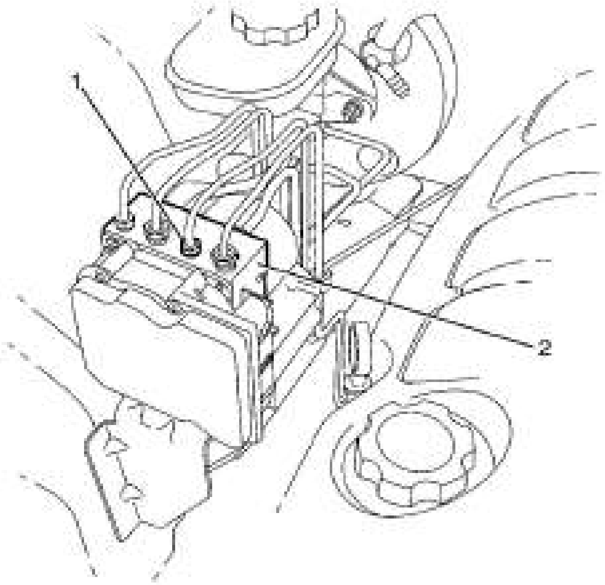


Important: Hold the brake pipe union (1) with a suitable tool whilst connecting the brake pipe fitting (2) to prevent damage to the brake pipe (3).

11. Tighten the brake pipe (1) to the brake pipe union (2).

Tighten

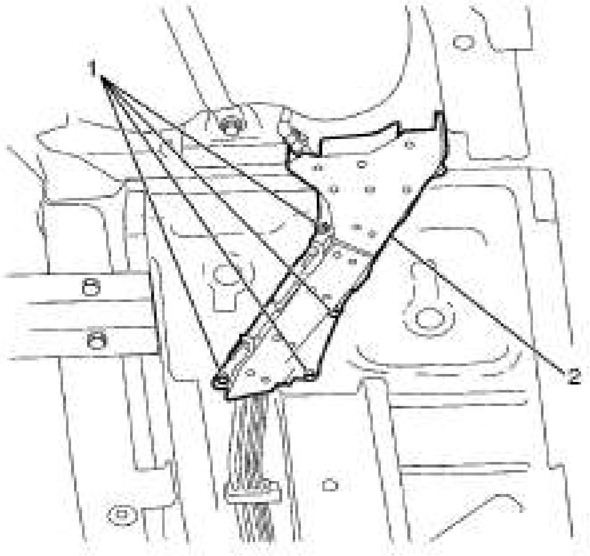
Tighten the brake pipe fitting to 15 N·m (11 lb ft).



12. Tighten the brake pipe (1) to the BPMV (2).

    Tighten
    Tighten the brake pipe fitting to 16 N·m (12 lb ft).

13. Install the rear subframe. Refer to Rear Frame ReplacementRear Frame Replacement

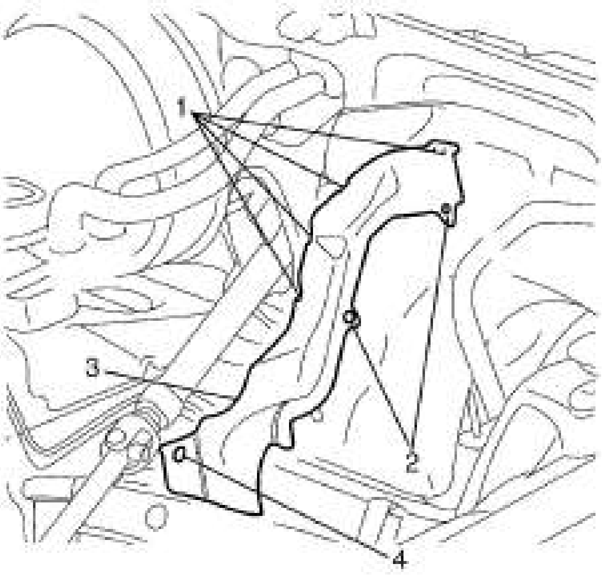


14. Install the brake and fuel pipe splash shield (2) to the underbody.
15. Install the brake and fuel pipe splash shield to chassis retaining nuts (1).

    Tighten

Tighten the nuts to 5 N·m (43 lb in).

16. Lower the vehicle.



17. Install the brake and fuel pipe heat shield (3).
18. Attach the brake and fuel pipe heat shield clips (1).
19. Install NEW brake and fuel pipe protector shield to bulkhead retaining rivets (2).
20. Install the brake and fuel pipe protector shield to bulkhead retaining bolt (4).
21. Install the engine. Refer to Engine ReplacementEngine Replacement for 3.6L or Engine ReplacementEngine Replacement for 6.0L.
22. Install the front heat shield. Refer to Exhaust Front Heat Shield ReplacementExhaust Front Heat Shield Replacement
23. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding

Rear Brake Pipe Removal Procedure - Right

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

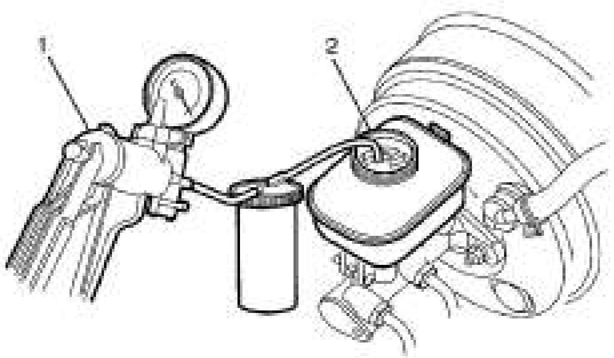
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

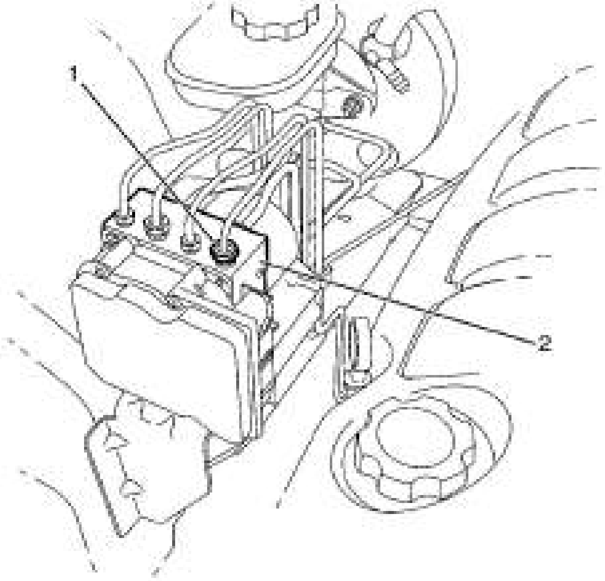
Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Clean the master cylinder, brake lines and reservoir cap.
2. Place a clean suitable container under the BPMV and master cylinder.

3. Remove the master cylinder reservoir cap.



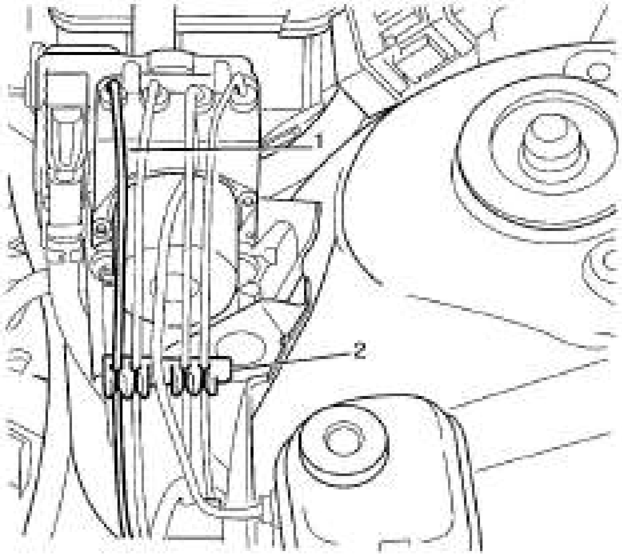
4. Siphon the brake fluid out of the master cylinder reservoir (2) using the J 23738-A J 23738-A (1)



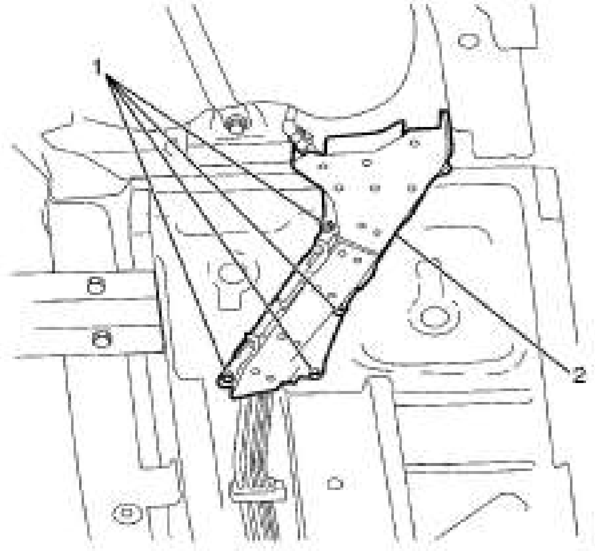
5. Disconnect the brake pipe (1) from the BPMV (2).

   Important: Install a rubber cap or plug to the BPMV (2) in order to prevent fluid loss and contamination.

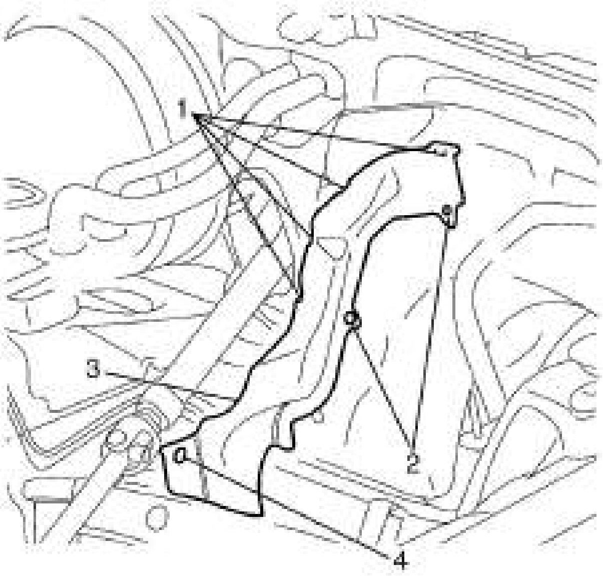
6. Plug the BPMV (2).



7. Detach the brake pipe (1) from the locating clip (2).
8. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle

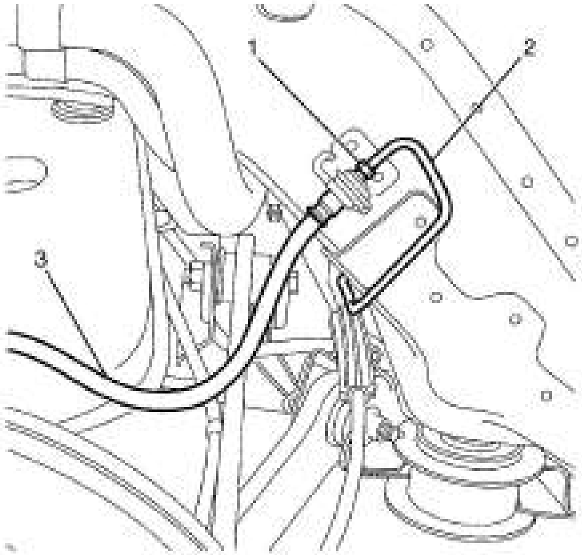


9. Remove the brake and fuel pipe splash shield to chassis retaining nuts (1).
10. Remove the brake and fuel pipe splash shield (2).
11. Remove the front heat shield. Refer to Exhaust Front Heat Shield ReplacementExhaust Front Heat Shield Replacement
12. Remove the engine. Refer to Engine ReplacementEngine Replacement for 3.6L or Engine ReplacementEngine Replacement for 6.0L.



Important: The brake and fuel pipe heat shield (3) is retained by rivets (2). These rivets (2) must be drilled out during removal and replaced as per the installation procedure.

13. Remove the brake and fuel pipe heat shield to bulkhead retaining rivets (2).
14. Remove the brake and fuel pipe heat shield to bulkhead retaining bolt (4).
15. Detach the brake and fuel pipe heat shield clips (1).
16. Remove the brake and fuel pipe heat shield (2).

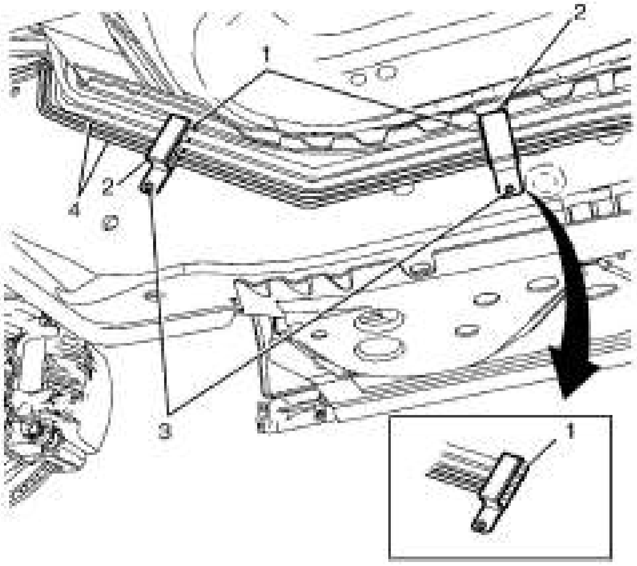


Important: Hold the brake hose (3) with a suitable whilst disconnecting the brake pipe fitting (1) to prevent damage to the brake pipe (2).

17. Disconnect the brake pipe fitting (1) from the brake hose (3).

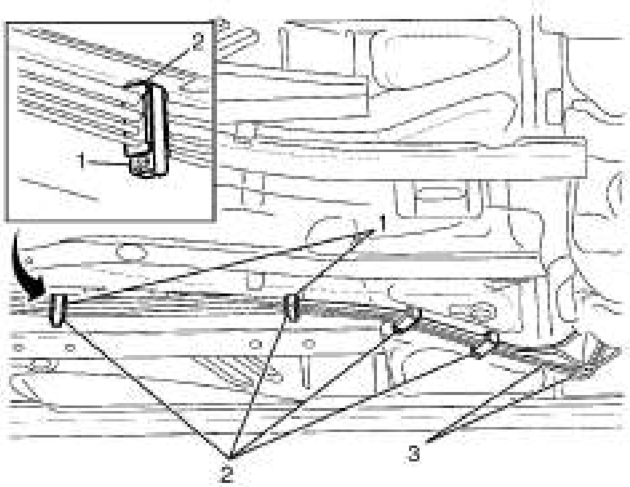
Important: Install a rubber cap or plug to the brake hose (3) in order to prevent brake fluid loss and contamination.

18. Plug the brake hose (3).



Important: The brake and fuel pipe retaining brackets (2) are retained by rivets (3). These rivets (3) must be drilled out during removal and replaced as per the installation procedure.

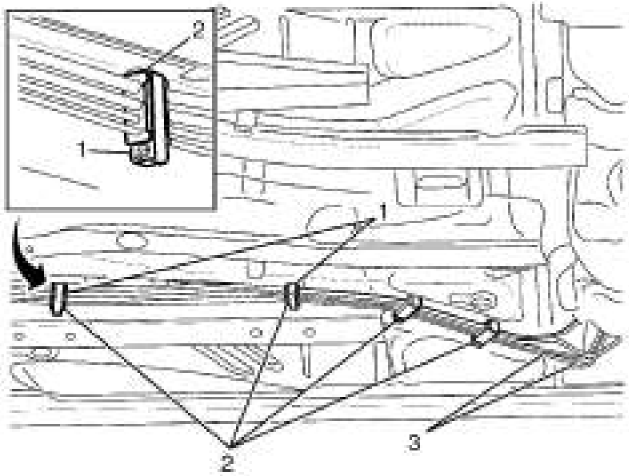
19. Remove the brake and fuel pipe retaining bracket to chassis retaining rivets (3).
20. Remove the brake and fuel pipe retaining brackets (2).
21. Remove the brake pipes (4) from the brake and fuel pipe retaining bracket rubber insulators (1).



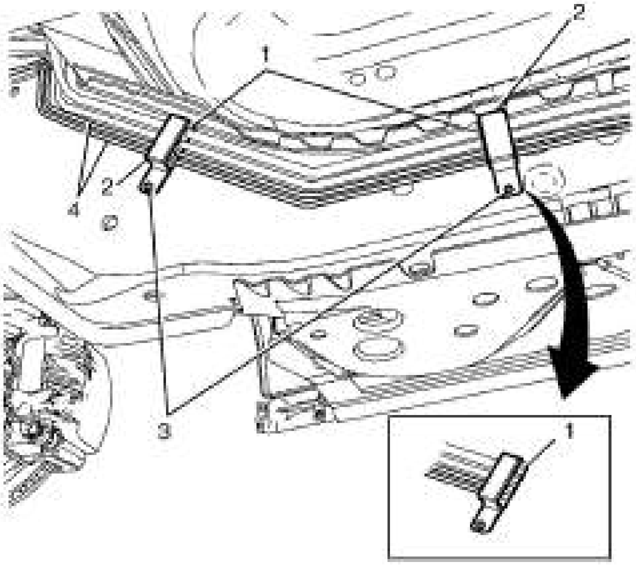
Important: Use a suitable tool to open the brake and fuel pipe retaining brackets (1) by detaching the brake and fuel pipe retaining bracket (1) clip.

22. Open the brake and fuel pipe retaining brackets (1).
23. Remove the brake pipes (3) from the brake and fuel pipe retaining bracket rubber insulators (2).
24. Remove the brake pipe from the vehicle.

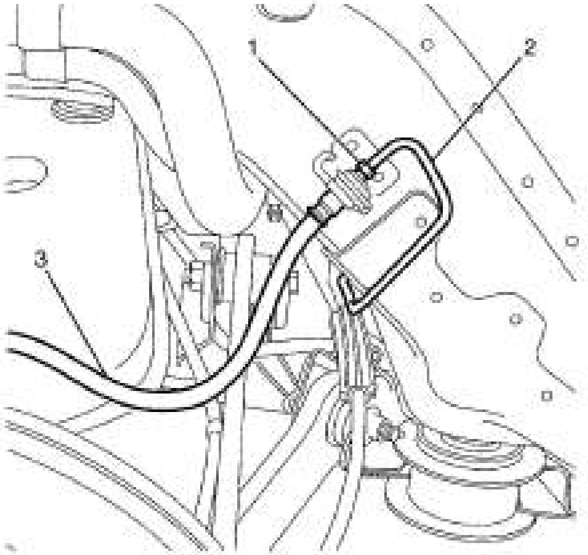
Rear Brake Pipe Installation Procedure - Right



1. Install the brake pipes (3) to the brake and fuel pipe retaining bracket rubber insulators (2).
2. Close the brake and fuel pipe retaining brackets (1).



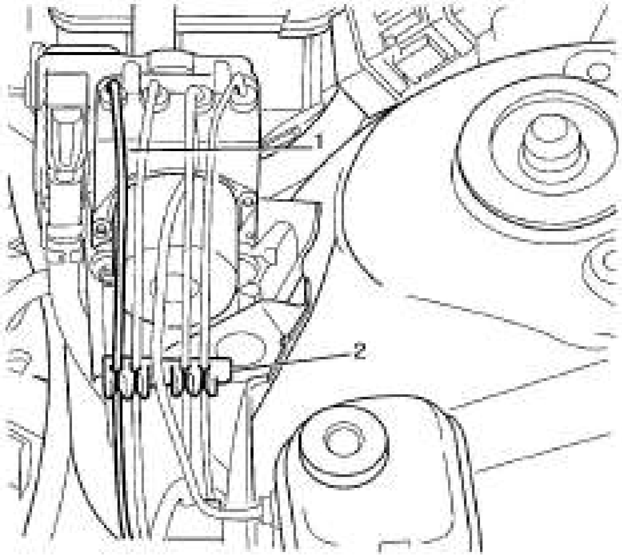
3. Install the brake pipes (4) to the two brake and fuel pipe retaining bracket rubber insulators (1).
4. Install the two brake and fuel pipe retaining brackets (2).
5. Install the NEW brake and fuel pipe retaining bracket to chassis retaining rivets (3).



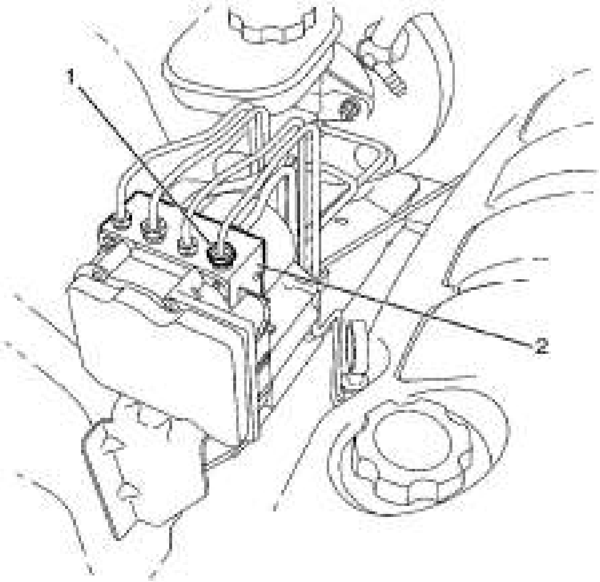
6. Remove the rubber cap or plug from the brake hose (3).
7. Connect the brake pipe fitting (1) to the brake hose (3).

   Do not fully tighten at this stage.

8. Lower the vehicle.



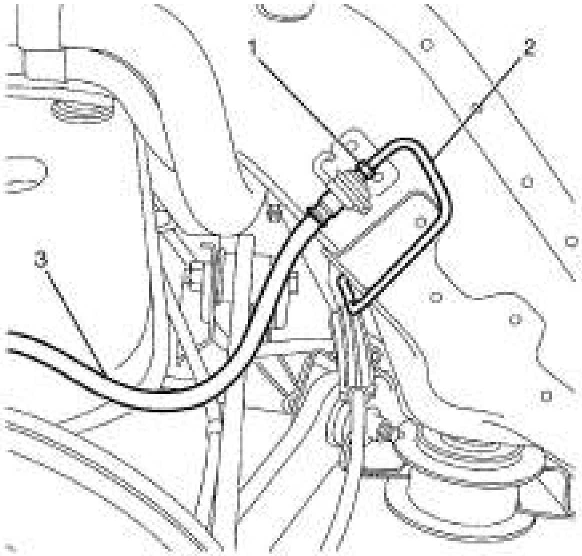
9. Attach the brake pipe (1) to the locating clip (2).



10. Remove the rubber cap or plug from the BPMV (2).
11. Install the brake pipe (1) to the BPMV (2).

    Do not fully tighten at this stage.

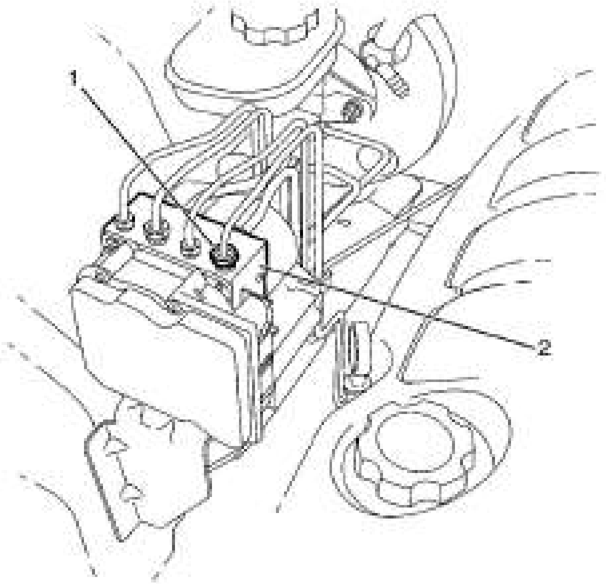
    Notice: Refer to Fastener Notice in the Preface section.



Important: Hold the brake hose (3) with a suitable tool whilst connecting the brake pipe fitting (1) to prevent damage to the brake pipe (2).

12. Tighten the brake pipe fitting (1) to the brake hose (3).

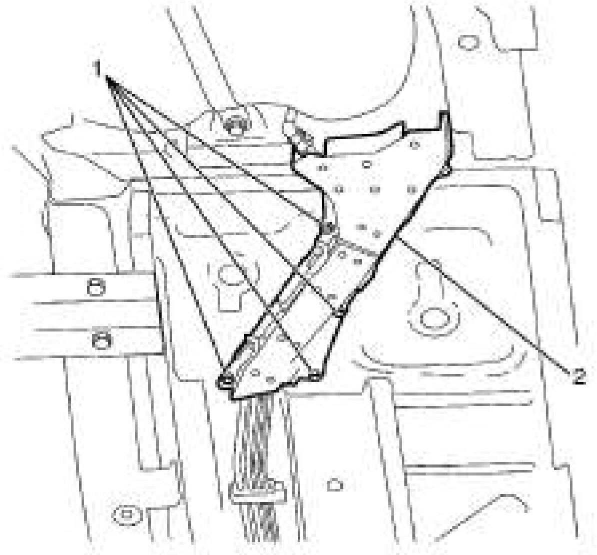
Tighten
Tighten the brake pipe fitting to 16 Nm (12 lb ft).



13. Tighten the brake pipe (1) to the BPMV (2).

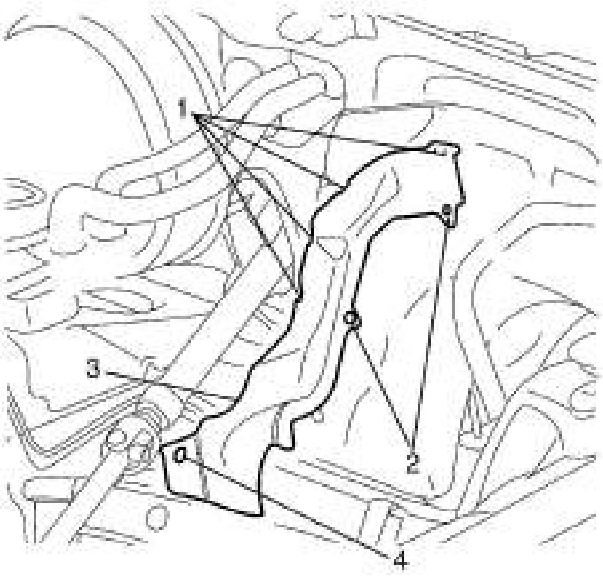
    Tighten
    Tighten the brake pipe fitting to 16 Nm (12 lb ft).

14. Raise the vehicle.

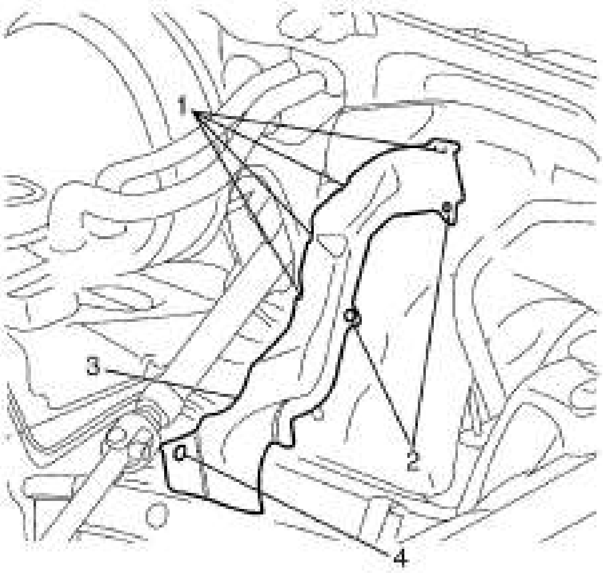


15. Install the brake and fuel pipe splash shield (2) to the underbody.
16. Install the brake and fuel pipe splash shield to chassis retaining nuts (1).

Tighten
Tighten the nuts to 5 Nm (43 lb in).



17. Install the brake and fuel pipe heat shield (3).
18. Attach the brake and fuel pipe heat shield clips (1).
19. Install NEW brake and fuel pipe heat shield to bulkhead retaining rivets (2).
20. Install the brake and fuel pipe heat shield to bulkhead retaining bolt (4).
21. Install the engine. Refer to Engine ReplacementEngine Replacement for 3.6L or Engine ReplacementEngine Replacement for 6.0L.
22. Install the front heat shield. Refer to Exhaust Front Heat Shield ReplacementExhaust Front Heat Shield Replacement
23. Lower the vehicle.



24. Install the brake and fuel pipe heat shield (3).

25. Attach the brake and fuel pipe heat shield clips (1).
26. Install NEW brake and fuel pipe heat shield to bulkhead retaining rivets (2).
27. Install the brake and fuel pipe heat shield to bulkhead retaining bolt (4).
28. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding

Rear Brake Pipe Removal Procedure - Left

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

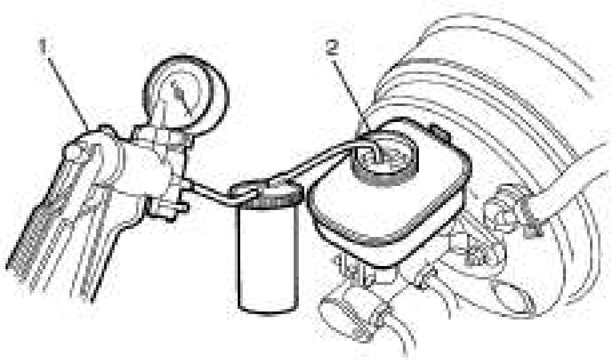
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

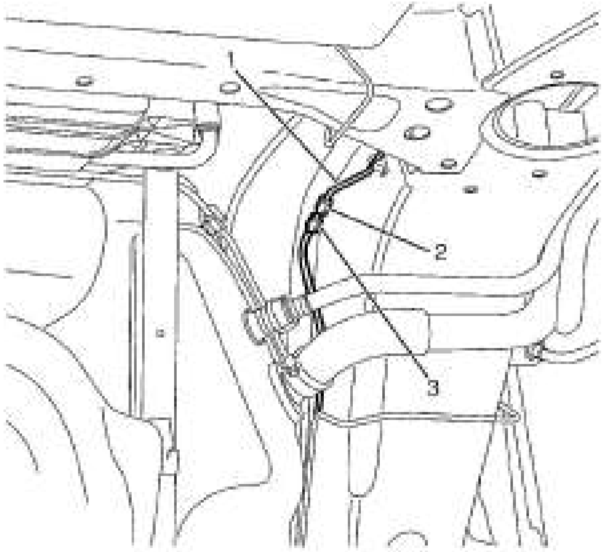
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Clean the master cylinder, brake lines and reservoir cap.
2. Remove the master cylinder reservoir cap.



3. Siphon the brake fluid out of the master cylinder reservoir (2) using the J 23738-A J 23738-A (1)
4. Remove the rear suspension sub frame assembly. Refer to Rear Frame ReplacementRear Frame Replacement



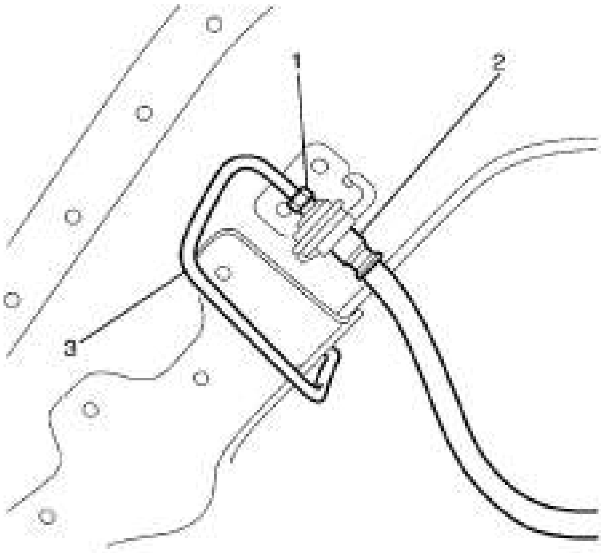
5. Place a clean suitable container under the brake pipe union (3).

   Important: Hold the brake pipe union (3) with a suitable tool whilst disconnecting the brake pipe fitting (2) to prevent damage to the brake pipe (1).

6. Disconnect the intermediate brake pipe (1) from the brake pipe union (3).

   Important: Install a rubber cap or plug to the brake pipe union (3) in order to prevent brake fluid loss and/or contamination.

7. Plug the brake pipe union (3).

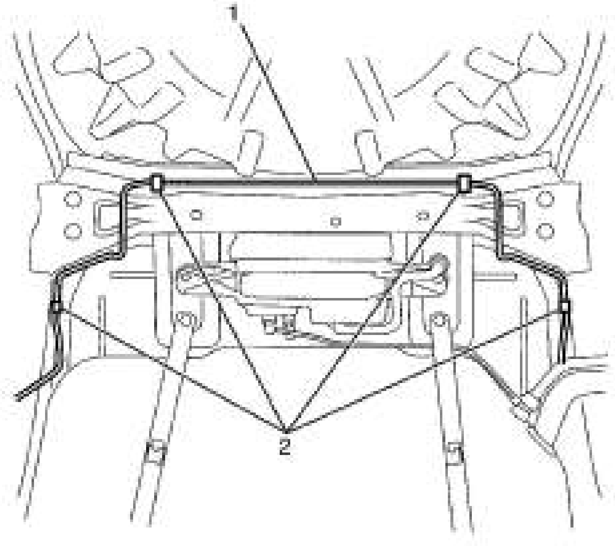


Important: Hold the brake hose (2) with a suitable tool whilst disconnecting the brake pipe fitting (1) to prevent damage to the brake pipe (3).

8. Disconnect the brake pipe fitting (1) from the brake hose (2).

   Important: Install a rubber cap or plug to the brake hose fitting end in order to prevent brake fluid loss and contamination.

9. Plug the brake hose (2).



10. Remove the brake pipe (1) from the brake pipe retaining clips (2).

Rear Brake Pipe Installation Procedure - Left

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

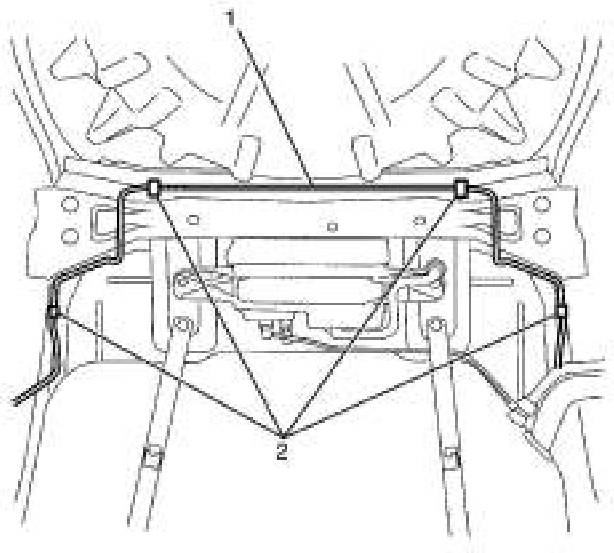
Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

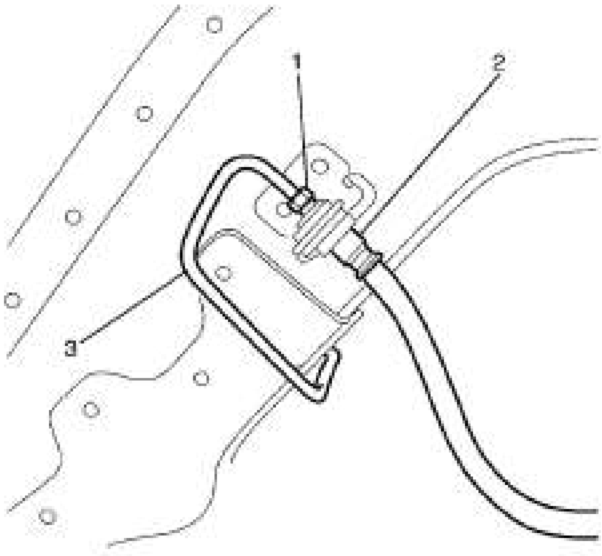
Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

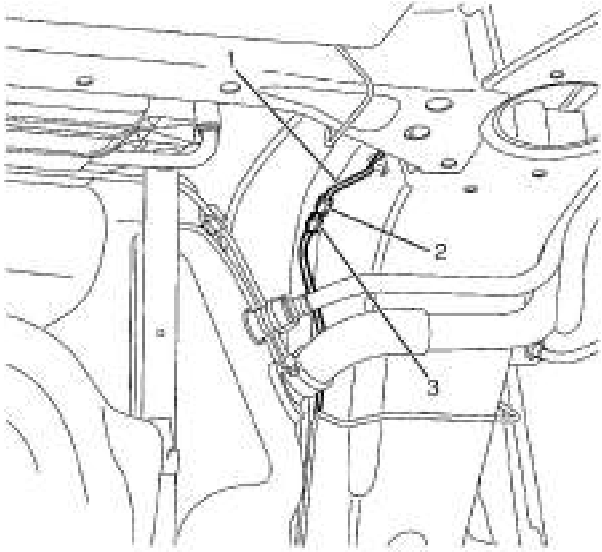


1. Install the brake pipe (1) to the brake pipe retaining clips (2).



2. Remove the rubber cap or plug from the brake hose (2).
3. Connect the brake pipe fitting (1) to the brake hose (3).

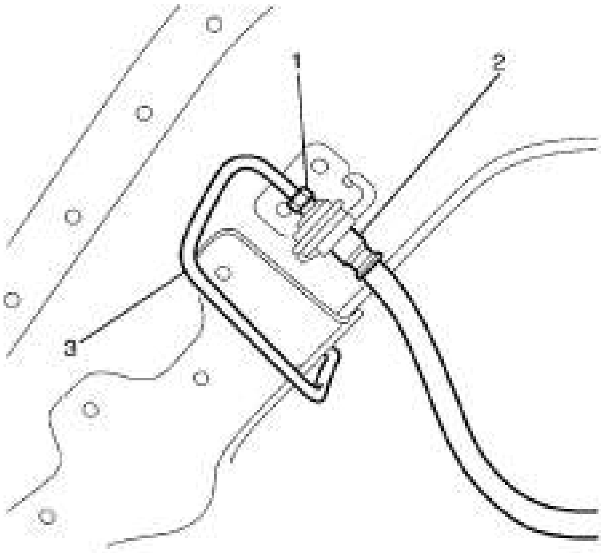
   Do not fully tighten at this stage.



4. Remove the rubber cap or plug from the brake pipe union (2).
5. Connect the brake pipe (1) to the brake pipe union (2).

   Do not fully tighten at this stage.

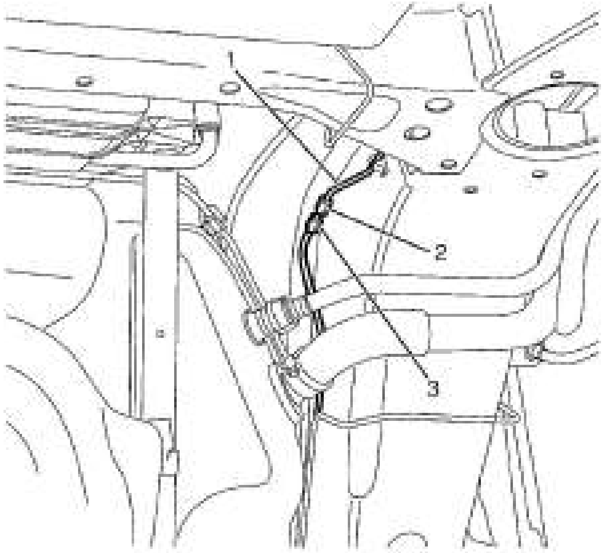
   Notice: Refer to Fastener Notice in the Preface section.



Important: Hold the brake hose (2) with a suitable tool whilst connecting the brake pipe fitting (1) to prevent damage to the brake pipe (3).

6. Tighten the brake pipe fitting (1) to the brake hose (3).

Tighten
Tighten the brake pipe fitting to 16 Nm (12 lb ft).



Important: Hold the brake pipe union (2) with a suitable tool whilst connecting the brake pipe fitting (3) to prevent damage to the brake pipe (2).

7. Tighten the brake pipe (1) to the brake pipe union (2).

   Tighten
   Tighten the brake pipe fitting to 15 Nm (11 lb ft).

8. Install the rear suspension sub frame assembly. Refer to Rear Frame ReplacementRear Frame Replacement
9. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | **Document ID: 2194830**

Front Brake Hose Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

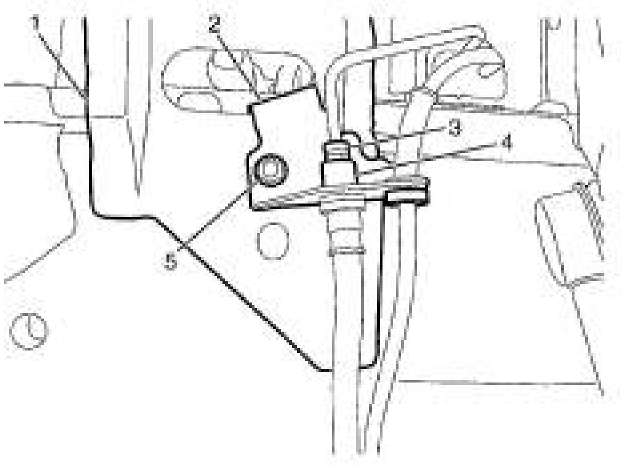
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the front wheels. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
3. Clean all dirt and foreign material from the brake hose and the brake pipe fittings.



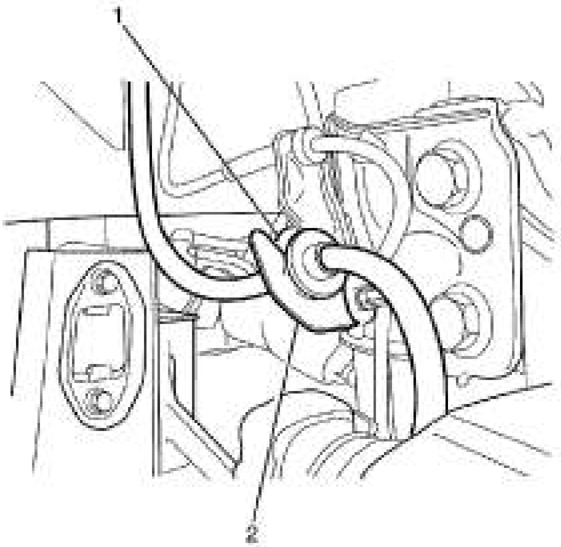
4. Detach the ABS wheel speed sensor wiring harness (5) from the brake hose retaining bracket (2).
5. Place a clean suitable container under the brake pipe fitting (3).

Important: Hold the brake hose (4) with a suitable tool whilst disconnecting the brake pipe fitting (3) to prevent damage to the brake pipe fitting (3).

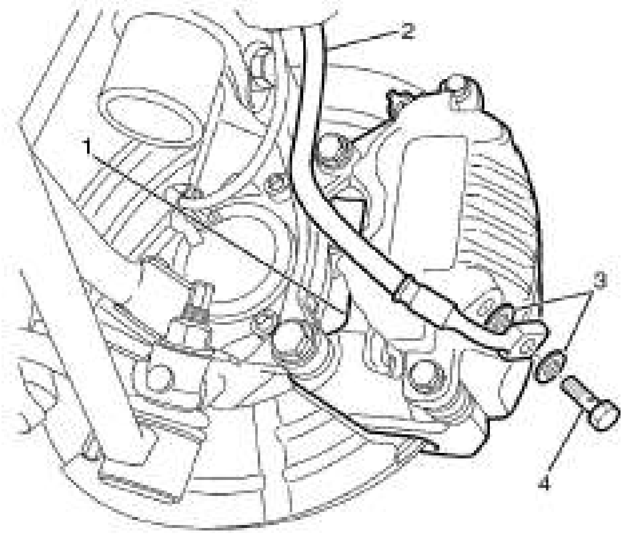
6. Disconnect the brake pipe fitting (3) from the brake hose (4).

   Important: Install a rubber cap or plug to the brake pipe fitting (3) in order to prevent brake fluid loss and contamination.

7. Plug the brake pipe fitting (3).
8. Remove the brake hose retaining bracket to wheel house retaining nut (6).
9. Remove the brake hose retaining bracket (2) from the wheel house (1).



10. Detach the brake hose (1) from the strut mounted brake hose retaining bracket (2).



11. Remove the brake hose to brake caliper banjo retaining bolt (4).
12. Remove the brake hose (2) from the brake caliper (1).

    Important: Install a rubber cap or plug to the brake caliper (1) in order to prevent brake fluid loss and/or contamination.

13. Plug the brake hose to brake caliper banjo retaining bolt hole in the brake caliper (1).
14. Place a shop towel on a hard surface.

Important: The copper brake hose sealing washers (3) may be stuck to the brake caliper (1) and/or the brake hose (2).

15. Tap the threaded end of the brake hose to brake caliper banjo retaining bolt (4) on the shop towel to remove the copper brake hose sealing washers (3) from the brake hose to brake caliper banjo retaining bolt (4).

Important: Copper brake hose sealing washers become work hardened due to the heat generated with brake applications and will not reseal. Install NEW copper brake hose sealing washers (4) whenever the brake hose to brake caliper banjo retaining bolt (3) is removed.

16. Remove the two copper brake hose sealing washers (3).

Discard the two copper brake hose sealing washers (3).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

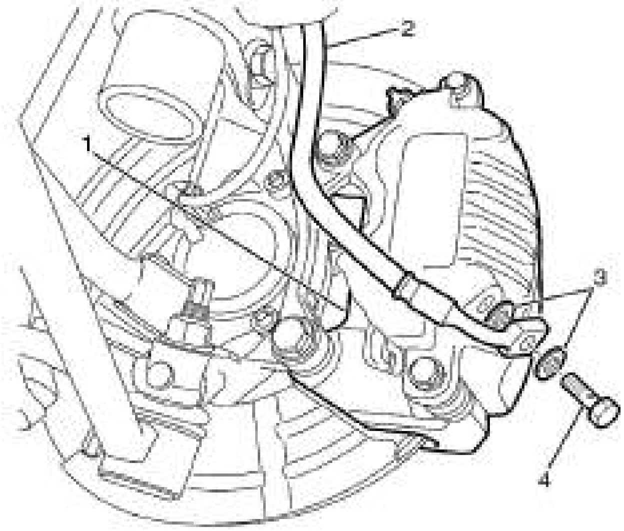
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Remove the rubber plug from the brake hose to brake caliper banjo retaining bolt hole in the brake caliper.

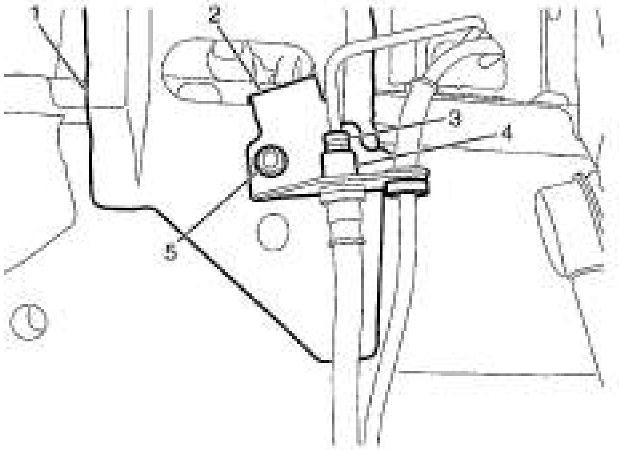


2. Assemble the NEW copper brake hose sealing washers (3), and the brake hose to brake caliper banjo retaining bolt (4) to the brake hose (2).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the brake hose (2) and brake hose to brake caliper banjo retaining bolt (4) to the brake caliper (1).

   Tighten
   Tighten the brake hose to brake caliper banjo retaining bolt to 35 Nm (26 lb ft).



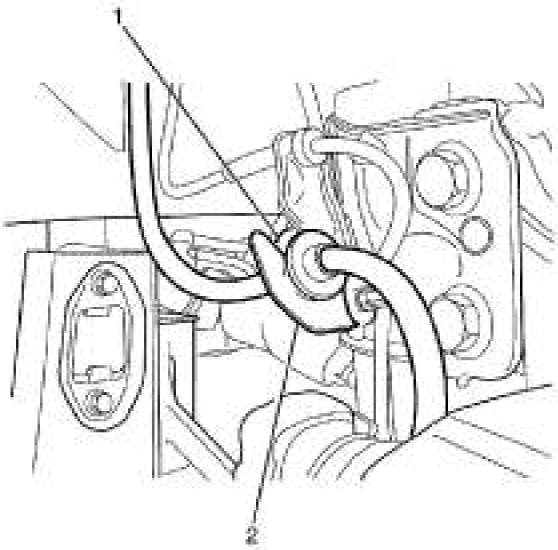
4. Position the brake hose retaining bracket (2) to the inner skirt panel (1).

5. Install the brake hose retaining bracket to inner skirt panel retaining nut (5).
6. Remove the rubber cap or plug from the brake pipe fitting (3).

    Important: Hold the brake hose (4) with a back up spanner whilst connecting the brake pipe fitting (3) to prevent damage to the brake pipe fitting (3).

7. Connect the brake pipe fitting (3) to the brake hose (4).

    Tighten
    Tighten the brake pipe fitting to 16 Nm (12 lb ft).



Important: Slightly twist the brake hose (1) to enable the slot in the brake hose retaining bracket (2) to line up with the flat in the brake hose (1). Slide the brake hose (1) down the brake hose retaining bracket (2) and allow the brake hose to return to its untwisted position for positive engagement in the brake hose retaining bracket (2)

8. Install the brake hose (1) to the strut mounted brake hose retaining bracket (2).
9. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding.
10. Install the front wheel assembly. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
11. Lower the vehicle.

Hydraulic Brake System Bleeding (Manual)

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Place a clean suitable container beneath the brake master cylinder to catch brake fluid spills.

Important: With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.

2. Deplete the brake booster power reserve.
3. If you have performed a brake master cylinder bench bleed, disconnected the brake pipes from the master cylinder or the hydraulic modulator assembly, you MUST perform the following steps to bleed air at the ports of the hydraulic component:
   - 3.1. Clean the outside of the reservoir on and around the reservoir cap prior to removal.
   - 3.2. With the brake pipes installed securely to the master cylinder or hydraulic modulator assembly, loosen and separate one of the brake pipes from the port of the component:

For the hydraulic modulator assembly, perform these steps in the sequence of system flow; begin with the fluid feed pipes from the master cylinder.

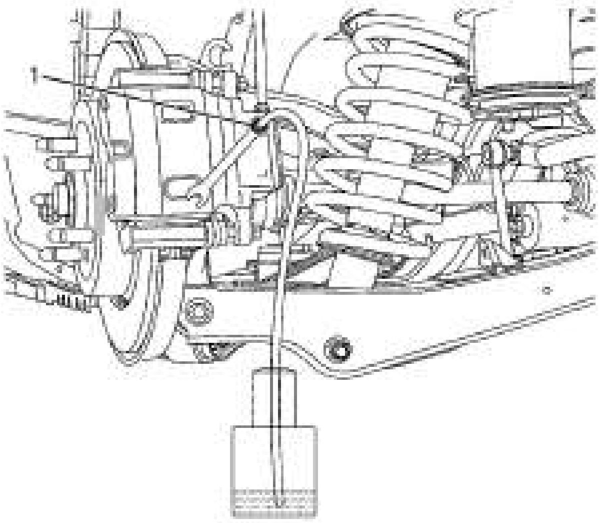
   - 3.3. Allow a small amount of brake fluid to gravity bleed from the open port of the component.
   - 3.4. Reconnect the brake pipe to the component and tighten securely.
   - 3.5. With the aid of an assistant slowly depress the brake pedal fully and maintain steady pressure on the pedal.
   - 3.6. Loosen the same brake pipe to purge air from the open port of the component.
   - 3.7. Tighten the brake pipe, then have the assistant slowly release the brake pedal.
   - 3.8. Wait 15 seconds, then repeat steps 3.3-3.7 until all air is purged from the same port of each component.
   - 3.9. With the brake pipe installed securely to the master cylinder or hydraulic modulator assembly, and after all air has been purged from the first port of the component that was bled, loosen and separate the next brake pipe from the component, then repeat steps 3.3-3.8 until each of the ports on the component has been bled.

    3.10. After completing the final component port bleeding procedure, make sure that each of the brake pipe to component fittings is correctly tightened.

4. Clean the outside of the brake master cylinder reservoir on and around the reservoir cap.

Important: Make sure the brake master cylinder reservoir remains at least half-full during this bleeding procedure. Add fluid as needed to maintain the correct level.

5. Remove the master cylinder reservoir cap.
6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
7. Remove the wheels. Refer to Tire and Wheel Removal and Installation.



8. Fit a correct sized ring spanner onto the LEFT REAR wheel hydraulic circuit bleeder valve (1).
9. Install a transparent hose over the end of the LEFT REAR wheel hydraulic circuit bleeder valve (1).
10. Submerge the open end of the transparent hose into a container partially filled with brake fluid conforming to specification, from a clean, sealed brake fluid container. Refer to Brake System Specifications for correct brake fluid specification.
11. Have an assistant slowly depress the brake pedal fully and maintain steady pressure on the pedal.
12. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
13. Tighten the bleeder valve, then have the assistant slowly release the brake pedal.
14. Wait 15 seconds, then repeat steps 11-13 until all air is purged from the wheel hydraulic circuit.
15. Tighten the wheel circuit bleeder valve securely.
16. Fit a correct sized ring spanner onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
17. Repeat steps 9-15.
18. Fit a correct sized ring spanner onto the LEFT FRONT wheel hydraulic circuit bleeder valve.
19. Repeat steps 9-15.
20. Fit a correct sized ring spanner onto the RIGHT FRONT wheel hydraulic circuit bleeder valve.
21. Repeat steps 9-15.
22. After completing the final wheel hydraulic circuit bleeding procedure, make sure that each of the 4 wheel hydraulic circuit bleeder valves is correctly tightened.
23. Install the wheels. Refer to Tire and Wheel Removal and Installation.
24. Lower the vehicle.
25. Fill the brake master cylinder reservoir to the maximum-fill level with brake fluid conforming

to specification, from a clean, sealed brake fluid container. Refer to Brake System Specifications for correct brake fluid specification.

26. Slowly depress and release the brake pedal. Observe the feel of the brake pedal.

    Important: If it is determined that air was induced into the system upstream of the hydraulic modulator assembly prior to servicing, the Antilock Brake System Automated Bleed Procedure must be performed. Refer to Antilock Brake System Automated Bleed Procedure.

27. If the brake pedal feels spongy, repeat the bleeding procedure again. If the brake pedal still feels spongy after repeating the bleeding procedure, perform the following steps:
    27.1. Inspect the brake system for external leaks. Refer to Brake System External Leak Inspection.
    27.2. Pressure bleed the hydraulic brake system in order to purge any air that may still be trapped in the system.
28. Turn the ignition ON, engine OFF. Check to see if the brake system warning lamp is illuminated.

    Important: DO NOT allow the vehicle to be driven until it is diagnosed and repaired.

29. If the brake system warning lamp is illuminated, refer to Symptoms - Hydraulic Brakes.

Hydraulic Brake System Bleeding (Pressure)

Tools Required

- J 29532 Diaphragm Pressure Bleeder
- J 35589-A Brake Pressure Bleeder Adapter

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Place a clean suitable container beneath the brake master cylinder to catch brake fluid spills.

   Important: With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal becomes firm, in order to deplete the vacuum brake booster power reserve.

2. Deplete the vacuum brake booster power reserve.
3. If you have performed a brake master cylinder bench bleed, disconnected the brake pipes from the master cylinder or the Brake Pressure Modulator Valve (BPMV), you MUST perform the following steps to bleed air at the ports of the hydraulic component:
   - 3.1. Clean the outside of the reservoir on and around the reservoir cap prior to removal.
   - 3.2. With the brake pipes installed securely to the master cylinder or BPMV, loosen and separate one of the brake pipes from the port of the component:

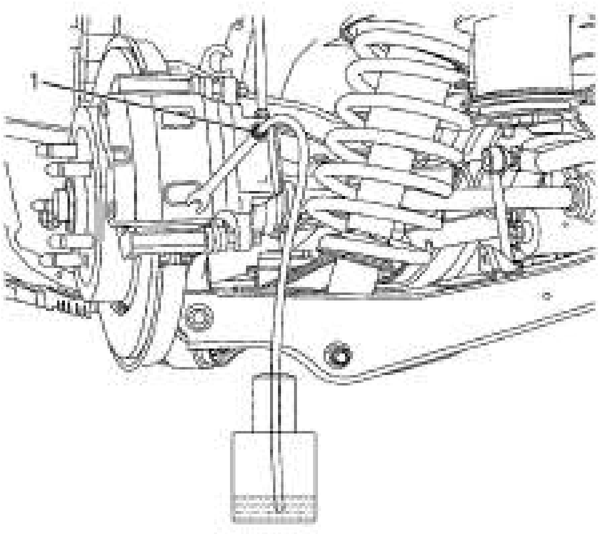
   For the BPMV, perform these steps in the sequence of system flow; begin with the fluid feed pipes from the master cylinder.

   - 3.3. Allow a small amount of brake fluid to gravity bleed from the open port of the component.
   - 3.4. Reconnect the brake pipe to the component and tighten securely.
   - 3.5. With the aid of an assistant slowly depress the brake pedal fully and maintain steady pressure on the pedal.
   - 3.6. Loosen the same brake pipe to purge air from the open port of the component.
   - 3.7. Tighten the brake pipe, then have the assistant slowly release the brake pedal.
   - 3.8. Wait 15 seconds, then repeat steps 3.3-3.7 until all air is purged from the same port of each component.

   3.9. With the brake pipe installed securely to the master cylinder or BPMV, and after all air has been purged from the first port of the component that was bled, loosen and separate the next brake pipe from the component, then repeat steps 3.3-3.8 until each of the ports on the component has been bled.
   3.10. After completing the final component port bleeding procedure, make sure that each of the brake pipe to component fittings is correctly tightened.
4. Clean the outside of the reservoir on and around the reservoir cap.
5. Remove the master cylinder reservoir cap and diaphragm.
6. Fill the brake master cylinder reservoir to the maximum-fill level with brake fluid conforming to specification, from a clean, sealed brake fluid container. Refer to Brake System Specifications for correct brake fluid specification.
7. Set up the brake pressure bleeder following the manufacturer's instructions.
8. Open the brake pressure bleeder fluid valve to allow pressurised brake fluid to enter the brake system.

Important: Any brake fluid leaks identified require repair prior to completing this procedure.

9. Wait approximately 30 seconds, then inspect the entire hydraulic brake system in order to make sure that there are no existing external brake fluid leaks.
10. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
11. Remove the wheels. Refer to Tire and Wheel Removal and Installation.



Important: Make sure the brake master cylinder reservoir remains at least half-full during this bleeding procedure. Add fluid as needed to maintain the correct level.

12. Fit a suitable tool onto the LEFT REAR wheel hydraulic circuit bleeder valve (1).
13. Install a transparent hose over the end of the LEFT REAR wheel hydraulic circuit bleeder valve (1).
14. Submerge the open end of the transparent hose into a container partially filled with brake fluid (3) conforming to specification, from a clean, sealed brake fluid container. Refer to Brake System Specifications for correct brake fluid specification.
15. Loosen the bleeder valve to purge air from the wheel hydraulic circuit. Allow fluid to flow until air bubbles stop flowing from the bleeder, then tighten the bleeder valve.

16. Tighten the wheel circuit bleeder valve securely.
17. Fit a suitable tool onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
18. Repeat steps 13-15.
19. Tighten the wheel circuit bleeder valve securely.
20. Fit a suitable tool onto the LEFT FRONT wheel hydraulic circuit bleeder valve.
21. Repeat steps 13-15.
22. Tighten the wheel circuit bleeder valve securely.
23. Fit a suitable tool onto the RIGHT FRONT wheel hydraulic circuit bleeder valve.
24. Repeat steps 13-15.
25. After completing the final wheel hydraulic circuit bleeding procedure, make sure that each wheel hydraulic circuit bleeder valve is correctly tightened.
26. Close the brake pressure bleeder fluid valve.
27. Install the wheels. Refer to Tire and Wheel Removal and Installation.
28. Lower the vehicle.
29. Remove the brake pressure bleeder from the brake master cylinder reservoir.
30. Fill the brake master cylinder reservoir to the maximum-fill level with brake fluid conforming to specification, from a clean, sealed brake fluid container. Refer to Brake System Specifications for correct brake fluid specification.
31. Slowly depress and release the brake pedal. Observe the feel of the brake pedal.

    Important: If it is determined that air was induced into the system upstream of the BPMV prior to servicing, the Antilock Brake System Automated Bleed Procedure must be performed. Refer to Antilock Brake System Automated Bleed Procedure.

32. If the brake pedal feels spongy, repeat the bleeding procedure again. If the brake pedal still feels spongy after repeating the bleeding procedure, perform the following step:

    Inspect the brake system for external leaks. Refer to Brake System External Leak Inspection.

33. Turn the ignition ON, engine OFF. Check to see if the brake system warning lamp is illuminated.

    Important: DO NOT allow the vehicle to be driven until it is diagnosed and repaired.

34. If the brake system warning lamp is illuminated, refer to Symptoms - Hydraulic Brakes.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | Document ID: 1967132

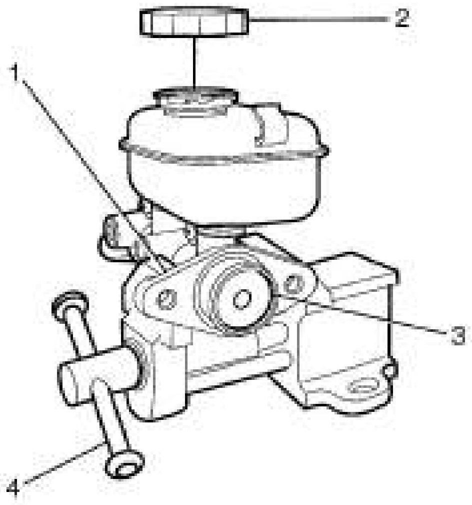
Master Cylinder Bench Bleeding (RHD)

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

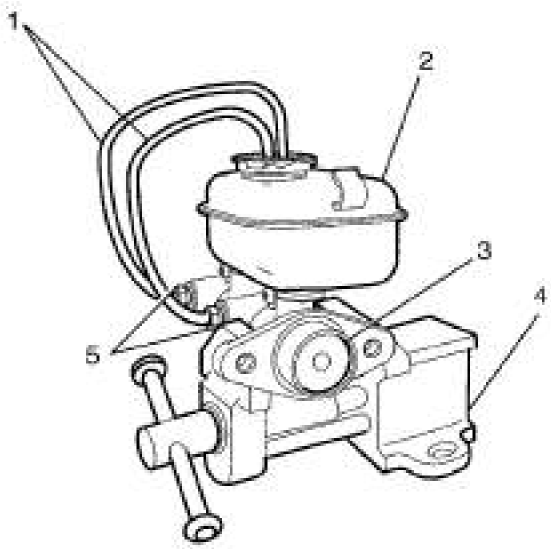
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



Important: The rear of the primary piston (3) must be accessible.

1. Secure the mounting flange of the brake master cylinder (1) in a suitable bench vise (4).
2. Remove the master cylinder reservoir cap (2).



Important: Install suitable fittings to the master cylinder ports (5) that match the type of flare seat required and also provide for hose attachment.

3. Install suitable fittings to the master cylinder ports (5).
4. Install transparent hoses (1) to the fittings installed to the master cylinder ports (5).

   Route the hoses into the master cylinder reservoir (2).

   Important: Brake fluid from a clean, sealed brake fluid container must be used when topping up the brake fluid level.

5. Fill the master cylinder reservoir (2) to the maximum fill level.

   Important: Make sure that the ends of the transparent hoses (1) running into the master cylinder reservoir (2) are fully submerged in the brake fluid.

   Important: As air is bled from the primary and secondary pistons, the effort required to depress the primary piston (3) will increase and the amount of travel will decrease.

   Important: Use a suitable smooth, round-ended tool to depress and release the primary piston (3) as far as it will travel. Observe the flow of fluid coming from the ports.

6. Depress and release the primary piston (3).
7. Continue to depress and release the primary piston (3) until fluid flows freely from the ports with no evidence of air bubbles.
8. Remove the fittings installed to the master cylinder ports (5) and transparent hoses (1).

   Wrap the master cylinder with a clean shop cloth to prevent brake fluid spills.

9. Install the master cylinder reservoir cap.
10. Remove the master cylinder from the suitable bench vise (4).

Master Cylinder Replacement (RHD)

Tools Required

J 23738-A J 23738-A Hand Vacuum Pump

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and ConnectionBattery Negative Cable Disconnection and Connection l.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

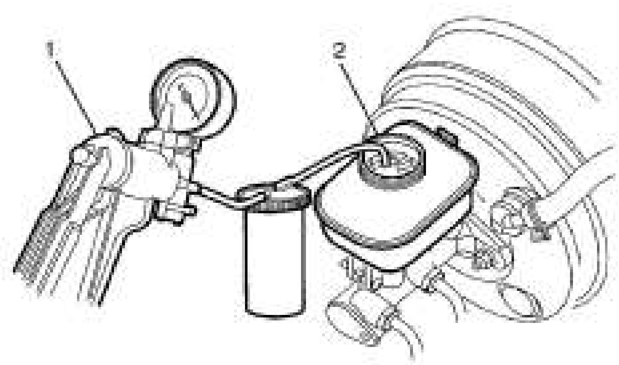
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

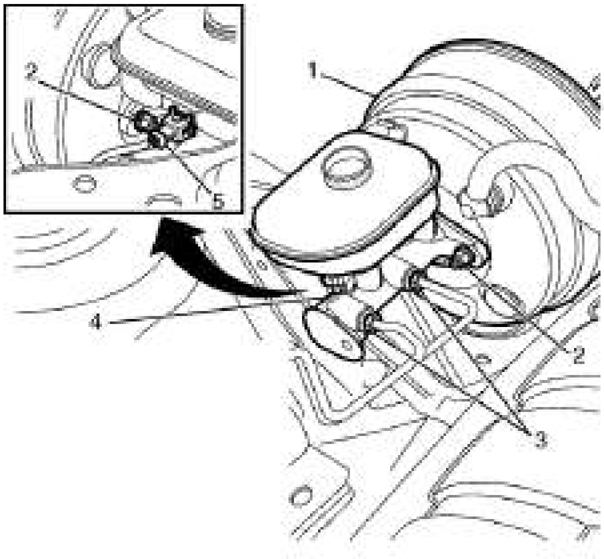
2. Apply the park brake and chock the wheels.

Important: With the ignition OFF and the brakes cool, apply the brakes three to five times, or until the brake pedal effort increases significantly, in order to deplete the vacuum brake booster power reserve.

3. Deplete the vacuum brake booster power reserve.
4. Clean the master cylinder, around the brake lines and the reservoir cap.
5. Place a clean suitable container under the master cylinder.
6. Remove the master cylinder reservoir cap.



7. Siphon the brake fluid out of the master cylinder reservoir (2) using J 23738-A J 23738-A (1).

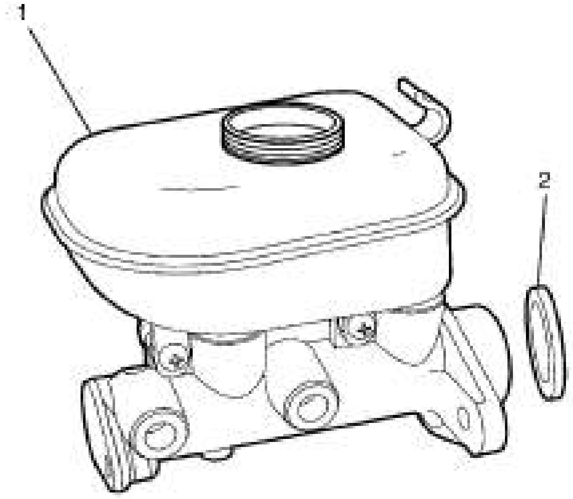


Important: Using a suitable tool lift the connector security clip to release the brake fluid level switch electrical connector (8) from the brake fluid level switch.

8. Disconnect the brake fluid level switch electrical connector (8).
9. Disconnect the brake pipes (3) from the master cylinder (7).

Important: Install a suitable rubber cap or plug on the exposed brake pipes (3) in order to prevent fluid loss and contamination.

10. Plug both the exposed brake pipes (3).
11. Remove the strut tower to master cylinder support bracket retaining nuts (4).
12. Remove the master cylinder support bracket to master cylinder retaining bolt (6).
13. Remove the master cylinder support bracket (5).
14. Remove the master cylinder to vacuum brake booster retaining nuts (2).
15. Remove the master cylinder (7) from the vacuum brake booster (1).



Important: The vacuum brake booster to master cylinder sealing O-ring (2) is a single use only component and will not reseal. Install a NEW master cylinder sealing O-ring (2) whenever the master cylinder (1) is removed from the vacuum brake booster.

16. Remove the vacuum brake booster to master cylinder sealing O-ring (2) from the master cylinder (1).

    Discard the master cylinder sealing O-ring (2).

Installation Procedure

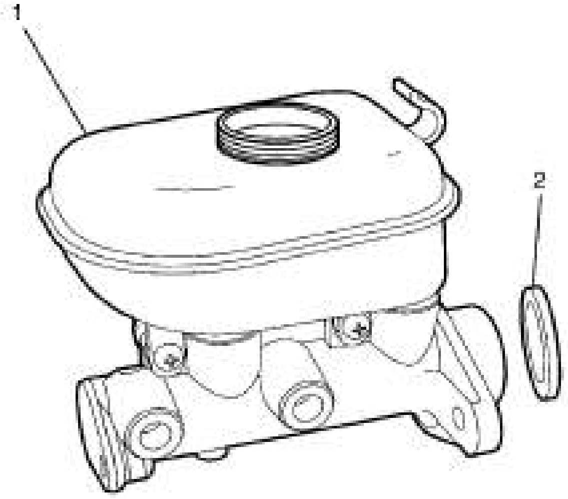
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

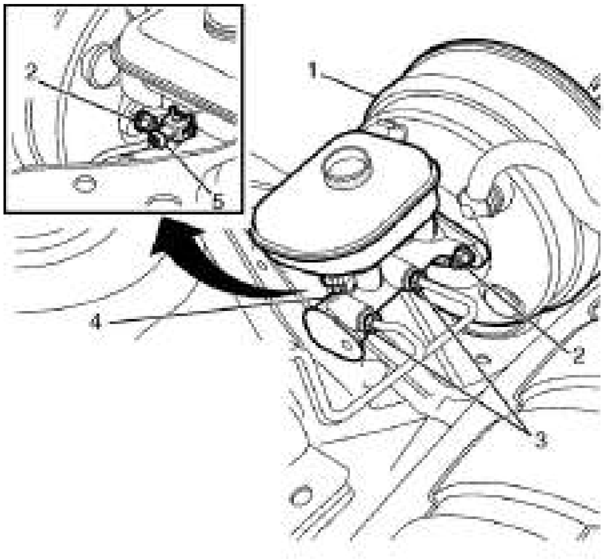
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Install the master cylinder reservoir. Refer to Master Cylinder Reservoir ReplacementMaster Cylinder Reservoir Replacement .
2. Bench bleed the master cylinder. Refer to Master Cylinder Bench BleedingMaster Cylinder Bench Bleeding.



3. Install a NEW vacuum brake booster to master cylinder sealing O-ring (2) to the master cylinder (1).
4. Place a clean suitable container under the master cylinder (1).



5. Install the master cylinder (7) to the vacuum brake booster (1).

   Notice: Refer to Fastener Notice in the Preface section.

6. Install the master cylinder to vacuum brake booster retaining nuts (2).

   Tighten
   Tighten the nuts to 15 Nm (11 lb ft).

7. Install the master cylinder support bracket (5).

8. Install the master cylinder support bracket to strut tower retaining nuts (4).

   Tighten
   Tighten the nuts to 22 Nm (16 lb ft).

9. Install the master cylinder support bracket to master cylinder retaining bolt (6).

   Tighten
   Tighten the bolt to 17 Nm (13 lb ft).

10. Remove the rubber caps from the exposed brake pipes (3).
11. Connect the brake pipes (3) to the master cylinder (7).

    Tighten
    Tighten the pipe fittings to 16 Nm (12 lb ft).

12. Connect brake fluid level switch electrical connector (8).

    Make sure the security clip is correctly installed.

13. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and ConnectionBattery Negative Cable Disconnection and Connection.
14. Release the park brake and remove the wheel chocks.
15. Bleed the braking system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding.

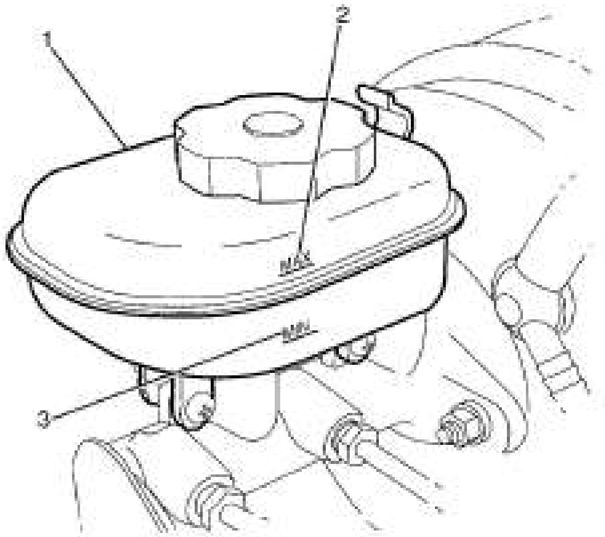
Master Cylinder Reservoir Filling (RHD)

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.



1. Visually inspect the brake fluid level in the master cylinder reservoir (1).
2. If the brake fluid level is at or below the minimum allowable level (3) during routine fluid inspections, the brake system should be inspected for wear and possible brake fluid leaks.
3. If the brake fluid level is at or below the minimum allowable level (3) and an inspection of the brake system did not reveal wear or brake fluid leaks, the brake fluid may be topped up to the maximum fill level (2).

Important: If brake fluid is to be added to the master cylinder reservoir (1), clean the outside and around the reservoir cap prior to removal.

4. If a brake system service was just completed, the brake fluid may be topped up to the maximum fill level (2).
5. If the brake fluid level is above the minimum allowable level (3), adding brake fluid is not recommended under normal conditions.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | Document ID: 1993512

Master Cylinder Reservoir Replacement (RHD)

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

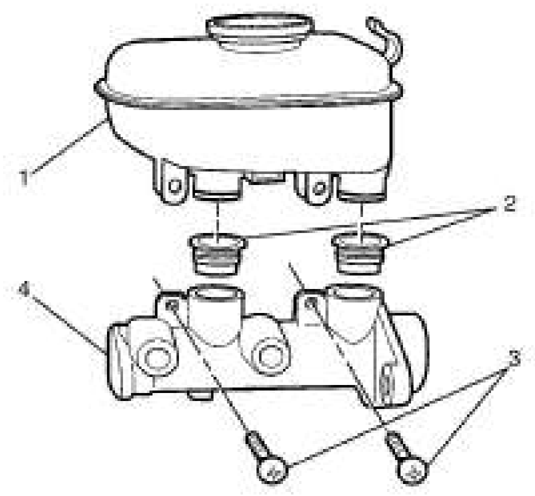
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

2. Apply the park brake and chock the wheels.

Important: With the ignition OFF and the brakes cool, apply the brakes three to five times, or until the brake pedal effort increases significantly, in order to deplete the vacuum brake booster power reserve.

3. Deplete the vacuum brake booster power reserve.
4. Remove the master cylinder. Refer to Master Cylinder Replacement.



5. Clean the master cylinder reservoir (1), and master cylinder (5).
6. Remove the master cylinder reservoir cap (2).
7. Remove the master cylinder reservoir to master cylinder retaining screws (4).

Important: To remove the master cylinder reservoir (1) grasp the master cylinder (5) then pull up on the master cylinder reservoir (1).

8. Remove the master cylinder reservoir (1) from the master cylinder (5).

Important: Master cylinder reservoir seals (3) are single use only components and will not reseal. Install NEW master cylinder reservoir seals (3) whenever the master cylinder reservoir (1) is removed from the master cylinder (5).

9. Remove the two master cylinder reservoir seals (3) from the master cylinder (5).

Discard the two master cylinder reservoir seals (3).

Installation Procedure

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

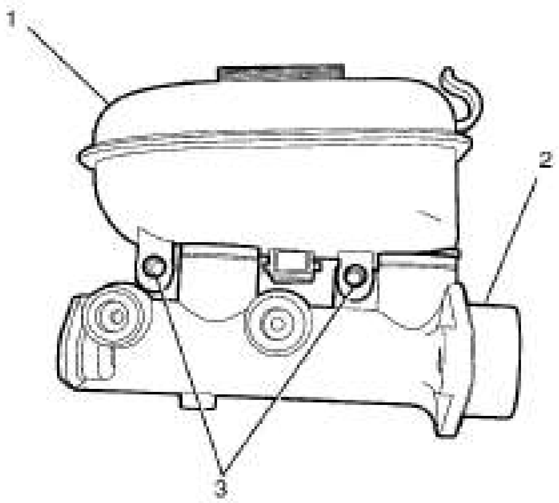
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Important: Lubricate the NEW master cylinder reservoir seals and the outer surface of the NEW master cylinder reservoir to housing barrels with brake fluid conforming to specification, from a clean, sealed brake fluid container in order to prevent tearing on installation. Refer to Brake System Specifications for correct brake fluid specification.

1. Install the NEW master cylinder reservoir seals to the master cylinder body.

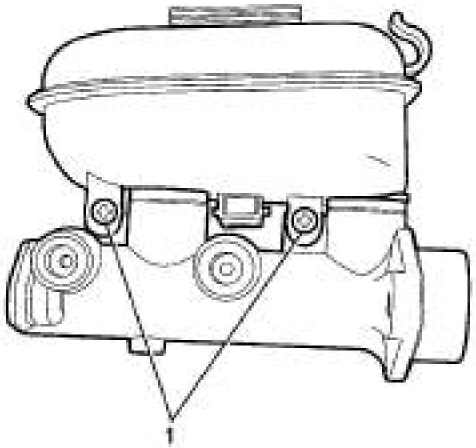
Make sure they are fully seated.



Important: Press down on the master cylinder reservoir (1) until the master cylinder reservoir to master cylinder retaining screw holes in the master cylinder body (3) are aligned.

2. Install the master cylinder reservoir (1) to the master cylinder body (2).

Notice: Refer to Fastener Notice in the Preface section.



3. Install the master cylinder reservoir to master cylinder retaining screws (1).

Tighten
Tighten the screws to 2.5 N·m (22 lb in).

4. Install the master cylinder. Refer to Master Cylinder Replacement.
5. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

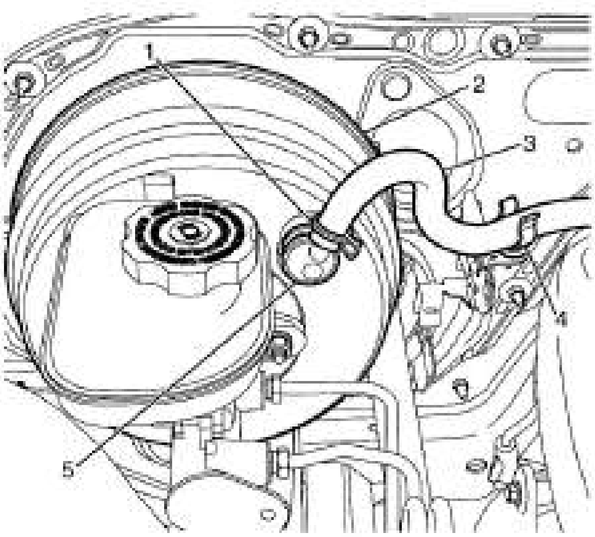
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | Document ID: 1993539

Power Brake Booster Inlet Hose Replacement (3.6L Engine RHD)

Removal Procedure

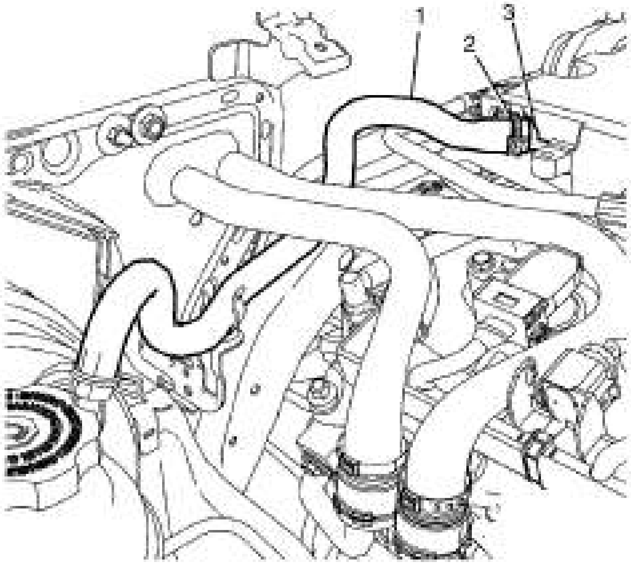
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

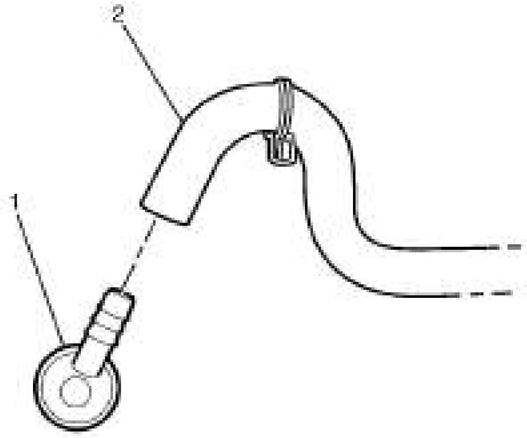


Important: With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal becomes firm, in order to deplete the vacuum brake booster power reserve.

2. Deplete the vacuum brake booster power reserve.
3. Remove the engine dress cover. Refer to Engine Cover Replacement
4. Compress the vacuum hose retaining clamp (1) at the vacuum brake booster (2) end and slide 50 mm (2 in) along the vacuum hose (3).
5. Disconnect the vacuum hose (3) and the vacuum brake booster check valve (5) from vacuum brake booster (2).
6. Detach the vacuum hose (3) from the bulkhead mounted vacuum hose retaining bracket (4).

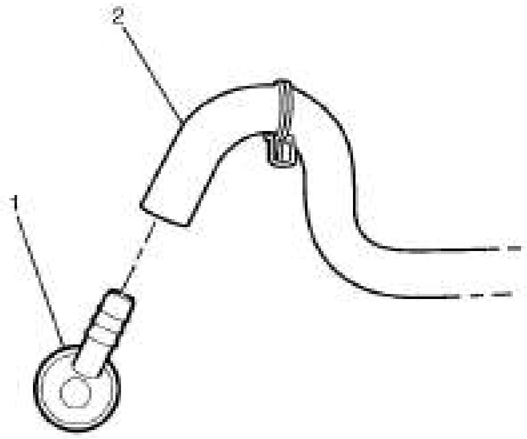


7. Compress the vacuum hose retaining clamp (2) at the intake manifold vacuum port (3) and slide 50 mm (2 in) along the vacuum hose (1).
8. Disconnect the vacuum hose (1) from the intake manifold vacuum port (3).

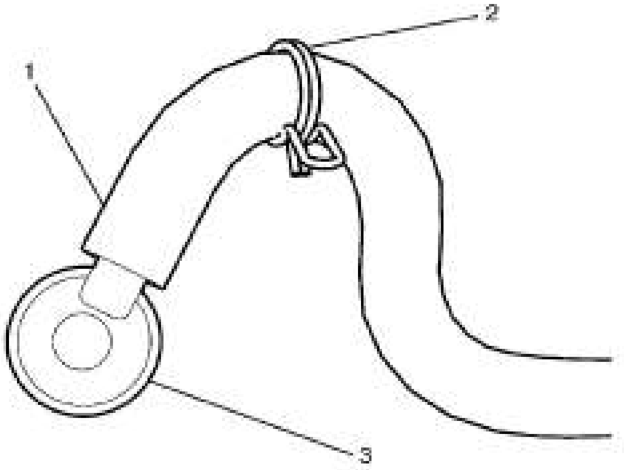


9. Remove the vacuum brake booster check valve (1) from the vacuum hose (2).

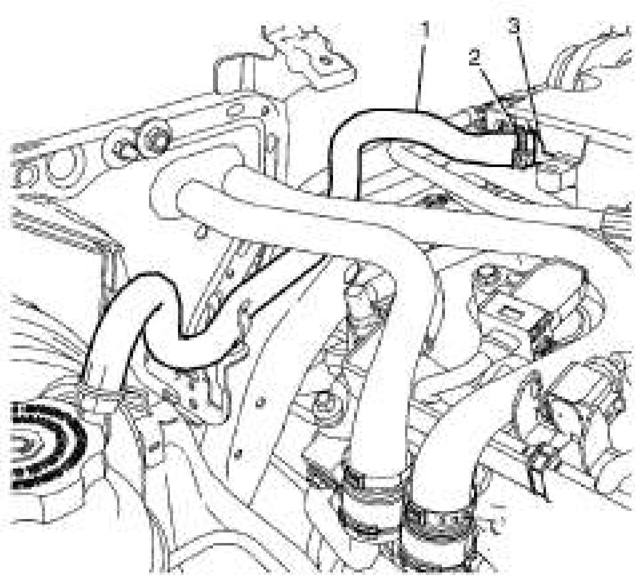
Installation Procedure



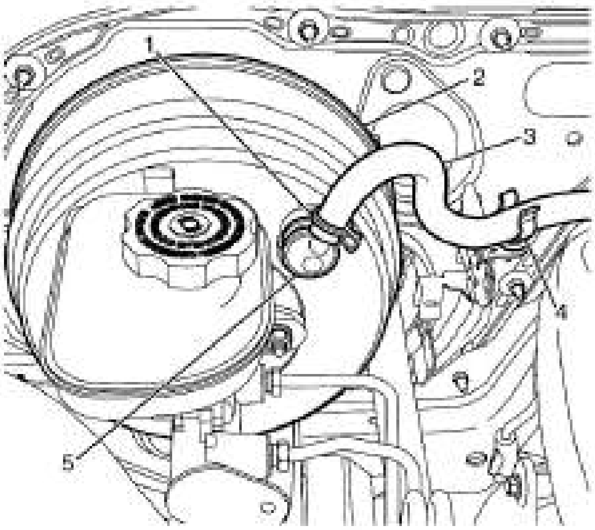
1. Install the vacuum brake booster check valve (1) to the vacuum hose (2).



2. Install the vacuum hose retaining clamp (2) to the correct location on the vacuum hose (1) to secure the vacuum brake booster check valve (3).



3. Connect the vacuum hose (1) to the intake manifold vacuum port (3).
4. Compress the vacuum hose retaining clamp (2) and slide along the vacuum hose (1) to the correct location to secure the vacuum hose (1) to the intake manifold vacuum port (3).



Important: Make sure the vacuum hose (3) is not twisted. Compress the vacuum hose retaining clamp (1) and rotate the vacuum brake booster check valve (5) as required.

5. Connect the vacuum hose (3) and vacuum brake booster check valve (5) to vacuum brake booster (2).
6. Attach the vacuum hose (3) to the bulkhead mounted vacuum hose retaining bracket (4).
7. Install the engine dress cover. Refer to Engine Cover Replacement
8. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection .

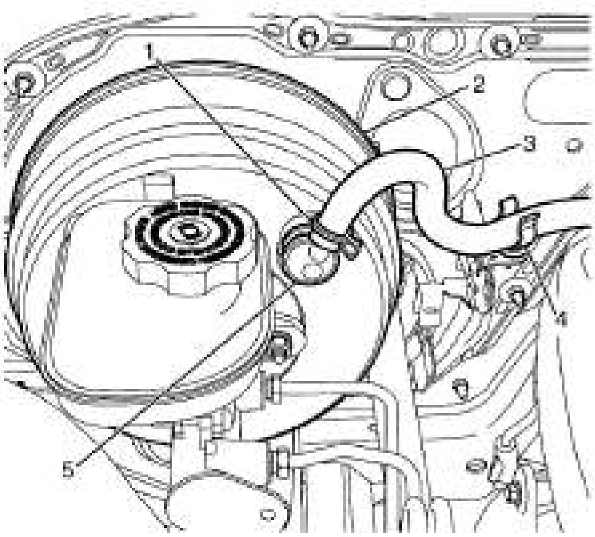
Power Brake Booster Inlet Hose Replacement (6.0L Engine RHD)

Removal Procedure

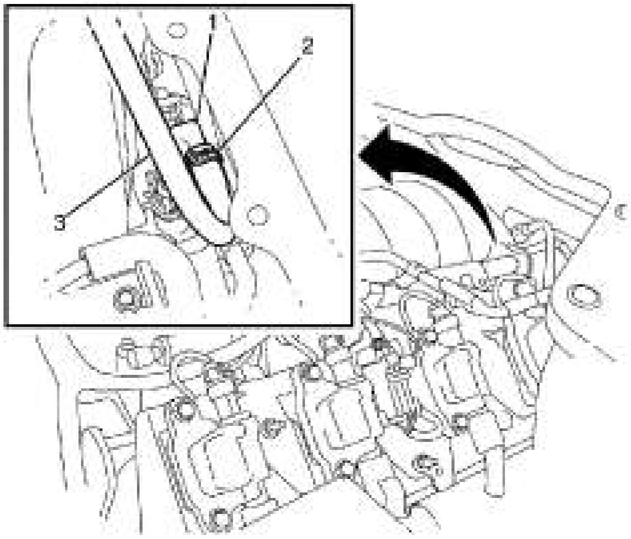
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

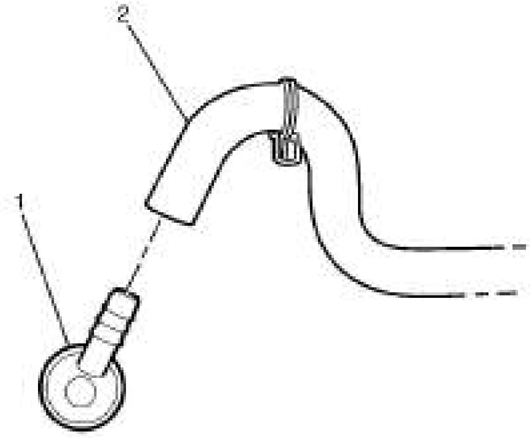


Important: With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal becomes firm, in order to deplete the vacuum brake booster power reserve.

2. Deplete the vacuum brake booster power reserve.
3. Remove the engine dress cover. Refer to Engine Cover Replacement.
4. Compress the vacuum hose retaining clamp (1) at the vacuum brake booster (2) end and slide 50 mm (2 in) back along the vacuum hose (3).
5. Disconnect the vacuum hose (3) and the vacuum brake booster check valve (5) from vacuum brake booster (2).
6. Detach the vacuum hose (3) from the bulkhead mounted vacuum hose retaining bracket (4)

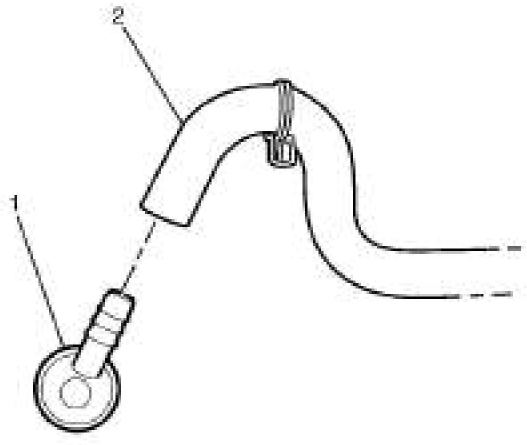


7. Compress the vacuum hose retaining clamp (2) at the intake manifold vacuum port (1) and slide 50 mm (2 in) back along the vacuum hose (3).
8. Disconnect the vacuum hose (3) from the intake manifold vacuum port (1).

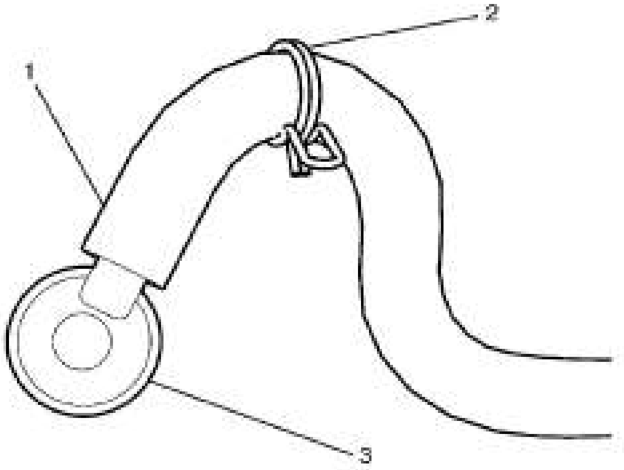


9. Remove the vacuum brake booster check valve (1) from the vacuum hose (2).

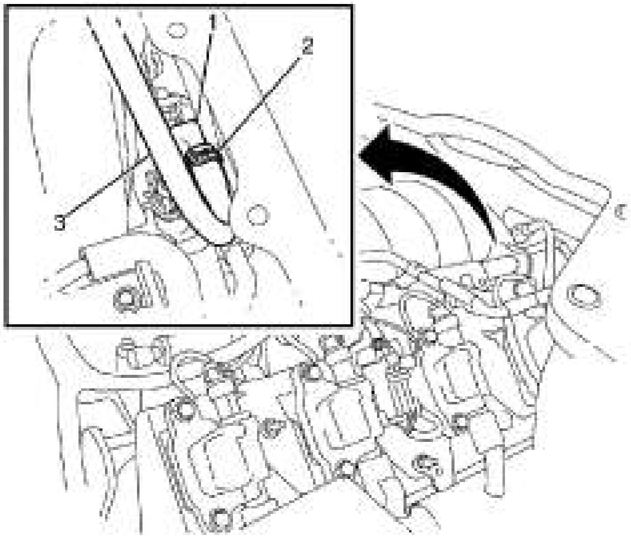
Installation Procedure



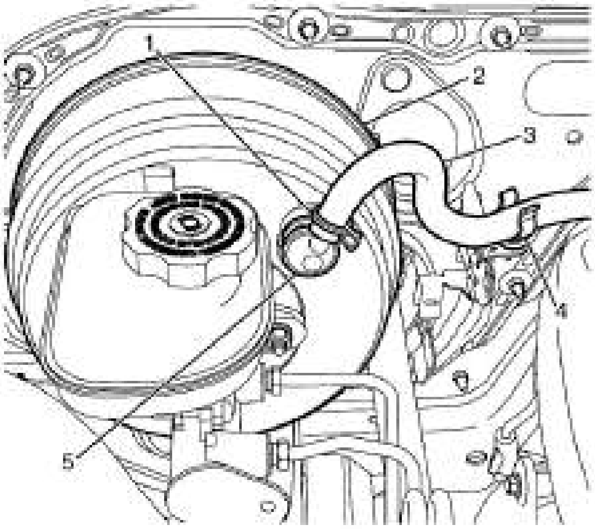
1. Install the vacuum brake booster check valve (2) to the vacuum hose (1).



2. Install the vacuum hose retaining clamp (1) to the correct location on the vacuum hose (2) to secure the vacuum brake booster check valve (3).



3. Connect the vacuum hose (3) to the intake manifold vacuum port (1).
4. Compress the vacuum hose retaining clamp (2) and slide along the vacuum hose (3) to the correct location to secure the vacuum hose (3) to the intake manifold vacuum port (1).



Important: Make sure the vacuum hose (3) is not twisted. Compress the vacuum hose retaining clamp (1) and rotate the vacuum brake booster check valve (5) as required.

5. Connect the vacuum hose (3) and vacuum brake booster check valve (5) to vacuum brake booster (2).
6. Attach the vacuum hose (3) to the bulkhead mounted vacuum hose retaining bracket (4).
7. Install the engine dress cover. Refer to Engine Cover Replacement.
8. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | **Document ID: 2022172**

Power Vacuum Brake Booster Replacement (RHD)

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

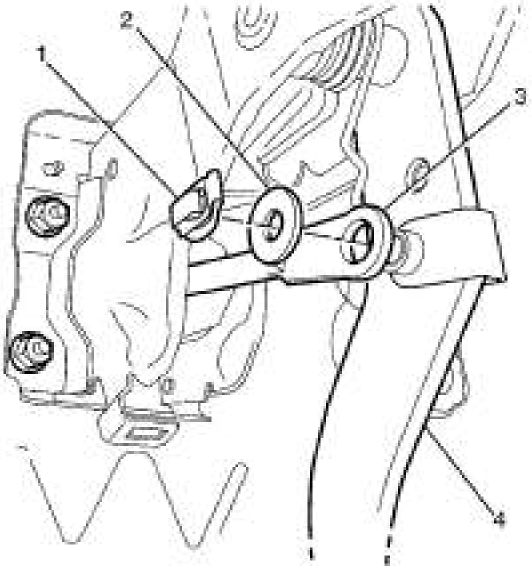
   Caution: Refer to Brake Fluid Caution in the Preface section.

   Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

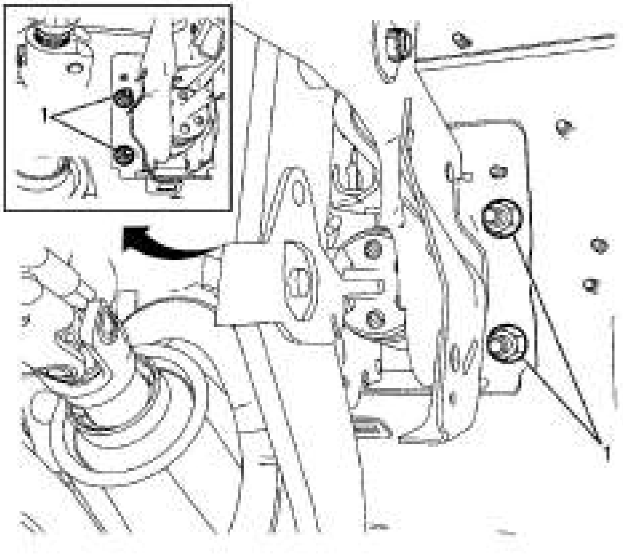
   Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

   Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

2. Remove the instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement.
3. Remove the instrument panel lower trim panel retainer. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
4. Remove the master cylinder from the vehicle. Refer to Master Cylinder Replacement.
5. Remove the vacuum hose and check valve from the vacuum brake booster. Refer to Power Brake Booster Inlet Hose Replacement



6. Remove the brake pedal pushrod retaining clip (1), washer (2) and the brake pedal pushrod (3) from the brake pedal (4).



7. Remove the vacuum brake booster to brake pedal support bracket retaining nuts (1).

   Important: From the engine compartment, pull the vacuum brake booster forward to release the four studs from the bulkhead and brake pedal support bracket.

8. Remove the vacuum brake booster from the vehicle.

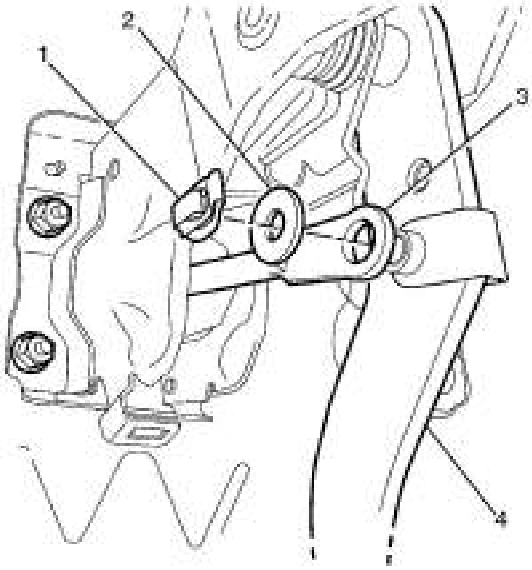
Installation Procedure

Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

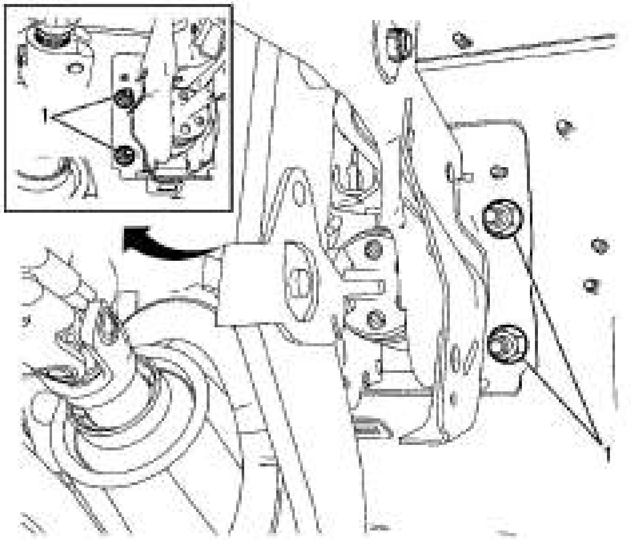
Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

1. With the aid of an assistant, install the vacuum brake booster from the engine compartment. Make sure the vacuum brake booster's four studs are correctly located in the bulkhead and brake pedal support bracket.



2. Install the push rod (3), washer (2) and retaining clip (1) to the brake pedal assembly (4).

   Notice: Refer to Fastener Notice in the Preface section.



3. Install the vacuum brake booster to brake pedal support bracket retaining nuts (1).

   Tighten
   Tighten the nuts to 23 N·m (17 lb ft).

4. Install the vacuum hose and check valve to the vacuum brake booster. Refer to Power Brake Booster Inlet Hose Replacement
5. Install the master cylinder to the vacuum brake booster. Refer to Master Cylinder

Replacements.

6. Bleed the braking system. Refer to Hydraulic Brake System Bleeding.
7. Install the instrument panel lower trim panel retainer. Refer to Instrument Panel Insulator Panel Replacement - Right Side.
8. Install the instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement.
9. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Hydraulic Brakes | Repair Instructions | **Document ID: 2194831**

Rear Brake Hose Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

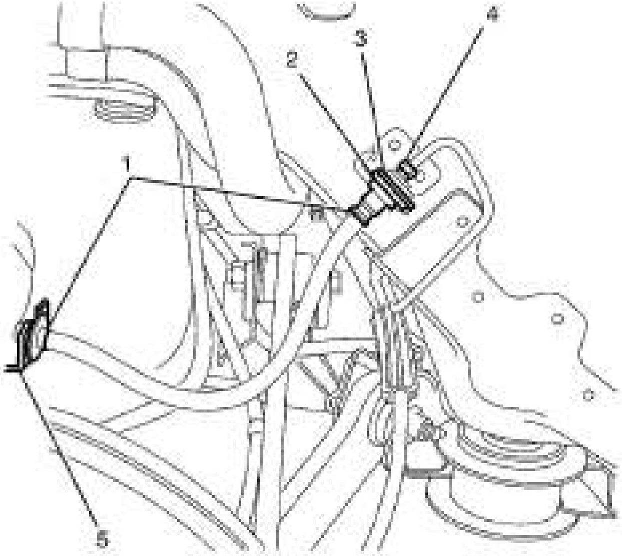
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the VehicleLifting and Jacking the Vehicle.
2. Remove the rear wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
3. Clean all dirt and foreign material from the brake hose and the brake pipe fittings.



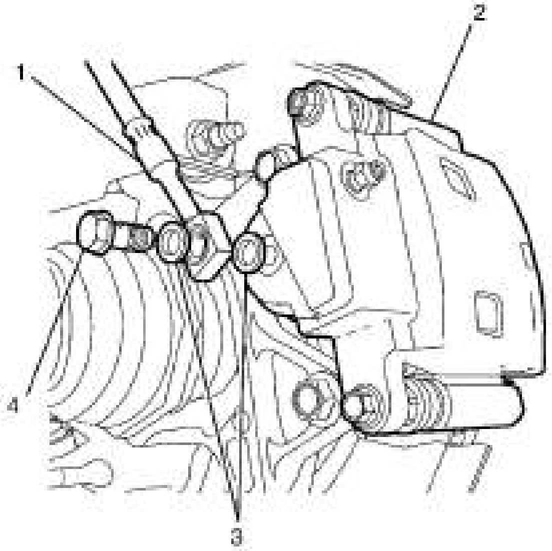
4. Place a clean suitable container under the brake pipe fitting (4).

Important: Hold the brake hose (1) with a suitable tool whilst disconnecting the brake pipe fitting (4) to prevent damage to the brake pipe fitting (4).

5. Disconnect the brake pipe fitting (4) from the brake hose (1).

Important: Install a rubber cap or plug to the brake pipe fitting (4) in order to prevent brake fluid loss and contamination.

6. Plug the brake pipe fitting (4).
7. Remove the brake hose retaining clip (2) from brake hose (1) and remove from the brake hose retaining bracket (3).
8. Detach the brake hose (1) from the upper control arm mounted brake hose retaining bracket (5).



9. Remove the brake hose to brake caliper banjo retaining bolt (4) from the brake caliper (2).
10. Remove the brake hose (1) from the brake caliper (2).

Important: Install a rubber cap or plug to the exposed brake caliper (2) in order to prevent brake fluid loss and/or contamination.

11. Plug the brake hose to brake caliper banjo retaining bolt hole in the brake caliper (2).
12. Place a shop towel on a hard surface.

Important: The copper brake hose sealing washers (3) may be stuck to the brake caliper (2) and/or the brake hose (1).

13. Tap the threaded end of the brake hose to brake caliper banjo retaining bolt (4) on the shop towel to remove the copper brake hose sealing washers (3) from the brake hose to brake caliper banjo retaining bolt (4)

Important: Copper brake hose sealing washers (3) become work hardened due to the heat generated with brake applications and will not reseal. Install NEW copper brake hose sealing washers (3) whenever the brake hose to brake caliper banjo retaining bolt (4) is removed.

14. Remove the two copper brake hose sealing washers (3).

Discard the two copper brake hose sealing washers (3).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

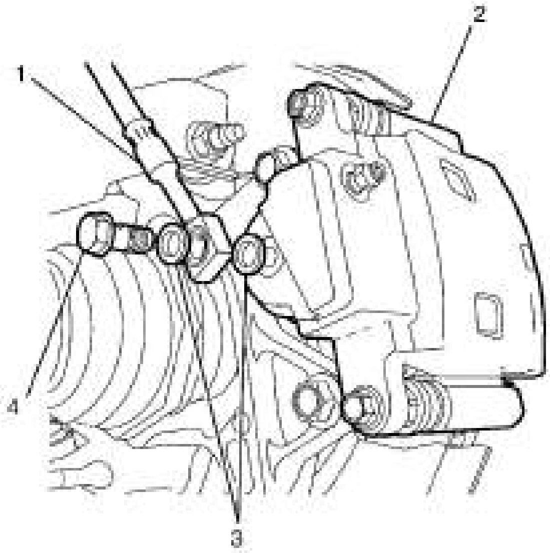
Caution: Refer to Brake Fluid Caution in the Preface section.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Adding Fluid to the Brake System Notice in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

1. Remove the rubber cap or plug from the brake hose to brake caliper banjo retaining bolt hole in the brake caliper.



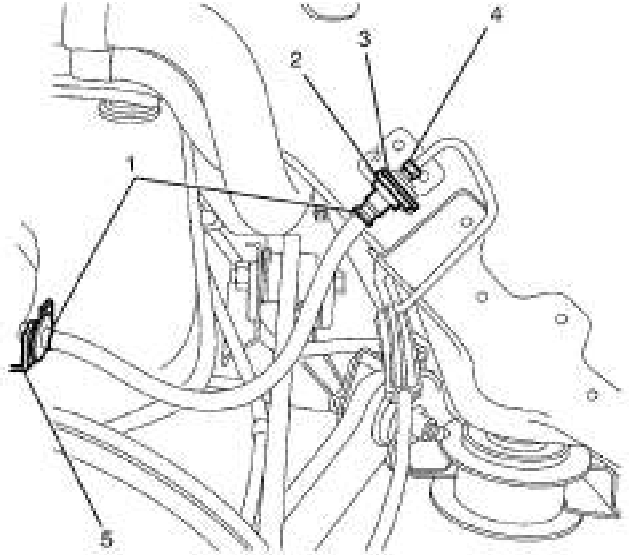
2. Assemble the NEW copper brake hose sealing washers (3), and the brake hose to brake caliper banjo retaining bolt (4) to the brake hose (1).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the brake hose to brake caliper banjo retaining bolt (4) to the brake caliper (2).

   Tighten
   Tighten the brake hose to brake caliper banjo retaining bolt to 35 Nm (26 lb ft).

4. Remove the rubber cap or plug from the brake pipe fitting end.



5. Install the brake pipe fitting (3) to the brake hose (1) through brake hose retaining bracket (4).

   Tighten
   Tighten the brake pipe fitting to 16 Nm (12 lb ft).

6. Install the bracket retainer clip (2).

   Important: Slightly twist the brake hose (1) to enable the slot in the brake hose retaining bracket (5) to line up with the flat in the brake hose (1). Slide the brake hose (1) down the brake hose retaining bracket (5) and allow the brake hose to return to its untwisted position for positive engagement in the brake hose retaining bracket (5)

7. Attach the brake hose (1) to the upper control arm mounted brake hose retaining bracket (5).
8. Bleed the hydraulic brake system. Refer to Hydraulic Brake System BleedingHydraulic Brake System Bleeding.
9. Install the rear wheel. Refer to Tire and Wheel Removal and InstallationTire and Wheel Removal and Installation.
10. Lower the vehicle.

Brake Warning System Description and Operation

The purpose of the brake warning system is to warn the driver of the park brake being applied whilst the vehicle is being driven, a brake Electronic Brake Differential (EBD) failure and/or a low brake fluid level condition.

- The Park Brake Warning is active when the park brake signal is active and the vehicle speed is greater than 10 km/h (6 mph).

  A red telltale illuminates whilst the park brake signal is active, regardless of the vehicle speed.

  The Park Brake Warning is displayed both as an animation on the Multi Function Display (MFD) and as a telltale. The General Warning Chime sounds when the animated warning activates. The chime will not repeat whilst the warning remains active.

  The Park Brake Warning remains on the Multi Function Display (MFD) until:

  - The ENTER switch is pressed.
  - The TRIP button is pressed.
  - The condition is rectified.
  - The speed is reduced to less than 10 km/h (6 mph).
- A brake EBD fail warning is active when the brake fail signal is active.

  A red telltale illuminates whilst the brake fail signal is active.

  A brake EBD Fail Warning is displayed both as an animation on the MFD and as a telltale. The General Warning Chime sounds when the animated warning activates. The chime will not repeat whilst the warning remains active.

  The brake EBD fail warning remains on the MFD until:

  - The ENTER switch is pressed.
  - The TRIP button is pressed.
  - The condition is rectified.
- A brake fluid level warning is active when the Instrument Panel Cluster (IPC) detects an increase in resistance in the Brake Fluid Level Switch circuit.

  A red telltale illuminates continuously with the ignition in the ON position and the resistance of the Brake Fluid Level Switch circuit above a predetermined value.

  The brake fluid level warning is displayed both as an animation on the MFD and as a telltale. The General Warning Chime sounds when the animated warning activates. The chime will not repeat whilst the warning remains active.

  The brake fluid level warning remains on the MFD until:

  - The ENTER switch is pressed.
  - The TRIP button is pressed.
  - The condition is rectified.

Hydraulic Brake System Description and Operation

System Component Description

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Reservoir: Contains a supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder: Converts mechanical input force into hydraulic output pressure. Hydraulic output pressure is distributed from the master cylinder through two hydraulic circuits to the Brake Modulator Assembly. Under normal braking the Brake Modulator Assembly allows fluid pressure to be distributed through out the hydraulic brake system.

Hydraulic Brake Pressure Balance Control System: Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force. Pressure balance control is achieved through Electronic Brake Differential (EBD), which is a function of the ABS modulator. For specific information on the operation of Electronic Brake Differential (EBD) refer to ABS Description and Operation.

Hydraulic Brake Pipes and Flexible Brake Hoses: Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components: Converts hydraulic input pressure into mechanical output force.

System Operation

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses brake linings against rotating brake system components.

Brake Assist System Description and Operation

System Component Description

The brake assist system consists of the following:

Brake Pedal: Multiplies the braking effort applied by the driver.

Brake Pedal Pushrod: Transfers multiplied input force received from the brake pedal to the vacuum brake booster.

Vacuum Brake Booster: Uses source vacuum to decrease effort required by the driver when applying the brakes.

Vacuum Source: The source vacuum for a spark ignition engine is normally derived from the Intake Manifold.

Vacuum Source Delivery System: Enables delivery and retention of source vacuum for vacuum brake booster.

System Operation

Under normal driving conditions, without the brakes applied, vacuum is allowed to act on both sides of the diaphragm within the vacuum brake booster. When the brake pedal is applied, the effort by the driver is multiplied due to the relative length of the brake pedal in relationship to its pivot point and the point at which the push rod to the Vacuum Brake Booster is attached. Movement of the push rod causes a valve within the Vacuum Brake Booster to close between the two sides of the diaphragm, thus isolating each side. It also allows a valve to open that allows atmospheric pressure to act on the pedal side of the Vacuum Brake Booster whilst maintaining vacuum on the vacuum source side of the diaphragm. The movement of the Brake Pedal Pushrod is transferred to the Hydraulic Brake Master Cylinder via the Vacuum Brake Booster. The pressure differential within the Vacuum Brake Booster reduces the effort required by the driver in applying the brakes.

(2) Park Brake Switch

(3) Park Brake Switch Electrical Connector

(4) Park Brake Cable Assembly (Front)

(5) Park Brake Cable Assembly (Rear)

Diagnostic Starting Point - Park Brake

Begin the system diagnosis by reviewing the system description and operation. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Park Brake, order to identify the correct procedure for diagnosing the system and where the procedure is located.

Symptoms - Park Brake

Important: Review the system operation in order to familiarise yourself with the system functions.

Refer to Park Brake System Description and Operation.

Visual / Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the park brake system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Park Brake Will Not Hold or Release.

Park Brake System Diagnosis.

Park Brake Will Not Hold or Release

Step	Action	Yes	No
1	Were you sent here from the Park Brake Symptom List?	Go to Step 2	Go to Diagnostic Starting Point - Park Brake.
2	Inspect the park brake system for correct operation. Refer to Park Brake System Diagnosis. Did you find and correct a condition?	Go to Step 5	Go to Step 3
3	Inspect the disc brake system for correct operation. Refer to Disc Brake System Diagnosis. Did you find and correct a condition?	Go to Step 5	Go to Step 4
4	Inspect the hydraulic brake system for correct operation. Refer to Hydraulic Brake System Diagnosis. Did you find and correct a condition?	Go to Step 5	Go to Diagnostic Starting Point - Park Brake.
5	Road test the vehicle in order to confirm correct operation. Refer to Brake System Vehicle Road Test. Is the condition still present?	Go to Step 2	System OK

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Park Brake | Diagnostic Information and Procedures | **Document ID: 1982155**

Park Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the PARK brake system in order to determine if the PARK brake system is operating correctly. You will be directed by the appropriate Symptom Table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Hydraulic Brake Symptom Table?	Go to Step 4	Go to Step 2
2	Were you sent here from a Park Brake Symptom List?	Go to Step 4	Go to Step 3
3	Is the symptom related to the ability of the park brake system to hold and/or release?	Go to Park Brake Will Not Hold or Release	Go to Diagnostic Starting Point - Hydraulic Brakes
4	1. Raise and support the vehicle with the rear axle supported by jack stands. Refer to Lifting and Jacking the Vehicle . 2. Shift the transmission into NEUTRAL. 3. With the park brake RELEASED, attempt to rotate the rear wheels to inspect the rear brakes for a significant amount of drag. Do the rear brakes have a substantial amount of drag?	Go to Step 11	Go to Step 5
5	1. With the transmission still in NEUTRAL, apply the park brake. 2. Attempt to rotate the rear wheels to inspect the rear brakes for a significant amount of drag. Do the rear brakes have a significant amount of drag?	Go to Step 6	Go to Step 7
6	1. Release the park brake. 2. Rotate the rear wheels to inspect the rear brakes for a significant reduction in the amount of drag. Did the rear brakes exhibit a significant reduction in the amount of drag?	Go to Step 21	Go to Step 11
7	Visually inspect the park brake cable connections and the cables that are accessible on the UNDERSIDE of the vehicle for disconnections and/or damage. Were any of the park brake cables disconnected and/or damaged?	Go to Step 8	Go to Step 9
	Reconnect or replace the park brake cables as		

8	necessary. Refer to the following procedures as necessary: Parking Brake Front Cable Replacement . Did you complete the repair and/or replacement?	Go to Step 9	--
9	Inspect the adjustment of the park brake. Refer to Park Brake Adjustment . Was the park brake adjusted correctly?	Go to Step 11	Go to Step 10
10	Adjust the park brake. Refer to Park Brake Adjustment . Were you able to attain adjustment of the park brake?	Go to Step 16	Go to Step 11
11	**Notice:** Do not depress the brake pedal with the brake rotors and/or the brake drums removed, or with the brake calipers repositioned away from the brake rotors, or damage to the brake system may result. 1. Remove the rear brake discs. Refer to Rear Brake Rotor Replacement . 2. Inspect the park brake shoe assembly for play, damaged, broken or missing components. 3. Inspect the park brake actuators for a seized condition. Does the park brake assembly and/or park brake actuators require replacement?	Go to Step 12	Go to Step 13
12	1. Replace park brake hardware components as necessary. Refer to Parking Brake Shoe Replacement in Park Brake. 2. Replace the park brake actuators as necessary. Refer to Parking Brake Actuator Replacement . Did you complete the replacement?	Go to Step 13	--
13	Have an assistant apply and release the park brake, while you observe the park brake cables for free movement. Do the park brake cables move freely?	Go to Step 14	Go to Step 17
14	Inspect the adjustment of the park brake. Refer to Park Brake Adjustment . Was the park brake adjusted correctly?	Go to Step 16	Go to Step 15
15	Adjust the park brake. Refer to Park Brake Adjustment . Were you able to attain adjustment of the park		

	brake?	Go to Step 16	Go to Step 24
16	1. With the transmission still in NEUTRAL, apply the park brake. 2. Attempt to rotate the rear wheels to inspect the rear brakes for a significant amount of drag. 3. Release the park brake. 4. Rotate the rear wheels to inspect the rear brakes for a significant reduction of drag. Does the park brake apply and release correctly?	Go to Step 23	Return to Symptom Table
17	Disconnect the park brake cable connections that are accessible on the UNDERSIDE of the vehicle one at a time and inspect each cable for free movement. Do any of the park brake cables accessible on the underside of the vehicle require replacement?	Go to Step 18	Go to Step 19
18	Replace any of the park brake cables that do not have free movement (do not release correctly). Refer to the following procedures as necessary: - Parking Brake Front Cable Replacement . - Parking Brake Rear Cable Replacement . Did you complete the replacement?	Go to Step 23	--
19	Replace the park brake lever assembly. Refer to Parking Brake Release Handle Assembly Replacement . Did you complete the replacement?	Go to Step 23	--
20	Inspect the adjustment of the park brake. Refer to Park Brake Adjustment . Is the park brake adjusted correctly?	Park Brake System OK	Go to Step 21
21	Adjust the park brake. Refer to Park Brake Adjustment . Were you able to attain adjustment of the park brake system?	Go to Step 25	Go to Step 22
22	1. Remove the rear brake discs if they have not yet been removed. Refer to Rear Brake Rotor Replacement . 2. Inspect the park brake actuators for a seized condition. 3. Replace the park brake actuators as necessary. Refer to Parking Brake Actuator Replacement . Did you find and correct a condition?	Go to Step 23	Go to Step 24
	Adjust the park brake. Refer to Park Brake		

23	Adjustment . Were you able to attain adjustment of the park brake system?	Go to Step 25	Go to Step 24
24	1. Replace the component that is used to adjust the park brake system. Refer to Parking Brake Release Handle Assembly Replacement . 2. Adjust the park brake. Refer to Park Brake Adjustment . Did you complete the replacement and adjustment?	Go to Step 25	Return to Symptom Table
25	1. With the transmission still in NEUTRAL, apply the park brake. 2. Attempt to rotate the rear wheels to inspect the rear brakes for a significant amount of drag. 3. Release the park brake. 4. Rotate the rear wheels to inspect the rear brakes for a significant reduction of drag. Did the park brake apply and release correctly?	Go to Step 26	Return to Symptom Table
26	Install or connect any components that were removed or disconnected during diagnosis. Did you complete the operation?	Park Brake System OK Return to Symptom Table	--

Parking Brake Shoe Inspection

Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation.
3. Remove the rear brake caliper and brake disc. Refer to Rear Brake Rotor Replacement.
4. Inspect the park brake shoe and lining for the following conditions:
   - Substantial wear indicated by the park brake lining being worn down to the shoe
   - Brake lining cracking
   - Oil or fluid contamination of the brake lining
5. If any of the conditions listed are found, replace the park brake shoes. Refer to Parking Brake Shoe Replacement.
6. Adjust the park brake shoe. Refer to Park Brake Adjustment.
7. Install the rear brake disc. Refer to Rear Brake Rotor Replacement.
8. Install the rear brake caliper. Refer to Rear Brake Caliper Replacement.
9. Install the rear wheels. Refer to Tire and Wheel Removal and Installation.
10. Lower the vehicle.

Parking Brake Actuator Replacement

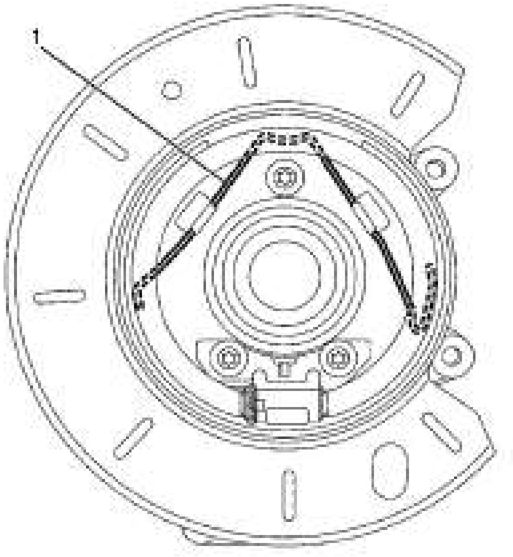
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

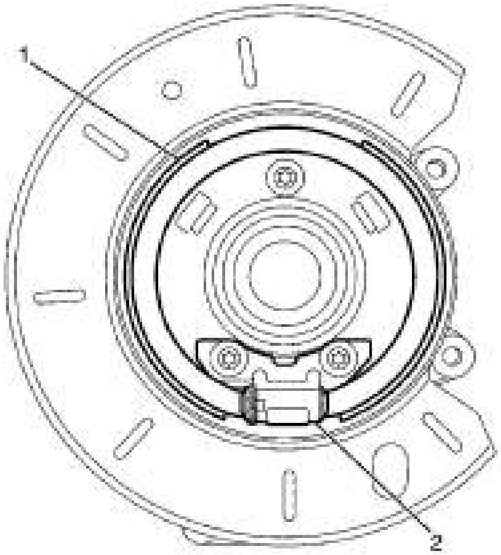
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .
3. Remove the rear brake caliper and brake disc. Refer to Rear Brake Rotor Replacement .
4. Remove the rear wheel hub and bearing assembly. Refer to Rear Wheel Bearing and Hub Replacement .
5. Rotate the park brake adjusting nut until all park brake shoe adjustment has been removed.

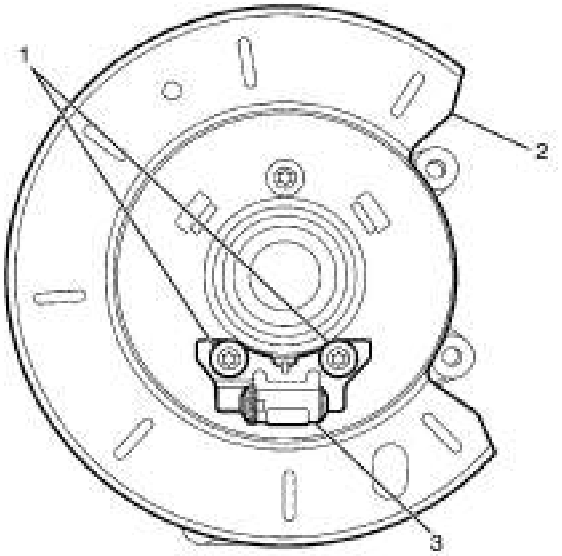


6. Remove the park brake shoe retaining spring (1).



Important: Detach the park brake shoe (1) from the actuator assembly (2) by grasping the shoe and pushing upwards.

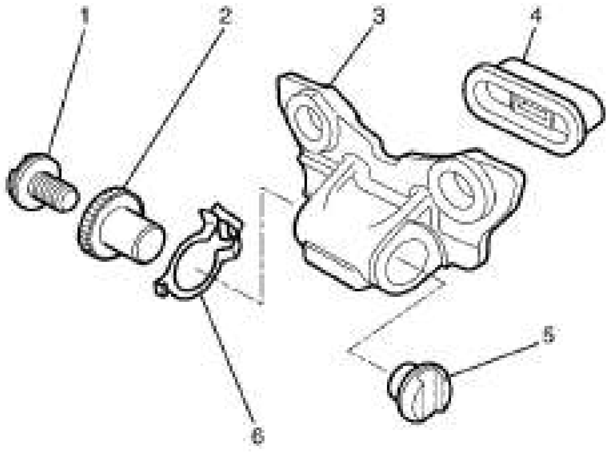
7. Detach the park brake shoe (1) from the actuator assembly (2).
8. Remove the park brake shoe (1).



9. Remove the actuator assembly / backing plate to knuckle retaining bolts (1).

Important: Slide the actuator assembly (3) downwards to detach the actuator assembly (3) from the locating tab on the backing plate (2).

10. Remove the actuator assembly (3) from the backing plate (2).



Important: Using a flat blade screwdriver remove the adjuster nut (2) from the abutment plate (3).

11. Remove the adjuster nut (2) from the abutment plate (3).
12. Remove the adjustment screw (1) from the adjuster nut (2).

Important: Using a flat blade screwdriver remove the tappet (5) from the abutment plate (3).

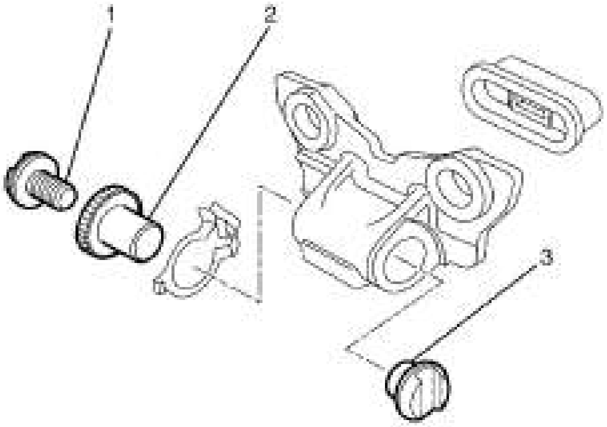
13. Remove the tappet (5) from the abutment plate (3).
14. Remove the adjustment pawl (6).
15. Remove the dust cover (4) from the abutment plate (3).

Installation Procedure

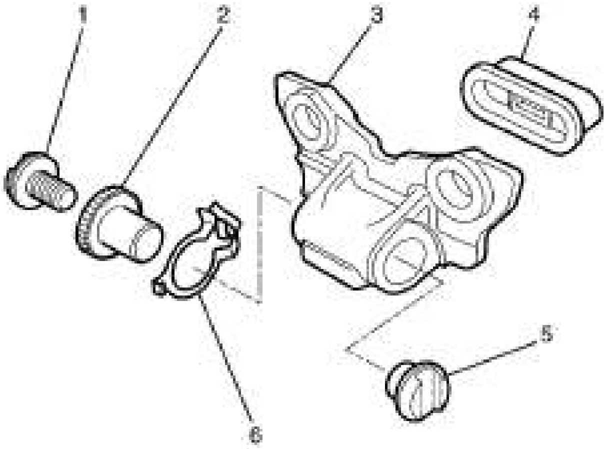
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

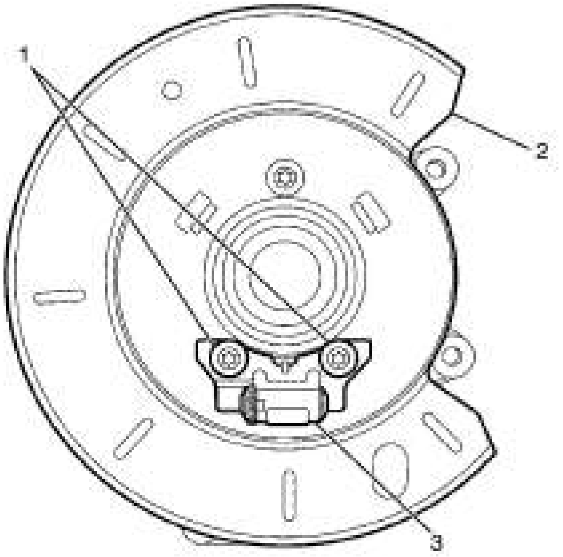
Caution: Refer to Brake Dust Caution in the Preface section.



1. Apply a small amount of GM approved silicone grease to positions (2, 3). DO NOT apply grease to the bolt threads (1).



2. Install the dust cover (4) to the abutment plate (3).
3. Install the adjustment pawl (6).
4. Install the tappet (5) to the abutment plate (3).
5. Install the adjustment screw (1) to the adjuster nut (2).
6. Install the adjuster nut (2) to the abutment plate (3).



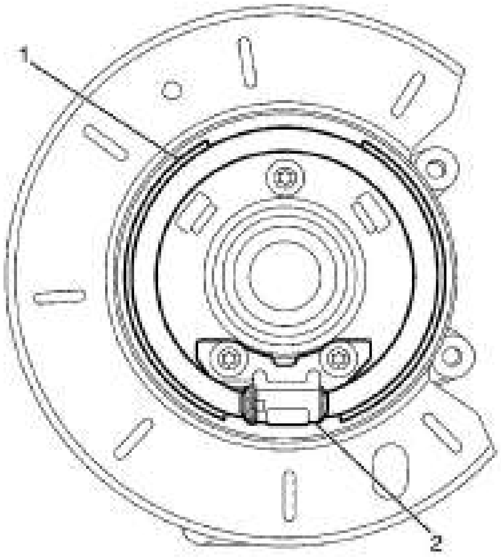
Important: Slide the actuator assembly (3) upwards to attach the actuator assembly (3) to the locating tab on the backing plate (2).

7. Install the actuator assembly (3) to the backing plate (2).

   Notice: Refer to Fastener Notice in the Preface section.

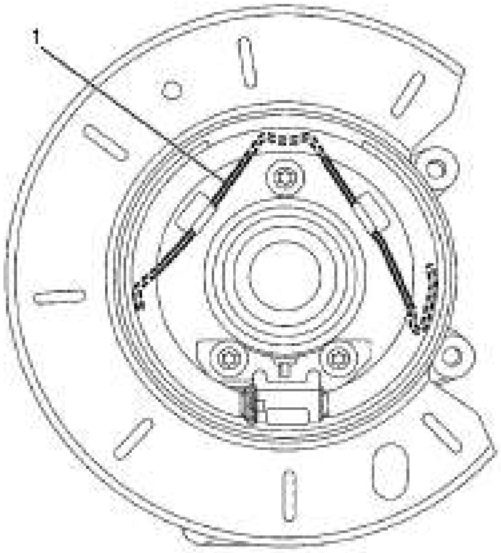
8. Install the actuator assembly/backing plate to knuckle retaining bolts (1).

   Tighten
   Tighten the bolt to 130 Nm (96 lb ft).



Important: Install the park brake shoe assembly (1) by grasping the shoe and spreading slightly while pulling the shoe over the actuator assembly (2).

9. Install the park brake shoe assembly (1) to the actuator assembly (2).



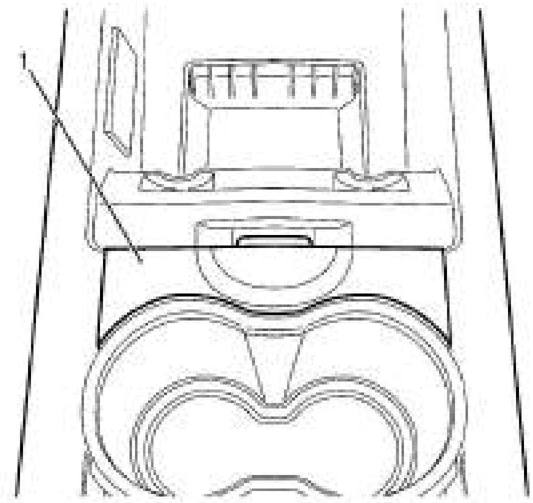
10. Install the park brake shoe retaining spring (1).
11. Install the rear wheel hub and bearing assembly. Refer to Rear Wheel Bearing and Hub Replacement .
12. Install the rear brake disc and rear brake caliper. Refer to Rear Brake Rotor Replacement .
13. Adjust the park brake. Refer to Park Brake Adjustment .
14. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
15. Lower the vehicle.

Parking Brake Adjustment

Caution: Refer to Safety Glasses Caution in the Preface section.

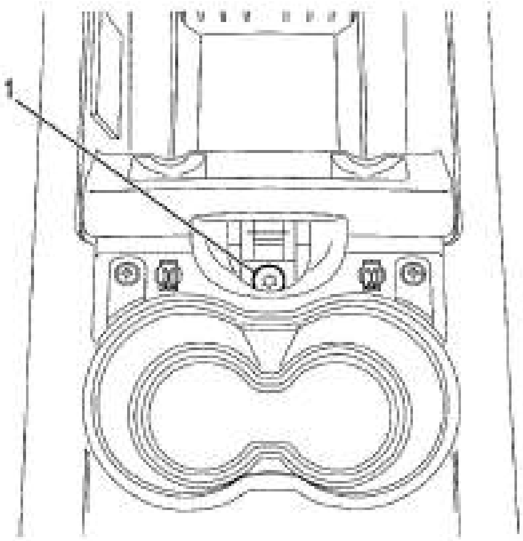
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

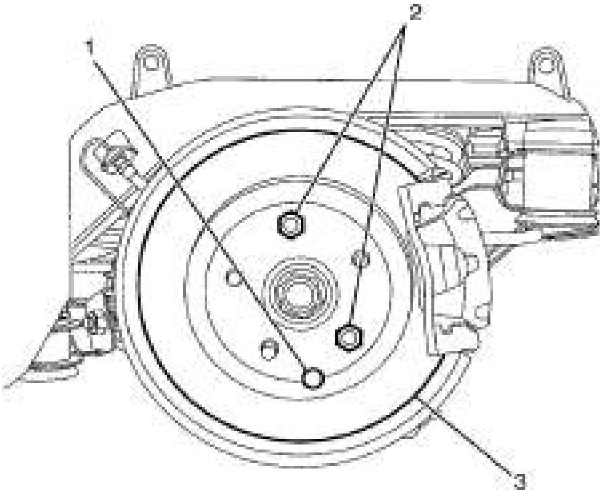


Important: The park brake cable adjustment bolt cover trim (1) is retained by two clips. Gently pry upwards with fingers at the front floor console armrest latch to remove.

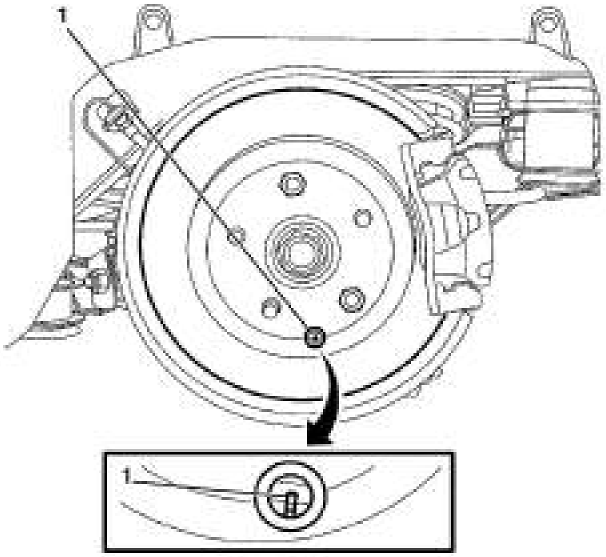
1. Remove the park brake cable adjustment bolt cover trim (1).



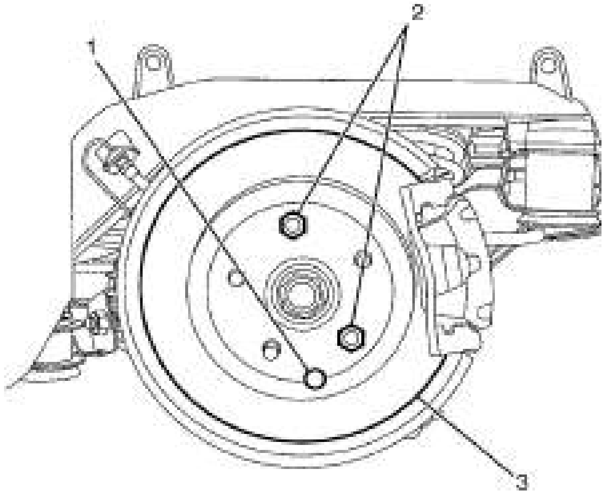
2. Loosen the park brake cable adjustment bolt (1) several turns to allow slack in the park brake rear cables.
3. Make sure that the park brake actuator arms have fully retracted.
4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
5. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation.



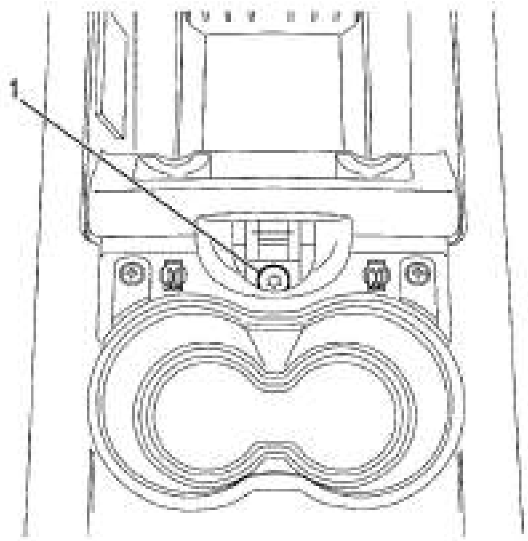
6. Install 2 wheel nuts (2) in reverse to opposite wheel studs to retain the brake disc (3) to the hub.
7. Make sure that the brake disc (3) is free and does not bind. If the brake disc (3) is binding refer to the following procedures.
   - Brake Rotor Thickness Variation Measurement.
   - Brake Rotor Assembled Lateral Runout Measurement.
   - Brake Caliper Inspection.
8. Remove the access hole plug (1) from the brake disc (3).



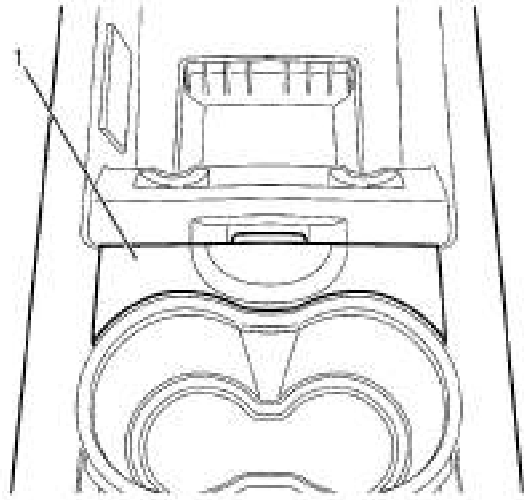
9. Using a suitable lever such as a screwdriver, tighten the adjuster nut (1), until the brake disc is locked.
10. Loosen the adjuster nut (1) 3-5 clicks. Make sure that the brake disc is free and does not bind.



11. Install the access hole plug (1).
12. Remove the 2 wheel nuts (2) retaining the brake disc (3) to the hub
13. Install the rear wheels. Refer to Tire and Wheel Removal and Installation.
14. Lower the vehicle.



15. Apply the park brake until the lever is extended 4-6 clicks.
16. Tighten the park brake cable adjustment bolt (1) to remove any excess slack from the park brake cable.
17. Make sure that this adjustment applies the park brake shoes by attempting to turn each rear wheel.
18. Release the park brake and inspect that each rear wheel is free and does not bind.
19. Lower the vehicle to the ground.



20. Install the park brake cable adjustment bolt cover trim (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Park Brake | Repair Instructions | **Document ID: 1964709**

Parking Brake Front Cable Replacement

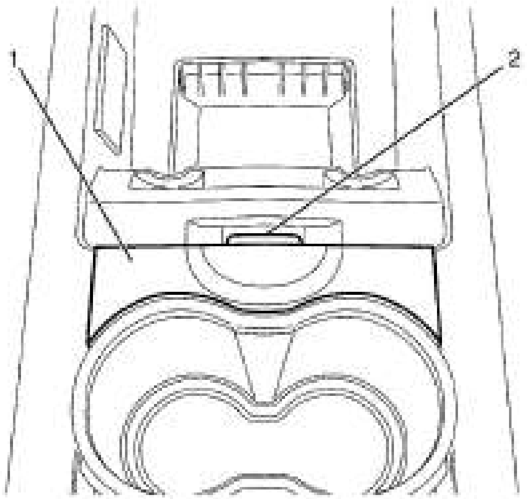
Removal Procedure Up to - 05 Mar 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

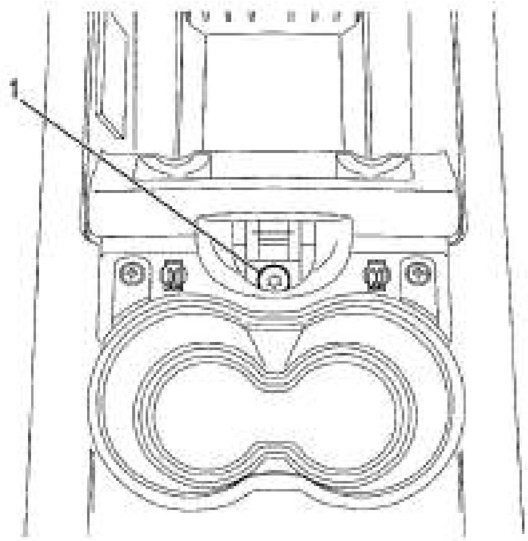
Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .
3. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
4. Remove the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center .
5. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
6. Remove the fuel tank heat shield. Refer to Fuel Tank Heat Shield Replacement .
7. Lower the vehicle.

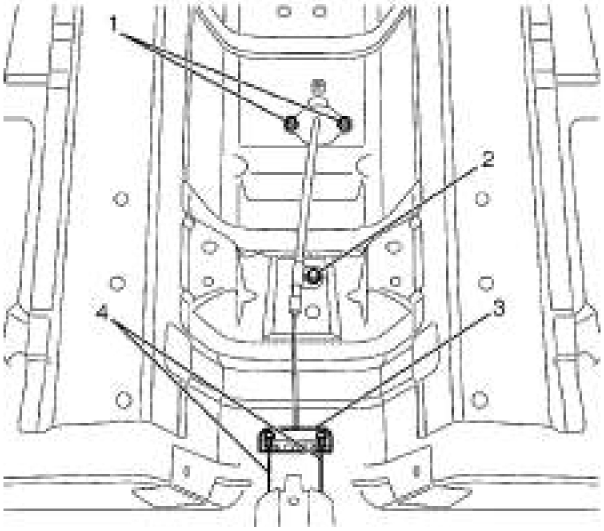


Important: The park brake cable adjustment bolt cover trim (1) is retained by two clips. Gently pry upwards with fingers at the front floor console armrest latch (2) to remove.

8. Remove the park brake cable adjustment bolt cover trim (1).



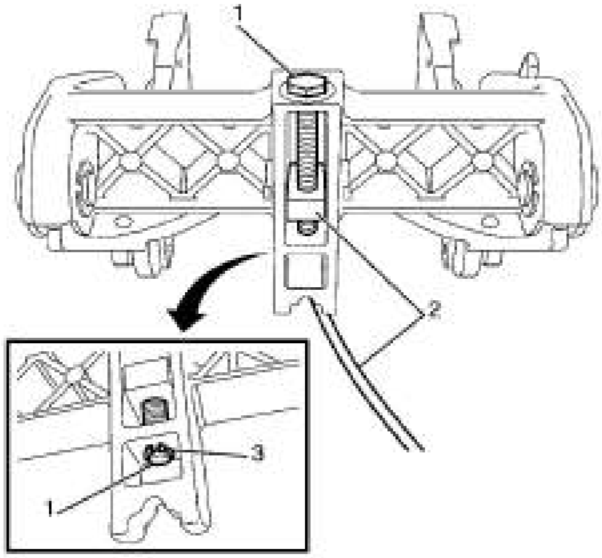
9. Loosen the park brake cable adjustment bolt (1) all the way to allow maximum slack in the rear park brake cables.
10. Raise the vehicle.



Important: Wrap a workshop cloth around the rear inner cable (4) to protect it from damage. Using pliers, pull the rear inner cable (4) forward and upwards to release the ball nipple from the front park brake cable and equaliser bracket assembly (3).

11. Remove the rear inner cables (4) from the front park brake cable and equaliser bracket assembly (3).
12. Remove the front park brake cable forward bracket to vehicle underbody retaining (1) nuts.
13. Remove the front park brake cable rear bracket to vehicle underbody retaining bolt (2).
14. Lower the vehicle.

15. Remove the park brake lever assembly from the front floor console. Refer to Parking Brake Release Handle Assembly Replacement .



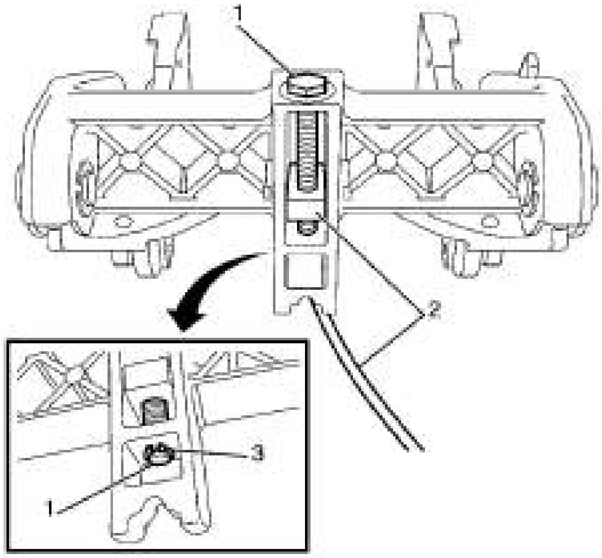
16. Remove the park brake cable adjustment bolt to park brake assembly retaining circlip (3).
17. Remove the park brake cable adjustment bolt (1).
18. Remove the front park brake cable (2).

Installation Procedure - Up to 05 Mar 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

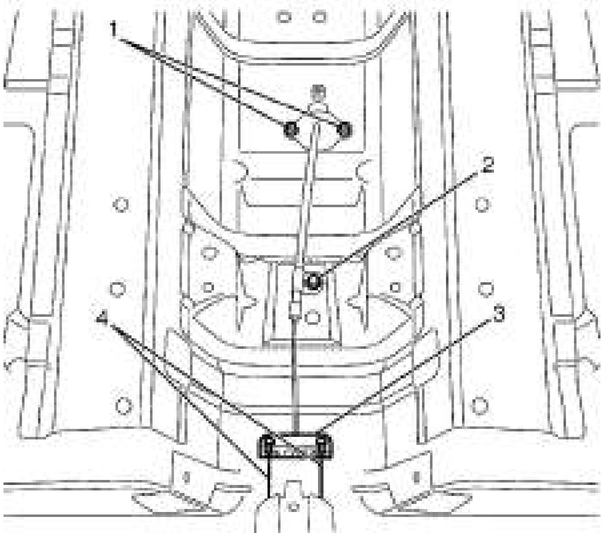
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Install the front park brake cable (2) into position.
2. Install the park brake cable adjustment bolt (1).
3. Install the park brake cable adjustment bolt to park brake assembly retaining circlip (3).
4. Install the park brake lever assembly and front floor console. Refer to Parking Brake Release Handle Assembly Replacement .
5. Raise the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.



6. Install the front park brake cable rear bracket to vehicle underbody retaining bolt (2).

   Tighten
   Tighten the bolt to 22 Nm (16 lb ft).

7. Install the front park brake cable forward bracket to vehicle underbody retaining (1) nuts.

   Tighten
   Tighten the nuts to 9 Nm (80 lb in).

   Important: Wrap a workshop cloth around the rear inner cable (4) to protect it from damage. Using pliers, pull the rear inner cable (4) forward and downwards to install the ball nipple to the front park brake cable and equaliser bracket assembly (3).

8. Install the rear inner cables (4) to the front park brake cable and equaliser bracket assembly (3).

   Make sure that the rear cables are properly seated.

9. Adjust the park brake. Refer to Parking Brake Release Handle Assembly Replacement .

10. Cycle the park brake pedal 2-3 times to make sure that the park brake cable retainers are seated.
11. Install the fuel tank heat shield. Refer to Fuel Tank Heat Shield Replacement .
12. Install the propeller shaft. Refer to Propeller Shaft Replacement .
13. Install the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center .
14. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
15. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
16. Lower the vehicle.

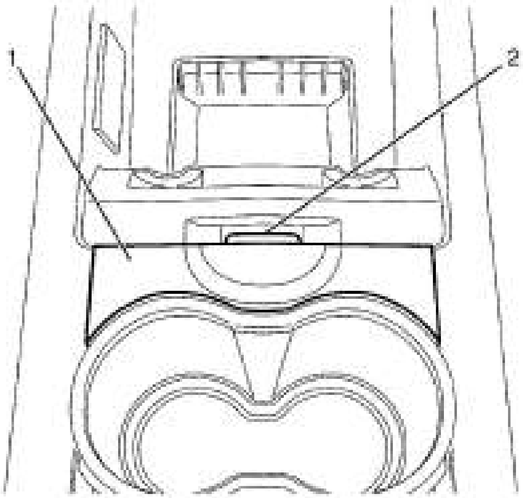
Removal Procedure - From 05 Mar 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

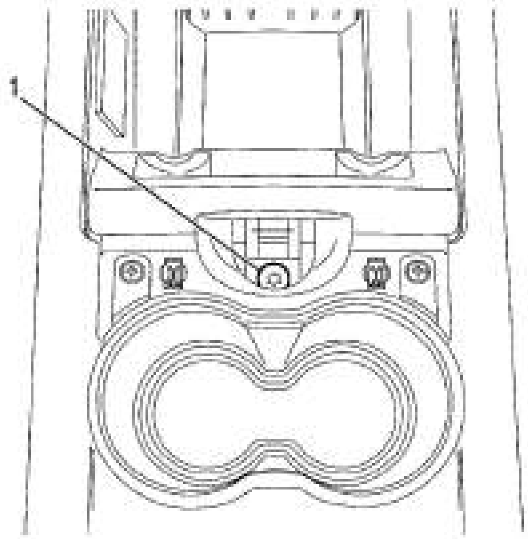
Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation .
3. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
4. Remove the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center .
5. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
6. Remove the fuel tank heat shield. Refer to Fuel Tank Heat Shield Replacement .
7. Lower the vehicle.

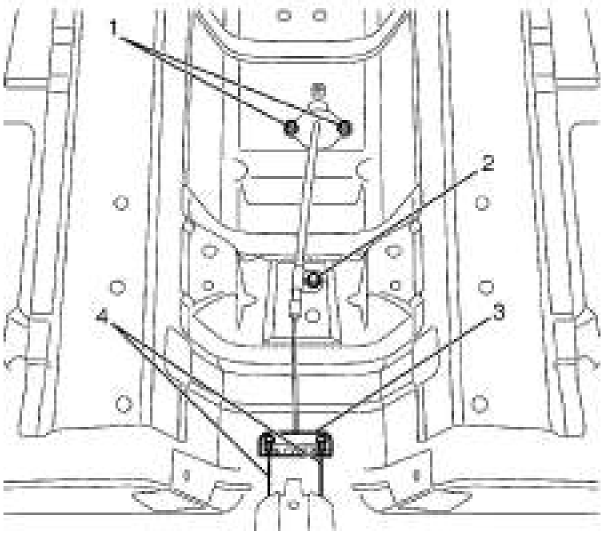


Important: The park brake cable adjustment bolt cover trim (1) is retained by two clips. Gently pry upwards with fingers at the front floor console armrest latch (2) to remove.

8. Remove the park brake cable adjustment bolt cover trim (1).



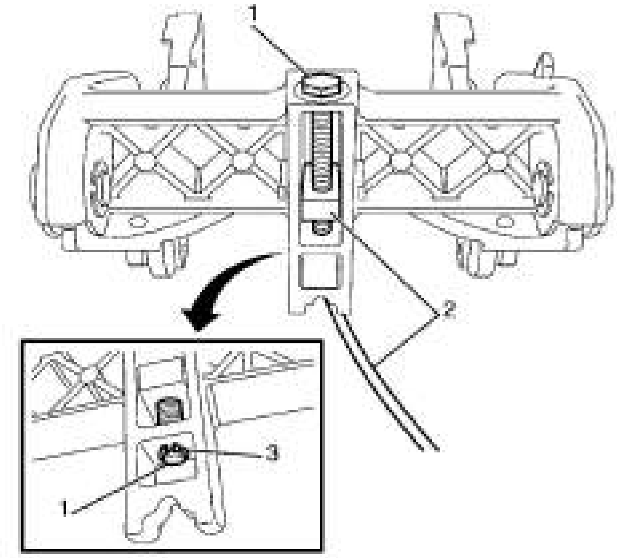
9. Loosen the park brake cable adjustment bolt (1) all the way to allow maximum slack in the rear park brake cables.
10. Raise the vehicle.



Important: Wrap a workshop cloth around the rear inner cable (4) to protect it from damage. Using pliers, pull the rear inner cable (4) forward and upwards to release the ball nipple from the front park brake cable and equaliser bracket assembly (3).

11. Remove the rear inner cables (4) from the front park brake cable and equaliser bracket assembly (3).
12. Remove the front park brake cable forward bracket to vehicle underbody retaining (1) nuts.
13. Remove the front park brake cable rear bracket to vehicle underbody retaining bolt (2).
14. Lower the vehicle.

15. Remove the park brake lever assembly from the front floor console. Refer to Parking Brake Release Handle Assembly Replacement .



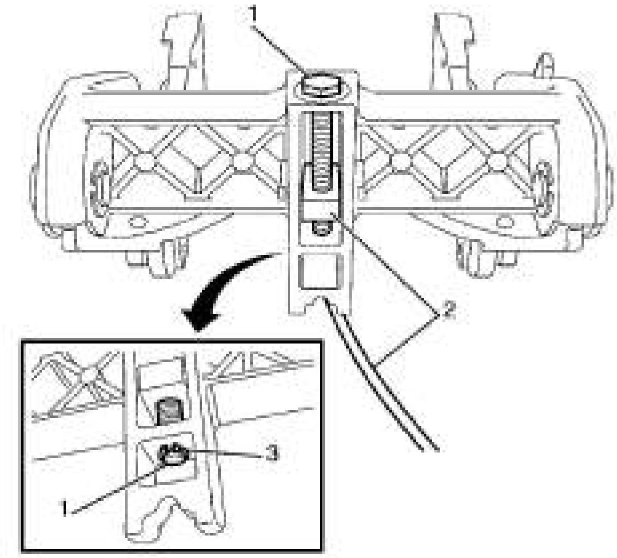
16. Remove the park brake cable adjustment bolt to park brake assembly retaining circlip (3).
17. Remove the park brake cable adjustment bolt (1).
18. Remove the front park brake cable (2).

Installation Procedure - From 05 Mar 2007

Caution: Refer to Safety Glasses Caution in the Preface section.

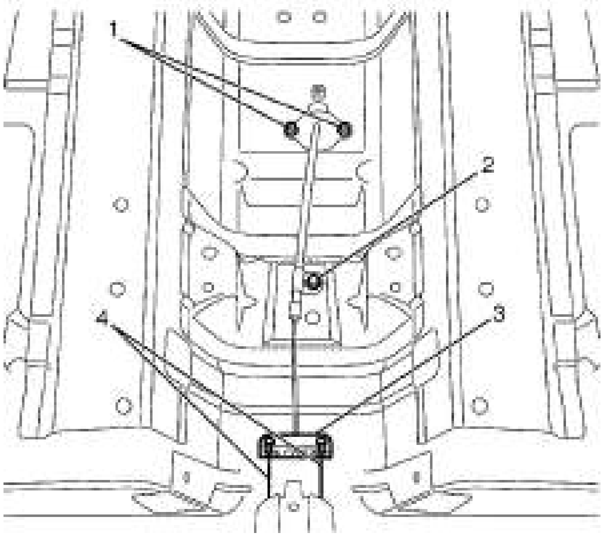
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Install the front park brake cable (2) into position.
2. Install the park brake cable adjustment bolt (1).
3. Install the park brake cable adjustment bolt to park brake assembly retaining circlip (3).
4. Install the park brake lever assembly and front floor console. Refer to Parking Brake Release Handle Assembly Replacement .
5. Raise the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.



6. Install the front park brake cable rear bracket to vehicle underbody retaining bolt (2).

   Tighten
   Tighten the bolt to 22 Nm (16 lb ft).

7. Install the front park brake cable forward bracket to vehicle underbody retaining (1) nuts.

   Tighten
   Tighten the nuts to 11 Nm (97 lb in).

   Important: Wrap a workshop cloth around the rear inner cable (4) to protect it from damage. Using pliers, pull the rear inner cable (4) forward and downwards to install the ball nipple to the front park brake cable and equaliser bracket assembly (3).

8. Install the rear inner cables (4) to the front park brake cable and equaliser bracket assembly (3).

   Make sure that the rear cables are properly seated.

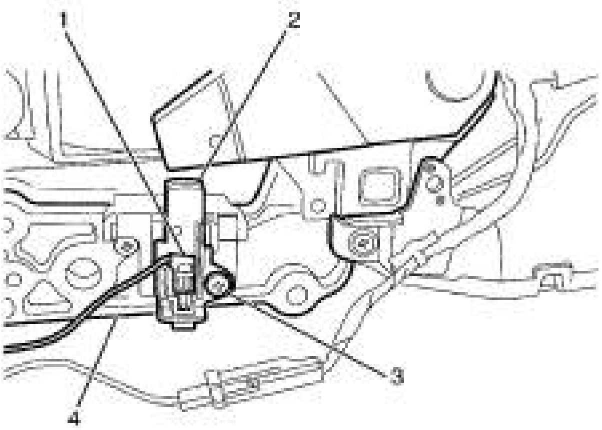
9. Adjust the park brake. Refer to Parking Brake Release Handle Assembly Replacement .

10. Cycle the park brake pedal 2-3 times to make sure that the park brake cable retainers are seated.
11. Install the fuel tank heat shield. Refer to Fuel Tank Heat Shield Replacement .
12. Install the propeller shaft. Refer to Propeller Shaft Replacement .
13. Install the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center .
14. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
15. Install the rear wheels. Refer to Tire and Wheel Removal and Installation .
16. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Park Brake | Repair Instructions | **Document ID: 1964621**

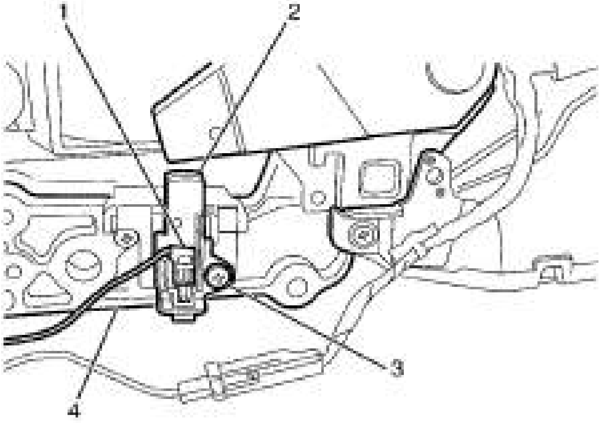
Parking Brake Indicator Switch Replacement (RHD)

Removal Procedure



1. Remove the front floor console left side panel. Refer to Console Trim Plate Replacement.
2. Disconnect the park brake warning lamp switch electrical connector (1).
3. Remove the park brake warning lamp switch to park brake lever assembly retaining screw (3).
4. Remove the park brake warning lamp switch (2) from the park brake lever assembly (4).

Installation Procedure



1. Connect the park brake warning lamp switch electrical connector (1).
2. Install the park brake warning lamp switch (2) to the park brake lever assembly (4).
3. Install the park brake warning lamp switch to park brake lever assembly retaining screw (3).

   Tighten
   Tighten the bolt to 2 Nm (18 lb in).

4. Install the front floor console left side panel. Refer to Console Trim Plate Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Park Brake | Repair Instructions | Document ID: 1964723

Parking Brake Rear Cable Replacement

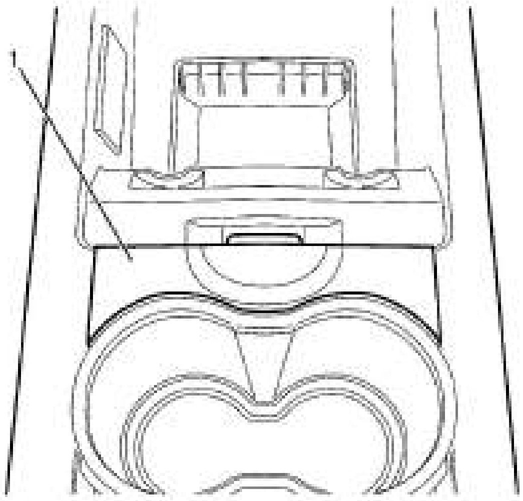
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

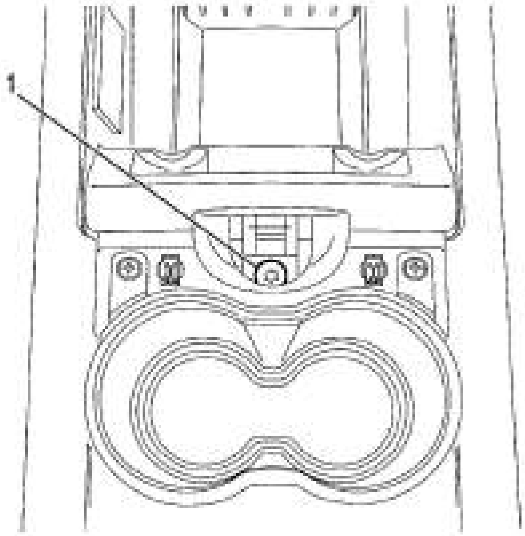
Caution: Refer to Brake Dust Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear wheels. Refer to Tire and Wheel Removal and Installation.
3. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.
4. Remove the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center .
5. Remove the propeller shaft. Refer to Propeller Shaft Replacement.
6. Remove the fuel tank heat shield. Refer to Fuel Tank Heat Shield Replacement.
7. Lower the vehicle to the ground.

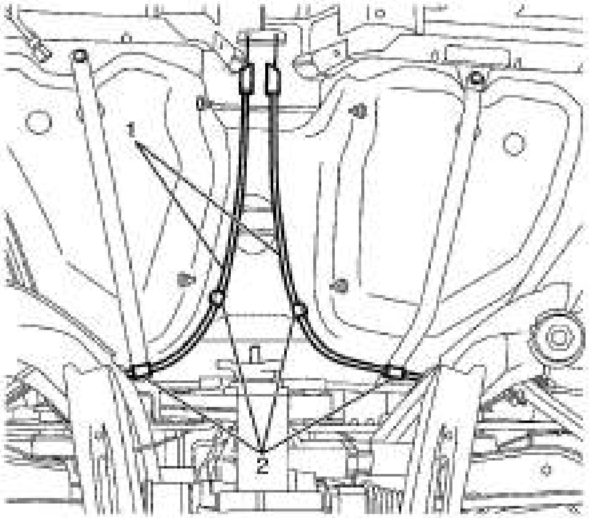


Important: The park brake cable adjustment bolt cover trim (1) is retained by two clips. Gently pry upwards with fingers at the front floor console armrest latch to remove.

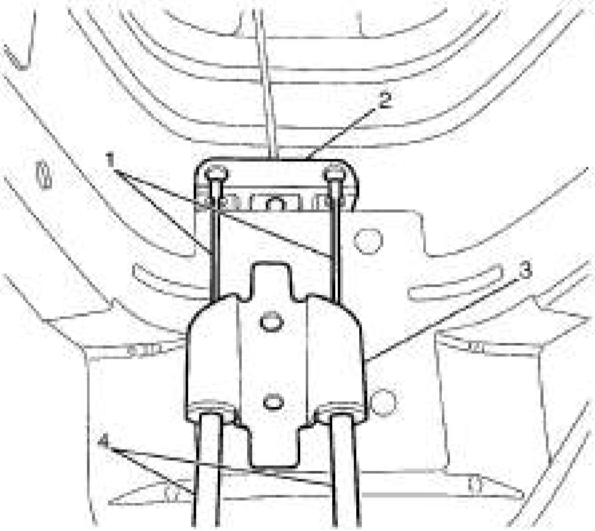
8. Remove the park brake cable adjustment bolt cover trim (1).



9. Loosen the park brake cable adjustment bolt (1) all the way to allow maximum slack in the rear park brake cables.
10. Raise the vehicle.



11. Detach the park brake cables (1) from the underbody park brake cable retaining clips (2).

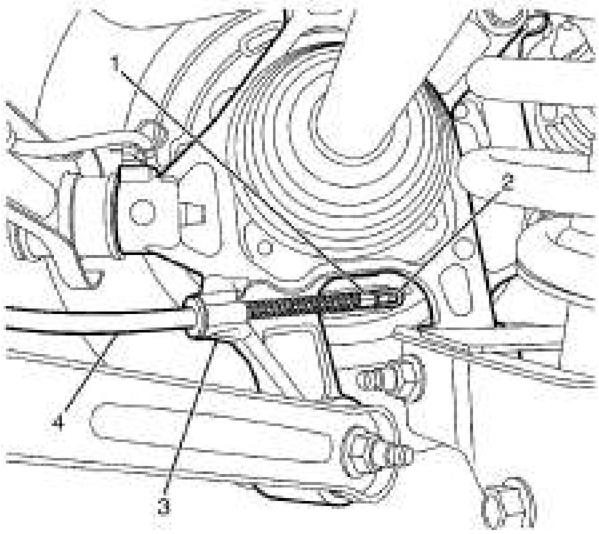


Important: Wrap a workshop cloth around the rear inner cable (1) to protect it from damage. Using pliers, pull the rear inner cable (1) forward and upwards to release the ball nipple from the front park brake cable and equaliser bracket assembly (2).

12. Remove the rear inner cables (1) from the front park brake cable and equaliser bracket assembly (2).

Important: Remove the outer cable (4) from the vehicle underbody bracket (3) by pulling the outer cable (4) rearward.

13. Remove the outer cable (4) from the vehicle underbody bracket (3).



Important: Remove the outer cable (4) from the rear knuckle (3) by pulling the outer cable (4) forward.

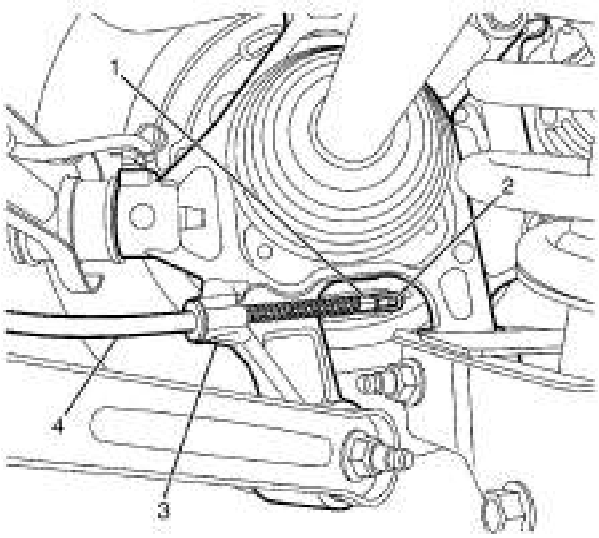
14. Remove the outer cable (4) from the rear knuckle (3).
15. Detach the rear park brake cable and clevis (1) from the park brake actuator (2).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

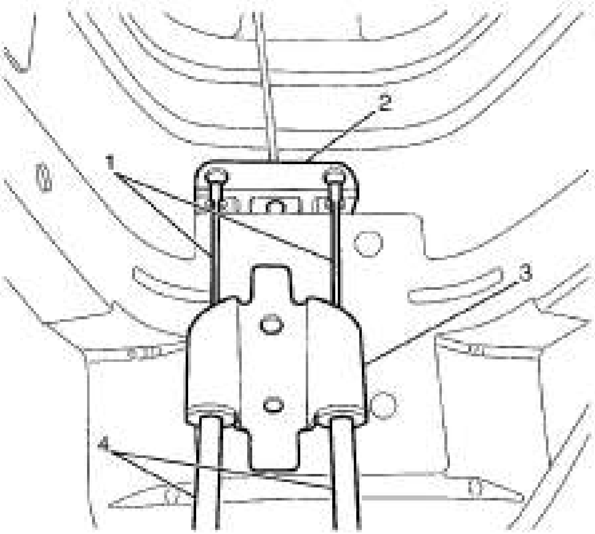
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



1. Attach the rear park brake cable and clevis (1) to the park brake actuator (2).
2. Install the rear park brake cable (4) into the rear knuckle (3).

   Make sure that the rear park brake cables (4) are properly seated.

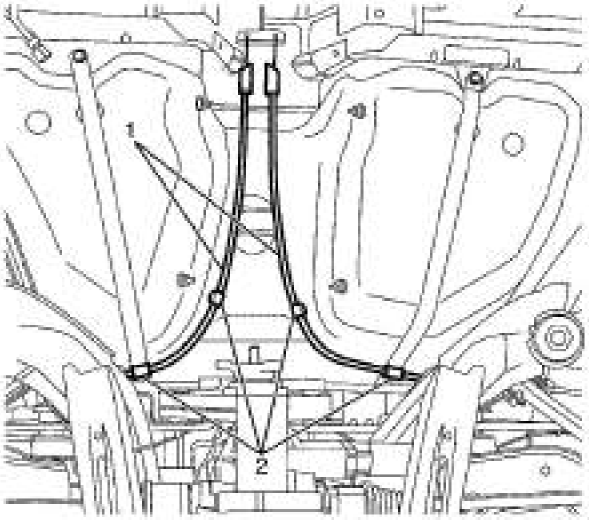


3. Install the outer cable (4) to the vehicle underbody bracket (3).

   Make sure that the outer cables (4) are properly seated in the vehicle underbody bracket (3).

   Important: Wrap a workshop cloth around the rear inner cable (1) to protect it from damage. Using pliers, pull the rear inner cable (1) forward and downwards to install the ball nipple to the front park brake cable and equaliser bracket assembly (2).

4. Install the rear inner cables (1) to the front park brake cable and equaliser bracket assembly (2).



5. Attach the park brake cables (1) to the underbody park brake cable retaining clips (2).
6. Adjust the park brake. Refer to Park Brake Adjustment.
7. Cycle the park brake lever 2-3 times to make sure that the park brake cable retainers are

seated.

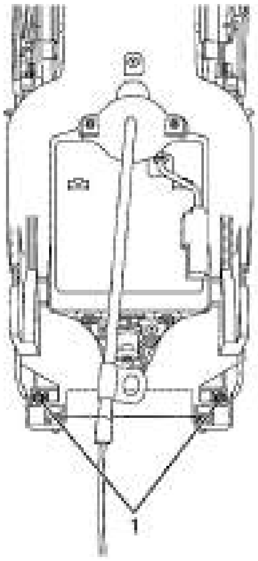
8. Install the fuel tank heat shield. Refer to Fuel Tank Heat Shield Replacement.
9. Install the propeller shaft. Refer to Propeller Shaft Replacement.
10. Install the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center.
11. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.
12. Install the rear wheels. Refer to Tire and Wheel Removal and Installation.
13. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Park Brake | Repair Instructions | Document ID: 1964626

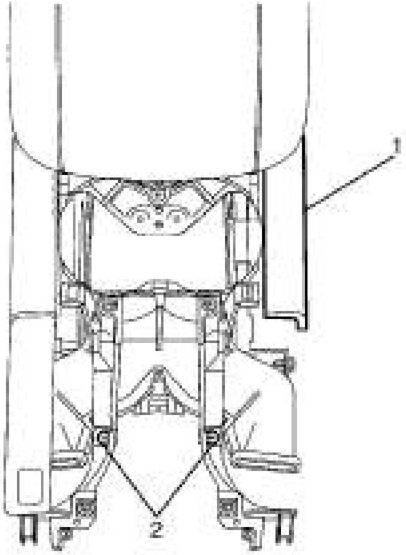
Parking Brake Release Handle Assembly Replacement (RHD)

Removal Procedure

1. Remove the front floor console assembly. Refer to Front Floor Console Replacement .



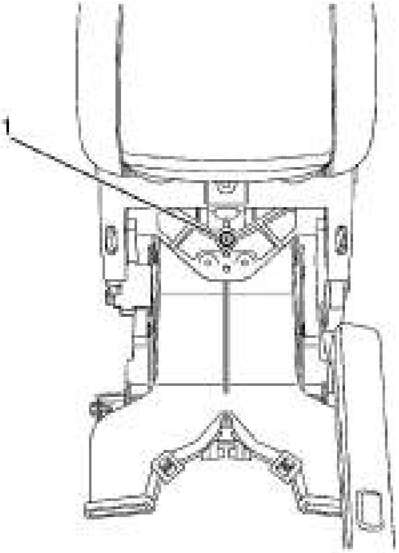
2. Remove the rear front floor console cover assembly to rear floor air outlet duct retaining screws (1).



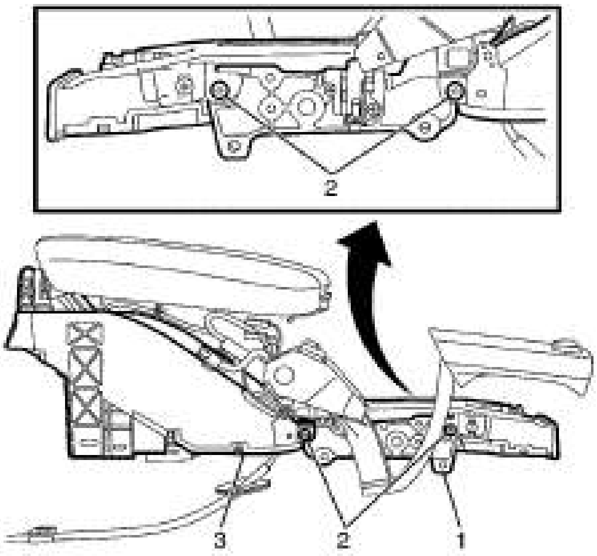
3. Remove the front floor console cover assembly to rear floor air outlet duct retaining

screws (2).

4. Remove the front floor console cover assembly (1).

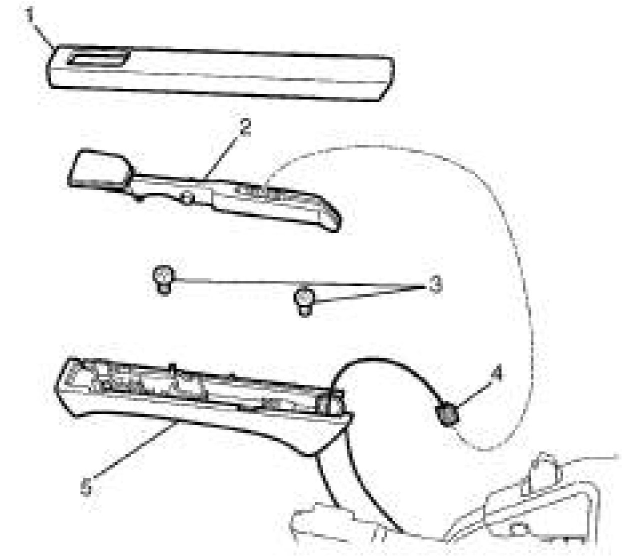


5. Remove the rear floor air outlet duct to park brake assembly retaining screw (1).



6. Remove the rear floor air outlet duct to park brake assembly retaining screw (2).
7. Remove the park brake assembly (1) from the rear floor air outlet duct (3).

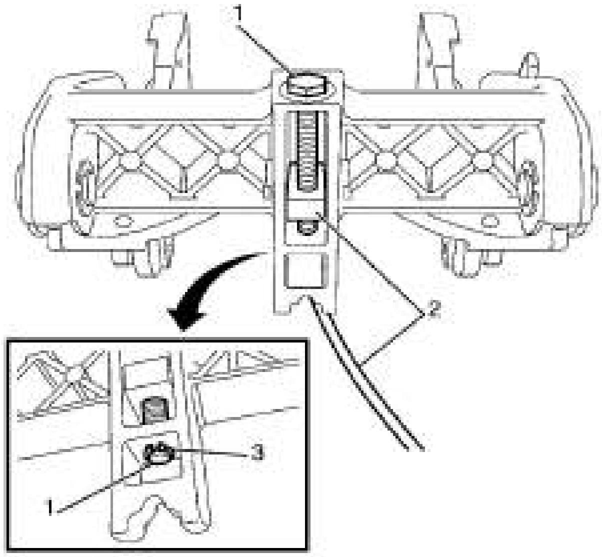
Disassembly Procedure



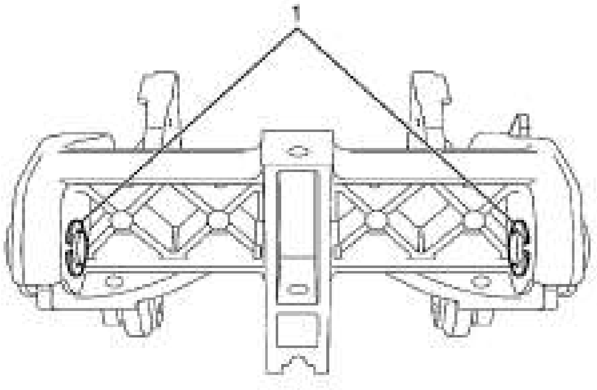
Important: The park brake lever upper grip (1) is retained by clips and glue. Lift the park brake lever upper grip (1) upwards with your fingers to detach the clips from the park brake lever lower grip (5).

Important: Due to the glue holding them together, the park brake lever upper and lower grips will need replacing once disassembled.

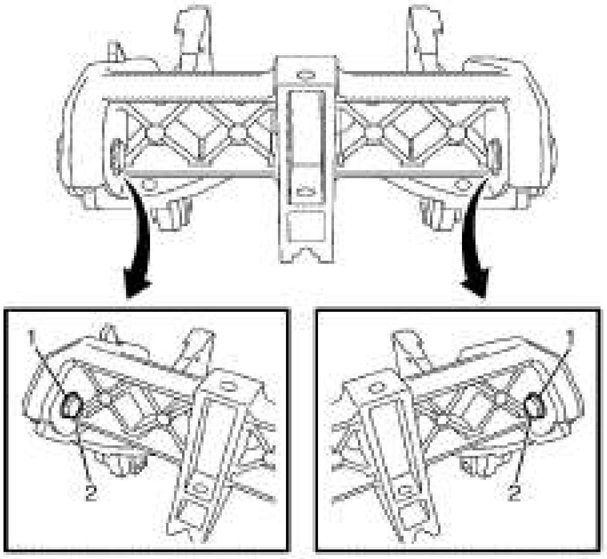
1. Remove the park brake lever upper grip (1) and discard.
2. Detach the park brake lever cable (4) from the park brake lever button (2).
3. Remove the park brake lever button (2) and the park brake lever spring.
4. Remove the park brake lever to park brake lever lower grip retaining screws (3).
5. Remove the park brake lever lower grip (5) and discard.



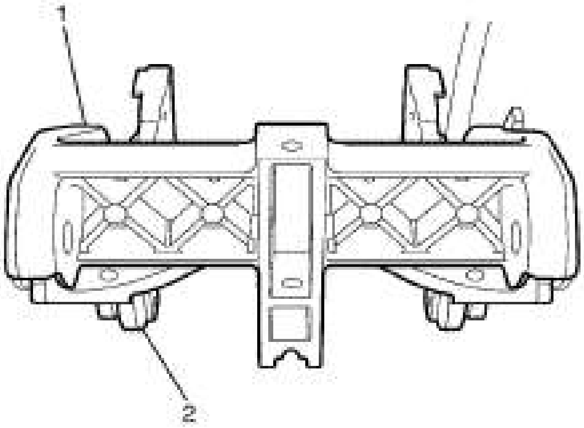
6. Remove the park brake cable adjustment bolt to park brake assembly retaining circlip (3).
7. Remove the park brake cable adjustment bolt (1).
8. Remove the front park brake cable (2).



9. Remove the pivot pin to park brake assembly retaining circlips (1).

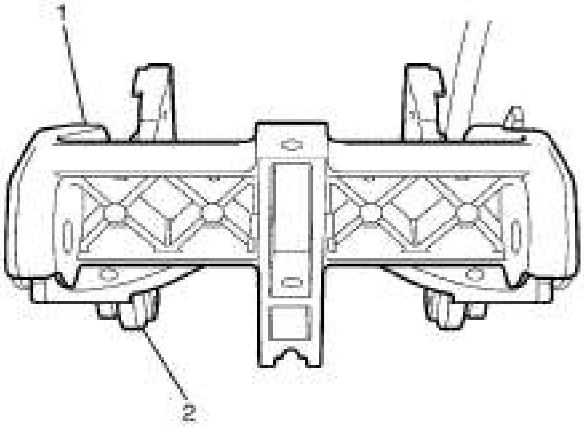


10. Remove the pivot pins (1) and bushes (2) from the park brake base.

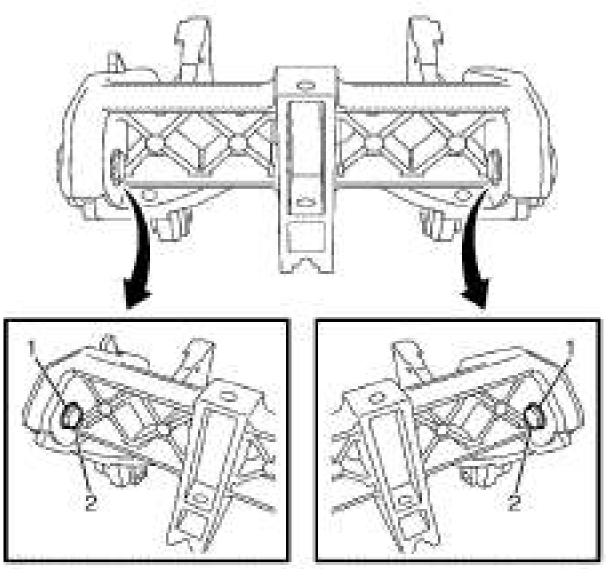


11. Separate the park brake lever assembly (1) from the park brake base (2).

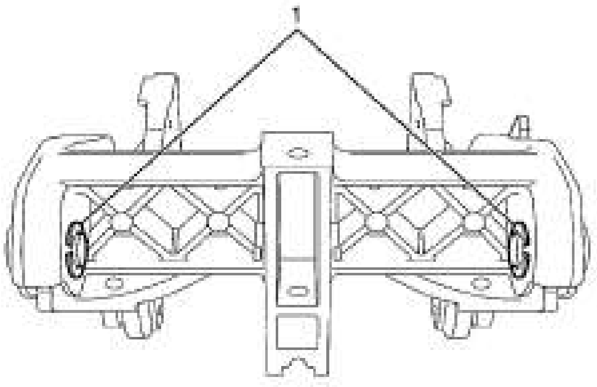
Assembly Procedure



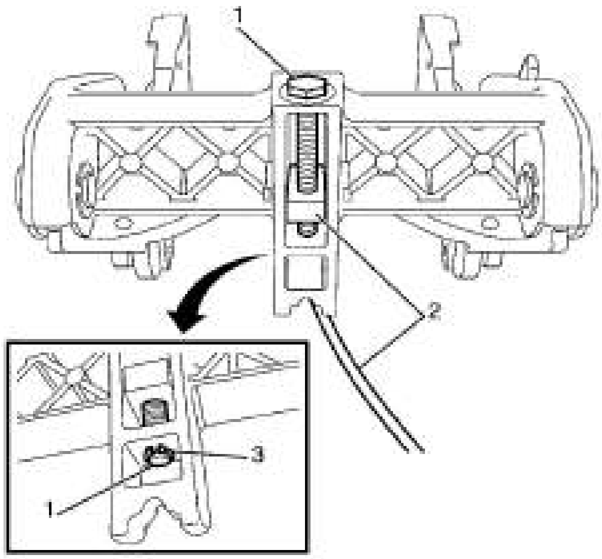
1. Install the park brake lever assembly (1) to the park brake base (2).



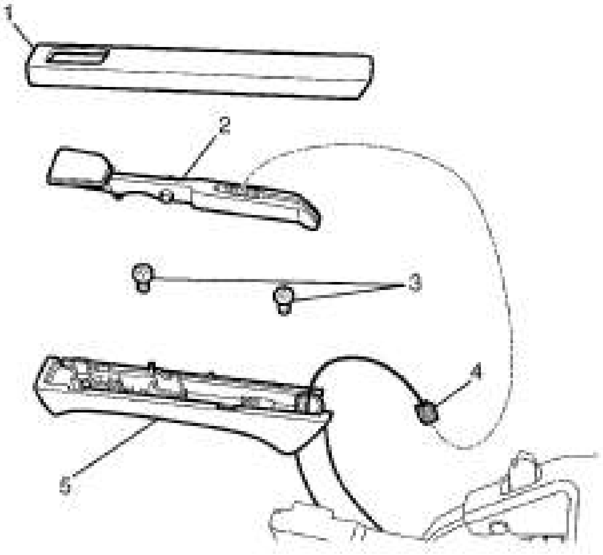
2. Install the pivot pins (1) and bushes (2) to the park brake base.



3. Install the pivot pin to park brake assembly retaining circlips (3).



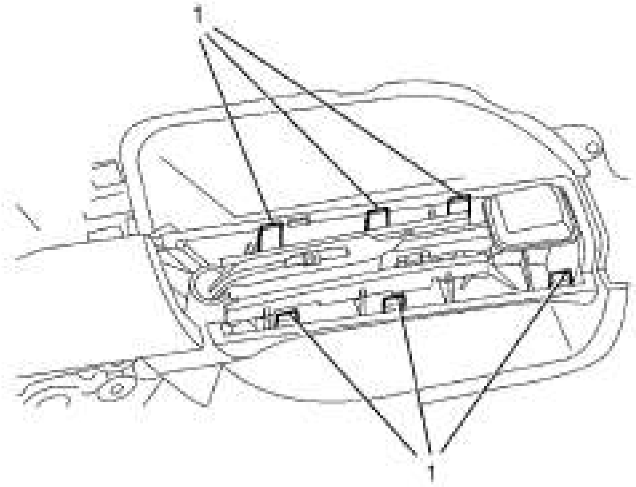
4. Install the front park brake cable (2) into position.
5. Install the park brake cable adjustment bolt (1).
6. Install the park brake cable adjustment bolt to park brake assembly retaining circlip (3).



7. Install NEW park brake lever lower grip (5).
8. Install the park brake lever to park brake lever lower grip retaining screws (3).
9. Install the park brake lever spring and the park brake lever button (2).

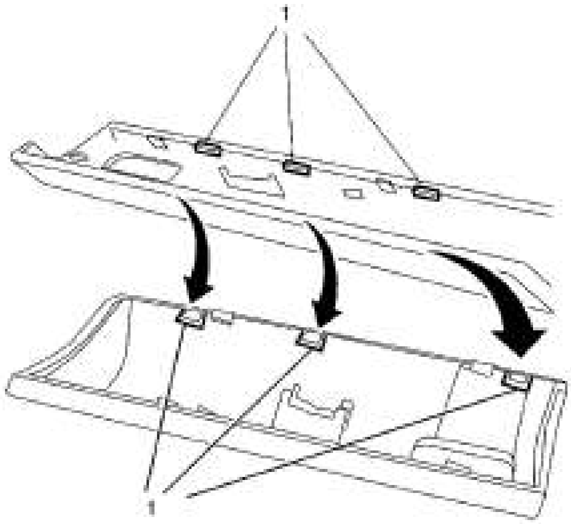
Important: Make sure there is not preload on the button release cable, this cable adjustment affects the release of the park brake, and could result in accidental release of the park brake.

10. Attach NEW park brake lever cable (4) to the park brake lever button (2).



Important: Apply 3M Scotch-Weld Acrylic Structural Plastic Adhesive DP-8005 or super glue (Loctite 406) to the six clips to ensure the park brake lever upper grip is retained. Glue should be applied under the barb of clip.

11. Apply Glue to the six clips on the park brake lever lower grip (1).



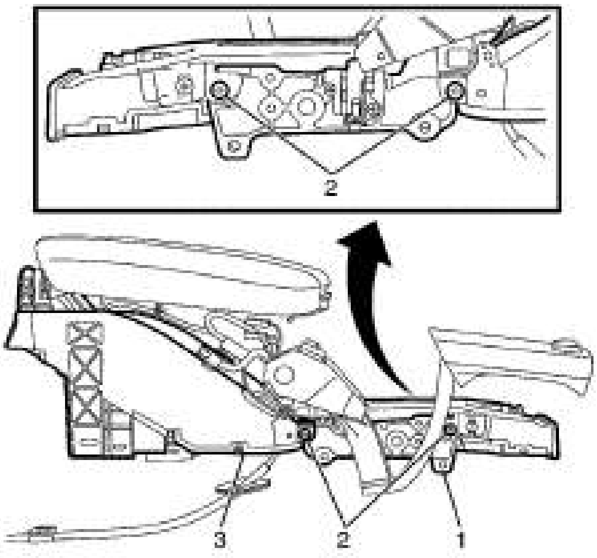
Important: Apply 3M Scotch-Weld Acrylic Structural Plastic Adhesive DP-8005 or super glue (Loctite 406) to the six clips to ensure the park brake lever upper grip (1) is retained.

12. Apply Glue to the six clips on the park brake lever upper grip (1).

Important: The park brake lever upper grip (1) is retained by clips. Fit the top cover by clipping inboard side first, and rolling over. Hold top down tight while glue sets. Make sure all the clips are aligned with the park brake lever lower grip and are engaged to avoid an induced rattle condition.

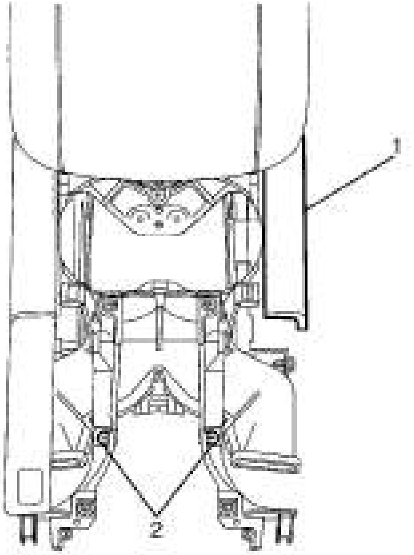
13. Install the park brake lever upper grip (1).

Installation Procedure



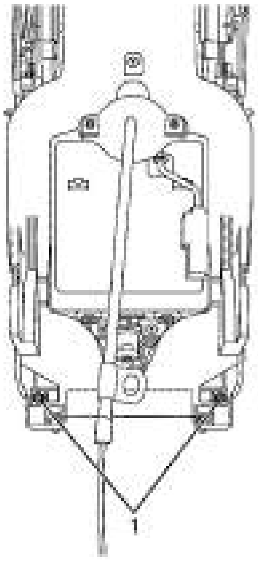
1. Install the park brake assembly (1) to the rear floor air outlet duct (3).
2. Install the rear floor air outlet duct to park brake assembly retaining screw (2)

   Tighten
   Tighten the bolt to 2 Nm (18 lb in).



3. Install the front floor console cover assembly (1).
4. Install the front floor console cover assembly to rear floor air outlet duct retaining screws (2).

Tighten
Tighten the bolt to 2 Nm (18 lb in).



5. Install the rear front floor console cover assembly to rear floor air outlet duct retaining screws (1).

Tighten
Tighten the bolt to 2 Nm (18 lb in).

6. Install the front floor console assembly. Refer to Front Floor Console Replacement .
7. Adjust the park brake. Refer to Park Brake Adjustment .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Brakes | Park Brake | Repair Instructions | **Document ID: 1964826**

Parking Brake Shoe Replacement

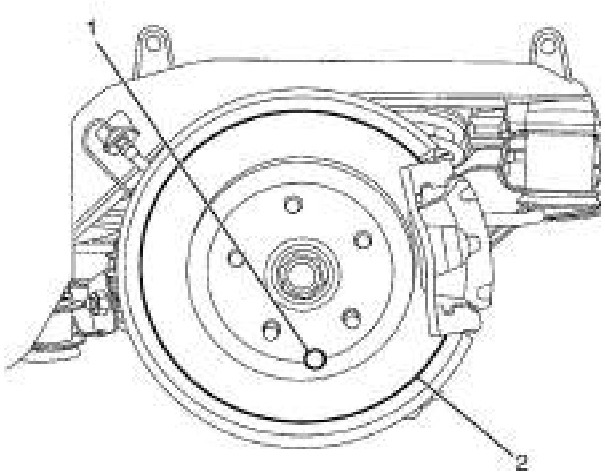
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

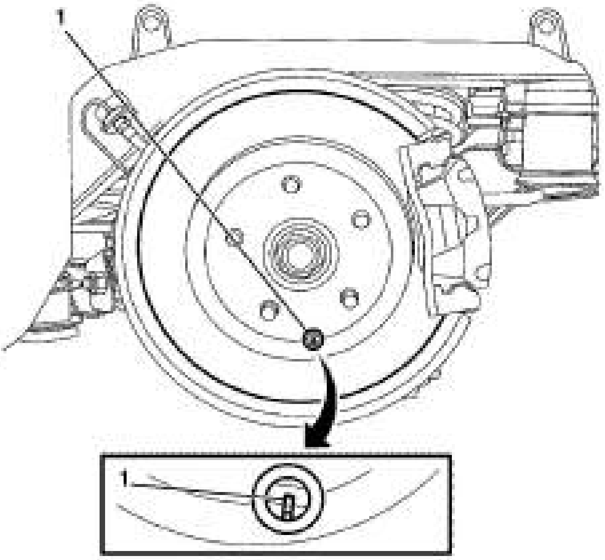
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.

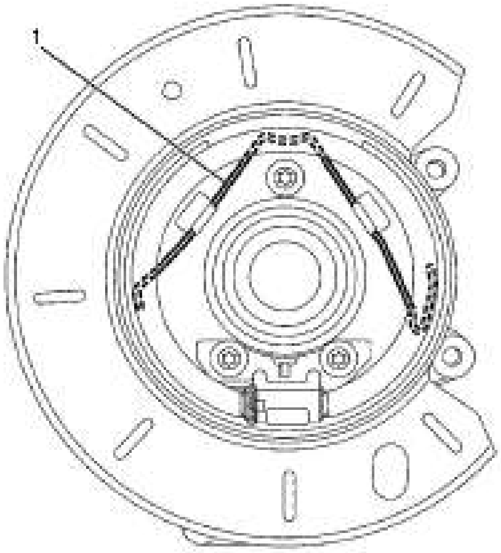
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation.



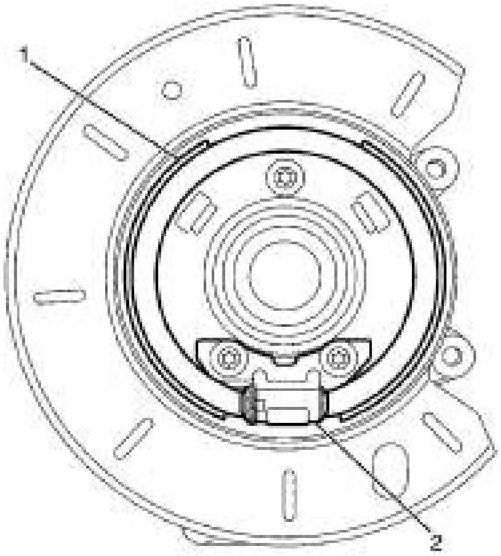
3. Remove the park brake adjustment access hole plug (1) from the brake disc (2).



4. Rotate the park brake adjuster nut (1) until all park brake shoe adjustment has been removed.
5. Remove the rear brake caliper and brake disc. Refer to Rear Brake Rotor Replacement.
6. Remove the wheel bearing and hub assembly. Refer to Rear Wheel Bearing and Hub Replacement.



7. Remove the park brake shoe retaining spring (1).



Important: Detach the park brake shoe (1) from the actuator assembly (2) by grasping the park brake shoe assembly (1) and pushing upwards.

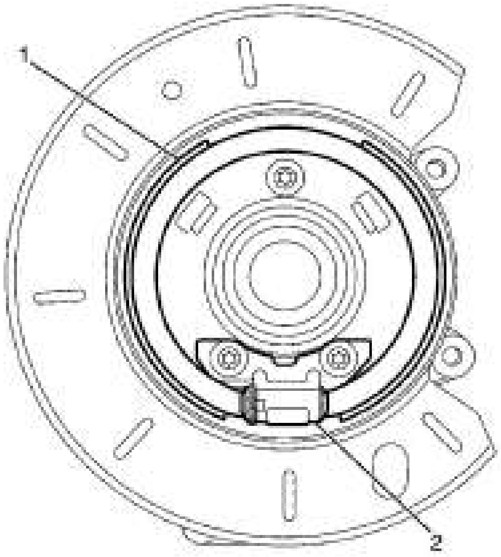
8. Detach the park brake shoe (1) from the actuator assembly (2).
9. Remove the park brake shoe (1).

Installation Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

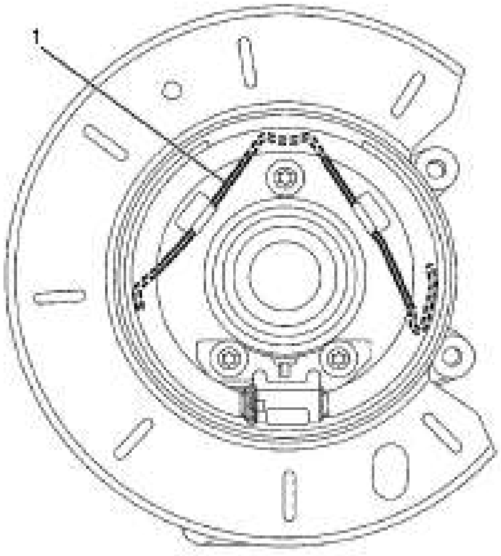
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Brake Dust Caution in the Preface section.



Important: Attach the park brake shoe assembly (1) to the actuator assembly (2) by grasping the park brake shoe assembly (1) and spreading slightly while pulling the shoe over the actuator assembly (2).

1. Attach the park brake shoe assembly (1) to the actuator assembly (2).



2. Install the parking brake shoe retaining spring (1).
3. Install the wheel bearing and hub assembly. Refer to Rear Wheel Bearing and Hub Replacement.
4. Install the rear brake disc and rear brake caliper. Refer to Rear Brake Rotor Replacement.
5. Adjust the park brake. Refer to Park Brake Adjustment.
6. Install the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation.
7. Lower the vehicle.

Park Brake System Description and Operation

System Component Description

The park brake system consists of the following:

Park Brake Handle Assembly: When pulled upward applies the park brake system and engages a ratchet assembly to hold the park brake on. A button on the top of the park brake handle releases the ratchet assembly and allows the park brake handle assembly to be lowered which releases the application of the park brake system.

Park Brake Cables: Transfers input force received from park brake handle assembly through park brake cable equalizer, to park brake apply lever.

Park Brake Cable Equalizer: Evenly distributes input force to both the left and right park brake units.

Park Brake Apply Lever: Multiplies and transfers input force to park brake actuator.

Park Brake Actuator / Adjuster: Uses multiplied input force from apply lever to expand park brake shoe toward the friction surface of the drum portion of the rear brake disc. Threaded park brake actuators are also used to control clearance between the park brake shoe and the friction surface of the drum portion of the rear brake disc.

Park Brake Shoe: Applies mechanical output force from park brake actuator to friction surface of the drum portion of the rear brake disc.

System Operation

Park brake application is achieved by the park brake handle assembly being pulled upward. This also engages a ratchet assembly in the park brake handle assembly which holds the park brake on. Park brake apply input force is transferred and evenly distributed through the park brake cables and park brake cable equalizer to the left and right park brake apply levers. The park brake apply levers multiply and transfer the apply input force to the park brake actuators. The park brake actuators expand the park brake shoe toward the friction surface of the drum portion of the rear brake disc preventing the rotation of the rear tyre and wheel assemblies. The park brake handle assembly has a release button on the top of the handle which releases the ratchet assembly when depressed. This allows the park brake handle assembly to be lowered which releases the application of the park brake system.

Obtaining TIS Approval (RHD)

General Information

Certain programming functions performed with the scan tool are prohibited without TIS approval. TIS approval can be obtained by clicking on the Security Access icon on the TIS 2000 Application Selection Screen

Security Access

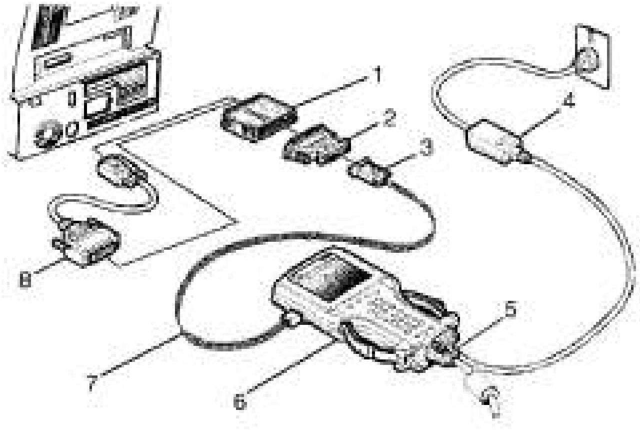
Security Access is used in order to prevent unauthorised persons from programming certain security functions.

After a scan tool security programming function has been selected, the scan tool will display: Please get programming approval from TIS!

To enable these programming procedures they must be approved by the TIS 2000 Security Access function and scan tool must be connected to TIS 2000 using the RS232 interface and a registered security hardware key. Without this security hardware key, an error message is given by TIS 2000.

Security Access Procedure

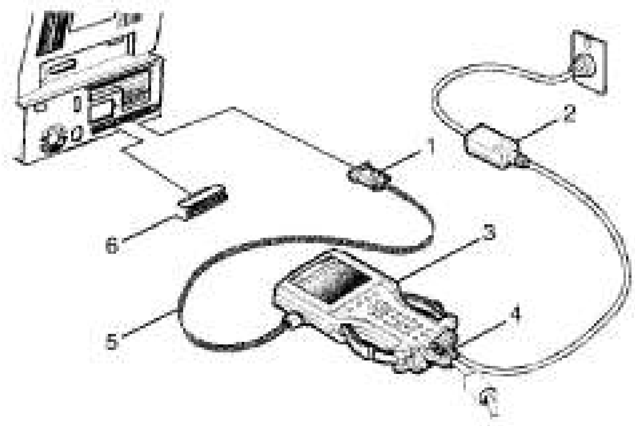
1. If your security hardware key is the serial type, go to step 2. If your hardware key is the parallel type, go to step 7. If your hardware key is the USB type, go to step 12.



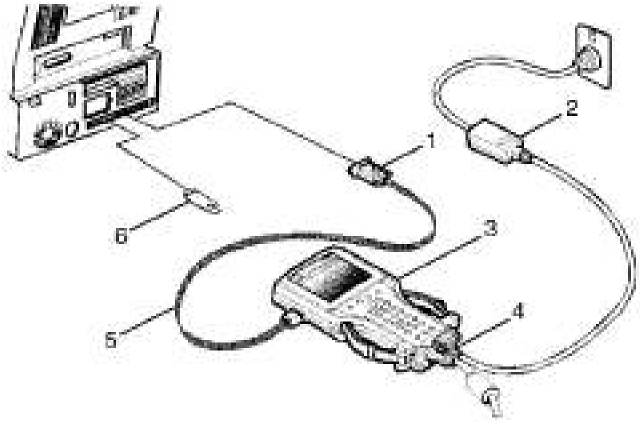
2. Connect the RS-232 cable (7) to the scan tool (6) RS-232 communication port.
3. Connect the other end of the RS-232 cable to the DB-9 adapter (3) and then connect the DB-9 adapter to the 25/9 pin adapter (2).

Important: If your PC has a 9 pin serial communication port you will need to fit the 9/25 pin adapter (8) between the hardware key and the serial port of the TIS 2000 PC.

4. Connect the 25/9 pin adapter to the Serial Security Hardware Key (1) and then connect the Serial Security Hardware Key to the serial port of a Personal Computer (PC) with TIS 2000 installed.
5. Connect the power supply (4) to the scan tool power supply jack (5). Press the PWR button to turn on the scan tool. The scan tool should now be at the title display screen.
6. Now go to step 16.



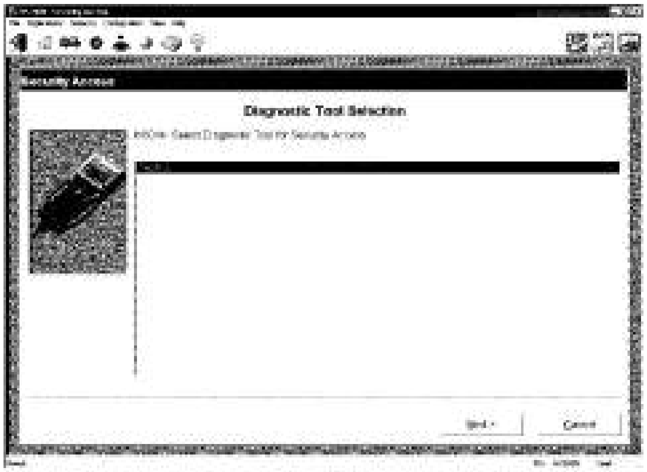
7. Connect the RS-232 cable (5) to the scan tool (3) RS-232 communication port.
8. Connect the other end of the RS-232 cable to the DB-9 adapter (1) and then connect the DB-9 adapter to the Comms port of the Personal Computer (PC) with TIS 2000 installed.
9. Connect the Parallel Security Hardware Key (6) to the serial port of the Personal Computer (PC) with TIS 2000 installed.
10. Connect the power supply (2) to the scan tool power supply jack (4). Press the PWR button to turn on the scan tool. The scan tool should now be at the title display screen.
11. Now go to step 16.



12. Connect the RS-232 cable (5) to the scan tool (3) RS-232 communication port.
13. Connect the other end of the RS-232 cable to the DB-9 adapter (1) and then connect the DB-9 adapter to the Comms port of the Personal Computer (PC) with TIS 2000 installed.
14. Connect the USB Security Hardware Key (6) to the USB port of the Personal Computer (PC) with TIS 2000 installed.
15. Connect the power supply (2) to the scan tool power supply jack (4). Press the PWR button to turn on the scan tool. The scan tool should now be at the title display screen.

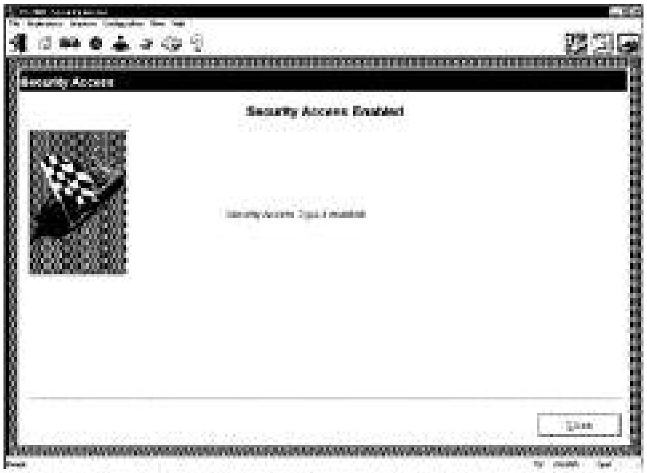
Object Number: 1954313 Size: SH

16. From the TIS 2000 main menu, click on the Security Access icon to start the application.



Security Access
Diagnostic Tool Selection

17. Select diagnostic tool (Tech 2) for Security Access.
18. Select Next> to continue.



Security Access
Security Access Enabled

19. When the process is complete, a Security Access Enabled, Security Access Type 2 and or 3 enabled screen appears. Click on the Close button to close the application.
20. Reconnect the scan tool to the vehicle DLC and reselect the programming function, you will now be permitted to complete the programming function.

Audio/Video Interface Module Programming and Setup

Rear Seat Entertainment (RSE) Interface Module Replacement

Important: If the RSE interface module vehicle identification number (VIN) does not match the VIN transmitted by the body control module (BCM) the system will enter theft mode and will be locked. After the installation of a new RSE interface module, the RSE interface module will auto-learn the VIN that is transmitted by the BCM.

If the RSE interface module is replaced, the following procedures must be performed:

1. RSE interface module reprogramming - Refer to Service Programming System (SPS) .
2. Link RSE Components procedure.
3. Program Region Code to the RSE interface module.

Link RSE Components

Important: Performing the Link RSE Components procedure is prohibited without TIS approval. Refer to Obtaining TIS Approval for more information.

Important: If the Link RSE Components procedure is not performed the RSE system will not function correctly. If either the RSE interface module or any of the RSE system components are independently replaced it will be necessary to perform the "Link RSE Components" procedure. If all RSE components are replaced together they will auto-link.

1. Install a diagnostic scan tool.
2. Select Infotainment System.
3. Select RSE (Rear Seat Entertainment).
4. Select Programming.
5. Select the Link RSE Components procedure and follow the directions displayed on the screen.
6. Obtain TIS approval then repeat steps 1-5.

Program Region Code

Important: Performing the program region code procedure is prohibited without TIS approval. Refer to Obtaining TIS Approval for more information.

Important: The region code can only be set ONCE. Once the region code has been set it cannot be reprogrammed again.

1. Install a diagnostic scan tool.
2. Select Infotainment System.
3. Select RSE (Rear Seat Entertainment).
4. Select Programming.
5. Select the Program Region Code procedure and follow the directions displayed on the screen.
6. Obtain TIS approval then repeat steps 1-5.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Body Control Module Programming and Setup

Introduction

A new body control module (BCM) must be programmed with the latest operating software and vehicle calibrations. Ensure that the following conditions exist in order to prepare for BCM programming:

- The battery is fully charged.
- The ignition switch is in the ON position.
- The data link connector (DLC) is accessible.
- All disconnected modules and devices are connected.

Programming the BCM

Important: The vehicle will not start and many other functions may not operate correctly if a replacement BCM is not correctly set up. The following procedures must be followed:

1. The BCM reprogramming - Refer to Service Programming System (SPS) Notice .
2. Brake pedal position sensor (BPPS) learn.
3. Program SDM primary key to BCM

Important: After the procedure is completed, the personalization settings of the BCM are set to default settings. Inform the customer that the personalization must be set again.

Brake Pedal Position Sensor (BPPS) Learn

1. *Calibration Criteria* DO NOT apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the BPPS calibration must be repeated. BPPS calibration must be performed after the BPPS or body control module (BCM) have been serviced. The calibration procedure will set the BPPS home value. This value is used by the BCM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via the serial data communication bus.

   Apply the parking brake.

2. Place the transmission in the PARK position for automatic transmission or NEUTRAL for manual transmission.
3. Install a diagnostic scan tool.
4. Key ON, engine OFF, select Body.
5. Select BCM (Body Control Module).
6. Select Programming.
7. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.
8. Check all vehicle lights for correct operation.

Program SDM Primary Key to BCM

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Body.
3. Select BCM (Body Control Module).
4. Select Programming.
5. Select the Program SDM primary key to BCM procedure and follow the directions displayed on the screen.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Clutch Pedal Position Sensor Learn

Important: The clutch pedal position (CPP) sensor learn procedure is required when the following service procedures have been performed regardless of whether DTC P080A is set:

- An engine control module (ECM) replacement
- A CPP sensor replacement
- Any repairs which affect the CPP sensor relationship

1. Install a scan tool.
2. Monitor the ECM for DTCs with a scan tool. If other DTCs are set, except DTC P080A, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC that set.
3. With a scan tool, select Clutch Pedal Position Learn under Module Setup in Manual Transmission, and perform the following instructions displayed on the scan tool screen.

   Important: The CPP sensor learn procedure cannot be performed more than once per ignition cycle. The clutch pedal needs to be fully depressed and held steady throughout this procedure in order to perform a correct learning.

4. The scan tool will display under CPP Learn Status: Not Learned, In Process, Complete, Fail - Low Volt, Fail - High Volt, or Fail Moving. The scan tool will display under CPP Learn Status Complete if the process was successful.
5. If the scan tool indicates that DTC P080A ran and passed this ignition the CPP sensor learn procedure is complete. If the scan tool indicates DTC P080A failed or did not run this ignition, refer to DTC P080A. If any other DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC.
6. Turn OFF the ignition for 30 seconds after the learn procedure has successfully completed in order to store the CPP sensor variation values in ECM history.

Diagnostic Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 seconds.
5. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

   Or

   If the repair was symptom related, duplicate the conditions under which the customer concern occurred to verify the repair. If the customer concern reoccurs or another symptom is present, return to Symptoms - Vehicle and perform the appropriate symptom diagnostic.

Driver Information Display Control Module Programming and Setup

Important: There are two display types available for this vehicle - standard and sports, the standard has one programming option for audio display. The sports has two programming options, one for audio display, one for voltage/oil pressure depending on the vehicle option level.

If the standard secondary information centre (SIC) is removed or replaced the following procedures must be performed:

Standard Installation

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Infotainment System.
3. Select SIC (Secondary Information Centre).
4. Select Programming.

   Important: The VIN will automatically program to the SIC once this process is selected. No further steps are required.

5. Select Learn Vehicle Identification Number (VIN).

If the standard secondary information centre (SIC) is removed or replaced the following procedures must be performed:

Sports Installation

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Infotainment System.
3. Select SIC (Secondary Information Centre).
4. Select Programming.
5. Select Display Type.
6. Select Standard or Sports - standard will provide audio display, sports will provide voltage/oil pressure gauges.

   Important: The VIN will automatically program to the SIC once the following process is selected.

7. Select Learn Vehicle Identification Number (VIN).

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Electronic Brake Control Module Programming and Setup

EBCM Replacement

If the electronic brake control module (EBCM) is replaced it must be programmed. The following must be performed in the specified order to program the EBCM:

1. Service Programming System (SPS)
2. Steering Angle Sensor Centering

Service Programming System (SPS)

For step-by-step programming instructions, please refer to the techline information system (TIS) terminal.

Review the information below to ensure proper programming protocol.

Important:

- DO NOT program a control module unless you are directed by a service procedure or you are directed by a General Motors Corporation service bulletin. Programming a control module at any other time will not permanently correct a customers concern.
- It is essential that the Tech 2, MDI and the TIS terminal are all equipped with the latest software before performing service programming.
- Due to the time requirements of programming a controller, it is recommended that an external power source be used to maintain system voltage. Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. To ensure trouble-free programming, GM recommends using one of the following external power sources:
  - A Midtronics PSC charger
  - A fully charged 12V jumper or booster pack disconnected from the AC voltage supply
- Some modules will require additional programming/setup events performed before or after programming.
- Some vehicles may require the use of a CANDi or MDI module for programming.
- Review the appropriate service information for these procedures.
- DTCs may set during programming. Clear DTCs after programming is complete.
- Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Ensure the following conditions are met before programming a control module:

- Vehicle system voltage:
  - There is not a charging system concern. All charging system concerns must be repaired before programming a control module.
  - Battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the control module.
  - Turn OFF or disable any system that may put a load on the vehicles battery, such as the following components:
    - Twilight sentinel
    - Interior lights
    - Daytime running lights (DRL)--Applying the parking brake, on most vehicles, disables the DRL system
    - Heating, ventilation, and air conditioning (HVAC) systems
    - Engine cooling fans, radio, etc.
- The ignition switch must be in the proper position. SPS prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the

programming procedure, unless instructed to do so.

- Make certain all tool connections are secure, including the following components and circuits:
  - Tech 2
    - The RS-232 communication cable port
    - The connection at the data link connector (DLC)
    - The voltage supply circuits
  - MDI
    - The USB, Ethernet or Wireless communication port
    - The connection at the data link connector (DLC)
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or control module damage may occur.
- DO NOT turn OFF the ignition if the programming procedure is interrupted or unsuccessful. Ensure that all control module and DLC connections are secure and the TIS terminal operating software is up to date. Attempt to reprogram the control module. If the control module cannot be programmed, replace the control module.

Steering Angle Sensor Centering

The steering angle sensor does not require centering often. Centering of the steering angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Steering gear replacement
- Steering column replacement
- Steering angle sensor replacement
- Intermediate shaft replacement
- Electronic brake control module (EBCM) replacement
- Collision or other physical damage

The steering angle sensor centering procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align the front wheels forward.
2. Set the transmission in the PARK position.
3. Turn the ignition switch ON, with the engine OFF.
4. Clear any DTCs that may be set.
5. Select Steering Angle Sensor Centering in the EBCM Special Functions list.
6. Follow the scan tool directions to complete the centering procedure.

Engine Control Module Programming and Setup (3.6L)

The following service procedures require either a programming or a setup event performed for a complete repair.

Warning: Replacement or reprogramming of the ECM, or replacement of the clutch pedal position sensor (CPPS) or clutch pedal requires that a CPPS learn procedure be performed. Failure to perform the CPPS learn procedure may result in personal injury or damage to the vehicle or its components if the vehicle is in gear and the starter motor is accidentally engaged.

ECM Replacement and Reprogramming

If the engine control module (ECM) is replaced or reprogrammed, the following procedures must be performed:

1. ECM Reprogramming--Refer to Service Programming System (SPS) .
2. Clutch pedal position sensor learn, if equipped--Refer to Clutch Pedal Position Sensor Learn .
3. Idle Learn Procedure--Refer to Idle Learn
4. Theft Deterrent--Refer to Theft Deterrent Control Module Programming and Setup . The ECM will learn the incoming fuel continue password immediately upon receipt of a password message. Once a password message is received, and a password is learned, a learn procedure must be performed to change this password again. An ECM which has been previously installed in another vehicle will have learned the other vehicle's fuel continue password, and will require a learn procedure after programming to learn the current vehicle's password.
5. Engine Oil Life Remaining--When available, use a scan tool to reset the Engine Oil Life Remaining back to the original percentage recorded before the module was replaced.

Setup for Component Replacement

The replacement of some components will require a setup procedure for complete repair.

- If any of the following components are replaced, an Idle Learn Procedure must be performed. Refer to Idle Learn .
  - Throttle body assembly
  - ECM
- If any of the following components are replaced, a Clutch Pedal Position Sensor Learn Procedure must be performed. Refer to Clutch Pedal Position Sensor Learn .
  - Clutch pedal
  - Clutch pedal position sensor

Engine Control Module Programming and Setup (6.0L)

The following service procedures require either a programming or a setup event performed for a complete repair.

ECM Replacement

Warning: Replacement or reprogramming of the ECM, or replacement of the clutch pedal position sensor (CPPS) or clutch pedal requires that a CPPS learn procedure be performed. Failure to perform the CPPS learn procedure may result in personal injury or damage to the vehicle or its components if the vehicle is in gear and the starter motor is accidentally engaged.

If the engine control module (ECM) is replaced, the following procedures must be performed:

> **Note:** When replacing the ECM, the ECM must be reset prior to removal. Failure to perform this procedure will result in the inability to:
> - Test the ECM for warranty purposes.
> - Install the ECM into other vehicles.

1. ECM reset procedure
2. ECM reprogramming--Refer to Service Programming System (SPS) .
3. The Throttle Learn procedure--Refer to Throttle Learn .
4. The CKP Variation Learn/CASE-Crank Angle Sensing Error procedure--Refer to Customer Concern Verification Sheets .
5. The Theft Deterrent Programming--Refer to Theft Deterrent Control Module Programming and Setup .
6. The Clutch Pedal Position Sensor Learn--Refer to Clutch Pedal Position Sensor Learn .

ECM Reprogramming

Warning: Replacement or reprogramming of the ECM, or replacement of the clutch pedal position sensor (CPPS) or clutch pedal requires that a CPPS learn procedure be performed. Failure to perform the CPPS learn procedure may result in personal injury or damage to the vehicle or its components if the vehicle is in gear and the starter motor is accidentally engaged.

- If the ECM needs to be reprogrammed, refer to Service Programming System (SPS) .
- The Clutch Pedal Position Sensor Learn--Refer to Clutch Pedal Position Sensor Learn .
- Engine Oil Life Remaining - When available, use a scan tool to reset the Engine Oil Life Remaining back to the original percentage recorded before the module was reprogrammed.

Setup for Component Replacement

The replacement of some components will require a setup procedure for complete repair.

If any of the following components are replaced, a CKP Variation Learn Procedure must be performed. Refer to Customer Concern Verification Sheets .

- Engine replacement
- Any engine repair that disturbs the crankshaft position (CKP) sensor or its relationship with the crankshaft reluctor wheel.
- CKP sensor

If the throttle body is replaced, a Throttle Learn procedure must be performed. Refer to Throttle Learn .

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

HVAC Control Module Programming and Setup

Each of the following service procedures may require programming or setup procedures to be performed on the HVAC control module or HVAC actuators.

HVAC Control Module Replacement

If the HVAC manual or HVAC automatic control modules are replaced, an automatic re-calibration of all the actuators will occur. For the best re-calibration results, start and run the engine for at least one minute after installing the new module . Do not adjust any controls on the HVAC control module during the re-calibration procedure. If interrupted, improper HVAC performance may result. No additional procedures are necessary.

HVAC Control Module Reprogramming

Do not reprogram the HVAC control module unless directed by a service procedure or a service bulletin.

Reprogram HVAC Control Module--Refer to Service Programming System (SPS) .

Inflatable Restraint Sensing and Diagnostic Module Programming and Setup

Important: After installing and one cycle of the ignition, the inflatable restraint sensing and diagnostic module (SDM) is locked to the vehicle and it will not be possible to swap between other vehicles.

Program SDM Primary Key to BCM

Important: Performing the SDM primary key to BCM programming is prohibited without TIS approval. Refer to Obtaining TIS Approval for more information.

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Body.
3. Select SDM (Sensory Diagnostic Module).
4. Select Programming.
5. Select the Program SDM primary key to BCM procedure and follow the directions displayed on the screen.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Instrument Cluster Programming and Setup

IPC Replacement

Important: The original odometer reading, together with other important vehicle parameters, must be programmed into the replacement instrument cluster. If a replacement cluster has been fitted to a vehicle it will require programming, the vehicle type must be selected followed by the country and then the engine type. The engine type is required only for some countries and this is highlighted below.

If the instrument panel cluster (IPC) is replaced, the following procedures must be performed in the order shown:

1. Odometer reprogramming.

   Important: The IPC variant configuration must be correct or the performance of the EBCM will be reduced.

2. Variant configuration.
3. IPC reprogramming - Refer to Service Programming System (SPS) .

Program Odometer

Important: It is only possible to reset the odometer reading if no more than 100 km has been registered on the odometer. It is essential to enter the correct odometer value, as the programming of the odometer can only be performed once.

Important: Programming the odometer is prohibited without TIS approval. Refer to Obtaining TIS Approval for more information.

1. Install a diagnostic scan tool.
2. Select Body.
3. Select IPC (Instrument Panel Cluster).
4. Select Programming.
5. Select the Program Odometer procedure and follow the directions displayed on the screen.
6. Obtain TIS approval then repeat steps 1-5.

Program Variant Configuration

This option allows you to reconfigure the instrument panel cluster (IPC) from the default factory settings.

Important: Regular production options (RPOs) are located on the vehicle security card.

Prior to removal use a scan tool to identify the existing RPOs that are programmed into the IPC.

The following options are available:

1. Car Body Style.

- 4 Door Short Wheel Base Sedan.
- 4 Door Long Wheel Base Sedan.

2. Engine Type.
   - 3.6 L V6 (LE0)
   - 3.6 L V6 (LY7)
   - 3.6 L V6 LPG (LW2)
   - 6.0 L V8 (L76/L98)
   - 6.0 L V8 HSV (LS2)
3. Transmission Type.
   - 6 Speed Manual (D173) MV5
   - 6 Speed Manual (T56) M10
   - 4 Speed Automatic RWD (4L60E) M30
   - 4 Speed Automatic RWD (4L65E) M32
   - 5 Speed Automatic RWD (5L40E) M82
   - 6 Speed Automatic RWD (6L80E) MYC
4. Suspension Type.
   - Unknown
   - Standard FE1
   - Sports FE2
   - Country FR1
5. Country.
   - Australia (B13)
   - New Zealand (E13)
   - Middle East (E05)
   - Brazil (B08)
   - South Africa (B02)
   - Indonesia (B00)
6. Tyre Pressure Monitoring.
   - Not Fitted
   - Fitted
7. Police Mode.
   - Disabled
   - Enabled
8. Navigation.
   - Not Fitted
   - TBT Nav (UY4)
   - Full Nav (UV9)
9. Fleet Telematics (U86).
   - Not Fitted
   - Fitted
10. LPG.
    - Not Fitted
    - Fitted

11. AHL (Automatic Headlamp Levelling).
    - Not Fitted
    - Fitted

Programming

1. Install a diagnostic scan tool.
2. Select Body.
3. Select IPC (Instrument Panel Cluster).
4. Select Programming.
5. Select the Program Variant Configuration procedure and follow the directions displayed on the screen.
6. Obtain TIS approval then repeat steps 1-5.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Object Alarm Module Programming and Setup

If the object alarm module is replaced it must be programmed. Refer to Service Programming System (SPS) .

Power Steering Control Module Programming and Setup

If the steering angle sensor is removed or replaced it must be recalibrated.

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Chassis.
3. Select EBCM (Electronic Brake Control Module).
4. Select Programming.
5. Select the Calibrate Steering Angle Sensor procedure and follow the directions displayed on the screen.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Radio Programming and Setup

Infotainment Unit Replacement

Important: If the infotainment unit vehicle identification number (VIN) does not match the VIN transmitted by the body control module (BCM) the system will enter theft mode and will be locked. After the installation of a new infotainment unit, the infotainment unit will auto-learn the VIN that is transmitted by the BCM.

Important: If either the infotainment unit or infotainment facia is being independently replaced it will be necessary to perform the "Facia link to IRC" procedure. If both infotainment facia and infotainment unit are new and are replaced together they will auto-link.

Important: If the vehicle has a rear seat entertainment (RSE) system installed it will be necessary to enable the rear auxiliary input to allow RSE video to play through the infotainment unit display. The default setting is Rear Auxiliary Off.

If the infotainment unit is replaced, the following procedures must be performed:

1. Audio system reprogramming - Refer to Service Programming System (SPS) .
2. Facia link to IRC procedure.

Facia Link to IRC

> **Important:** Performing the facia link to IRC procedure is prohibited without TIS approval. Refer to Obtaining TIS Approval for more information.

1. Install a diagnostic scan tool.
2. Select Infotainment System.
3. Select Audio System.
4. Select Programming.
5. Select the Facia Link to IRC procedure and follow the directions displayed on the screen.
6. Obtain TIS approval then repeat steps 1-5.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Remote Control Door Lock Receiver and Theft Deterrent Module Programming and Setup

Tools Required

- EL-47826 TPMS Activation and Test Tool.
- EL-49310 TPMS Activation and Test Tool.

Remote Function Actuator (RFA) Replacement

If the RFA is replaced, the following procedures must be performed:

Important: When the RFA is programmed via the service programming system (SPS) the remote key and TPMS pressure sensor data will be erased. Remote keys and TPMS pressure sensors (where installed) must be programmed whenever a RFA is replaced.

1. RFA reprogramming - Refer to Service Programming System (SPS).
2. Select Body.
3. Select RFA (Remote Function Actuator).
4. Select Programming.

Important: Performing the Erase All and Program Remotes procedure is prohibited without TIS approval. Refer to Obtaining TIS Approval for more information.

Important: Remote keys must be programmed to the RFA. Remote keys can be reused, a maximum of 4 remote keys may be reprogrammed.

5. Select Erase All and Program Remotes.
6. Obtain TIS approval then repeat steps 1-5.

Important: The scan tool must stay connected until all of the remote keys are programmed.

7. Press and hold the LOCK button and the UNLOCK button simultaneously on one remote key. After a delay of 5-10 seconds, the scan tool will indicate that the remote key is programmed.
8. Repeat the previous step in order to program up to 4 remote keys.

Important: The following procedures are only required on vehicles where the tyre pressure monitoring system (TPMS) is installed.

9. Select Tire Type/Pressure selection.
10. Select TPM Learn mode.
11. Activate each TPMS pressure sensor in the order displayed on the scan tool display and follow the instructions below:

Important: To program each TPMS pressure sensor ID into the RFA and/or to activate a sensor, the mandatory TPMS Activation and Test Tool EL-47826 or EL-49310 is required.

Important: For this vehicle, the TPMS Activation and Test Tool LED and audible tone do not operate during the program procedure, activation of each TPMS pressure sensor is confirmed using the scan tool.

12. Hold the Activation and Test Tool EL-47826 or EL-49310 against the tyre sidewall, with the end of the tool at the valve location and perpendicular to the tyre wall.
13. Press the activation button once, then release. This begins the sensor activation process.
14. Following activation of each TPMS pressure sensor, the vehicle horn will sound, the indicators will flash once and confirmation will be displayed on the scan tool display.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Battery
BARTEC USA
TEST
TPMS Wheel Sensor
Activation Tool

Seat Adjuster Control Module Programming and Setup

If the seat interface module (SIM) is removed or replaced it must the vehicle identification number (VIN) must be relearned.

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Body.
3. Select Memory Seats and Mirrors.
4. Select Programming.

   Important: The VIN will automatically program to the SIM once the following process is selected.

5. Select Learn Vehicle Identification Number (VIN).

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Diagnostic Navigation | Programming and Setup | Repair Instructions | **Document ID: 1265170**

Service Programming System (SPS)

For step-by-step programming instructions, please refer to the techline information system (TIS) terminal.

Review the information below to ensure proper programming protocol.

Important:

- DO NOT program a control module unless you are directed by a service procedure or you are directed by a General Motors Corporation service bulletin. Programming a control module at any other time will not permanently correct a customers concern.
- It is essential that the Tech 2, MDI and the TIS terminal are all equipped with the latest software before performing service programming.
- Due to the time requirements of programming a controller, it is recommended that an external power source be used to maintain system voltage. Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. To ensure trouble-free programming, GM recommends using one of the following external power sources:
  - A Midtronics PSC charger
  - A fully charged 12V jumper or booster pack disconnected from the AC voltage supply
- Some modules will require additional programming/setup events performed before or after programming.
- Some vehicles may require the use of a CANDi or MDI module for programming.
- Review the appropriate service information for these procedures.
- DTCs may set during programming. Clear DTCs after programming is complete.
- Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Ensure the following conditions are met before programming a control module:

- Vehicle system voltage:
  - There is not a charging system concern. All charging system concerns must be repaired before programming a control module.
  - Battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the control module.
  - Turn OFF or disable any system that may put a load on the vehicles battery, such as the following components:
    - Twilight sentinel
    - Interior lights
    - Daytime running lights (DRL)--Applying the parking brake, on most vehicles, disables the DRL system
    - Heating, ventilation, and air conditioning (HVAC) systems
    - Engine cooling fans, radio, etc.
- The ignition switch must be in the proper position. SPS prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the

programming procedure, unless instructed to do so.

- Make certain all tool connections are secure, including the following components and circuits:
  - Tech 2
    - The RS-232 communication cable port
    - The connection at the data link connector (DLC)
    - The voltage supply circuits
  - MDI
    - The USB, Ethernet or Wireless communication port
    - The connection at the data link connector (DLC)
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or control module damage may occur.
- DO NOT turn OFF the ignition if the programming procedure is interrupted or unsuccessful. Ensure that all control module and DLC connections are secure and the TIS terminal operating software is up to date. Attempt to reprogram the control module. If the control module cannot be programmed, replace the control module.

Steering Angle Sensor Centering

The steering angle sensor does not require centering often. Centering of the steering angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Steering gear replacement
- Steering column replacement
- Steering angle sensor replacement
- Intermediate shaft replacement
- Electronic brake control module (EBCM) replacement
- Collision or other physical damage

The steering angle sensor centering procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align the front wheels forward.
2. Set the transmission in the PARK position.
3. Turn the ignition switch ON, with the engine OFF.
4. Clear any DTCs that may be set.
5. Select Steering Angle Sensor Centering in the EBCM Special Functions list.
6. Follow the scan tool directions to complete the centering procedure.

Theft Deterrent Control Module Programming and Setup

There are three programming routines available for the theft deterrent system:

- Theft deterrent link to ECM.
- Reprogram all transponder keys.
- Program additional transponder keys.

Theft deterrent link to ECM

The theft deterrent link to ECM will be required for three different scenarios, when replacing the theft deterrent module (TDM), when replacing of the engine control module (ECM) or when replacing both TDM and ECM together.

Theft Deterrent Module (TDM) Replacement

If the TDM is replaced, the following procedures must be performed:

1. TDM reprogramming - Refer to Service Programming System (SPS) .
2. TDM Link to ECM.
3. Program transponder keys.

Engine Control Module (ECM) Replacement

If the ECM is replaced, the following procedures must be performed:

1. ECM reprogramming - Refer to Engine Control Module Programming and Setup .
2. TDM Link to ECM.

Theft Deterrent Module (TDM) and Engine Control Module (ECM) Replacement

If the TDM and ECM are replaced, the following procedures must be performed:

1. ECM reprogramming - Refer to Engine Control Module Programming and Setup .
2. TDM reprogramming - Refer to Service Programming System (SPS) .
3. TDM Link to ECM.
4. Program transponder keys.

TDM Link to ECM

Important: Performing the TDM link to ECM procedure may require TIS approval. Refer to Obtaining TIS Approval for more information.

Important: A new TDM is already unlocked and in learn mode, for new TDMs the 10 minute wait to enter learn mode will not be required.

When linking a previously programmed TDM or ECM, or reprogramming all transponder keys, there will be a 10 minute wait while the TDM enters learn mode. There are two types of learn mode:

- When linking an ECM to an existing TDM, the TDM must be unlocked in order to transmit the security data; this does not erase transponder keys. There is no timer displayed for this type of learn.
- When a TDM is linked to an existing ECM or all transponder keys are programmed the TDM must be unlocked in order to transmit the security data and existing transponder keys will be erased. There is a timer displayed for this type of learn. Once the first two keys are programmed, the TDM exits learn mode and allows additional transponder keys to be reprogrammed.

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Body.
3. Select Theft Deterrent.
4. Select Programming.
5. Select V6 or V8 engine, depending on the vehicle being reprogrammed.
6. Select Theft Deterrent link to ECM.
7. Obtain TIS approval then repeat steps 1-6.

   Important: The Security Code is a four digit code that is located on the vehicle security card supplied with the vehicle. For more details on the vehicle security card refer to the owner handbook.

8. Enter Security Code and follow the directions displayed on the screen.

   Important: To perform the TDM Link to ECM as a security measure two pre-programmed transponder keys must be present. The TDM will unlock and learn the first of the transponder keys, the second transponder key must then be inserted and accepted by the TDM. When the TDM has recognized both valid transmitter keys it will then move to link to the ECM.

   Important: If two transponder keys are not present at the time of reprogramming a possible vehicle non-start event can occur.

Reprogram all transponder keys

If the TDM is replaced, the following procedures must be performed:

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Body.
3. Select Theft Deterrent.
4. Select Programming.
5. Select V6 or V8 engine, depending on the vehicle being reprogrammed.
6. Reprogram all transponder keys.
7. Obtain TIS approval then repeat steps 1-6.

   Important: The Security Code is a four digit code that is located on the vehicle security card supplied with the vehicle. For more details on the vehicle security card refer to the owner handbook.

8. Enter Security Code and follow the directions displayed on the screen.

Important: When programming transponder keys ensure that no other transponder keys are within 50cm of the TDM.

Important: If two transponder keys are not present at the time of reprogramming a possible vehicle non-start event can occur.

Program additional transponder keys

Important: Up to four transponder keys can be programmed for use at one time.

1. Install a diagnostic scan tool.
2. Key ON, engine OFF, select Body.
3. Select Theft Deterrent.
4. Select Programming.
5. Select V6 or V8 engine, depending on the vehicle being reprogrammed.
6. Program additional transponder keys.
7. Obtain TIS approval then repeat steps 1-6.

    Important: The Security Code is a four digit code that is located on the vehicle security card supplied with the vehicle. For more details on the vehicle security card refer to the owner handbook.

8. Enter Security Code and follow the directions displayed on the screen.

    Important: When programming transponder keys ensure that no other transponder keys are within 50cm of the TDM.

    Important: If two transponder keys are not present at the time of reprogramming a possible vehicle non-start event can occur.

Perform the Diagnostic Repair Verification after completing the proceeding procedures.

Transmission Control Module Programming and Setup (4L60-E/4L65-E/4L70-E)

The following service procedures require either a programming or a setup event be performed for a complete repair.

Transmission Control Module (TCM) Replacement

If the TCM is replaced, TCM Reprogramming must be performed. Refer to Service Programming System (SPS).

TCM Reprogramming

If the TCM is reprogrammed, TCM Reprogramming must be performed. Refer to Service Programming System (SPS).

Ensure the following conditions exist in order to prepare for TCM programming or reprogramming:

- The battery is fully charged.
- The ignition switch is in the RUN position.
- The Techline equipment cable connection at the data link connector (DLC) is secure.

Program the TCM using the latest software matching the vehicle. Refer to up-to-date Techline equipment user instructions.

If the TCM fails to program, proceed as follows:

- Ensure the TCM connection is good.
- Inspect the Techline equipment for the latest software version.
- Attempt to program the TCM. If the TCM still cannot be programmed properly, replace the TCM.

TCM Setup

This device requires no setup.

Window Regulator Motor Programming and Setup

Window Motor Programming and Setup

If the battery has been disconnected, recharged or replaced, it will be necessary to reprogram each power window for the express-up and express-down feature.

To program each front window, follow these steps:

1. With the ignition in ACCESSORY, RUN, or in the retained accessory power (RAP) mode.
2. Close all doors.
3. Press and hold the power window switch until the window is fully open and continue holding the switch up for approximately two seconds after the window is completely open.
4. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 2 seconds after the window is completely closed.

The window is now reprogrammed. Repeat the process for the remaining windows.

Special Tools

Illustration	Tool Number/Description
	7000086I Scan Tool Used for diagnosis of vehicle electrical system.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Diagnostic Navigation | Vehicle Diagnostic Information | Specifications | Document ID: 2026108

Body Control Module Scan Tool Information

Use the scan tool data display values and definitions information in order to assist in diagnosing vehicle malfunctions. Compare the vehicles actual scan tool data with the typical data display value table information. Use the information in order to aid in understanding the nature of the concern when the vehicle data does not match the typical data display values.

The scan tool data values were taken from a known good vehicle under the following conditions:

- The ignition switch is in the Run position.
- The engine is not running.
- The vehicle is in PARK.

Parameter	Operating Conditions	Expected Value	Definition
Ignition is ON, engine OFF, and vehicle is stationary			
Accessory Relay Command	Ignition is in ACC/RUN position	On	The scan tool displays On or Off. This is the state of the accessory relay.
	Ignition is in OFF position	Off	
Acc./RAP Relay Command	Acc./RAP relay switch activated	On	The scan tool displays On or Off. This is the state of the Acc./RAP relay.
	Acc./RAP relay switch deactivated	Off	
All Door Lock Command	All door lock switch activated	Active	The scan tool displays Active or Inactive. This is the state of the all door lock switch.
	All door lock switch deactivated	Inactive	
Ambient Light Sensor	--	4.6 Volts	The scan tool displays the ambient light level as detected by the sensor as a voltage.
Ambient Light Status	--	Night	The scan tool displays Night, Day, Unknown or Invalid. This is the state of the ambient light sensor.
	--	Day	
	--	Unknown	
	--	Invalid	
Anti Theft Warning System	Anti theft warning system activated	Armed	This parameter displays whether the anti theft warning system is Armed or Disarmed.
	Anti theft warning system deactivated	Disarmed	
ATWS LED (Anti-Theft Warn.)	--	On	The scan tool displays On or Off. This is the current state of the ATWS indicator.
	--	Fast Flash	
	--	Off	
	Auto headlamp disable switch	Active	

Auto Headlamp Disable Switch	activated		This parameter displays the status of the auto headlamp disable switch.
	Auto headlamp disable switch idle position	Inactive	
Battery Current	--	0 - 4 amps	The scan tool displays amperes. This numeric value is the battery amperage.
Battery Low at Start Up	Battery voltage below 11 Volts	Yes	The scan tool displays Yes if the voltage is below 11 Volts or No if the voltage is above 12 Volts.
	Battery voltage above 12 Volts	No	
Battery Open Circuit Volts	--	12 Volts	This parameter displays the Voltage of the battery open charge.
Battery Open Circuit Tested	Battery circuit open	Yes	The scan tool will display Yes, if the battery has an open circuit.
	Battery circuit closed	No	
Battery Sulfation Mode	--	Active	This parameter displays Active if the regulated voltage has been low for some time the BCM will command a higher regulated voltage to prevent sulfation.
	--	Inactive	
Battery Voltage	--	12 Volts	The scan tool displays 0-14 Volts. The scan tool displays approximately 12 Volts when the ignition is On.
Battery Voltage High Resolution	--	12 Volts	The scan tool displays 0-14 Volts. The scan tool displays approximately 12 Volts when the ignition is On.
Boost Level 2 Counter	--	0 Counts	The scan tool displays a numeric value. This is the number of level 2 idle boosts.
Boost Level 3 Counter	--	0 Counts	The scan tool displays a numeric value. This is the number of level 3 idle boosts.
BPPS High During Learn	--	Yes	The scan tool displays Yes or No. Yes is displayed if the BPPS was high during BPP calibration.
	--	No	
BPPS Learned Home Position	--	219 Counts	The scan tool displays Counts. This numeric value is the BPPS learned home position.
BPPS Low During Learn	--	Yes	The scan tool displays Yes or No. Yes is displayed if the BPPS was low during BPP calibration.
	--	No	
BPPS Move During Learn	--	Yes	The scan tool displays Yes or No. Yes is displayed if the BPPS was moved during BPP calibration.
	--	No	
BPPS Reference	--	792 Counts	The scan tool displays Counts. This numeric value is the BPPS reference.
BPPS Status (Brake Pedal)	--	Learned	The scan tool displays Invalid, Learned, Undecided and Learning. This is the state of the BPPS calibration in the BCM.
	Brake pedal		

Brake Lamps	applied	On	The scan tool will display On or Off depending on the position of the brake pedal.
	Brake pedal not applied	Off	
Brake Pedal Position (BPP) Sensor	--	174 Counts	The scan tool displays counts. The numerical value is the location of the BPP as interpreted by the BCM
Brake Status	Brakes applied	On	The scan tool displays On or Off. This is the state of the brakes.
	Brakes not applied	Off	
Central Door Lock Switch	Centre console door lock button pressed	Active	This parameter displays Active if the central door lock switch has been activated.
	Centre console door lock button in idle position	Inactive	
Central Door Unlock Switch	Centre console door unlock button pressed	Active	This parameter displays Active if the central door lock switch has been deactivated.
	Centre console door unlock button in idle position	Inactive	
Cruise Control Switch	Cruise control switched Off	Off	The scan tool displays Off, On, Resume, Set, Error or Cancel. This is the current state of the cruise control switch.
	Cruise control switched On	On	
	Resume/Accel cruise button pressed	Resume	
	Set/Decel cruise button pressed	Set	
	--	Error	
	Brake pedal applied	Cancel	
Current Anti-Theft Warning	No Anti Theft Warnings	None	The scan tool displays None, Driver Door, Passenger Door, Hood, Ignition, Intrusion, Inclination, Remote, Battery Reconnect, Power Mode or Tamper. These parameters are the possible current anti-theft warnings
	--	Driver Door	
	--	Passenger Door	
	--	Hood	
	--	Ignition	
	--	Intrusion	
	--	Inclination	
	--	Remote	
	--	Battery Reconnect	
	--	Power Mode	

	--	Tamper	
Daytime Running Lamps	Daytime running lamps activated	On	This parameter displays whether the daytime running lamps are On or Off. If fitted
	Daytime running lamps deactivated	Off	
Desired Voltage	--	12 Volts	The scan tool displays 0-14 Volts. The scan tool displays approximately 12 Volts when the ignition is On.
Dimming Control Switch	Dimming control increase switch activated	Up	This parameter displays the status of the dimming control switch.
	Dimming control decrease switch activated	Down	
	Dimming control switch idle position	Inactive	
Door Key Cylinder Lock Switch	Door key cylinder in the lock position	Active	The scan tool displays Active or Inactive. This is the state of the door key cylinder lock switch.
	Door key cylinder in the idle position	Inactive	
Door Key Cylinder Unlock Switch	Door key cylinder in the unlock position	Active	The scan tool displays Active or Inactive. This is the state of the door key cylinder unlock switch.
	Door key cylinder in the idle position	Inactive	
Door Lock Request	Centre console door lock button pressed	Power lock	The scan tool displays Power Lock, Door Key Cyl. Keyless Entry, or Auto Locks. This is the current state of the door lock request as monitored by the BCM.
	Door locked by key in door lock cylinder	Door Key Cyl.	
	Remote key door lock button pressed	Keyless Entry	
	Key removed from ignition	Auto locks	
Driver Door Unlock Command	Driver door unlock switch activated	Active	The scan tool displays Active or Inactive. This is the state of the driver door unlock switch.
	Driver door unlock switch deactivated	Inactive	
Driver Identification	Driver key 1/2/3 in ignition	Driver 1	This parameter identifies the current key in the ignition.
		Driver 2	
		Driver 3	
Drivers Door Ajar Switch	With door open	Door Ajar	The scan tool displays the current status of the drivers door ajar switch
	With door closed	Door Closed	

Engine Hood Open Switch	Engine hood open	Active	This parameter displays the status of the engine hood open switch.
	Engine hood closed	Inactive	
Estimated Battery Temperture	--	12 °C	This parameter displays the current temperature of the battery.
Flash to Pass Switch	Flash to pass switch activated	Active	The scan tool displays Active or Inactive. This is the state of the flash to pass switch.
	Flash to pass switch in idle position	Inactive	
Fog Lamp Front	Front fog lamps activated	On	This parameter displays On, when you activate the front fog lamp switch.
	Front fog lamps deactivated	Off	
Front Fog Lamp Switch	Front fog lamp switch activated	Active	This parameter displays if the front fog lamp switch is Active or Inactive. This determines whether the switch is receiving voltage.
	Front fog lamp switch deactivated	Inactive	
Fuel Economy Mode	--	Active	If the battery is over 80% charged the BCM may reduce regulated voltage to as low as 12.8 volts.
	--	Inactive	
Headlamp Switch	Headlamp switch activated	On	The scan tool displays On or Off. This is the state of the headlamp switch.
	Headlamp switch deactivated	Off	
Headlamp Washer Relay Command	Headlamp washer relay activated	On	This parameter displays On or Off. This is the state of the headlamp washer relay.
	Headlamp washer relay activated	Off	
High Beam	High beam activated	On	The scan tool displays if the high beam lamps are On or Off.
	High beam deactivated	Off	
High Beam Switch	High beam switch activated	Active	This parameter displays if the high beam switch is active or inactive.
	High beam switch deactivated	Inactive	
Hood Close Switch	Hood closed	Active	This parameter displays the status of the hood close switch.
	Hood open	Inactive	
HS Communication Command	HS communication activated	Active	The scan tool displays On or Off. This is the state of the high speed communications command of the BCM.
	HS communication deactivated	Inactive	
Ignition Accessory/Run	Ignition is in ACC/RUN position	Active	The scan tool displays Active or Inactive. This is the state of the ignition
	Ignition is in OFF		

	position	Inactive	Accessory/Run.
Ignition Off/Run/Crank	Ignition is in OFF position	Key In	This parameter displays the current status of the ignition Off/Run/Crank.
	Ignition is in ACC position	Key Off	
	Ignition is in RUN position	Run	
	Ignition is in CRANK position	Crank	
Ignition Run/Crank	Ignition is in RUN/CRANK position	Active	The scan tool displays Active or Inactive. This is the state of the ignition Run/Crank.
	Ignition is in OFF/ACC position	Inactive	
Incand Dimming PWM Command	0 - 100	%	This scan tool displays a percentage. This is the current incandescent dimming percentage.
Interior Lamp Door Switch	Interior lamp door switch activated	Active	This parameter displays the status of the interior lamp door switch.
	Interior lamp door switch deactivated	Inactive	
Interior Lamp Activation Reason	--	Off	This parameter displays the interior lamp activation reason.
	--	Door Open	
	--	Manual Defeat	
Interior Lamp On/Off Switch	Interior lamp On/Off switch activated	On	This parameter displays if the interior lamp is turned On or Off.
	Interior lamp On/Off switch deactivated	Off	
Interior Lamp PWM Command	0 -100	%	This parameter displays the interior lamp dimming percentage.
Key In Status	Key in ignition	Key In	This parameter displays if the ignition key is in or out of the ignition barrel
	Key not in ignition	Key Out	
LED Dimming PWM Command	0 - 100	%	The scan tool displays a percentage. This is the current LED dimming percentage.
Left Front Turn Signal	Left front turn signal activated	On	This parameter displays whether the left front turn signal is Active or Inactive.
	Left front turn signal deactivated	Off	
Left Rear Turn Signal	Left rear turn signal activated	On	This parameter displays whether the left rear turn signal is Active or Inactive.
	Left rear turn signal deactivated	Off	
	Left turn signal switch activated	Active	

Left Turn Signal Switch	Left turn signal switch in the idle position	Inactive	This parameter displays Active or Inactive. This is the status of the left turn signal switch.
Load Shed Level 2 Counter	--	0 Counts	
Load Shed Level 3 Counter	--	0 Counts	
Low Beam	Low beams activated	On	This parameter displays the status of the low beam headlamps.
	Low beams deactivated	Off	
Off/Run/Crank Reference	--	5.4 Volts	The scan tool displays volts. This is the current Off/Run/Crank reference voltage.
Off/Run/Crank Signal	--	4.4 Volts	The scan tool displays volts. This is the current Off/Run/Crank signal voltage.
Parasitic Current	--	0 Amps	The scan tool displays amperes. This is the state of the parasitic draw on the battery.
Park Brake Switch	Park brake engaged	Active	This parameter displays the current position of the park brake switch.
	Park brake disengaged	Inactive	
Park Lamp Switch	Park lamp switch activated	On	This parameter displays the status of the park lamp switch.
	Park lamp switch deactivated	Off	
Park Lamps	Park lamps activated	On	This parameter displays On when the park lamps are in the on position.
	Park lamps deactivated	Off	
Passenger Door Ajar Switch	With door open	Door Ajar	The scan tool displays the current status of the passenger door ajar switch.
	With door closed	Door Closed	
Passenger Door Unlock Command	Passenger door unlock switch activated	Active	The scan tool displays Active or Inactive. This is the state of the passenger doors unlock system.
	Passenger door unlock switch deactivated	Inactive	
Powertrain HS Communication	Powertrain HS communication activated	Active	The scan tool displays Active or Inactive. This is the state of the powertrain high speed communications command.
	Powertrain HS communication deactivated	Inactive	
Previous State of Charge	0 - 100	%	The scan tool displays a percentage. This was the previous state of charge of the battery at start up.

Puddle Lamps	Puddle lamps activated	On	This parameter displays On when the puddle lamps are active.
	Puddle lamps deactivated	Off	
Rain Sensor Mode	--	Off Parked	
Rain Sensor Signal	--	Volts	
Rain Sensor Wiper Request	--	Valid	
	--	Invalid	
Rear Fog Light Status	Rear fog lights activated	On	The scan tool displays On or Off. This is the state of the rear fog light.
	Rear fog lights deactivated	Off	
Rear Fog Light Switch	Rear fog light switch activated	Active	This parameter displays the status of the rear fog light switch.
	Rear fog light switch deactivated	Inactive	
Rear Lamp Flasher Switch	Rear lamp flasher switch activated	Active	This parameter displays the status of the rear lamp flasher switch.
	Rear lamp flasher switch deactivated	Inactive	
Regulator Setpoint	0 - 100	%	The scan tool displays a percentage. This is the set point of the voltage regulator.
Reverse Lamps	Reverse gear selected	On	This parameter displays whether the reverse lamps are On or Off.
	Reverse gear not selected	Off	
Right Front Turn Signal	Right front turn signal activated	On	This parameter displays the status of the right front turn signal.
	Right front turn signal deactivated	Off	
Right Rear Turn Signal	Right rear turn signal activated	On	This parameter displays the status of the right rear turn signal.
	Right rear turn signal deactivated	Off	
Right Turn Signal Switch	Right turn signal switch activated	Active	This parameter displays the status of the right turn signal switch.
	Right turn signal switch in idle position	Inactive	
Run/Crank Relay Command	Ignition is in RUN/CRANK position	On	The scan tool displays On or Off. This is the state of the Run/Crank relay.
	Ignition is in OFF/ACC position	Off	
	Shift lock solenoid		

Shift Lock Solenoid Command	activated	Lock	The scan tool displays Lock or Unlock. This is the state of the shift lock solenoid.
	Shift lock solenoid deactivated	Unlock	
Shift Mode Switch	Shift mode switch is activated	Active	This parameter displays the status of the shift mode switch.
	Shift mode switch is deactivated	Inactive	
Shifter Unlock Command	Shifter unlock command activated	On	The scan tool displays On or Off. This is the state of the shifter unlock command
	Shifter unlock command deactivated	Off	
Start Up State of Charge	0 - 100	%	The scan tool displays a percentage. This was the last state of charge of the battery at start up.
State of Charge	0 - 100	%	The scan tool displays a percentage. This is the current state of charge of the battery.
Surveillance Mode Switch	Surveillance mode switch activated	Active	This parameter displays the status of the surveillance mode switch.
	Surveillance mode switch deactivated	Inactive	
System Power Mode	Ignition is in OFF position	Off	This parameter displays Accessory/Run/Crank. This is the status of the system power mode dependent on the ignition position.
	Ignition is in ACC position	Accessory	
	Ignition is in RUN position	Run	
	Ignition is in CRANK position	Crank	
TC/ESP Switch (Traction Control)	Traction control turned ON	Active	This parameter displays the status of the TC/ESP switch (traction control).
	Traction control turned OFF	Inactive	
Theft Horn Relay Command	Security system activated	On	The scan tool displays On or Off. This is the state of the theft horn relay.
	Security system deactivated	Off	
Trunk Release Command	Trunk release button is pressed	Active	The scan tool displays Active or Inactive. This is the state of the trunk release relay.
	Trunk release button not pressed	Inactive	
Trunk Switch	Trunk switch activated	Active	This parameter displays the status of the trunk switch.
	Trunk switch	Inactive	

	deactivated		
Up and Down Shift Switch	Active select shift up	Up	This parameter displays the status of the up and down shift switch.
	Active select shift down	Down	
	Active select idle position	Inactive	
Washer Relay Command	Washer relay command activated	On	The scan tool displays On or Off. This is the state of the washer relay.
	Washer relay command idle position	Off	
Windscreen Washer Switch	Windscreen washer switch activated	Active	This parameter displays the status of the windscreen washer switch.
	Windscreen washer switch in idle position	Inactive	
Windscreen Wiper Switch	User dependent	Off	The scan tool displays Off, Single wipe, Low, High or Switch Fault. This is the state of the windscreen wiper switch.
		Single wipe	
		Low	
		High	
Wiper Delay Setting	User dependent	1 - 5	The scan tool displays a numeric value. This is the wiper delay setting.
Wiper High Speed Relay	Wiper high speed relay activated	On	The scan tool displays On or Off. This is the state of the wiper high speed relay.
	Wiper high speed relay deactivated	Off	
Wiper High Speed Switch	Wiper high speed switch activated	Active	This parameter displays the status of the wiper high speed switch.
	Wiper high speed switch deactivated	Inactive	
Wiper Park Switch	Wiper park switch activated	On	This parameter displays the status of the wiper park switch.
	Wiper park switch in idle position	Off	
Wiper Relay Command	Wiper relay activated	On	This parameter displays whether the wiper relay is receiving power. The wiper function is controlled via the BCM.
	Wiper relay deactivated	Off	

Body Control Module Scan Tool Output Controls

Scan Tool	Additional Menu Selection	

Output Control	(s)	Description
Backup Lamps	Exterior Lighting	The BCM activates the backup lamp relay when you select ON. The backup lamps illuminate for 5 seconds or until commanded OFF.
Fog Lamps	Exterior Lighting	The BCM activates the fog lamps relay when you select ON. The fog lamps illuminate for 5 seconds or until commanded OFF.
High Beams	Exterior Lighting	The BCM activates the high beam relay when you select ON. The high beam headlamps illuminate for 5 seconds or until commanded OFF.
LF Turn Signal	Exterior Lighting	The BCM activates the left front turn signal lamps when you select ON. The turn signal lamps illuminate for 5 seconds or until commanded OFF.
Low Beams	Exterior Lighting	The BCM activates the low beam relay when you select ON. The low beam headlamps illuminate for 5 seconds or until commanded OFF.
LR Turn Signal	Exterior Lighting	The BCM activates the left rear turn signal lamps when you select ON. The lamp illuminates for 5 seconds or until commanded OFF.
Parking Lamps	Exterior Lighting	The BCM activates the park lamp relay when you select ON. The park lamps illuminate for 5 seconds or until commanded OFF.
RF Turn Signal	Exterior Lighting	The BCM activates the right front turn signal lamps when you select ON. The turn signal lamps illuminate for 5 seconds or until commanded OFF.
RR Turn Signal	Exterior Lighting	The BCM activates the right rear turn signal lamps when you select ON. The lamp illuminates for 5 seconds or until commanded OFF.
Courtesy Lamp	Interior Lighting	The BCM activates the interior lamps outputs for 5 seconds when you select ON. The dome, footwell, and courtesy lamps illuminate for 5 seconds or until commanded OFF.
Incandescent Dimming	Interior Lighting	The BCM activates the interior incandescent type component lamps from full dim to full bright for 5 seconds or until commanded OFF.
LED Dimming	Interior Lighting	The BCM activates the interior LED type component lamps from full dim to full bright for 5 seconds or until commanded OFF.
Wiper	Miscellaneous Test	The Wiper/Washer switch has to be in the off position for this output control to function. The BCM actuates the Wiper relay when you select ON. The front wipers should operate in intermittent mode.
Horn	Miscellaneous Test	The BCM Energizes the horn relay for 5 seconds when you select On or until you select Off.

The Transmission Scan Tool Data Definitions contain a brief description of manual transmission related parameters available on the scan tool. The list is in alphabetical order. A given parameter may appear in any one of the data lists. In some cases, the parameter appears more than once or in more than one data list in order to group certain related parameters together.

CPP Switch: This parameter displays the state of the clutch pedal switch circuit input. The scan tool will display APPLIED when the clutch pedal is depressed, and RELEASED when the clutch pedal is released.

Vehicle Speed Sensor: This parameter displays the speed at which the vehicle is traveling. The scan tool displays vehicle speed as kilometers per hour (km/h), miles per hour (mph). The vehicle speed is calculated based on the input signal from the vehicle speed sensor.

Wheel Speed Sensor: This parameter displays the speed at which the vehicle is travelling. The scan tool displays vehicle speed as kilometres per hour (km/h), miles per hour (m.p.h.). The vehicle speed is calculated based on the input signal from the wheel speed sensor.

The Transmission Scan Tool Data List contains manual transmission related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists, and in some cases may appear more than once, or in more than one data list in order to group certain related parameters together.

Use the Transmission Scan Tool Data List only after the following is determined:

- The Diagnostic System Check - Vehicle in Vehicle DTC Information, is completed.
- There are no diagnostic trouble codes (DTCs) shown.
- The on-board diagnostics are functioning properly.

Scan tool values from a properly functioning vehicle may be used for comparison with the vehicle you are diagnosing.

Important: A scan tool that displays faulty data should not be used. The scan tool concern should be reported to the manufacturer. Use of a faulty scan tool can result in misdiagnosis and unnecessary parts replacement.

Only the parameters listed below are referenced in this service manual for use in diagnosis. If all values are within the typical range described below, refer to Symptoms - Manual Transmission in Manual Transmission - Aisin AY6.

The column labelled Data List indicates where a parameter can be located on the scan tool. Refer to the scan tool operating manual for the exact locations of the data lists. The following is a description of each term listed:

Engine Data 1: (1)

Engine Data 2: (2)

EVAP Data: (3)

Fuel Trim Data: (4)

HO2S Data: (5)

Misfire Data: (6)

TAC Data: (7)

CMP Actuator Data: (8)

Cooling / HVAC Data: (9)

Cruise / Traction Data: (10)

Electrical / Theft Data: (11)

IPC Data: (12)

ODM Data: (13)

Scan Tool Parameter	Data List	Units Displayed	Typical Data Value
Engine Idling / Radiator Hose Hot / Closed Throttle / Park or Neutral / Closed Loop / Accessories Off / Brake Pedal Released			
CPP Switch (If Equipped)	1	APPLIED/RELEASED	RELEASED
Wheel Speed Sensor	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12	km/h (mph)	0

Use the scan tool data values under the following conditions:

- The Diagnostic System Check - Vehicle in Vehicle DTC Information is complete.
- The on-board diagnostics are functioning properly.
- No diagnostic trouble codes (DTCs) are present.

The values below represent a typical display recorded from a properly functioning system.

Important: Do not use a scan tool that displays faulty data. Report the condition to the scan tool manufacturer. The use of a faulty scan tool can result in misdiagnosis and the unnecessary replacement of parts.

Only the parameters listed below are used in this manual for diagnosing. If a scan tool displays other parameters, the values are not recommended by General Motors for use in diagnosis.

Scan tool values below were recorded under the following conditions:

- Engine at idle
- Upper radiator hose hot
- Closed throttle
- Transmission in Neutral
- Closed Loop operation
- Accessories OFF
- Brake pedal not applied

Scan Tool Parameter	Data List	Units Displayed	Typical Data Value
Clutch Pedal Switch	F0, F3	applied/released	released
Reverse Inhibit Solenoid Command	F0	INHIBIT/OFF	OFF

Wheel Speed Sensor	ALL	km/h (mph)	0
*Data List Legend • F0: Engine Data 1 • F1: Engine Data 2 • F2: Engine Data 3 • F3: Cruise Control Data • F4: Enhanced EVAP Data • F5: Fuel Trim Data • F6: Misfire Data • F7: TAC Data • F8: H02S Data			

Clutch Pedal Switch: This parameter displays the state of the clutch pedal switch circuit input. The scan tool will display APPLIED when the clutch pedal is depressed, and RELEASED when the clutch pedal is released.

Reverse Inhibit Solenoid Command: This parameter displays the commanded state of the reverse inhibit solenoid. When the vehicle speed is greater than 5 km/h (3 mph), the solenoid is commanded ON, inhibiting shifts to Reverse. When the vehicle speed is less than 5 km/h (3 mph), the solenoid is commanded OFF, allowing shifts to Reverse. The scan tool will display ON/OFF.

Reverse Inhibit Solenoid Command: This parameter displays the commanded state of the reverse inhibit solenoid. When the vehicle speed is greater than 5 km/h (3 mph), the solenoid is commanded ON, inhibiting shifts to Reverse. When the vehicle speed is less than 5 km/h (3 mph), the solenoid is commanded OFF, allowing shifts to Reverse. The scan tool will display ON/OFF.

Vehicle Speed: This parameter displays the speed at which the vehicle is traveling. The scan tool displays vehicle speed as kilometers per hour (km/h), miles per hour (MPH). The vehicle speed is calculated based on the input signal from the vehicle speed sensor.

Scan Tool Output Control	Additional Menu Selection(s)	Description
Reverse Inhibit	Special Functions - Engine Output Controls	Command grounds the reverse lockout solenoid control circuit. Turns the reverse inhibit solenoid ON and OFF.

Diagnostic System Check - Vehicle

Diagnostic Instructions

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Continue through the Diagnostic System Check until you are directed to follow a particular diagnostic or repair procedure. Once a repair has been completed, perform the Diagnostic Repair Verification and verify the customer concern has been corrected.

The diagnostic procedures within this manual are developed on the assumption that the following areas function as designed:

- The 12V battery is fully charged and cables are clean and tight. Refer to Battery Inspection/Test.
- Fuses are not open. Refer to Power Distribution Schematics and Electrical Center Identification Views.
- Ground circuits for the area of customer concern are clean, tight, and in the correct location. Refer to Ground Distribution Schematics and Harness Routing Views.
- All connections/connectors for the area of concern are fully seated. Refer to Component Connector End Views.
- There are no aftermarket devices that affect the operation of the system. Refer to Checking Aftermarket Accessories.
- The scan tool powers up. Refer to Scan Tool Does Not Power Up.

Diagnostic System Check

1. *VERIFY CUSTOMER CONCERN* -- Understand and validate the customer concern. Inspect the visible system components for obvious damage or conditions that may cause the concern.
2. *BULLETIN SEARCH* -- Check for related bulletins, recall/field actions and preliminary information.
3. *MECHANICAL CONCERNS* -- Verify the symptom is not exclusively a mechanical concern.

   If the symptom is exclusively a mechanical concern, refer to Symptoms - Vehicle.

   Note: Do not clear any DTCs unless instructed to do so by a diagnostic procedure. If any DTC is Powertrain related, select Capture Info to store DTC and Freeze Frame/Failure Records to the Scan Tool.

4. *CONTROL MODULE COMMUNICATION and DTC CHECK* -- Using a scan tool, perform the Vehicle DTC Information function and verify at least one control module communicates with the scan tool. Record on the Repair Order the following information:
   - Any control module that is not communicating.
   - Any DTC, including symptom byte, and the control module that has set the DTC.

   If the scan tool does not communicate with any control module on the vehicle, refer to Power Mode Mismatch.
5. *CONTROL MODULE INTERNAL PERFORMANCE FAULTS* -- Verify there are no current control module Internal Hardware Performance DTCs set.

If any DTC of this type is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.

6. *CONTROL MODULE COMMUNICATION VERIFICATION* -- Verify the vehicle is built with any control module listed as not communicating, refer to Data Link References. All control modules should be communicating, as equipped.

   If the scan tool does not communicate with one or more control modules refer to Data Link References.

7. *COMMUNICATION and POWERMODE FAULTS* -- Verify there are no current control module Power Mode or Communication DTCs set..

   If any DTC of this type is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.

   Note: The engine may start during this test. Ensure the vehicle is out of gear and the parking brake is applied. Turn the engine OFF as soon as the crank power mode parameter has been observed.

8. *POWER MODE VERIFICATION* -- Driver door open, observe the scan tool Power Mode parameter while cycling the ignition switch through all the power modes. Verify the current Power Mode parameter matches the actual ignition switch positions.

   If the Power Mode parameter does not match the actual ignition switch positions, refer to Power Mode Mismatch.

9. *ENGINE CRANK and RUN VERIFICATION* -- Verify that the engine cranks and runs.

   If the engine does not crank, refer to Symptoms - Engine Electrical.

   If the engine does not run, refer to Engine Cranks But Does Not Runfor the 2.8L, 3.0L, 3.2L, or 3.6L engine or Engine Cranks But Does Not Runfor the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine.

10. *REMAINING DTC REVIEW* -- Verify there are no other DTCs set.

    If other DTCs are set, diagnose them in the order listed below. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.

    10.1. Voltage DTCs

    10.2. Programming, Setup, Configuration or Software Performance DTCs

    10.3. Component related DTCs

    10.4. System related DTCs

    10.5. Any remaining DTCs

11. *SYMPTOM DIAGNOSIS* -- Diagnose any remaining customer concern. Refer to Symptoms - Vehicle.

Driver Seat Adjuster and Mirror Memory Module Scan Tool Information

Table 1: Memory Seat Module Scan Tool Data Display
Table 2: Memory Seat Module Scan Tool Actuator Test

Memory Seat Module Scan Tool Data Display

Parameter	System State	Expected Value	Description
Operating Conditions: Ignition ON			
Able to Move	--	Yes	The scan tool displays Yes or No. When the seat is requested to move, the seat memory module monitors the amount of Steps that a position sensor has taken during that movement. This inability to move at all or quickly enough may be due to a physical restriction in that movement, or the battery not having enough charge to power the particular motor adequately.
Able To Recall	--	Yes	The scan tool displays Yes or NO. This is if the seat assembly has the ability to recall a memory position.
Button 1 Input Status	--	Active	The scan tool displays Active or Inactive. This is the state of button 1 on the memory position switch.
Button 1 Output Status	--	Active	The scan tool displays Active or Inactive. This is the state of the button 1 signal from the SIM to the MSM indicating the memory request.
Button 2 Input Status	--	Active	The scan tool displays Active or Inactive. This is the state of button 2 on the memory position switch.
Button 2 Output Status	--	Active	The scan tool displays Active or Inactive. This is the state of button 2 on the memory position switch.
Button 3 Input Status	--	Active	The scan tool displays Active or Inactive. This is the state of button 3 on the memory position switch.
Button 3 Output Status	--	Active	The scan tool displays Active or Inactive. This is the state of button 3 on the memory position switch.
Button M Input Status	--	Active	The scan tool displays Active or Inactive. This is the state of button M on the memory position switch.
Button M Output Status	--	Active	The scan tool displays Active or Inactive. This is the state of button M on the memory position switch.

Button Pack Communication	--	Okay	The scan tool displays Okay or Not Okay. This is whether there is serial data communication with the mirror control switch, right hand or left hand rear-view mirrors. If there is communication with at least one of these components, the scan tool will display Okay. If there is no communications with all of the components, the scan tool will display Not Okay.
Current Priority	--	Priority 1	The scan tool displays Priority 1, Priority 2, No Memory, or Invalid. This is the current priority that is set when the vehicle is unlocked with either priority key 1 or 2.
Demist Request	--	Yes	The scan tool displays Yes or No. This is the status of the rear demist system.
Driver Identification	--	Driver 1	The scan tool displays Driver 1, Driver 2, or Driver 3. This is the current User selection based from the ignition key.
Front Vertical Position Maximum Limit	--	Steps	The scan tool displays 0 - 65635 Steps. This is the maximum limit of seat front vertical upward travel displayed in Steps. This value should be high but never reach 65535 Steps. If the value displayed is 65535, the seat has not been calibrated.
Front Vertical Position Minimum Limit	--	Steps	The scan tool displays 0 - 65635 Steps. This is the minimum limit of the seat front vertical downward travel displayed in Steps. This value should be low but never reach 0 Steps. If the value displayed is 0, the seat has not been calibrated.
Front Vertical Position Sensor	--	Connected	The scan tool displays Connected or Not Connected. This parameter confirms if the front vertical motor position sensor is connected.
Front Vertical Position Sensor	--	Steps	The scan tool displays 0 - 65635 Steps. This value represents the current position of the front vertical motor. High scan tool step values indicate an up position while low step values indicate a down position.
Front Vertical Switch	--	Inactive	The scan tool displays Inactive, Up, Down, or Invalid. This is the state of the front vertical switch.
Horizontal Position Maximum Limit	--	Steps	The scan tool displays 0 - 65635 Steps. This is the maximum limit of seat horizontal forward travel displayed in Steps. This value should be high but never reach 65535 Steps. If the value displayed is 65535, the seat has not been calibrated.
Horizontal Position	--	0 Steps	The scan tool displays 0 - 65635 Steps. This is the minimum limit of seat horizontal rearward travel displayed in Steps. This

Minimum Limit			value should be low but never reach 0 Steps. If the value displayed is 0, the seat has not been calibrated
Horizontal Position Sensor	--	Connected	The scan tool displays Connected or Not Connected. This parameter confirms if the seat horizontal motor position sensor is connected.
Horizontal Position Sensor	--	Steps	The scan tool displays 0 - 65635 Steps. This value represents the current position of the seat horizontal motor. High scan tool step values indicate a forward position while low step values indicate a rearward position.
Horizontal Switch	--	Inactive	The scan tool displays Inactive, Forward, Backward, or Invalid. This is the state of the horizontal switch.
Ignition Accessory Signal	--	On/Off	This parameter indicates the status of the ignition switch.
Ignition On Signal	--	On/Off	This parameter indicates the status of the ignition switch.
Ignition Switch	--	On/Off/Accessory	This parameter indicates the status of the ignition switch.
Left Exterior Mirror Communication	--	Okay	The scan tool display Okay or Not Okay. This parameter confirms if the scan tool can communicate with the left hand exterior rear-view mirror.
Left Exterior Mirror Switch	--	Inactive	The scan tool displays Up, Down, Left, Right, or Inactive. When the mirror switch is pressed, this parameter displays the selected mirror direction.
Lumbar Switch	--	Inactive	The scan tool displays Inactive, Forward, Backward, or Invalid. This is the state of the lumbar switch.
Memory 1 Button	--	Not Pressed	The scan tool displays Pressed or Not Pressed. This parameter displays the state of button 1 on the memory seat switch.
Memory 2 Button	--	Not Pressed	The scan tool displays Pressed or Not Pressed. This parameter displays the state of button 2 on the memory seat switch.
Memory 3 Button	--	Not Pressed	The scan tool displays Pressed or Not Pressed. This is the state of button 3 on the memory seat switch.
Memory Recall Position in Use	--	No Active Memory	The scan tool displays Memory 1, Memory 2, Memory 3. Priority 1, Priority 2 or No Active Memory. This parameter displays the status of the current memory recall of the seat assembly.
Mirror DIP Button	--	Not Pressed	The scan tool displays Pressed or Not Pressed. This is the state of the mirror dip / memory store (M) button on the memory position switch.

MSM Power Output	--	Active	The scan tool displays Active or Inactive. This is the Power Output state of the Memory Seat Module.
MSM UART Bus Status	--	On	The scan tool displays On or Off. This is the Status of the Memory Seat Module UART Bus.
MSM Wake-Up Output	--	Active	The scan tool displays Active or Inactive. This is the Wake-Up Output state of the Memory Seat Module.
Rear Vertical Position Maximum Limit	--	Steps	The scan tool displays 0 - 65635 Steps. This is the maximum limit of seat rear vertical upward travel displayed in Steps. This value should be high but never reach 65535 Steps. If the value displayed is 65535, the seat has not been calibrated.
Rear Vertical Position Minimum Limit	--	Steps	The scan tool displays 0 - 65635 Steps. This is the minimum limit of the seat rear vertical downward travel displayed in Steps. This value should be low but never reach 0 Steps. If the value displayed is 0, the seat has not been calibrated.
Rear Vertical Position Sensor	--	Connected	The scan tool displays Connected or Not Connected. This parameter confirms if the rear vertical motor position sensor is connected.
Rear Vertical Position Sensor	--	Steps	The scan tool displays 0 - 65635 Steps. This value represents the current position of the rear vertical motor. High scan tool step values indicate an up position while low step values indicate a down position.
Rear Vertical Switch	--	Inactive	The scan tool displays Inactive, Up, Down, or Invalid. This is the state of the rear vertical switch.
Recline Position Sensor	--	Connected	The scan tool displays Connected or Not Connected. This parameter confirms if the seat back recline motor position sensor is connected.
Recline Position Sensor	--	Steps	The scan tool displays 0 - 65635 Steps. This value represents the current position of the seat back recline motor. High scan tool step values indicate a forward position while low step values indicate a rearward position.
Recline Switch	--	Inactive	The scan tool displays Inactive, Forward, Backward, or Invalid. This is the state of the seat back recline switch.
Reverse Gear	--	Inactive	The scan tool displays Active or Inactive. This parameter displays if the vehicle is in reverse gear.
Right Exterior Mirror	--	Okay	The scan tool display Okay or Not Okay. This parameter confirms if the scan tool can communicate with the right hand exterior

Communication			rear-view mirror.
Right Exterior Mirror Switch	--	Inactive	The scan tool displays Up, Down, Left, Right, or Inactive. When the mirror switch is pressed, this parameter displays the selected mirror direction.
Shift Lever Position	User Dependant	P	The scan tool displays P, R, N, D, 3, 2, or 1. This parameter displays the position of the transmission selector.
Start Wait Active	--	No	The scan tool displays Yes or No. Only when there has been a cold-start reset will the scan tool display No. A cold-start reset will occur when module detects too much electromagnetic interference (EMI) in the system. If the Start Wait Active displays No, the system will still be operational.
System Power Mode	--	Run	The scan tool displays Off, Accessory, Run, Crank, Invalid. This is the Power Mode required for the System to run.
Vehicle Speed	--	km/h	This parameter indicates the vehicle speed calculated by the control module based on an input from the vehicle speed sensor (VSS). The scan tool will display a high value at higher vehicle speeds, and a low value at lower vehicle speeds.

Memory Seat Module Scan Tool Actuator Test

Output Control	Description
Chime	This output control is used to command the chime ON and OFF.
Button 1 Output	This output control is used to command the driver seat to move to the driver 1 memory position.
Button 2 Output	This output control is used to command the driver seat to move to the driver 2 memory position.
Button 3 Output	This output control is used to command the driver seat to move to the driver 3 memory position.
Front Vertical Motor	This output control is used to command the driver seat front vertical motor Up and Down.
Horizontal Motor	This output control is used to command the driver seat forward and rearward.
Lumbar Motor	This output control is used to command the driver seat lumbar support motor forward and rearward.
Rear Vertical Motor	This output control is used to command the driver seat rear vertical motor Up and Down.
Recline Motor	This output control is used to command the driver seat back recline motor forward and rearward.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Diagnostic Navigation | Vehicle Diagnostic Information | Specifications | **Document ID: 2185032**

Electronic Suspension Control Module Scan Tool Information

Table 1: Electronic Suspension Control Scan Tool Data Parameters
Table 2: Electronic Suspension Control Scan Tool Output Controls

Electronic Suspension Control Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Ignition ON, Suspension control select switch ON			
Battery Voltage	--	Varies	This displays volts. This is the voltage input supplied to the module.
Ignition Voltage Status	--	Active	This displays Active. This indicates that ignition voltage is supplied to the module.
Suspension Control Select Switch Status	--	ON	This displays ON. This indicates the state of the switch.
Suspension Control Selection Indicator Status	--	ON	This displays ON. This indicates the state of the indicator.
Service Suspension Control Indicator	--	OFF	This displays OFF. This indicates the state of the Service Suspension Control indicator.
Vehicle Speed	--	0 km/h (0 mph)	This displays km/h (mph). This is the current vehicle speed.
Right Front Position Sensor	--	Volts	This displays Volts. This is the current right front position sensor voltage.
Right Front Damper Actuator Command	--	Varies	This displays %. This is the current right front damper actuator command percentage.
Left Front Position Sensor	--	Volts	This displays Volts. This is the current left front position sensor voltage.
Left Front Damper Actuator Command	--	Varies	This displays %. This is the current left front damper actuator command percentage.
Right Rear Position Sensor	--	Volts	This displays Volts. This is the current right rear position sensor voltage.
Right Rear Damper Actuator Command	--	Varies	This displays %. This is the current right rear damper actuator command percentage.
Left Rear Position Sensor	--	Volts	This displays Volts. This is the current left rear position sensor voltage.
Left Rear Damper Actuator Command	--	Varies	This displays %. This is the current left rear damper actuator command percentage.
Lift/Dive Status	--	Neutral	This displays Neutral. This indicates the state of the vehicle position.
			This displays Unchanged. This indicates if

Lift/Dive Change	--	Unchanged	the vehicle position has changed since the last sensor update.
Test Normal Force Left Rear	--	ON	This displays ON. This the state of the left rear damper actuator.
Test Normal Force Right Rear	--	ON	This displays ON. This the state of the right rear damper actuator.
Test Normal Force Left Front	--	ON	This displays ON. This the state of the left front damper actuator.
Test Normal Force Right Front	--	ON	This displays ON. This the state of the right front damper actuator.
Normal Force Left Front	--	20%	This displays 0-100%. This indicates the applied duty cycle of the left front damper actuator.
Normal Force Right Front	--	Varies	This displays 0-100%. This indicates the applied duty cycle of the right front damper actuator.
Normal Force Left Rear	--	Varies	This displays 0-100%. This indicates the applied duty cycle of the left rear damper actuator.
Normal Force Right Rear	--	Varies	This displays 0-100%. This indicates the applied duty cycle of the right rear damper actuator.

Electronic Suspension Control Scan Tool Output Controls

Output Control	Description
Static Test Damper Front	When commanded ON, both front shock damper actuators activate until commanded OFF.
Static Test Damper Rear	When commanded ON, both rear shock damper actuators activate until commanded OFF.
Cycle Test Damper Front	When commanded ON, both front shock damper actuators cycle between ON and OFF until commanded OFF.
Cycle Test Damper Rear	When commanded ON, both rear shock damper actuators cycle between ON and OFF until commanded OFF.

Engine Control Module Scan Tool Information (3.6L Engine)

Table 1: ECM Control Module Scan Tool Output Controls

The Engine Scan Tool Data List contains all engine related parameters that are available on the scan tool. The list is arranged in alphabetical order. A parameter may appear in any one of the data lists and in some cases may appear more than once or in more than one data list in order to group certain related parameters together.

Use the Engine Scan Tool Data List only after the following conditions are determined:

- The Diagnostic System Check - Vehicle is completed.
- There are no diagnostic trouble codes (DTCs).
- The on-board diagnostics are functioning correctly.

Scan tool values from an engine that is operating correctly may be used for comparison with the engine you are diagnosing. The Engine Scan Tool Data List represents the values that would be seen on a normal operating engine.

Important: Do not use a scan tool that displays faulty data. The scan tool concern should be reported to the manufacturer. Use of a faulty scan tool may result in mis-diagnosis and unnecessary parts replacement.

Only the parameters listed below are referenced in this service information for use in diagnosis. If all values are within the typical range described below, refer to Symptoms - Engine Controls , for diagnosis.

ECM Control Module Scan Tool Data Parameters

Parameter	Operating Conditions	Expected Value	Definition
Ignition is ON, engine OFF, and vehicle is stationary			
5V Reference Voltage Circuit 1 Status	--	Valid	This parameter displays the voltage sensed on the 5-volt reference 1 circuit at the engine control module.
	--	Invalid	
5V Reference Voltage Circuit 2 Status	--	Valid	This parameter displays the voltage sensed on the 5-volt reference 2 circuit at the engine control module.
	--	Invalid	
5V Reference Voltage Circuit 3 Status	--	Valid	This parameter displays the voltage sensed on the 5-volt reference 3 circuit at the engine control module.
	--	Invalid	
	--	Inactive	This parameter displays whether

A/C Cutoff Mode (Air Conditioning)	--	Pressure	the engine control module (ECM) is commanding the Air Conditioning (A/C) compressor clutch relay Off for max acceleration or pressure issues.
	--	Max. Acceleration	
	--	Active	
A/C Disengagement 1st History	--	Present	This parameter displays the last 8 A/C compressor disengagements in order from 1 to 8 with 8 being the most recent. There are about 8 possible causes for the A/C compressor to disengage.
	--	Not Present	
A/C Disengagement 2nd History	--	Present	
	--	Not Present	
A/C Disengagement 3rd History	--	Present	
	--	Not Present	
A/C Disengagement 4th History	--	Present	
	--	Not Present	
A/C Disengagement 5th History	--	Present	
	--	Not Present	
A/C Disengagement 6th History	--	Present	
	--	Not Present	
A/C Disengagement 7th History	--	Present	
	--	Not Present	
A/C Disengagement 8th History	--	Present	
	--	Not Present	
A/C Pressure Sensor	--	0 - 3,450 kPa	This parameter displays the pressure from the A/C high side pressure sensor signal circuit to the ECM.
A/C Pressure Sensor	--	0 - 5 Volts	The scan tool displays 0-5 Volts. The displayed voltage varies depending on the conditions prior to A/C shutdown.
A/C Request (Air Conditioning)	A/C button pressed	On	This parameter displays the state of the A/C request input to the ECM from the heating, ventilation and air conditioning (HVAC) controls.
	A/C button depressed	Off	
Actual Air/Flow Ratio	--	0.00 :1 Ratio	This parameter displays the ratio of air to fuel as calculated by the ECM based on various sensor inputs. The scan tool will display a lower air fuel ratio when a richer air to fuel mixture is commanded. The scan tool will display a higher air fuel ratio when a leaner air to fuel mixture is commanded. In closed loop operation the air fuel ratio should normally be around 14.2-14.7 to 1.
	Gear selector in park position	P/N	

Actual Gear	Gear selector in reverse position	R	The scan tool will display the gear that is currently selected as determined by the ECM from the information received from the TR switch.
	Gear selector in neutral position	P/N	
	Gear selector in drive position	D	
Actual Torque	--	0 - 100 %	This parameter indicates the percentage of available torque requested from the engine to the transmission as calculated by the ECM. The scan tool will display a high value for higher torque or a low value for lower torque.
Alternator F Terminal	--	0 - 100 %	This parameter displays the commanded state of the generator by the ECM. A High value indicates a high charging command, and a low value indicates a low charging command.
Alternator L Terminal Circuit Status	--	Complete	This parameter displays if the ECM is allowing the generator to operate. The scan tool displays Complete if the ECM is allowing the generator to operate, or Incomplete if the ECM is disabling the generator.
	--	Incomplete	
Alternator L Terminal Duty Cycle	--	0 - 100%	This parameter displays the control signal from the ECM to the alternator. This controls the load on the alternator.
Ambient Temperature	--	° C	This parameter displays the ambient, outside, air temperature as calculated by the ECM.
APP Sensors (Accelerator Pedal Position)	--	0 - 100 %	This parameter displays the angle of the accelerator pedal position (APP) sensors as a percentage calculated by the ECM using the signal from the APP sensors. APP sensors have a range of values indicating a low percentage when the accelerator pedal is not pressed to a high percentage when the accelerator pedal is fully pressed.
APP Sensor 1	--	Volts	The scan tool displays 0-5 Volts. The scan tool displays approximately 1 - 1.15 Volts when in the idle position.
APP Sensor 1 - 2 Correlation	--	OK	The scan tool displays Fault if the ECM detects the signal voltage from APP sensor 1 is not in correct relationship to APP sensor 2. The

	--	Fault	scan tool displays OK under the normal operating conditions.
APP Sensor 2	--	Volts	The scan tool displays 0-5 Volts. The scan tool displays approximately 0.5 - 0.6 Volts when in the idle position.
B1 Actual Exhaust Camshaft Position	--	° CA	This parameter displays the actual bank 1 exhaust camshaft position in degrees.
B1 Actual Intake Camshaft Position	--	° CA	This parameter displays the actual bank 1 intake camshaft position in degrees.
B1 Catalyst Temperature	--	° C	The scan tool displays the B1 catalytic converter temperature as calculated by the ECM.
B1 Commanded Exhaust Camshaft Position	--	0 - 100 %	This parameter displays the exhaust camshaft position as a percentage of the range as commanded by the ECM.
B1 Commanded Exhaust Camshaft Position	--	° CA	This parameter displays the actual exhaust camshaft position in degrees.
B1 Commanded Intake Camshaft Position	--	0 - 100 %	This parameter displays the intake camshaft position as percentage of the range as commanded by the ECM.
B1 Commanded Intake Camshaft Position	--	° CA	This parameter displays the actual intake camshaft position in degrees.
B1 Exhaust Camshaft Position Sensor Active Counter	--	Counts	This parameter displays the B1 exhaust camshaft position counters count as the active edge of the camshaft wheel passes the camshaft sensor. With the engine stopped this counter should not increment.
B1 Exhaust Camshaft Position Solenoid Circuit Status	--	OK	This parameter displays the state of the exhaust camshaft actuator solenoid control circuit. The parameter displays Fault if the camshaft actuator solenoid control circuit is open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Undefined	
B1 Intake Camshaft Position Sensor Active Counter	--	Counts	This parameter displays the B1 intake camshaft position counters count as the active edge of the camshaft wheel passes the camshaft sensor. With the engine stopped this counter should not increment.

B1 Intake Camshaft Position Solenoid Valve Circuit Status	--	OK	This parameter displays the state of the intake camshaft actuator solenoid control circuit. The parameter displays Fault if the camshaft actuator solenoid control circuit is open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Undefined	
B1 LTFT Cruise/Acceleration	--	0 - 100 %	The scan tool displays in %. This parameter is the long term fuel trim for this bank as calculated by the ECM. The scan tool will display more than 0 percent indicating that time is being added to the injector pulse width, increasing the amount of fuel to this bank of the engine. The scan tool will display a value less than 0 indicating time is being subtracted from the injector pulse width, reducing the amount fuel to this bank of the engine. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B1 LTFT Idle/Deceleration	--	0 - 100 %	The scan tool displays in %. This parameter is the long term fuel trim for this bank as calculated by the ECM. The scan tool will display more than 0 percent indicating that time is being added to the injector pulse width, increasing the amount of fuel to this bank of the engine. The scan tool will display a value less than 0 indicating time is being subtracted from the injector pulse width, reducing the amount fuel to this bank of the engine. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B1 Short Term Fuel Trim	--	0 - 100 %	The scan tool displays percentage. This parameter indicates the current short term fuel trim for this bank. The scan tool will display a value higher than 0 if the time is being added to the injector pulse width, increasing the amount of fuel to that bank of the engine to compensate for a lean condition sensed by the oxygen sensors on that bank. The scan tool will display a value lower than 0 if time is being subtracted from the injector pulse

			width, reducing the amount of fuel to the engine to compensate for a rich condition sensed by the oxygen sensors on that bank. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B1 Total Fuel Trim	--	0 - 100 %	This parameter displays the total fuel trim from the long term idle/decel parameter and the long term fuel trim cell.
B1S1 o2 Sensor - Bank 1 Sensor 1	--	mVolts	This parameter displays the voltage from the signal produced by the heated oxygen sensor (HO2S) used to monitor catalyst efficiency for cylinder bank 1. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B1S1 o2 Sensor Heater	--	Ohms	This parameter displays the resistance of the sensing element within the ECM.
B1S1 o2 Sensor Heater	--	Active	This parameter displays the status of the O2 sensor heater. If the scan tool displays Active the O2 sensor heater has been activated.
	--	Inactive	
B1S1 o2 Sensor Heater Circuit Status	--	OK	This parameter displays the state of the oxygen sensor heater control circuit. The parameter displays Fault if the oxygen sensor heater control circuit is open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Undefined	
B1S2 o2 Sensor - Bank 1 Sensor 2	--	mVolts	This parameter displays the voltage from the signal produced by the HO2S used to monitor catalyst efficiency for cylinder bank 1. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B1S2 o2 Sensor Heater	--	Active	This parameter displays the status of the O2 sensor heater. If the scan tool displays Active the O2 sensor heater has been activated.
	--	Inactive	
	--	OK	This parameter displays the state of the oxygen sensor heater control circuit. The parameter displays

B1S2 o2 Sensor Heater Circuit Status	--	Fault	Fault if the oxygen sensor heater control circuit is open, short to ground, or a short to voltage on the circuit.
	--	Undefined	
B2 Actual Exhaust Camshaft Position	--	° CA	This parameter displays the actual bank 2 exhaust camshaft position in degrees.
B2 Actual Intake Camshaft Position	--	° CA	This parameter displays the actual bank 2 intake camshaft position in degrees.
B2 Catalyst Temperature	--	° C	This parameter displays the B2 catalytic converter temperature as calculated by the ECM.
B2 Commanded Exhaust Camshaft Position	--	0 - 100 %	This parameter displays the exhaust camshaft position as a percentage of the range as commanded by the ECM.
B2 Commanded Exhaust Camshaft Position	--	° CA	This parameter displays the actual exhaust camshaft position in degrees.
B2 Command Intake Camshaft Position	--	0 - 100 %	This parameter displays the intake camshaft position as a percentage of range as commanded by the ECM.
B2 Command Intake Camshaft Position	--	° CA	This parameter displays the actual intake camshaft position in degrees.
B2 Exhaust Camshaft Position Sensor Active Counter	--	Counts	This parameter displays the B2 exhaust camshaft position counters count as the active edge of the camshaft wheel passes the camshaft sensor. With the engine stopped this counter should not increment.
B2 Exhaust Camshaft Position Solenoid Circuit Status	--	OK	This parameter displays the state of the exhaust camshaft actuator solenoid control circuit. The parameter displays Fault if the camshaft actuator solenoid control circuit is open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Undefined	
B2 Intake Camshaft Position Sensor Active Counter	--	Counts	This parameter displays the B2 intake camshaft position counters count as the active edge of the camshaft wheel passes the camshaft sensor. With the engine stopped this counter should not increment.
B2 Intake Camshaft	--	OK	This parameter displays the state of the intake camshaft actuator solenoid control circuit. The

Position Solenoid Circuit Status	--	Fault	parameter displays Fault if the camshaft actuator solenoid control circuit is open, short to ground, or a short to voltage on the circuit.
	--	Undefined	
B2 LTFT Cruise/Acceleration	--	0 - 100 %	The scan tool displays in %. This parameter is the long term fuel trim for this bank as calculated by the ECM. The scan tool will display more than 0 percent indicating that time is being added to the injector pulse width, increasing the amount of fuel to this bank of the engine. The scan tool will display a value less than 0 indicating time is being subtracted from the injector pulse width, reducing the amount fuel to this bank of the engine. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B2 LTFT Idle/Deceleration	--	0 - 100 %	The scan tool displays in %. This parameter is the long term fuel trim for this bank as calculated by the ECM. The scan tool will display more than 0 percent indicating that time is being added to the injector pulse width, increasing the amount of fuel to this bank of the engine. The scan tool will display a value less than 0 indicating time is being subtracted from the injector pulse width, reducing the amount fuel to this bank of the engine. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B2 Short Term Fuel Trim	--	0 - 100 %	The scan tool displays percentage. This parameter indicates the current short term fuel trim for this bank. The scan tool will display a value higher than 0 if the time is being added to the injector pulse width, increasing the amount of fuel to that bank of the engine to compensate for a lean condition sensed by the oxygen sensors on that bank. The scan tool will display a value lower than 0 if time is being subtracted from the injector pulse width, reducing the amount of fuel to the engine to compensate for a rich condition sensed by the oxygen

			sensors on that bank. A value of 0 percent indicates no compensation is required to operate the engine at the desired air/fuel ratio.
B2 Total Fuel Trim	--	0 - 100 %	This parameter displays the total fuel trim from the long term idle/decel parameter and the long term fuel trim cell.
B2S1 o2 Sensor - Bank 2 Sensor 1	--	mVolts	This parameter displays the voltage from the signal produced by the HO2S used to monitor catalyst efficiency for cylinder bank 2. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B2S1 o2 Sensor Heater - Bank 2 Sensor 1	--	Ohm	This parameter displays the resistance of the sensing element within the ECM.
B2S1 o2 Sensor Heater - Bank 2 Sensor 1	--	Active	This parameter displays the status of the O2 sensor heater. If the scan tool displays Active the O2 sensor heater has been activated.
	--	Inactive	
B2S1 o2 Sensor Heater Circuit Status	--	OK	This parameter displays the state of the intake camshaft actuator solenoid control circuit. The parameter displays Fault if the camshaft actuator solenoid control circuit is open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Undefined	
B2S2 o2 Sensor - Bank 2 Sensor 2	--	mVolts	This parameter displays the voltage from the signal produced by the HO2S used to monitor catalyst efficiency for cylinder bank 2. The scan tool will display a low voltage reading when that cylinder bank is running lean. The scan tool will display a high voltage reading when that cylinder bank is running rich.
B2S2 o2 Sensor Heater	--	Active	This parameter displays the status of the O2 sensor heater. If the scan tool displays Active the O2 sensor heater has been activated.
	--	Inactive	
B2S2 o2 Sensor Heater Circuit Status	--	OK	This parameter displays the state of the intake camshaft actuator solenoid control circuit. The parameter displays Fault if the camshaft actuator solenoid control circuit is open, short to ground, or
	--	Fault	

	--	Undefined	a short to voltage on the circuit.
Barometric Pressure	--	kPa	This parameter displays the barometric pressure as calculated by the ECM using the signal from the manifold absolute pressure (MAP) sensor measured when the ignition is turned on with the engine not running. The ECM will update the barometric pressure during wide-open throttle (WOT) conditions. The scan tool will display a low value when the barometric pressure is low, and a high value when the barometric pressure is high.
Barometric Pressure	--	Volts	The scan tool displays 0-?? Volts. The scan tool displayed Voltage varies depending on the atmospheric pressure and the altitude.
Brake Lamp Switch	Brake pedal depressed	Active	This parameter displays the state of the brake pedal position switch as determined by the brake pedal switch. The scan tool will display Active when the brake pedal is depressed, and Inactive when the brake pedal is not depressed.
	Brake pedal not depressed	Inactive	
Calculated Air Flow	--	g/s	This parameter displays the air flow of the engine as calculated by the ECM using information from the MAP sensor. The scan tool will display a range of values indicating a high air flow when MAP pressure is high and a low air flow when MAP pressure is low. This value is listed in grams per second (g/s).
Calculated ECT - Closed	--	° C	This parameter displays the modeled temperature that the ECM calculates from air entering the engine, coolant temperature, and ambient air temperature. If the actual engine coolant temperature does not reach this calculated temperature within a predetermined amount of time, a DTC will be set.
Calculated ECT - Thermostat	--	° C	This parameter displays the modeled temperature that the ECM calculates from air entering the engine, coolant temperature, and ambient air temperature. If the actual engine coolant temperature does not reach this calculated

			temperature within a predetermined amount of time, a DTC will be set.
Calculated Pedal Position	--	0 - 100 %	This parameter displays the angle of the accelerator pedal as calculated by the ECM using the signals from the APP sensors. The APP indicated angle is a range of values indicating a low percentage when the accelerator pedal is not pressed to a high percentage when the accelerator pedal is fully pressed.
Calculated Throttle Position	--	0 - 100 %	This parameter displays the angle of the throttle position (TP) sensor as a percentage. This information is calculated by the engine control module using the signal from the throttle position sensor. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
Camshaft Active Counter	--	Counts	This parameter displays an incrementing counter when the engine control module receives a signal form the camshaft position (CMP) sensor.
CC Disengagement 1st History	--	On	The parameter displays the last 8 cruise control (CC) disengagements in order from 1 to 8, with 8 being the most recent. There are about 33 possible causes for the CC to disengage.
	--	Off	
CC Disengagement 2nd History	--	On	
	--	Off	
CC Disengagement 3rd History	--	On	
	--	Off	
CC Disengagement 4th History	--	On	
	--	Off	
CC Disengagement 5th History	--	On	
	--	Off	
CC Disengagement 6th History	--	On	
	--	Off	
CC Disengagement 7th History	--	On	
	--	Off	
CC Disengagement 8th History	--	On	
	--	Off	
			This parameter indicates whether the engine meets the conditions for a cold start-up during the present

Cold Startup	--	Yes	ignition cycle. The scan tool displays Yes when the conditions for a cold start-up are met during this ignition cycle. The scan tool displays No when the conditions for a cold start-up are not met during the present ignition cycle. Conditions for a cold start-up require the coolant temperature and the intake air temperature to be below a predetermined temperature and within a certain range of each other. These conditions must occur after the engine was warmed up to a specific temperature during the previous ignition cycle.
	--	No	
Commanded B1S1 o2 Sensor Heater	--	0 - 100 %	This parameter displays the commanded state of the bank 1 sensor 1 heater by the ECM. The scan tool will display 100% when the heater command is at the maximum, and a 0% value if the heater command is Off.
Commanded B1S1 o2 Sensor Valve	--	Ratio	
Commanded B1S2 o2 Sensor Heater	--	0 - 100 %	This parameter displays the commanded state of the bank 1 sensor 2 heater by the ECM. The scan tool will display 100% when the heater command is at the maximum, and a 0% value if the heater command is Off.
Commanded B1S2 o2 Sensor Valve	--	Ratio	
Commanded B2S1 o2 Sensor Heater	--	0 - 100 %	This parameter displays the commanded state of the bank 2 sensor 1 heater by the ECM. The scan tool will display 100% when the heater command is at the maximum, and a 0% value if the heater command is Off.
Commanded B2S2 o2 Sensor Heater	--	0 - 100%	This parameter displays the commanded state of the bank 2 sensor 2 heater by the ECM. The scan tool will display 100% when the heater command is at the maximum, and a 0% value if the heater command is Off.
Coolant Temperature	--	° C	This parameter displays the temperature of the engine coolant based on a voltage input from the

			engine coolant temperature (ECT) sensor to the ECM.
Crank Request	--	Active	This parameter displays whether the ignition switch has been cycled to the crank position requesting the ECM to activate the starter relay.
	--	Inactive	
Crankshaft Active Counter	--	Counts	This parameter displays an incrementing counter when the engine control module receives a signal from the crankshaft position (CKP) sensor.
Crankshaft Resynchronis Counter	--	Counts	This parameter displays the number of times the ECM re-syncs with the CKP sensor.
Cruise Control Active	--	Yes	This parameter displays the status of the cruise control system as determined by the ECM. The scan tool will display Yes when the cruise control system is in control of the vehicle speed, or No when the cruise control system is not operating.
	--	No	
Cruise Control Disengagement Reason	--	Off	This parameter displays the reason for the last cruise control disengagement.
	--	Brake Applied	
Cruise Control Switch	Cruise control switch activate	Active	This parameter displays the status of the cruise control switch.
	Cruise control switch deactivated	Inactive	
Cruise Resume/Acceleration Switch	Cruise resume/accel button pressed	Active	This parameter displays the status of the cruise resume/acceleration switch.
	Cruise resume/accel button in idle position	Inactive	
Cruise Set/Deceleration Switch	Cruise set/decel button pressed	Active	This parameter displays the status of the cruise set/deceleration switch.
	Cruise set/decel button in idle position	Inactive	
Cycles of Misfire	--	Number	This parameter displays the number of cylinder firing events that were recorded as misfires as determined by the ECM.
Cylinder 1 Ignition	--	OK	This parameter displays the state of the ignition control circuit. The parameter displays Fault if the ignition control circuit is open,
	--	Fault	

Circuit Status	--	Indeterminate	shorted to ground, or shorted to voltage. The parameter displays indeterminate until the control circuit has been commanded On.
Cylinder 1 Injector Circuit Status	--	OK	This parameter displays the status of the output driver for the injector control circuit. The scan tool displays OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Incomplete	
Cylinder 1 Knock Detected	--	Yes	This parameter displays the knock retard as commanded by the ECM for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
	--	No	
Cylinder 2 Ignition Circuit Status	--	OK	This parameter displays the state of the ignition control circuit. The parameter displays Fault if the ignition control circuit is open, shorted to ground, or shorted to voltage. The parameter displays indeterminate until the control circuit has been commanded On.
	--	Fault	
	--	Indeterminate	
Cylinder 2 Injector Circuit Status	--	OK	This parameter displays the status of the output driver for the injector control circuit. The scan tool displays OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Incomplete	
Cylinder 2 Knock Detected	--	Yes	This parameter displays the knock retard as commanded by the ECM for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
	--	No	
Cylinder 3 Ignition Circuit Status	--	OK	This parameter displays the state of the ignition control circuit. The parameter displays Fault if the ignition control circuit is open, shorted to ground, or shorted to voltage. The parameter displays indeterminate until the control circuit has been commanded On.
	--	Fault	
	--	Indeterminate	
			This parameter displays the status

Cylinder 3 Injector Circuit Status	--	OK	of the output driver for the injector control circuit. The scan tool displays OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Incomplete	
Cylinder 3 Knock Detected	--	Yes	This parameter displays the knock retard as commanded by the ECM for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
	--	No	
Cylinder 4 Ignition Circuit Status	--	OK	This parameter displays the state of the ignition control circuit. The parameter displays Fault if the ignition control circuit is open, shorted to ground, or shorted to voltage. The parameter displays indeterminate until the control circuit has been commanded On.
	--	Fault	
	--	Indeterminate	
Cylinder 4 Injector Circuit Status	--	OK	This parameter displays the status of the output driver for the injector control circuit. The scan tool displays OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Incomplete	
Cylinder 4 Knock Detected	--	Yes	This parameter displays the knock retard as commanded by the ECM for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs..
	--	No	
Cylinder 5 Ignition Circuit Status	--	OK	This parameter displays the state of the ignition control circuit. The parameter displays Fault if the ignition control circuit is open, shorted to ground, or shorted to voltage. The parameter displays indeterminate until the control circuit has been commanded On.
	--	Fault	
	--	Indeterminate	
Cylinder 5 Injector Circuit Status	--	OK	This parameter displays the status of the output driver for the injector control circuit. The scan tool displays OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display
	--	Fault	

	--	Incomplete	a fault if there is an open, short to ground, or a short to voltage on the circuit.
Cylinder 5 Knock Detected	--	Yes	This parameter displays the knock retard as commanded by the ECM for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
	--	No	
Cylinder 6 Ignition Circuit Status	--	OK	This parameter displays the state of the ignition control circuit. The parameter displays Fault if the ignition control circuit is open, shorted to ground, or shorted to voltage. The parameter displays indeterminate until the control circuit has been commanded On.
	--	Fault	
	--	Indeterminate	
Cylinder 6 Injector Circuit Status	--	OK	This parameter displays the status of the output driver for the injector control circuit. The scan tool displays OK, Incomplete, Short B+, Short Gnd/Open. The scan tool will display OK if the circuit is operating correctly. The scan tool will display a fault if there is an open, short to ground, or a short to voltage on the circuit.
	--	Fault	
	--	Incomplete	
Cylinder 6 Knock Detected	--	Yes	This parameter displays the knock retard as commanded by the ECM for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.
	--	No	
Dec. Fuel Cutoff (Deceleration)	--	Active	This parameter displays the status of the operating mode of the engine control module used to turn off the fuel injectors and the evaporative emission (EVAP) canister purge valve during certain deceleration conditions.
	--	Inactive	
Desired Engine Idle Speed	--	744 RPM	This parameter displays the desired engine idle speed as commanded by the ECM.
Desired Throttle Position	--	0 - 100 %	This parameter displays the angle of the TP as a percentage. This information is calculated by the ECM using the signals from the TP sensors. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
			This parameter displays the

Distance Since DTC Cleared	--	Km	distance accumulated since an emission diagnostic trouble code was cleared. The scan tool will display increasing distance as the vehicle is driven.
Electronic Throttle Control Learn Counter	--	Counts	This parameter displays the stage of learning the throttle positions are at. The electronic throttle control learn counter will display 0 - 11 counts. When 11 is displayed this indicates that the learning is complete.
Engine Control Ignition Relay	--	On	This parameter displays the state of the control circuit ECM power relay as commanded by the ECM. The scan tool displays On with the engine running.
	--	Off	
Engine Control Ignition Relay Circuit Status	--	Complete	This parameter displays the status of the output driver for the EC Ignition Relay control circuit. The scan tool will display Complete, Incomplete. The scan tool will display Complete if the circuit is operating correctly. The scan tool will display Incomplete if there is an open, short to ground, or a short to voltage on the circuit.
	--	Incomplete	
Engine Control Ignition Relay Feedback	--	Volts	The scan tool displays 0-13 Volts. The scan tool displays approximately 12 Volts when the ignition is On.
Engine Load	--	0 - 100 %	This parameter displays the calculated engine load as a percentage based on inputs to the ECM from various engine sensors.
Engine Oil Level Switch	Normal engine oil level	Ok	This parameter displays if the level of the engine oil is within range as determined by the ECM from information received from the engine oil level switch.
	Low engine oil level	Low	
Engine Oil Life Remaining	--	0 - 100 %	This parameter displays the percent of engine oil life remaining. The controller calculates the engine oil life by monitoring engine load, coolant temperature, and engine speed.
Engine Oil Pressure	--	kPa	This parameter displays the engine oil pressure.
Engine Oil Pressure Sensor	--	Volts	The scan tool displays 0-?? Volts. The scan tool displayed Voltage varies depending on the engine oil

			pressure.
Engine Oil Pressure Sensor	Normal engine oil pressure	Ok	This parameter displays Ok if the engine oil pressure is within the correct range. If the engine control module detects that the engine oil pressure is not within the correct range, the scan tool displays Low.
	Low engine oil pressure	Low	
Engine Oil Temperature	--	° C	This parameter displays the temperature of the engine oil.
Engine Oil Temperature Calculated	--	° C	This parameter displays the engine oil temperature as calculated by the ECM.
Engine Run Time	--	hh:mm:ss	This parameter displays the time elapsed since the engine was started. The scan tool will display the time in hours, minutes and seconds. The engine run time will reset to zero as soon as the engine stops running.
Engine Speed	--	RPM	This parameter displays the speed of the crankshaft as calculated by the ECM based on inputs from the CKP Sensor. The scan tool will display the engine speed in RPM.
EVAP Purge Solenoid (Evaporative Emission)	--	0 - 100 %	This parameter displays the on-time or duty cycle of the EVAP canister purge solenoid commanded by the engine control module. Zero percent indicates no purge. One hundred percent indicates full purge.
EVAP Purge Solenoid Valve Circuit Status	--	Okay	This parameter displays the state of the EVAP purge solenoid valve control circuit. The parameter displays Fault if the EVAP purge solenoid valve control circuit is shorted to voltage. This parameter may not change if the scan tool is used to command the EVAP purge solenoid valve on.
	--	Fault	
	--	Undefined	
Fan 1 Relay	--	Okay	This parameter displays the state of the fan relay control circuit. The parameter displays Fault if the fan relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays Indeterminate until the circuit has been commanded on.
	--	Fault	
	--	Indeterminate	
Fan 1 Relay Circuit	--	Okay	This parameter displays the state of the fan relay control circuit. The parameter displays Fault if the fan
	--	Fault	

Status	--	Undefined	relay control circuit has an open, short to ground, or a short to voltage on the circuit
Fan 2 and 3 Relay	--	On	This parameter displays the engine control module commanded state of the fan relay control circuit.
	--	Off	
Fan 2 and 3 Relay Circuit Status	--	Okay	This parameter displays the state of the fan relay control circuit. The parameter displays Fault if the fan relay control circuit is open, short to ground, or a short to voltage on the circuit
	--	Fault	
	--	Undefined	
Fuel Level	--	0 - 100 %	This parameter displays the amount of fuel remaining in all of the fuel tanks of the vehicle as a percentage. The ECM calculates this level using the signals from the sensors used to monitor the fuel level in the fuel tanks. The scan tool will display a low reading when the total fuel level in the vehicle is low or near empty. The scan tool will display a high reading when the fuel level in the tank is high or near full.
Fuel Level	--	Litres	This parameter displays the amount of fuel remaining in all fuel tanks of the vehicle as measured in litres or gallons. The ECM calculates the amount of fuel remaining in the tank by using information from the fuel level sensors.
Fuel Level Sensor 1	--	Volts	The scan tool displays 0-?? Volts. The scan tool displayed Voltage varies depending on the fuel level in the fuel tank.
Fuel Level Sensor 2	--	Volts	The scan tool displays 0-?? Volts. The scan tool displayed Voltage varies depending on the fuel level in the fuel tank.
Fuel Pump Relay	--	On	This parameter displays the commanded state of the fuel pump relay control circuit. The fuel pump relay should be On when the scan tool indicates the fuel pump relay command is On. The fuel pump relay should be Off when the scan tool indicates the fuel pump relay command is Off.
	--	Off	
Fuel Pump Relay	--	Okay	This parameter displays the state of the fuel pump relay control circuit. The parameter displays Fault if the

Circuit Status	--	Fault	fuel pump relay control circuit is open, short to ground, or a short to voltage on the circuit
	--	Undefined	
Fuel System Status	--	Open Loop	The scan tool displays Closed Loop if the ECM is controlling the fuel delivery according to the HO2S voltages. The scan tool displays Open Loop if the engine control module is not adjusting for HO2S inputs. In Open Loop the engine control module bases fuel deliver on throttle position, engine coolant temperature, and mass airflow sensor inputs.
	--	Closed Loop	
Fuel Trim Learn	--	Enable	The scan tool displays Enabled when conditions are appropriate for enabling long term fuel trim corrections. If the scan tool displays Disabled, then long term fuel trim will not respond to changes in short term fuel trim.
	--	Disable	
Ignition Accessory Signal	Ignition is in ACC position	On	This parameter displays the state of the ignition input to the ECM from the ignition switch. The scan tool will display On when the ignition switch is in the ignition accessory position. The scan tool will display Off when the ignition switch is in any other position.
	Ignition is in OFF/RUN/CRANK positions	Off	
Ignition Off Time	--	hh:mm:ss	This parameter displays the time which the ignition has been switched off.
Ignition Voltage	--	Volts	The scan tool displays 0-13 Volts. The scan tool displays approximately 11-13 Volts when the ignition is On.
IMRC Solenoid (Intake Manifold Runner Control)	--	On	This parameter displays the ECM commanded state of the IMRC solenoid.
	--	Off	
IMRC Solenoid Circuit Status	--	OK	This parameter displays the state of the IMRC circuit. The parameter displays Fault if the IMRC circuit is open, shorted to ground, or shorted to voltage. The parameter displays Indeterminate until the circuit has been commanded on. This parameter may not change if the scan tool is used to command the IMRC solenoid on.
	--	Fault	
	--	Indeterminate	
Injection Time Cylinder 1	--	milliseconds	

Injection Time Cylinder 2	--	milliseconds	This parameter displays the amount of fuel injector on time or pulse width as commanded by the ECM.
Injection Time Cylinder 3	--	milliseconds	
Injection Time Cylinder 4	--	milliseconds	
Injection Time Cylinder 5	--	milliseconds	
Injection Time Cylinder 6	--	milliseconds	
Injector 1 Disabled Due to Misfire	--	Yes	This parameter displays the status of the fuel injector driver by the ECM. The scan tool will display Yes if the fuel injector is being disabled due to a misfire detection. The scan tool will display No if the fuel injector is not being disabled by the ECM due to a misfire.
	--	No	
Injector 2 Disabled Due to Misfire	--	Yes	
	--	No	
Injector 3 Disabled Due to Misfire	--	Yes	
	--	No	
Injector 4 Disabled Due to Misfire	--	Yes	
	--	No	
Injector 5 Disabled Due to Misfire	--	Yes	
	--	No	
Injector 6 Disabled Due to Misfire	--	Yes	
	--	No	
Intake Air Temperature	--	° C	This parameter displays the temperature of the intake air calculated by the ECM based on the input from the intake air temperature (IAT). The scan tool will display a low value for a low intake air temperature, and a high value for a high intake air temperature.
Knock Retard	--	° CA	This parameter indicates the amount of timing retard commanded by the ECM. The scan tool will display a lower value if no knock is detected, and a higher value as more knock is detected.
Knock Retard Cylinder 1	--	° CA	This parameter indicates the amount of timing retard commanded by the ECM. The scan tool will display a lower value if no knock is detected, and a higher value as more knock is detected and the ECM retards the ignition timing.
Knock Retard Cylinder 2	--	° CA	
Knock Retard Cylinder 3	--	° CA	
Knock Retard Cylinder 4	--	° CA	
Knock Retard Cylinder 5	--	° CA	

Knock Retard Cylinder 6	--	° CA	
Knock Sensor 1 Test Status	--	Complete	This parameter displays the knock sensor 1 test status. The scan tool displays Complete if the knock sensor 1 test is completed and operating normally.
	--	Incomplete	
Knock Sensor 2 Test Status	--	Complete	This parameter displays the knock sensor 2 test status. The scan tool displays Complete if the knock sensor 2 test is completed and operating normally.
	--	Incomplete	
Knock Sensor Circuit Test Status	--	Complete	This parameter displays the knock sensor circuit test status. The parameter displays Complete if the knock sensor circuit test is completed and operating normally.
	--	Incomplete	
Loop Status Bank 1 Sensor 1	--	Open Loop	This parameter displays the state of the fuel control system as commanded by the ECM. Closed Loop operation indicates that the ECM is controlling the fuel delivery based off the oxygen sensors input signal. In Open Loop operation the ECM ignores the oxygen sensor input signal and bases the amount of fuel to be delivered on other sensor inputs.
	--	Closed Loop	
Loop Status Bank 2 Sensor 1	--	Open Loop	This parameter displays the state of the fuel control system as commanded by the ECM. Closed Loop operation indicates that the ECM is controlling the fuel delivery based off the oxygen sensors input signal. In Open Loop operation the ECM ignores the oxygen sensor input signal and bases the amount of fuel to be delivered on other sensor inputs.
	--	Closed Loop	
Malfunction Indicator	--	On	This parameter displays the commanded state of the malfunction indicator lamp (MIL) control circuit by the ECM.
	--	Off	
Mass Air Flow	--	g/s	This parameter indicates the airflow into the engine as calculated by the ECM based on mass airflow (MAF) sensor inputs. The scan tool will display a high value at higher engine speeds, and a low value at idle.
			This parameter indicates the

Mass Air Flow Sensor	--	Hz	frequency signal sent from the MAF sensor to the ECM. The scan tool will display a high value indicates a higher engine speed. The scan tool will display a low value at idle.
Misfire Current Cylinder 1	--	Counts	This parameter indicates the number of cylinder firing events detected as possible misfires on each cylinder during the last 200 crankshaft revolutions as calculated by the ECM.
Misfire Current Cylinder 2	--	Counts	
Misfire Current Cylinder 3	--	Counts	
Misfire Current Cylinder 4	--	Counts	
Misfire Current Cylinder 5	--	Counts	
Misfire Current Cylinder 6	--	Counts	
Misfire History Cylinder 1	--	Counts	The scan tool displays in counts. This parameter displays the total level of cylinder misfires that have been calculated for each cylinder by the ECM. This parameter will not update or show activity until a misfire DTC has become active. The misfire history counters will update every 200 cylinder firing events.
Misfire History Cylinder 2	--	Counts	
Misfire History Cylinder 3	--	Counts	
Misfire History Cylinder 4	--	Counts	
Misfire History Cylinder 5	--	Counts	
Misfire History Cylinder 6	--	Counts	
Number of Warm Ups Since DTCs Cleared	--	(#)	This parameter indicates the number of warm up cycles that have occurred since DTCs were cleared. The scan tool will display a higher counts as more warm up cycles have occurred since the DTCs were cleared.
Oil Level	--	Normal	This parameter displays if the level of the engine oil is within range as determined by the ECM from information received from the engine oil level switch.
	--	Low	
Power Enrichment	--	Yes	Scan tool displays Yes or No. Yes displayed indicates that the ECM has detected conditions appropriate to operate in power enrichment mode. The ECM commands power enrichment mode when a large increase in throttle position and load is detected. While in power

	--	No	enrichment, the ECM will increase the amount of fuel delivered by entering open loop and increasing the injector pulse width.
Powertrain Immobiliser	--	Standby	This parameter displays the current status of the powertrain immobiliser as Active, Inactive or Standby
	--	Active	
	--	Inactive	
Reduced Engine Power	--	Active	The scan tool displays Active when the ECM receives a signal from the throttle actuator control (TAC) module that a TAC system fault is occurring. The scan tool displays Inactive when the engine is operating normally.
	--	Inactive	
Requested Torque	--	0 - 100 %	This parameter displays the calculated amount torque requested of the controller.
RVC (Regulated Voltage Control) Override Command	--	On	This parameter displays whether the ECM has command the alternator On or Off to maintain a regulated voltage.
	--	Off	
Spark Advance	--	° CA	This parameter displays the amount of spark advance the engine control module is commanding on the ignition control circuits. The ECM determines the desired advance.
Starter Relay	--	On	This parameter displays the ECM commanded state of the starter motor relay control circuit.
	--	Off	
Starter Relay Circuit Status	--	Okay	This parameter displays the state of the starter relay control circuit. The parameter displays Fault if the starter relay control circuit is open, short to ground, or a short to voltage on the circuit
	--	Fault	
	--	Undefined	
Start-Up ECT	--	° C	This parameter indicates the engine coolant temperature at start-up, as calculated by the ECM based on the input from the engine coolant temperature sensor. The scan tool will display a higher value at higher engine start-up temperatures, and a lower value at lower start-up temperatures.
Start-Up IAT	--	° C	This parameter indicates the intake air temperature (IAT) at the time that the vehicle was started. Used to determine if the last start-up was a cold start. The scan tool

			range is -39 to +140°C (-38 to +284°F). This parameter indicates the ambient air temperature at start-up.
System Power Mode	Ignition is in OFF position	Off	This parameter displays Off/Accessory/Run/Crank. This is the status of the system power mode dependant on the ignition position
	Ignition is in ACC position	Accessory	
	Ignition is in RUN position	Run	
	Ignition is in CRANK position	Crank	
TAC Motor PWM Command	--	0 - 100 %	This parameter indicates the commanded state of the TAC PWM Solenoid by the ECM. The scan tool displays as a percentage. The scan tool displays 0% when the solenoid is Off.
Throttle Position	--	0 - 100 %	This parameter displays the throttle position as a percentage as calculated by the ECM using information from the two TP sensors.
Total Knock Retard	--	° CA	This parameter indicates how much ignition spark timing is being retarded due to all control systems monitored by the ECM. The scan tool will display a high value during extreme conditions such as high temperatures and antilock braking. The scan tool will display a lower value during lighter driving conditions.
Total Misfire	--	(#)	The scan tool range is 0-255 counts. This parameter indicates the total level of misfire that has been detected on each cylinder. The misfire history counters will not update or show any activity until a misfire or DTC P0300 has become active. The misfire history counter will update every 200 cylinder firing events.
TP Sensor 1	--	0 - 100 %	This parameter displays the angle of the TP sensor 1 as a percentage. This information is calculated by the ECM using the signal from the TP sensor 1. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully

			open.
TP Sensor 1	--	Volts	The scan tool displays 0-5 Volts. The scan tool displays approximately 3-3.6 Volts when the ignition is On.
TP Sensor 1 Learned Lower Position	--	Volts	This parameter displays the learned minimum value of TP sensor 1 as recorded by the ECM during the last learn procedure.
TP Sensor 1-2 Correlation	--	OK	This parameter displays the results of a ECM test that compares signals from the TP sensors 1 and 2. The scan tool will display OK when the signal from TP sensor 1 corresponds with the signal from TP sensor 2. The scan tool will display Fault when the signal from TP sensor 1 conflicts with the signal from TP sensor 2.
	--	Fault	
TP Sensor 2	--	0 - 100 %	This parameter displays the angle of the TP sensor 2 as a percentage. This information is calculated by the ECM using the signal from the TP sensor 2. The scan tool will display a low percentage when the throttle plates are closed. The scan tool will display a high percentage when the throttle plates are fully open.
TP Sensor 2	--	Volts	The scan tool displays 0-5 Volts. The scan tool displays approximately 1.5-1.9 Volts when the ignition is On.
TP Sensor 2 Learned Lower Position	--	Volts	This parameter displays the learned minimum value of TP sensor 2 as recorded by the ECM during the last learn procedure.
Traction Control	--	Active	This parameter displays Active if the EBCM is commanding traction control.
	--	Inactive	
Transmission Gear	Gear selector in Park position	P/N	This parameter indicates the current state of the gear select switch on the transmission/transaxle as calculated by the ECM based on the TR switch.
	Gear selector in Reverse position	R	
	Gear selector in Neutral position	P/N	
	Gear selector in Drive position	D	
	--	OK	This parameter displays the status of the vehicle speed circuit. The

Vehicle Speed Circuit Status	--	Fault	parameter displays Fault if the vehicle speed circuit is open, shorted to ground, or shorted to voltage. The parameter displays Incomplete until the circuit has been commanded On. The scan tool will display OK if the circuit is operating correctly.
	--	Incomplete	
Vehicle Speed	--	Km/h	This parameter indicates the vehicle speed calculated by the ECM based on an input from the vehicle speed sensor (VSS). The scan tool will display a high value at higher vehicle speeds, and a low value at lower vehicle speeds.
Volumetric Efficiency	--	5 - 25 %	This parameter displays the calculated volumetric efficiency of the engine as calculated by the ECM.

ECM Control Module Scan Tool Output Controls

Scan Tool Output Control	Additional Menu Selection(s)	Description
Camshaft Actuator	Special Functions/Engine Output Controls/CMP Actuator System	This function controls the selected camshaft actuator. The normal commanded state is NONE. The system will increase or decrease the angle of the selected camshaft in 5 degree increments up to 40 crankshaft degrees. The scan tool initiates the test when the following conditions are met: • The vehicle speed is 0 km/h (0 mph). • The transmission is in park or neutral. • The engine speed is between 1,000-1,400 RPM. The system remains in the commanded state until cancelled by the scan tool.
Camshaft Actuator Solenoid	Special Functions/Engine Output Controls/CMP Actuator System	This function controls the selected camshaft actuator solenoid. The normal commanded state is NONE. When commanded ON/OFF, the ECM turns the camshaft actuator solenoid ON/OFF. The scan tool initiates the test when the following conditions are met: • The ignition is ON with the engine OFF. • No engine speed is detected. The system remains in the commanded state until cancelled by the scan tool.
		Important: The Misfire Current and Misfire History parameters may not increment when using this

Cylinder Power Balance	Special Functions/Fuel System	function. This function disables the selected fuel injector. The normal commanded state is None. The scan tool initiates the test when the following conditions are met: • The engine is operating and the engine idle is stable. • The vehicle speed is 0 km/h (0 mph). • There are no DTCs set for the vehicle speed sensor. If the fuel injector was disabled for 30 seconds, fuel injector control is not allowed again on the same fuel injector for 60 seconds.
Engine Speed Control	Special Functions/TAC System	This function controls the idle speed override in 25 RPM, 100 RPM, and 500 RPM increments, from the base idle speed to 1,400 RPM. The scan tool initiates the test when the following conditions are met: • The transmission is in park or neutral. • The engine speed is less than 1,000 RPM. The engine speed will remain in the commanded state until cancelled by the scan tool.
EVAP Purge Solenoid	Special Functions/Engine Output Controls/EVAP System	**Important:** The EVAP Purge Solenoid Command parameter may not change states when using this output control. This function controls the EVAP purge solenoid valve. The normal commanded state is NONE. The system will increase or decrease the amount of purge by changing the duty cycle of the purge valve in 10 percent increments within a range of 0-100 percent. The system remains in the commanded state until cancelled by the scan tool or the fuel tank pressure (FTP) sensor exceeds -24 mm Hg (-12 inch H20).
EVAP Purge/Seal	Special Functions/Engine Output Controls/EVAP System	**Important:** The EVAP Purge and Vent Solenoid Command parameters may not change states when using this output control. This function activates both the EVAP purge solenoid valve and EVAP vent solenoid to seal the EVAP system. When activated, the purge valve is commanded to 0 percent and the vent valve is commanded ON, Not-venting. The normal commanded state for both solenoids is None. Both of the solenoids remain in the commanded state until

		cancelled by the scan tool or the FTP sensor exceeds -24 mm Hg (-12 inch H20).
EVAP Test	Service Bay Test	This function activates the Service Bay Test to verify the integrity of the EVAP system. The scan tool initiates the test when the following conditions are met: • All instructions on the scan tool have been completed. • ECT is less than a specified value. • No EVAP DTCs are set.
EVAP Vent Solenoid	Special Functions/Engine Output Controls/EVAP System	**Important:** The EVAP Vent Solenoid Command parameter may not change states when using this output control. This function controls the EVAP vent solenoid. The normal commanded state is NONE. When commanded ON, the vent valve switches to Not-venting. The system remains in the commanded state unless one of the following conditions occur: • Cancelled by the scan tool • The EVAP canister purge solenoid is more than 0 percent, and the FTP sensor exceeds -24 mm Hg (-12 inch H20).
Fuel Injector Balance	Special Functions/Fuel System	This function enables the fuel injector in order to verify the correct fuel injector flow. The ECM will pulse the selected fuel injector when the following conditions are met: • All instruction on the scan tool is complete. • A fuel injector is selected. • The ignition is ON with the engine OFF. The selected fuel injector can only be flowed/pulsed once per ignition cycle.
Fuel Pump	Special Functions/Engine Output Controls	This function controls the fuel pump relay. The normal commanded state is NONE. The scan tool initiates the test when the following conditions are met: • There are no vehicle speed sensor DTCs set. • The vehicle speed is 0 km/h (0 mph). When commanded ON/OFF, the engine Control Module (ECM) turns the fuel pump relay ON/OFF. If the engine is running and the fuel pump relay is commanded OFF, the engine will stall. The system remains in the commanded state for about

		2 seconds or until cancelled by the scan tool or the ECM detects a vehicle speed.
Fuel Trim Reset	Special Functions/Fuel System	This function resets the fuel trim data and the learned values for the rear heated oxygen sensors.
Idle Learn Reset	Special Functions/TAC System	This function allows the throttle position and the idle speed to be relearned by the ECM, once the following conditions have been met. • The ignition is ON with the engine OFF. • The engine coolant temperature (ECT) is between 5-85°C (41-185°F). • No TAC system DTCs are set.
IMRC Solenoid	Special Functions/Engine Output Controls	This function controls the intake manifold runner control (IMRC) solenoid. The normal commanded state is NONE. When commanded ON/OFF, the ECM turns the IMRC solenoid ON/OFF. The scan tool initiates the test when the following conditions are met: • There are no vehicle speed sensor DTCs set. • The vehicle speed is 0 km/h (0 mph). The system remains in the commanded state until cancelled by the scan tool.
Loop Status	Special Functions/Engine Output Controls	This function controls the heated oxygen sensor (HO2S) loop status. The commanded states include NONE, OPEN, and CLOSED. The normal commanded state is NONE. The loop status changes as commanded, OPEN or CLOSED. The system remains in the commanded state until cancelled by the scan tool.
Malfunction Indicator Lamp	Special Functions/Engine Output Controls	This function controls the malfunction indicator lamp (MIL). The normal commanded state is NONE. When commanded ON/OFF, the ECM turns the MIL ON/OFF. The system remains in the commanded state until cancelled by the scan tool.
Throttle Position	Special Functions/TAC System	This function controls the throttle valve in 10 percent increments. The scan tool initiates the test when the following conditions are met: • There are no vehicle speed sensor DTCs set. • The vehicle speed is 0 km/h (0 mph). • The ignition is ON, with the engine OFF. • The ECM is not commanding a throttle learn. The system remains in the commanded state until cancelled by the scan tool.

Engine Control Module Scan Tool Information (V8 Gasoline)

Table 1: Engine Control Module Scan Tool Data
Table 2: Output Control

The Engine Control Module Scan Tool Data List contains all engine-related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists, and in some cases may appear more than once, or in more than one data list in order to group certain related parameters together.

Use the Engine Scan Tool Data List only after the following is determined:

- The Diagnostic System Check - Vehicle is completed.
- No DTCs are set
- The on-board diagnostics are functioning properly

The scan tool values from a properly running engine may be used for comparison with the engine you are diagnosing. The engine scan tool data list represents values that would be seen on a normally running engine.

Important: A scan tool that displays faulty data should not be used. The scan tool concern should be reported to the manufacturer. Use of a faulty scan tool can result in misdiagnosis and unnecessary parts replacement.

Only the parameters listed below are referenced in this service manual for use in diagnosis.

Engine Control Module Scan Tool Data

Parameter	System State	Expected Value	Description
Base Operating Conditions: Engine Idling/Radiator Hose Hot/Park or Neutral/Closed Loop/Accessories OFF			
5-volt Reference 1	--	5 Volts	This parameter displays the voltage sensed on the 5-volt reference 1 circuit at the control module. The scan tool will display a higher value at higher voltage. The scan tool will display a lower value at lower voltage.
5-volt Reference 1 Circuit Status	--	OK	This parameter will display OK if the circuit is good or Fault if a short to ground, short to B+ or open circuit is present.
5-volt Reference 2	--	5 Volts	This parameter displays the voltage sensed on the 5-volt reference 2 circuit at the control module. The scan tool will display a higher value at higher voltage. The scan tool will display a lower value at lower voltage.
5-volt			This parameter will display OK if the circuit is

Reference 2 Circuit Status	--	OK	good or Fault if a short to ground, short to B+ or open circuit is present.
A/C Request Signal	--	NO	The scan tool displays YES/NO. The HVAC module receives an input request when the HVAC module is turned ON.
A/C Relay Command	--	OFF	This parameter displays the commanded state of the air conditioning (A/C) clutch relay control circuit. The scan tool will display ON or OFF. ON indicates the A/C clutch relay control circuit is being grounded by the control module, allowing voltage to the A/C compressor clutch. OFF indicates the A/C clutch relay is not being commanded ON by the control module.
A/C Relay Ckt Short Gnd Test Status	--	OK	This displays the status of the relay control circuit. It can display OK, Fault or Not Run.
A/C Relay Ckt Open Test Status	--	OK	This displays the status of the relay control circuit. It can display OK, Fault or Not Run.
A/C Relay Ckt Short Volts Test Status	--	Not Run	This displays the status of the relay control circuit. It can display OK, Fault or Not Run.
A/C High side Pressure Sensor	A/C OFF	1.43 Volts	The scan tool displays 0-5 volts. The voltage applied to the ECM input for the A/C refrigerant pressure sensor.
	A/C ON	2.39 Volts	
A/C High side Pressure Sensor	A/C OFF	500-2,220 kPa (72-319 psi)	The scan tool displays 0-3450 kPa (0-500 psi). The voltage applied to the ECM input from the A/C refrigerant pressure sensor is converted to a pressure value.
	A/C ON	300-1,220 kPa (43-174 psi)	
A/C OFF for WOT	A/C ON	NO	The scan tool displays YES/NO. The state of the A/C request related to wide open throttle.
A/C Pressure Disable	--	NO	The scan tool displays YES/NO. The state of the A/C refrigerant pressure sensor and circuitry.
A/C Disengage 1-8 History	A/C ON	Reason for A/C Disengagement	The scan tool displays None, A/C Pressure, Engine Speed, Battery Voltage, Stall Prevention, RPM Unstable, WOT, Launch Performance or Coolant Hot. The scan tool displays None if OK.
Air Flow Calculated	--	3-7 g/s	This parameter displays the air flow of the engine as calculated by the control module using information from the manifold absolute pressure (MAP) sensor. The scan tool will display a range of values indicating a high air flow when MAP pressure is high and a low air flow when MAP pressure is low. This value is listed in grams per second (g/s).
Ambient Air Temperature	--	Varies	Outside temperature at any given altitude expressed in degrees

APP Indicated Angle	Accelerator pedal not applied	0%	This parameter displays the angle of the accelerator pedal as calculated by the control module using the signals from the accelerator pedal position sensors. The accelerator pedal position (APP) indicated angle is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.
	Accelerator pedal WOT	100%	
APP Sensor	--	Varies	This parameter displays the average of the APP sensors as calculated by the throttle actuator control (TAC) module. The APP average is a range of values indicating a low number when the accelerator pedal is not depressed to a high number when the accelerator pedal is fully depressed. This value is listed in counts.
APP Sensor 1	Accelerator pedal not actuated	0.7-1.2 Volts	This parameter displays the voltage signal sent to the control module from APP sensor 1 of the APP sensor assembly. APP sensor 1 is a range of values indicating a low voltage when the accelerator pedal is not depressed to a high voltage when the accelerator pedal is fully depressed.
	Accelerator pedal fully actuated	4.2-4.5 Volts	
APP Sensor 1 Indicated Position	Accelerator pedal not actuated	0%	This parameter displays the angle of the APP sensor 1 as calculated by the control module using the signal from the APP sensor 1. APP sensor 1 is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.
	Accelerator pedal fully actuated	100%	
APP Sensor 2	Accelerator pedal not actuated	0.3-0.5 Volts	This parameter displays the voltage signal sent to the control module from APP sensor 2 of the APP sensor assembly. APP sensor 2 is a range of values indicating a low voltage when the accelerator pedal is not depressed to a high voltage when the accelerator pedal is fully depressed.
	Accelerator pedal fully actuated	2.2-2.5 Volts	
APP Sensor 2 Indicated Position	Accelerator pedal not actuated	0%	This parameter displays the angle of the APP sensor 2 as calculated by the control module using the signal from the APP sensor 2. APP sensor 2 is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.
	Accelerator pedal fully actuated	100%	
APP Sensor 1 and 2	--	Agree	This parameter displays the results of a control module test that compares the signals from the APP sensors 1 and 2. The scan tool will display Agree or Disagree. Agree indicates that APP sensor 1 and APP sensor 2 voltages correspond to the same accelerator pedal position. Disagree indicates that APP

			sensor 1 and APP sensor 2 voltages correspond to different accelerator pedal positions.
BARO	--	Varies with altitude	This parameter displays the barometric pressure as calculated by the control module using the signal from the MAP sensor measured when the ignition is turned ON with the engine not running. The control module will update the barometric pressure during wide-open throttle (WOT) conditions.
BPP Signal	--	Released	This parameter displays the state of the brake pedal position switch as determined by the brake pedal switch. The scan tool will display Applied when the brake pedal is depressed, and Released when the brake pedal is not depressed.
BPP Circuit Signal	--	Released	The BCM uses the Brake Pedal Position sensor as an indication that the brake pedal is applied or released.
Catalytic Converter Protection Active	--	No	This parameter indicates the status of the control module control for catalytic converter protection. The scan tool will indicate YES if the control module is adjusting fuel and ignition quantity and timing to protect the catalytic converter from damage. The scan tool will indicate NO if the control module is in a normal fuel and ignition control mode.
Calc. TWC Temp.	--	Varies	This parameter displays the catalytic converter temperature as calculated by the control module.
Calc. TWC Temp. Bank 1 and Bank 2	--	Varies	This parameter displays the catalytic converter temperature as calculated by the control module.
Change Engine Oil Indicator Command	--	No	This parameter displays the state of the change engine oil lamp control circuit as commanded by the control module.
CKP Resync Counter	--	Varies	This parameter displays the number of times the control module has to synchronize the CKP sensor.
CKP Sensor	--	Engine Idle Speed	This parameter displays the engine speed as calculated by the control module using the signal from the CKP sensor.
CKP Active Counter	--	Incrementing	This parameter displays an incrementing counter when the control module receives a signal from the crankshaft position (CKP) sensor.
Cmmd. A/F Equivalence Ratio	--	1	Equivalence numbers greater than one represent excess fuel in the fuel air mix. Equivalence numbers less than one represent a deficiency of fuel in the fuel air mix for complete combustion. The equivalence ratio

			will be reported as one when the vehicle is in Closed Loop.
CMP Sensor	--	Engine Idle Speed	This parameter displays the engine speed as calculated by the control module using the signal from the CMP sensor.
Cold Startup	--	Varies	This parameter displays whether the engine meets the conditions for a cold startup during the present ignition cycle. The scan tool displays Yes when the conditions for a cold startup are met during this ignition cycle. The scan tool displays No when the conditions for a cold startup are not met during the present ignition cycle. Conditions for a cold startup require the coolant temperature and the intake air temperature to be below a predetermined temperature and within a certain range of each other. These conditions must occur after the engine was warmed up to a specific temperature during the previous ignition cycle.
Crank Request Signal	--	No	This parameter displays the state of the crank request input to the control module from the ignition switch. The scan tool will display Yes when the ignition switch is in the Crank position. The scan tool will display No when the ignition switch is in any other position.
Cruise Control Active	--	Inactive	This parameter displays the status of the cruise control system as determined by the control module. The scan tool will display Yes when the cruise control system is in control of vehicle speed. The scan tool will display No when the cruise control system is not operating.
Cruise Disengage 1-8 History	Cruise ON	None	The Scan tool displays the last 8 cruise control disengages in order from 1 to 8. There are 20 possible causes for the cruise control to disengage.
Cruise ON/OFF Switch	--	ON	This parameter displays the state of the ON/OFF switch input to the control module. The scan tool will display ON when the cruise ON/OFF switch is ON. The scan tool will display OFF when the cruise ON/OFF switch is OFF.
Cruise Resume/Accel Switch	--	Invalid	This parameter displays the state of the Resume/Accel switch input to the control module When the cruise control switch is in the ON position and the Resume/Accel switch is activated, the scan tool displays ON. When the Resume/Accel switch is released the scan tool displays OFF.
			This parameter displays the state of the Set/Coast switch input to the control module

Cruise Set/Coast Switch	--	Invalid	from the cruise control system. When the cruise control switch is in the ON position and the Set/Coast switch is activated, the scan tool displays ON. When the Set/Coast switch is released the scan tool displays OFF.
Cruise Control Cancel Switch	--	Off	This parameter displays the status of the cruise control cancel switch as determined by the control module. The scan tool will display On when the cruise control cancel switch is on. The scan tool will display Off when the cruise control cancel switch is off.
Cycles of Misfire Data	--	Incrementing 0-100	This parameter displays the number of cylinder firing events recorded by the control module
Cyl. 1-8 IC Ckt Short Gnd Test Status	--	OK	This parameter displays the status of the output driver for the ignition control circuits. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cyl. 1-8 IC Ckt Open Test Status	--	OK	This parameter displays the status of the output driver for the ignition control circuits. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cyl. 1-8 IC Ckt Short Volts Test Status	--	OK	This parameter displays the status of the output driver for the ignition control circuits. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cyl. 1-8 Inj. Ckt Short Gnd Test Status	--	OK	This parameter displays the status of the output driver for the ignition control circuits. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cyl. 1-8 Inj. Ckt Open Test Status	--	OK	This parameter displays the status of the output driver for the ignition control circuits. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cyl. 1-8 Inj. Ckt Short Volts Test Status	--	OK	This parameter displays the status of the output driver for the ignition control circuits. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Decel. Fuel Cut-off	--	Inactive	This parameter displays the status of the operating mode used to turn OFF the fuel injectors during certain deceleration conditions. When the scan tool displays Active, the control module has turned OFF the fuel injectors. When the scan tool displays Inactive, the fuel system is operating normally.

Desired EGR Position	--	0%	This parameter displays the position of the exhaust gas recirculation (EGR) valve commanded by the control module. The scan tool will display 0 percent when the control module is commanding the EGR valve closed. The scan tool will display a higher percentage when the EGR valve is commanded open.
Desired Exh CMP Bank 1 or 2	--	Varies in degrees	This parameter displays the desired exhaust camshaft position for Bank 1 or 2, as determined by the control module. The scan tool will display a higher value for more advanced exhaust valve timing, such as at high load or speed conditions. The scan tool will display a lower value for a less advanced exhaust valve timing, such as at idle.
Desired Idle Speed	--	650-700	This parameter displays the engine idle speed in RPM as commanded by the control module. The control module compensates for various engine loads in order to maintain the desired engine speed at idle. This parameter is not valid unless the engine is running
Desired Int. CMP Bank 1 or 2	--	Varies in degrees	This parameter displays the desired exhaust camshaft position for Bank 1 or 2, as determined by the control module. The scan tool will display a higher value for more advanced intake valve timing, such as at high load or speed conditions. The scan tool will display a lower value for a less advanced intake valve timing, such as at idle.
Distance Since DTC Cleared	--	Varies	This parameter displays the distance accumulated since an emission diagnostic trouble code was cleared. The scan tool will display increasing distance as the vehicle is driven.
Distance Since First Failure	--	Varies	This parameter displays the distance accumulated when the emission diagnostic trouble code first failed.
Distance Since Last Failure	--	Varies	This parameter displays the distance accumulated when the emission diagnostic trouble code last failed.
Drag Control Status	--	Inactive	Drop Throttle Control Mode is active when the Requested Torque Signal indicates greater than 90 percent duty cycle while the Traction Control System Data Control Signal input is active.
Drop Throttle Status	--	Inactive	Drop Throttle Control Mode is active when the Requested Torque Signal indicates greater than 90 percent duty cycle while the Traction Control System Data Control Signal input is active.
			This parameter displays the status of the output driver for the engine control (EC)

EC Ignition Relay Ckt Short Gnd Test Status	--	Not Run	Ignition Relay control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
EC Ignition Relay Ckt Open Test Status	--	Not Run	This parameter displays the status of the output driver for the engine control (EC) Ignition Relay control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
EC Ignition Relay Ckt Short Volts Test Status	--	OK	This parameter displays the status of the output driver for the engine control (EC) Ignition Relay control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
EC Ignition Relay Command	--	ON	This parameter displays the commanded state of the EC Ignition relay control circuit. The scan tool will display ON or OFF. ON indicates the EC ignition relay control circuit is being grounded by the control module, allowing voltage to other control module circuits and systems. OFF indicates the EC ignition relay is not being commanded ON by the control module.
EC Ignition Relay Feedback Signal	--	Battery Voltage	This parameter displays the voltage signal sent to the control module from the engine control ignition relay. The scan tool will display battery voltage when the engine is running. The scan tool will display no voltage when the relay is OFF.
ECM Authentication Status	--	Valid	This parameter indicates the result of the comparison between the last received immobilizer system response and the expected response calculated by the ECM.
ECM Challenge Status	--	Invalid	This parameter shows the immobilizer system status of the ECM challenge. This indicates whether the currently calculated ECM challenge is valid.
ECM Response Source	--	Normal	The parameter indicates the source used to calculate the ECM response. The sources include Normal Start, Remote Vehicle Start, PTO Remote Start.
ECT Sensor	--	85-105°C (185-220°F)	This parameter displays the temperature of the engine coolant based on the input from the engine coolant temperature (ECT) sensor. When the coolant temperature is low, the scan tool will display a low temperature. When the coolant temperature is high, the scan tool will display a high temperature.
			This parameter displays the engine load in percent based on inputs to the control module

Engine Load	--	25-30%	from various engine sensors. The scan tool will display a low percentage when the engine is at idle with little or no load. The scan tool will display a high percentage when the engine is running at a high RPM under a heavy load.
Engine OFF Time	--	Varies	This parameter displays the time elapsed since the engine turned OFF. The scan tool will display the time in hours, minutes and seconds. The engine OFF time will reset to zero when the engine starts.
Engine Oil Level Switch	--	OK	This parameter displays the status of the engine oil level switch as determined by the control module. The control module uses this information to turn ON the low engine oil lamp if the engine oil level remains approximately 1 quart low for a sufficient amount of time. The scan tool will display Low when the engine oil level is low. The scan tool will display OK when the engine oil level is correct.
Engine Oil Life Remaining	--	Varies	This parameter displays the amount engine oil life remaining before requiring an oil change based on calculations by the control module. The scan tool will display lower values as the engine oil life approaches 0 miles.
Engine Oil Pressure Switch	--	OK	This parameter displays the state of the EOP as determined by the control module. The control module monitors the EOP switch to determine if the EOP is sufficient. The scan tool will display low when the EOP is below a predetermined value.
Engine Oil Temperature Calculated	--	Varies °C/°F	This parameter displays the temperature of the engine oil as calculated by the control module using various sensor inputs. The engine oil temperature calculated has a range of values indicating a low value when the oil temperature is low to a high value when the oil temperature is high.
Engine Run Time	--	Varies	This parameter displays the time elapsed since the engine was started. The scan tool will display the time in hours, minutes and seconds. The engine run time will reset to zero when the engine stops running.
Engine Speed	--	650 RPM	This parameter displays the speed of the crankshaft as determined by the control module using an input from the CKP sensor. The scan tool will display a high value at high engine speeds and a low value at low engine speeds.
			This parameter displays the reason for the

EPM Inhibit Reason	--	None	regulated voltage control (RVC) override command. RVC lowers system operating voltage to reduce the system electrical load and improve fuel economy performance. The RVC command will be overridden if the voltage commanded is below the minimum system voltage required to ensure that the fuel demand, powertrain OBD diagnostics, airflow measurement, cylinder deactivation, or transmission control module functions will execute properly. Reasons include the following: None, Device Control, Fuel Demand, OBD Diagnostics, Airflow Measurement, Cylinder Deactivation, Transmission Control Module Request.
EVAP Fault History	--	No Fault	This parameter displays the result of the evaporative emission (EVAP) system diagnostic as determined by the control module. The scan tool will display various messages, depending on the result of the test.
EVAP Purge Solenoid Command	--	15%	This parameter displays the on-time or duty cycle of the EVAP purge solenoid commanded by the control module expressed as a percent. The scan tool will display a high percentage when the control module is commanding the EVAP purge solenoid to be open a large amount. The scan tool will display a low percentage when the control module is commanding the EVAP purge solenoid to be open a small amount. The scan tool will display 0 when the control module is commanding the EVAP purge solenoid closed.
EVAP Purge Solenoid Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission purge solenoid control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
EVAP Purge Solenoid Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission purge solenoid control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
EVAP Purge Solenoid Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission purge solenoid control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is

			operating correctly.
EVAP Vent Solenoid Command	--	Venting	This parameter displays the state of the EVAP vent solenoid commanded by the control module. The scan tool will display venting when the control module is commanding the EVAP vent solenoid to be open. The scan tool will display a not venting when the control module is commanding the EVAP vent solenoid to be closed.
EVAP Vent Solenoid Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission vent solenoid control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
EVAP Vent Solenoid Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission vent solenoid control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
EVAP Vent Solenoid Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission vent solenoid control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Exh CMP Angle Bank 1 or 2	--	0 Degrees	This parameter displays the actual exhaust camshaft position in degrees.
Exh CMP Bank 1 or 2 Command	--	0 Degrees	This parameter displays the degrees of advanced exhaust camshaft angle related to crankshaft position as commanded by the control module. The scan tool will display a higher value for a more advanced exhaust camshaft position. The scan tool will display a lower value when the exhaust camshaft is not being advanced, such as at idle.
Exh CMP Bank 1 or 2 Variance	--	0 Degrees	This parameter displays in degrees, the difference between the desired exhaust camshaft position and the actual exhaust camshaft position.
Exh CMP Bank 1 or Bank 2 Active Counter	--	Varies in counts	This parameter displays an incrementing counter when the control module receives a signal from the exhaust camshaft position (CMP) sensor.
Exh CMP Sol Bn 1 Ckt Short Volts Test	--	OK	This parameter displays the diagnostic state of the output driver for the Exh CMP solenoid Bn 1 control circuit as determined by the control module. The scan tool will display OK,

Status			Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Exh CMP Sol Bn 1 Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Exh CMP solenoid Bn 1 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Exh CMP Sol Bn 1 Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Exh CMP solenoid Bn 1 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Exh CMP Sol Bn 2 Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Exh CMP solenoid Bn 2 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Exh CMP Sol Bn 2 Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Exh CMP solenoid Bn 2 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Exh CMP Sol Bn 2 Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Exh CMP solenoid Bn 2 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Ext. Travel BPP Signal	--	Released	This parameter will display the state of the brake pedal, applied or released.
Fail Counter	--	Varies Counts	This parameter displays the number of times a specific diagnostic has run and failed.
FC Relay 1 Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the cooling fan relay 1 control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
FC Relay 1 Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the cooling fan relay 1 control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
FC Relay 1 Ckt Short Volts Test Status	--	Not Run	This parameter displays the diagnostic state of the output driver for the cooling fan relay 1 control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.

FC Relay 1 Command	--	Varies ON/OFF	This parameter displays the commanded state of the cooling fan relay 1 control circuit. The cooling fan relay 1 should be ON when the scan tool indicates the FC relay 1 command is ON. The cooling fan relay 1 should be OFF when the scan tool indicates the FC Relay 1 Command is OFF.
FC Relays 2 and 3 Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the cooling fan relays 2 and 3 control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
FC Relays 2 and 3 Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the cooling fan relays 2 and 3 control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
FC Relays 2 and 3 Ckt Short Volts Test Status	--	Not Run	This parameter displays the diagnostic state of the output driver for the cooling fan relays 2 and 3 control circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
FC Relays 2 and 3 Command	--	Varies ON/OFF	This parameter displays the commanded state of the cooling fan relays 2 and 3 control circuit. The cooling fan relays 2 and 3 should be ON when the scan tool indicates the FC Relay 2 and 3 command is ON. The cooling fan relays 2 and 3 should be OFF when the scan tool indicates the FC Relay 2 and 3 command is OFF.
Fuel Level Sensor	--	Varies	This parameter displays the voltage from the sensor used to monitor the fuel level inside the fuel tank. The scan tool will display a low voltage reading when that the fuel level in the tank is low or near empty. The scan tool will display a high voltage reading when the fuel level in the tank is high or near full.
Fuel Level Sensor Left or Right Tank	--	0-5 Volts	This parameter displays the voltage signal received by the control module from the fuel level sensors.
Fuel Pump Relay Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the Fuel Pump Relay circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Fuel Pump Relay Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the Fuel Pump Relay circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating

			correctly.
Fuel Pump Relay Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the Fuel Pump Relay circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Fuel Pump Relay Command	--	ON	This parameter displays the commanded state of the Fuel Pump Relay control circuit. The fuel pump relay should be ON when the scan tool indicates the Fuel Pump Relay command is ON. The fuel pump relay should be OFF when the scan tool indicates the Fuel Pump Relay Command is OFF.
Fuel Pump Relay Circuit Status	--	OK/Incomplete	This parameter displays the diagnostic state of the output driver for the Fuel Pump Relay control circuit. The scan tool will display OK if the circuit is operating correctly. The scan tool will display the appropriate fault if there is an open, short to ground or a short to voltage on the circuit.
Fuel Tank Level Remaining	--	Varies	This parameter displays the amount of fuel remaining in the fuel tank as measured in percentage. The control module determines the amount of fuel remaining in the tank by using information from the fuel level sensors. The scan tool will display a higher value with a full fuel tank, and a lower value with an empty fuel tank.
Fuel Tank Pressure Sensor	--	1.5 Volts	This parameter displays the voltage signal sent to the control module from the sensor used to monitor the pressure inside the fuel tank. The scan tool will display a low voltage when the pressure in the fuel tank is high. The scan tool will display a high voltage when the pressure in the fuel tank is low or in a vacuum.
Fuel Tank Pressure Sensor	--	0 inches H2O (0 mm Hg)	This parameter displays the fuel tank pressure as calculated based on a signal sent to the control module from the fuel tank pressure (FTP) sensor. The scan tool will display a low value when the pressure in the fuel tank is low or a vacuum. The scan tool will display a high value when the pressure in the fuel tank is high.
Fuel Tank Rated Capacity	--	17.5-20 gals (66.24-75.7 liter)	This parameter displays the rated maximum quantity of fuel the fuel tank will hold. This is calibrated in the control module to match the vehicle. See Owner's Manual-Capacities and Specifications.
			This parameter displays the fuel trim cell number as calculated by the control module based on engine speed and load inputs. The

Fuel Trim Cell	--	Varies	scan tool will display a lower number as conditions are nearer to idle, and a higher value as conditions approach maximum engine speed and maximum load.
Fuel Trim Learn	--	Enabled	This parameter indicated if the control module is adjusting long term fuel trim in response to the short term fuel trim. The scan tool displays Enabled or Disabled. When conditions are appropriate for enabling long term fuel trim corrections, the scan tool displays Enabled.
Fuel Trim System Test State	--	Monitoring	This parameter indicates the status of the Fuel Trim System Test. The scan tool will display Disabled, Enabled, Monitoring, or Run Purge Test.
Fuel Volatility	--	Varies	This parameter indicates the rate the fuel can be vaporized in the cylinder as calculated by the control module. The scan tool displays Low, Moderate, or High. The scan tool will display HIGH when the fuel volatility is high. The scan tool will display LOW when the fuel volatility is low.
GEN F-Terminal Signal	--	0-100%	This parameter indicates the generator field duty cycle as commanded by the voltage regulator or control module. The scan tool will display a higher value for a higher commanded generator output, and a lower value for a lower commanded generator output.
GEN L-Terminal Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the Gen- L Terminal circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
GEN L-Terminal Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the Gen- L Terminal circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
GEN L-Terminal Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the Gen- L Terminal circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
GEN L-Terminal Command	--	0-100%	This parameter displays the control modules commanded state of the voltage regulator on the generator.
HO2S Bank 1 or 2 Sensor 1	--	80-850 mV	This parameter indicates the heated oxygen sensor (HO2S) bank 1 or bank 2, sensor 1 output voltage as measured by the control module. The scan tool value fluctuates constantly while operating in Closed Loop.

			The scan tool will display a higher value during rich running conditions, and a lower value during leaner running conditions.
HO2S Bank 1 or 2 Sensor 1 Heater	--	0.60-0.80 amps	This parameter displays the current through the control module when the bank 1 or bank 2, sensor 1 HO2S heater is commanded ON by the control module. HO2S Heater Bank 1 Sen. 1 is a range of values indicating a low current when the heater circuit resistance is high to a high current when the heater circuit resistance is low.
HO2S Bn 1 or 2 Sen 1 Heater Ckt Short Gnd Test Status	--	OK	This parameter displays the status of the output driver for the HO2S Heater Bank 1 or Bank 2 Senor 1. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
HO2S Bn 1 or 2 Sen 1 Heater Ckt Open Test Status	--	OK	This parameter displays the status of the output driver for the HO2S Heater Bank 1 or Bank 2 Senor 1. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
HO2S Bn 1 or 2 Sen 1 Heater Ckt Short Volts Test Status	--	OK	This parameter displays the status of the output driver for the HO2S Heater Bank 1 or Bank 2 Senor 1. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
HO2S Bn 1 or 2 Sen 1 Heater Command	--	0-99%	This parameter displays the commanded state of the Bank 1 or Bank 2 Sensor 1 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
HO2S Bn 1 or 2 Sen 1 Heater Command	--	ON	This parameter displays the commanded state of the Bank 1 or Bank 2 Sensor 1 heater by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF when the heater is commanded OFF.
HO2S Bank 1 or 2 Sensor 2	--	80-850 mV	This parameter indicates the heated oxygen sensor (HO2S) bank 1 sensor 2 output voltage as measured by the control module. The scan tool value fluctuates constantly while operating in Closed Loop. The scan tool will display a higher value during rich running conditions, and a lower value during leaner running conditions.
HO2S Bank 1 or 2 Sensor 2 Heater		0.60-0.80 amps	This parameter displays the current through the control module when the bank 1 sensor 2 HO2S heater is commanded ON by the control module. HO2S Heater Bank 1 Sensor 2 is a range of values indicating a low current when the heater circuit resistance is

			high to a high current when the heater circuit resistance is low.
HO2S Bn 1 Sen 2 Heater Ckt Short Gnd Test Status	--	OK	This parameter displays the status of the output driver for the HO2S Heater Bank 1 Sen. 2. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
HO2S Bn 1 Sen 2 Heater Ckt Open Test Status	--	OK	This parameter displays the status of the output driver for the HO2S Heater Bank 1 Sen. 2. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
HO2S Bn 1 Sen 2 Heater Ckt Short Volts Test Status	--	OK	This parameter displays the status of the output driver for the HO2S Heater Bank 1 Sen. 2. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
HO2S Bn 1 or 2 Sen 2 Heater Command	--	0-99%	This parameter displays the commanded state of the Bank 1 Sensor 2 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
HO2S Bn 1 or 2 Sen 2 Heater Command	--	ON	This parameter displays the commanded state of the Bank 1 Sensor 2 heater by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF when the heater is commanded OFF.
Hot Open Loop	--	Inactive	This parameter indicates the status of the fuel delivery system. The scan tool will display Active if the fuel system is running in open loop due to a temperature concern. The scan tool will display Inactive if the fuel system is operating normally.
IAT Sensor		Varies	This parameter displays the temperature of the air entering the engine as calculated by the control module based on the input from the intake air temperature (IAT) sensor. The scan tool will display a low value when the air temperature is low, and a high value when the air temperature is high.
IAT Sensor 2	--	Varies	This parameter displays the temperature of the air entering the engine as calculated by the control module based on the input from the IAT sensor 2. The scan tool will display a low value when the air temperature is low, and a high value when the air temperature is high.
Ignition			This parameter displays the state of the ignition 0 input to the control module from the ignition switch. The scan tool will display

Accessory Signal	--	OFF	ON when the ignition switch is in the ignition accessory position. The scan tool will display OFF when the ignition switch is in any other position.
Ignition 1 Signal	--	Battery Voltage	This parameter displays the voltage measured at the ignition 1 circuit of the control module. Voltage is applied to the control module when the ignition switch is in the ignition 1 position. The scan tool will display a low value when the voltage is low. The scan tool will display a high value, such as battery voltage, when the voltage is higher.
Ignition OFF Time	--	Varies	This parameter displays the time elapsed since the ignition was last turned OFF. The scan tool will display the time in hours, minutes and seconds. The ignition OFF time will reset to zero when the ignition is turned ON.
Injector PWM Bank 1 or Bank 2	--	2.0-5.4 ms	This parameter indicates the average commanded ON time for each injector on Bank 1 or Bank 2 by the control module. The scan tool will display a larger value for a longer injector commanded ON time, causing more fuel to be delivered to the cylinders. The scan tool will display a smaller value for a shorter injector commanded ON time, causing less fuel to be delivered to the cylinders.
Injector 1-8 Disabled Due To Misfire	--	No	This parameter displays the status of the fuel injector driver by the control module. The scan tool will display YES if the fuel injector is being disabled due to a misfire detection. The scan tool will display NO if the fuel injector is not being disabled by the control module due to a misfire.
Int. CMP Angle Bank 1 or 2	--	0 Degrees	This parameter displays the degrees of advanced intake camshaft angle related to crankshaft position as determined by the control module based on input from the intake CMP sensors. The scan tool will display a higher value for a more advanced intake camshaft position. The scan tool will display a lower value when the intake camshaft is not being advanced, such as at idle.
Int. CMP Bank 1 or 2 Command	--	0 Degrees	This parameter displays the degrees of advanced intake camshaft angle related to crankshaft position as commanded by the control module. The scan tool will display a higher value for a more advanced intake camshaft position. The scan tool will display a lower value when the intake camshaft is not being advanced, such as at idle.
			This parameter indicates the difference

Int. CMP Bank 1 or 2 Variance	--	0 Degrees	between the actual camshaft angle and the commanded camshaft angle as determined by the control module. The scan tool will display a higher value for larger differences, or a lower value if there is only a small difference.
Int. CMP Bank 1 or 2 Active Counter	--	Varies in counts	This parameter displays an incrementing counter when the control module receives a signal from the intake camshaft position (CMP) sensor.
Int CMP Sol Bn 1 Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Int CMP solenoid Bn 1 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Int CMP Sol Bn 1 Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Int CMP solenoid Bn 1 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Int CMP Sol Bn 1 Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Int CMP solenoid Bn 1 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Int CMP Sol Bn 2 Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Int CMP solenoid Bn 2 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Int CMP Sol Bn 2 Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Int CMP solenoid Bn 2 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Int CMP Sol Bn 2 Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Int CMP solenoid Bn 2 control circuit as determined by the control module. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Intake Manifold Pressure	--	70-75 kPa	This parameter displays the pressure difference between the MAP and the barometric pressure (BARO) as calculated by the control module. The scan tool will display a higher value during high vacuum conditions, such as idle or deceleration. The scan tool will display a lower value during low

			vacuum conditions, such as wide open throttle or low load cruising.
Knock Detected Cyl. 1-8	--	NO	This parameter displays the status of each cylinder for knock detection by the control module. The scan tool will display YES if a knock condition has been detected related to that cylinder combustion event. The scan tool will display NO if there is no knock condition detected related to that cylinder combustion event.
Knock Retard	--	0	This parameter indicates the amount of spark advance the control module removes from the ignition control (IC) spark advance in response to the signal from the knock sensors. The scan tool displays a high value for a large amount of spark retard, and a low value for a small amount of spark retard.
Long Term FT Bank 1 or Bank 2	--	0% ± 10%	This parameter is calculated by the control module based on the Short Term FT value. The Long Term FT bank 1 is used for the long term correction of the fuel delivery in bank or bank 2. The scan tool will a high value for a large amount of long term fuel correction, and 0 percent for no long term fuel trim correction. The scan tool will display a negative value when fuel system is running too rich and fuel is being removed from the combustion event. The scan tool will display a positive value if the fuel system is running lean and fuel is being added to the combustion event.
LT FT Test Avg. Bank 1 or Bank 2	--	1%	This parameter is calculated by the control module based on an intrusive test by the control module. The Long Term FT test average used for the long term correction of the fuel delivery in each bank. The scan tool will a high value for a large amount of long term fuel correction, and 0 percent for no long term fuel trim correction. The scan tool will display a negative value when fuel system is running too rich and fuel is being removed from the combustion event. The scan tool will display a positive value if the fuel system is running lean and fuel is being added to the combustion event.
LT FT Avg. Bank 1 or Bank 2 w/o	--	1%	This parameter is calculated by the control module based on the Short Term FT value. The Long Term FT bank 1 is used for the long term correction of the fuel delivery in bank 1. The scan tool will display a high value for a large amount of long term fuel correction, and 0 percent for no long term fuel trim correction. The scan tool will display a

Purge			negative value when fuel system is running too rich and fuel is being removed from the combustion event. The scan tool will display a positive value if the fuel system is running lean and fuel is being added to the combustion event.
Loop Status	--	Closed	This parameter displays the state of the fuel control system as commanded by the control module. Closed Loop operation indicates that the control module is controlling the fuel delivery based off the oxygen sensors input signal. In Open Loop operation the control module ignores the oxygen sensor input signal and bases the amount of fuel to be delivered on other sensor inputs.
Low EOP Indicator Command	--	OFF	• This parameter displays the commanded state of the low oil lamp control circuit. The low oil lamp should be ON when the scan tool indicates the Low Oil Lamp Command is ON. The low oil lamp should be OFF when the scan tool indicates the Low Oil Lamp Command is OFF. • The scan tool displays ON/OFF • The scan tool displays ON or OFF. The scan tool displays ON when the ECM detects that there is a low oil level condition. The low oil lamp is then commanded ON by the ECM. • Scan tool displays ON or OFF. Represents the commanded state of the Low Oil Lamp indicator control circuit.
MAF Performance Test	--	OK	This parameter displays the status of the mass air flow (MAF) performance test by the control module. The scan tool will display OK if no fault is found. The scan tool will display Fault if the control module detects a fault during the test.
MAF Sensor	Engine Idling	3.4-6.5 g/s	This parameter indicates the quantity calculated by the control module based on a signal from the MAF sensor. The scan tool will display a high value at high engine speeds, and a low value at low engine speeds.
	Engine speed at 2,500 RPM	11.88 g/s	
MAF Sensor	--	1510-3224 Hz	This parameter indicates the frequency signal received from the MAF sensor by the control module. The scan tool will display a high value at high engine speeds, and a low value at low engine speeds.
MAP Performance	--	OK	This parameter displays the status of the MAP performance test 1 by the control module. The scan tool will display OK if no fault is

Test 1			found. The scan tool will display Fault if the control module detects a fault during the test.
MAP Performance Test 2	--	OK	This parameter displays the status of the MAP performance test 2 by the control module. The scan tool will display OK if no fault is found. The scan tool will display Fault if the control module detects a fault during the test.
MAP Sensor	--	30-38 kPa	This parameter indicates the manifold absolute pressure inside the engine as calculated by the control module based on the signal from the MAP sensor. The scan tool will display a higher value wide open throttle, and a lower value at idle.
MAP Sensor	--	0.75-1.40 Volts	This parameter indicates the voltage signal received by the control module from the MAP sensor. The scan tool displays a low voltage at idle, and a high voltage at wide open throttle. Barometric pressure and altitude can effect these values.
MIL Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the malfunction indicator lamp control (MIL) circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
MIL Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the malfunction indicator lamp control (MIL) circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
MIL Ckt Short Volts Test Status	--	Not Run	This parameter displays the diagnostic state of the output driver for the malfunction indicator lamp control (MIL) circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
MIL Command	--	OFF	This parameter displays the commanded state of the MIL control circuit. The MIL should be ON when the scan tool indicates the MIL Command is ON. The malfunction indicator lamp should be OFF when the scan tool indicates the MIL Command is OFF. The control module will command the MIL ON when the ignition is ON with the engine OFF in order to perform a bulb check.
MIL Requested by DTC	--	NO	This parameter indicates the reason the control module illuminated the MIL. The scan tool will display YES when the MIL is requested as a result of an A or B type DTC. The scan tool will display NO if the MIL is illuminated for another reason, such as

			transmission DTCs.
Misfire Current Cyl. 1-8	--	0	This parameter displays the number of possible misfires during the last 200 cylinder firing events detected on Cylinders 1-8 as calculated by the control module. The misfires are calculated based on engine crankshaft rotation speed variations. The scan tool displays an incrementing counter. This counter should display some activity, but the activity should be the same for all cylinders.
Misfire History Cyl. 1-8	--	0	This parameter displays the number of possible misfires that have occurred after 195 current misfires have been counted on Cylinders 1-8 as calculated by the control module. The misfires are calculated based on engine crankshaft rotation speed variations. The scan tool displays an incrementing counter. This counter should display some activity, but the activity should be the same for all cylinders.
Not Run Counter	--	Varies	This parameter displays the number of ignition cycles that a DTC has not run. The scan tool display will increment as the number of ignition cycles increase without a DTC pass or Fail.
Pass Counter	--	Counts	The scan tool displays the number of times a DTC has run and passed.
PNP Switch	--	P/N	This parameter indicates the range selection of the automatic transmission as calculated by the control module based on input from the PNP switch. The scan tool will display, In Gear, Park, or Neutral depending on the PNP switch position.
Power Enrichment	--	Inactive	This parameter indicates if the control module has detected conditions appropriate to operate in Power Enrichment mode. The scan tool will display Active if the mode is in operation, and Inactive if the mode is not in operation. The control module enters Open Loop operation and increases injector pulse width when in power enrichment mode.
Reduced Engine Power	--	Inactive	This parameter indicates if the control module has detected that a TAC system fault has occurred. The scan tool will display Active if the mode is in operation, and Inactive if the mode is not in operation. The control module limits engine power when this mode is Active.
Reverse Inhibit Command	--	OFF	This parameter displays the commanded state of the reverse inhibit solenoid control circuit. The reverse inhibit solenoid should be ON when the scan tool indicates the Reverse Inhibit Solenoid Command is ON. The reverse

			inhibit solenoid should be OFF when the scan tool indicates the Reverse Inhibit Solenoid Command is OFF.
Reverse Inhibit Solenoid Command	--	OFF	This parameter displays the commanded state of the reverse inhibit solenoid control circuit. The reverse inhibit solenoid should be ON when the scan tool indicates the Reverse Inhibit Solenoid Command is ON. The reverse inhibit solenoid should be OFF when the scan tool indicates the Reverse Inhibit Solenoid Command is OFF.
Rev. Inhibit Solenoid Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Reverse Inhibit Solenoid circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Rev. Inhibit Solenoid Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Reverse Inhibit Solenoid circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Rev. Inhibit Solenoid Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the output driver for the Reverse Inhibit Solenoid circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
RVS Disable 1-8 History	--	None	This parameter displays one of the last eight reasons that powertrain has disabled remote vehicle start (RVS).
RVS Request Signal	--	ON/OFF	This parameter indicates the state of the request received over serial communication from the remote vehicle start (RVS) system to start the vehicle in remote mode.
Short Term FT Bank 1 or Bank 2	--	0% ± 10%	This parameter displays the short term correction to fuel delivery for bank 1 or bank 2 by the control module in response to the amount of time the oxygen sensor voltage spends above or below the 450 mV threshold. The scan tool will display 0 percent if no adjustments are required. The scan tool will display a higher positive value if fuel has to be added, and a higher negative value if fuel has to be removed.
Spark	--	9-11°	This parameter displays the spark timing being commanded by the control module ON the IC circuit. The scan tool will display a negative value if the spark timing is before top dead center (BTDC) or spark advance; the scan tool will display a positive value if the spark timing is after top dead center (ATDC) or spark retard. Because the ignition control module sets spark advance at a fixed

			value BTDC while operating in bypass mode, the displayed spark advance only reflects true spark timing when the PCM has commanded IC mode.
Start Up ECT	--	Varies	This parameter Indicates the engine coolant temperature at engine start up as calculated by the control module based on the signal from the ECT sensor. The scan tool will display a higher value on a warmer engine, and a lower value on a colder engine.
Start Up IAT	--	Varies	This parameter Indicates the intake air temperature at engine start up as calculated by the control module based on the signal from the IAT sensor. The scan tool will display a higher value during warmer under hood temperatures, and a lower value during colder under hood temperatures.
ST FT Test Avg. Bank 1 or Bank 2	--	1%	This parameter is calculated by the control module based on an intrusive test by the control module. The Short Term FT Test Average used for the short term correction of the fuel delivery in each bank. The scan tool will display a high value for a large amount of short term fuel correction, and 0% for no short term fuel trim correction. The scan tool will display a negative value when fuel system is running too rich and fuel is being removed from the combustion event. The scan tool will display a positive value if the fuel system is running lean and fuel is being added to the combustion event.
Starter Relay Ckt Short Gnd Test Status	--	OK	The scan tool displays OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Starter Relay Ckt Open Test Status	--	OK	The scan tool displays OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Starter Relay Ckt Short Volts Test Status	--	Not Run	The scan tool displays OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Starter Relay Command	--	OFF	The scan tool displays ON/OFF. The scan tool displays OFF until the ignition is placed into the CRANK position, then it reads ON.
TAC Forced Engine Shutdown	--	NO	This parameter indicates the status of TAC control by the control module. The scan tool will display YES if the engine has been shut down due to a throttle control fault. The scan tool will display NO if the engine has not been shut down by a throttle control fault.
TAC Motor	--	Enabled	This parameter indicates the status of the TAC motor driver by the ECM. The scan tool will display Enabled if TAC motor operation is

			allowed. The scan tool will display disabled if the TAC motor is disabled.
TAC Motor Command	--	15-25%	This parameter indicates the required duty cycle to maintain a desired throttle position. The scan tool will display a higher value if more effort is required to move the throttle to the desired position, such as physical resistance. The scan tool will display a lower value if less effort is required to move the throttle to the desired position.
TCS and Drop Throttle Status	--	Inactive	TCS Active and Drop Throttle Control Mode is active when the Requested Torque Signal is within the TCS region, 40-90 percent duty cycle, while the Traction Control System Data Control Signal input is Active.
TCS Torque Request Signal	--	3 N·m (2 lbs ft)	This parameter indicates the percentage of available torque requested from the engine to the transmission as calculated by the control module. The scan tool will display a higher value for higher torque, and a lower value for lower torque.
TCS Torque Request Signal	--	100%	This parameter indicates the torque requested from the engine to the transmission as calculated by the control module. The scan tool will display a higher value for higher torque, and a lower value for lower torque.
TCS Torque Delivered Signal	--	1%	This parameter indicates the torque delivered from the engine to the transmission as calculated by the control module. The scan tool will display a higher value for higher torque, and a lower value for lower torque.
TFT Sensor	--	Varies °C/°F	• The scan tool displays °C (°F). This value represents the input signal of the transmission fluid temperature sensor. • The scan tool range is -40 to +150°C (-40 to +302°F). This display indicates the temperature of the transmission fluid. • Scan Tool Range -39 to +140°C (-38 to +284°F). The Trans Fluid Temp. sensor parameter displays the temperature of the manual transmission.
Torque Management Spark Retard	--	0°	This parameter indicates how much the ignition spark timing is being retarded to control torque by the control module. The scan tool will display a higher value under extreme torque control conditions such as spinning wheels. The scan tool will display a lower value under low torque control conditions such as light driving.

Total Knock Retard	--	0°	This parameter indicates how much ignition spark timing is being retarded due to all control systems monitored by the control module. The scan tool will display a high value during extreme conditions such as high temperatures and antilock braking. The scan tool will display a lower value during lighter driving conditions.
Total Misfire	--	0	This parameter displays the number of possible misfires during the last 200 cylinder firing events detected on all cylinders as calculated by the control module. The misfires are calculated based on engine crankshaft rotation speed variations. The scan tool displays an incrementing counter.
TP Desired Angle	--	2-6%	This parameter indicates the desired throttle angle calculated by the TAC module as commanded by the vehicle operator. The scan tool will display a higher value when the accelerator pedal is depressed, and a lower value as the accelerator pedal is released.
TP Indicated Angle	--	2-6%	This parameter displays the angle of the throttle plate as calculated by the control module using the signals from the throttle position (TP) sensors. The TP indicated angle is a range of values indicating a low percentage when the throttle is closed to a high percentage when the throttle is wide open.
TP Performance Test	--	OK	This parameter displays the status of the TP performance test by the control module. The scan tool will display OK if no fault is found. The scan tool will display Fault if the control module detects a fault during the test.
TP Sensor 1	--	4.1-4.5 Volts	This parameter displays the voltage signal sent to the control module from TP sensor 1 of the throttle assembly. The TP sensor 1 is a range of values indicating a high voltage when the throttle is closed to a low voltage when the throttle plate is fully open.
TP Sensor 1 Indicated Position	--	2%	This parameter displays the angle of the throttle position (TP) sensor 1 as calculated by the control module using the signal from the TP sensor 1. The TP sensor 1 is a range of values indicating a low percentage when the throttle is closed to a high percentage when the throttle is fully open.
TP Sensors 1 and 2	--	Agree	This parameter displays the results of a control module test that compares the signals from the TP sensors 1 and 2. The scan tool will display Agree or Disagree. Agree indicates that TP sensor 1 and TP sensor 2 voltages correspond to the same throttle

			position. Disagree indicates that TP sensor 1 and TP sensor 2 voltages correspond to different throttle positions.
TP Sensor 2	--	0.5-0.8 Volts	This parameter displays the voltage signal sent to the control module from TP sensor 2 of the throttle assembly. The TP sensor 2 is a range of values indicating a low voltage when the throttle is closed to a high voltage when the throttle plate is fully open.
TP Sensor 2 Indicated Position	--	2%	This parameter displays the angle of the TP sensor 2 as calculated by the control module using the signal from the TP sensor 2. The TP sensor 2 is a range of values indicating a low percentage when the throttle is closed to a high percentage when the throttle is fully open.
Torque Delivered Signal	--	N·m (lbs ft) Varies	• This parameter indicates the amount of available engine torque. • Scan tool range 0-100 percent. Represents the PWM signal which indicates the percent of available torque the engine is delivering to the drive wheels. The EBTCM monitors the Traction Control Torque signal to ensure that the PCM is responding properly to the Traction Control Desired Torque signal. • The scan tool displays -473 to +473 N·m/-349 to 349 lbs ft This is the calculated torque output from the engine to the transaxle used by the EBTCM for the traction control system operation.
Traction Control Status	--	Inactive	This parameter indicates the status of the traction control system as reported by the control module. The scan tool will display ACTIVE if the traction control system is taking action to reduce drive wheel slippage. The scan tool will display INACTIVE if the traction control system is not being required to take action to reduce drive wheel slippage.
Vehicle Speed Ckt Short Volts Test Status	--	OK	This parameter displays the diagnostic state of the Vehicle Speed Sensor circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Vehicle Speed Ckt Open Test Status	--	OK	This parameter displays the diagnostic state of the Vehicle Speed Sensor circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.

Vehicle Speed Ckt Short Gnd Test Status	--	OK	This parameter displays the diagnostic state of the Vehicle Speed Sensor circuit. The scan tool will display OK, Fault or Not Run. The scan tool will display OK if the circuit is operating correctly.
Vehicle Speed Sensor	--	0 km/mi	This parameter indicates the vehicle speed as calculated by the control module based on a signal from the vehicle speed sensor (VSS). The scan tool will display a higher value at higher vehicle speeds, and a lower value at lower vehicle speeds.
VTD Auto. Learn Counter	--	Counts	The scan tool displays the count value when using the 30-minute reprogramming procedure. Three 10-minute cycles, or three counts, are required to complete the 30-minute auto learn reprogramming procedure.
VTD Auto. Learn Timer	--	Inactive	This parameter indicates that either the auto learn timer (used in the auto learn procedure to enable VTD password learning) or the seed and key timer (used in the seed and key procedure to enable VTD password learning) is active.
VTD Fuel Disable	--	Inactive	This parameter indicates the VTD system has disabled fuel.
VTD Fuel Disable Until Ign. OFF	--	NO	This parameter indicates the VTD system has disabled fuel for the remainder of the ignition cycle.
VTD Fuel Enabled	--	Yes	This parameter indicates the VTD system has enabled fuel.
VTD Password Learn Enabled	--	No	The scan tool will display Yes when a valid theft password has been learned.
VTD Password Learned	--	No	This indicates learning of the VTD password received from the platform electronics is enabled. VTD password learning is first enabled in assembly plant (prior to the manufacturer’s enable counter being set to zero) may be re-enabled using 1 of 2 procedures.
VTD Security Code Accepted	--	No	This parameter indicates that the received immobilizer system security code is correct.
VTD Security Code Lockout	--	Inactive	This parameter displays Active or Inactive. Security Code Lockout Active indicates that the security code has not passed and lockout is active.
VTD Security Code Programmed	--	No	This parameter indicates if the immobilizer system security code has been programmed.
VTD Security Info. Programmed	--	Yes	This parameter indicates if the immobilizer secret information, e.g. powertrain pre-release password, powertrain secret key, has been programmed.

VTD System Status	--	Dis. Neg. Resp.	This parameter indicates the current state of the immobilizer algorithm. The states include the following: Standby, Disabled at Startup, Disabled Due to No Response, Disabled Due to Negative Response, Disabled Due to Incorrect Response, Post Release, Pre-Release, Released.
Warm-ups Since DTC Cleared	--	Varies	This parameter indicates the number of warm up cycles that have occurred Since DTCs were cleared. The scan tool will display a higher counts as more warm up cycles have occurred since the DTCs were cleared.
Warm-ups w/o Emission Faults	--	Varies	This parameter indicates the number of warm up cycles that have occurred without an emission fault present. The scan tool will display a 0 if a fault has occurred. The scan tool will display a higher count if a number of warm up cycles have occurred without an emission fault.
Warm-ups w/o Non-emission Faults	--	Varies	This parameter indicates the number of warm up cycles that have occurred without a non-emission fault present. The scan tool will display a 0 if a fault has occurred. The scan tool will display a higher count if a number of warm up cycles have occurred without a non-emission fault.
Wide Open Throttle	--	NO	This parameter indicates the throttle status commanded by the control module. The scan tool will display YES is the vehicle throttle is commanded to wide open. The scan tool will display NO if the vehicle throttle is commanded to an amount less than 100%.

Output Control

Parameter	Description
A/C Relay	The engine must be running and the ECM must receive an A/C request from the HVAC control module in order to enable the output control. The ECM de-energizes the A/C compressor clutch relay when you select OFF. The relay remains de-energized until you select ON.
CMP Actuator	This function controls the camshaft actuator Ssolenoid. The normal commanded state is NONE. The system will increase or decrease the angle of the selected camshaft in 5 degree increments up to 25 crankshaft degrees. The scan tool initiates the test when the following conditions are met: • The vehicle speed is 0 km/h (0 mph). • The transmission is in Park or Neutral. • The engine speed is between 1,000-1,400 RPM. The system remains in the commanded state until cancelled by the scan tool.
CMP Actuator Solenoid	This function controls the camshaft actuator. The normal commanded state is NONE. The system will increase or decrease the angle of the camshaft in 5

	degree increments up to 20 crankshaft degrees. The engine must be OFF.
Cylinder Power Balance	Enables/disables a cylinder by turning OFF the fuel injector to the cylinder. The fuel injector is normally enabled. The control module disables the fuel injector when the following conditions are met: • The engine speed has stabilized. • The fuel injector has been selected. When DISABLE is selected, the control module turns the injector OFF for 30 seconds.
Dash Lamps	Malfunction Indicator Lamp--Controls the malfunction indicator lamp (MIL). The commanded states include NONE, ON, and OFF. When commanded ON or OFF, the system remains in the commanded state until cancelled by the scan tool.
Engine Controls Ignition Relay	This function activates the engine control (EC) ignition relay. The normal commanded state is NONE. When commanded ON or OFF, the engine control module (ECM) turns the relay ON or OFF. The system remains in the commanded state until cancelled by the scan tool.
Engine Speed Control	Activates the idle air control (IAC) valve to change engine RPM. The normal commanded state is NONE. To enable the RPM control, all instruction on the scan tool must be completed. The system will INCREASE or DECREASE the engine speed. The SET STEP VALUE changes the engine speed by increments of 25 RPM, 100 RPM, and 500 RPM. The system remains in the commanded state until cancelled by the tool.
EVAP Purge Solenoid	Activates the EVAP Purge Valve. The normal commanded state is NONE. The system will INCREASE or DECREASE the amount of EVAP purge valve opening by 10 percent increments within a range of 0-100 percent. The system remains in the commanded state until cancelled by the tool or the fuel tank pressure exceeds 24 mm Hg (12 in H2O).
EVAP Service Test	Activates the on-board EVAP diagnostic test.
EVAP Vent Solenoid	Activates the EVAP vent solenoid. The normal commanded state is NONE. When commanded ON, the vent valve switches to non-venting. The system remains in the commanded state unless one of the following conditions occurs: • Cancelled by the tool • Purge is greater than 0 percent, and the fuel tank pressure exceeds 24 mm Hg (12 in H2O).
EVAP Purge/Seal	This control enables 2 functions. One function increases or decreases the amount of purge by changing the duty cycle of the purge valve and commanding the vent ON (non-venting). The normal commanded state of both valves is NONE. The system will INCREASE or DECREASE the amount of EVAP purge valve opening by 10 percent increments within a range of 0-100 percent. The second function seals the system after using the purge function to obtain a specific amount of fuel tank pressure (FTP). When activated the purge valve is commanded to 0 percent and the vent valve is commanded ON (non-venting). Both functions remain in the commanded state until cancelled by the tool or the FTP exceeds 24 mm Hg (12 in H2O).
	This function controls the exhaust camshaft actuator for bank 1. The normal

Exhaust CMP Actuator Bank 1	commanded state is NONE. The system will increase or decrease the angle of the selected camshaft in 5 degree increments up to 25 crankshaft degrees. The scan tool initiates the test when the following conditions are met: • The vehicle speed is 0 km/h (0 mph). • The transmission is in Park or Neutral. • The engine speed is between 1,000-1,400 RPM. The system remains in the commanded state until cancelled by the scan tool.
Exhaust CMP Actuator Bank 2	This function controls the exhaust camshaft actuator for bank 2. The normal commanded state is NONE. The system will increase or decrease the angle of the selected camshaft in 5 degree increments up to 25 crankshaft degrees. The scan tool initiates the test when the following conditions are met: • The vehicle speed is 0 km/h (0 mph). • The transmission is in Park or Neutral. • The engine speed is between 1,000-1,400 RPM. The system remains in the commanded state until cancelled by the scan tool.
Exhaust CMP Actuator Sol. Bank 1	This function controls the exhaust camshaft actuator solenoid for bank 1. The normal commanded state is NONE. When commanded ON/OFF, the ECM turns the camshaft actuator solenoid ON/OFF. The scan tool initiates the test when the following conditions are met: • The ignition is ON with the engine OFF. • No engine speed is detected. The system remains in the commanded state until cancelled by the scan tool.
Exhaust CMP Actuator Sol. Bank 2	This function controls the exhaust camshaft actuator solenoid for bank 2. The normal commanded state is NONE. When commanded ON/OFF, the ECM turns the camshaft actuator solenoid ON/OFF. The scan tool initiates the test when the following conditions are met: • The ignition is ON with the engine OFF. • No engine speed is detected. The system remains in the commanded state until cancelled by the scan tool.
Fan Relay 1	Commands the low speed fan relay ON and OFF. Both cooling fans will activate on low speed
Fan Relays 2 and 3	Commands the series parallel and high speed fan relays ON and OFF. The driver side fan will be OFF. The passenger side fan will activate on high speed.
Fan Relays 1, 2 and 3	Commands the low speed fan , high speed fan, and series parallel relays ON and OFF. Both fans will activate on high speed.
	Enables the fuel injector in order to verify proper fuel injector flow. The ECM will pulse the selected injector when the following conditions are met:

Fuel Injector Balance	• All instruction on the scan tool completed • Fuel injector selected • Key ON, engine OFF The selected fuel injector can only be flowed/pulsed once per ignition cycle.
Fuel Pump Relay	Controls the fuel pump relay. The normal commanded state is NONE. When commanded ON/OFF, the PCM turns the fuel pump ON/OFF. If the engine is running, and the fuel pump is commanded OFF, the engine will stall. The system remains in the commanded state until cancelled by the scan tool.
Fuel Trim Enable	Disables the ECM ability to learn new fuel trim parameters. The commanded states are NONE, ENABLED, DISABLED. The normal commanded state is NONE. The system remains in the commanded state until cancelled by the scan tool.
Fuel Trim Reset	Activates the reset of fuel trim data in all fuel trim cells.
GEN L-Terminal	The commanded states are ON and OFF. Selecting OFF commands the ECM to turn OFF the generator and stop generating an output voltage.
HO2S Heater Bank 1 Sensor 1 Command	Activates the HO2S bank 1 sensor 1 heater. The commanded states include NONE, ON, and OFF. The normal commanded state is NONE. Commanding the HO2S bank 1 sensor 1 heater ON turns on the heater driver. The system remains in the commanded state until cancelled by the tool.
HO2S Heater Bank 1 Sensor 2 Command	Activates the HO2S bank 1 sensor 2 heater. The commanded states include NONE, ON, and OFF. The normal commanded state is NONE. Commanding the HO2S bank 1 sensor 2 heater ON turns on the heater driver. The system remains in the commanded state until cancelled by the tool.
HO2S Heater Bank 2 Sensor 1 Command	Activates the HO2S bank 2 sensor 1 heater. The commanded states include NONE, ON, and OFF. The normal commanded state is NONE. Commanding the HO2S bank 2 sensor 1 heater ON turns on the heater driver. The system remains in the commanded state until cancelled by the tool.
HO2S Heater Learn	his output control is used to trigger the reset of the learned resistances for the oxygen sensor heaters following a replacement in service. The learned resistances are reset to a calibration used to prevent overheating of the sensors until more accurate resistances may be learned following an extended engine OFF time, typically 12 or more hours.
Idle Spark	Disables and enables idle spark advance with the engine running.
Intake CMP Actuator Bank 1	This function controls the intake camshaft actuator for bank 1. The normal commanded state is NONE. The system will increase or decrease the angle of the selected camshaft in 5 degree increments up to 20 crankshaft degrees. The scan tool initiates the test when the following conditions are met: • The vehicle speed is 0 km/h (0 mph). • The transmission is in Park or Neutral. • The engine speed is between 1,000-1,400 RPM. The system remains in the commanded state until cancelled by the scan tool.
	This function controls the intake camshaft actuator for bank 2. The normal commanded state is NONE. The system will increase or decrease the angle of the selected camshaft in 5 degree increments up to 20 crankshaft degrees.

Intake CMP Actuator Bank 2	The scan tool initiates the test when the following conditions are met: • The vehicle speed is 0 km/h (0 mph). • The transmission is in Park or Neutral. • The engine speed is between 1,000-1,400 RPM. The system remains in the commanded state until cancelled by the scan tool.
Intake CMP Actuator Sol. Bank 1	This function controls the intake camshaft actuator solenoid for bank 1. The normal commanded state is NONE. When commanded ON/OFF, the ECM turns the camshaft actuator solenoid ON/OFF. The scan tool initiates the test when the following conditions are met: • The ignition is ON with the engine OFF. • No engine speed is detected. The system remains in the commanded state until cancelled by the scan tool.
Intake CMP Actuator Sol. Bank 2	This function controls the intake camshaft actuator solenoid for bank 2. The normal commanded state is NONE. When commanded ON/OFF, the ECM turns the camshaft actuator solenoid ON/OFF. The scan tool initiates the test when the following conditions are met: • The ignition is ON with the engine OFF. • No engine speed is detected. The system remains in the commanded state until cancelled by the scan tool.
Loop Status	Controls the system loop status. The commanded states include NONE, OPEN, or CLOSED. The normal commanded state is NONE. When commanded OPEN or CLOSED, the system remains in the commanded state until cancelled by the scan tool.
Malfunction Indicator Lamp	Controls the malfunction indicator lamp (MIL). The commanded states include NONE, ON, and OFF. When commanded ON or OFF, the system remains in the commanded state until cancelled by the scan tool.
Misfire Graphic	Graphs the accumulated misfires occurring in each cylinder. The scan tool allows for a reset of the misfire graph.
Reverse Inhibit	This device control is used to override the state of the Reverse Inhibit output.
RVS Disable History Reset	This output control is used to trigger the reset of the last 8 reasons the ECM has disabled remote vehicle start (RVS).
Spark Retard	Controls the amount of spark retard. The normal commanded state is NONE. The system will INCREASE or DECREASE the amount of spark retard by 1 degree increments within a range of 0-10 degrees maximum retard. The system remains in the commanded state until cancelled by the tool.
Starter Relay	This output control is used to override the state of the Starter Relay output. Fuel and spark are disabled to prevent the engine from starting if the starter relay output is commanded ON.
	This function opens the throttle plate in 10 percent increments. The scan tool initiates the test when the following conditions are met:

Throttle Position	- The ignition is ON, with the engine OFF. - The vehicle speed is 0 km/h (mph). The system remains in the commanded state until cancelled by the scan tool.

Inflatable Restraint Sensing and Diagnostic Module Scan Tool Information

The sensing and diagnostic module (SDM) scan tool data list contains all the restraint system related parameters that are available on the scan tool. The parameters in the list are arranged in alphabetical order.

Use the SDM scan tool data list as directed by a diagnostic table or in order to supplement the diagnostic procedures. Begin all of the diagnostic procedures with the Diagnostic System Check - SIR. Use the SDM scan tool data list after the following is determined:

- There is no published diagnostic trouble code (DTC) procedure nor published symptom procedure for the customer concern
- The DTC or symptom diagnostic procedure indicated by the diagnostic system check does not resolve the customer concern

The typical data values are obtained from a properly operating vehicle under the conditions specified in the second row of the scan tool data list table. Comparison of the parameter values from the suspect vehicle with the typical data values may reveal the source of the customer concern.

Parameter	Operating Conditions	Expected Value	Definition
Ignition is ON, engine OFF, and vehicle is stationary			
Backup System Power Mode	Backup system power mode activated	Enable	This parameter displays the status of the Backup System Power Mode
	Backup system power mode deactivated	Disable	
Driver Air Bag Stage 1 Squib	--	2.6 - 3.3 Ohms	The scan tool displays 2.6 - 3.3 Ohms. This is the resistance of the driver air bag stage 1 squib circuit as interpreted by the Sensing and Diagnostic Module.
Driver Air Bag Stage 2 Squib	--	2.6 - 3.3 Ohms	The scan tool displays 2.6 - 3.3 Ohms. This is the resistance of the driver air bag stage 2 squib circuit as interpreted by the Sensing and Diagnostic Module.
Driver EFS Status	--	Okay	The scan tool displays Okay or Not Okay. This is the current status of the Driver EFS.
	--	Not Okay	
Driver Seat Position Sensor Status	--	Okay	The scan tool displays Okay or Not Okay. This is the current status of the Driver Seat Position Sensor.
	--	Not Okay	
Driver Curtain Air Bag Squib	--	1.9 - 2.6 Ohms	The scan tool displays 1.9 - 2.6 Ohms. This is the resistance of the driver curtain air bag squib circuit as interpreted by the

			Sensing and Diagnostic Module.
Driver Pretensioner Circuit	--	2.6 - 3.3 Ohms	The scan tool displays 2.6 - 3.3 Ohms. This is the resistance of the driver pretensioner circuit as interpreted by the Sensing and Diagnostic Module.
Driver Seat Belt Status	Seat belt buckled	Buckled	The scan tool displays whether the driver seat belt is Buckled or Not Buckled.
	Seat belt unbuckled	Not Buckled	
Driver Side Air Bag Squib	--	2.6 - 3.3 Ohms	The scan tool displays 2.6 - 3.3 Ohms. This is the resistance of the driver side air bag squib circuit as interpreted by the Sensing and Diagnostic Module.
Driver SIS Status	--	Okay	The scan tool displays Okay or Not Okay. This is the current status of the Driver SIS.
	--	Not Okay	
Passenger Air Bag Stage 1 Squib	--	1.9 - 2.6 Ohms	The scan tool displays 1.9 - 2.6 Ohms. This is the resistance of the passenger air bag stage 1 squib circuit as interpreted by the Sensing and Diagnostic Module.
Passenger Air Bag Stage 2 Squib	--	1.9 - 2.6 Ohms	The scan tool displays 1.9 - 2.6 Ohms. This is the resistance of the passenger air bag stage 2 squib circuit as interpreted by the Sensing and Diagnostic Module.
Passenger Curtain Air Bag Squib	--	2.6 - 3.3 Ohms	The scan tool displays 2.6 - 3.3 Ohms. This is the resistance of the passenger curtain air bag squib circuit as interpreted by the Sensing and Diagnostic Module.
Passenger EFS Status	--	Okay	The scan tool displays Okay or Not Okay. This is the current status of the Passenger EFS.
	--	Not Okay	
Passenger Pretensioner Circuit	--	1.9 - 2.6 Ohms	The scan tool displays 1.9 - 2.6 Ohms. This is the resistance of the passenger pretensioner circuit as interpreted by the Sensing and Diagnostic Module.
Passenger Side Air Bag Squib	--	1.9 - 2.6 Ohms	The scan tool displays 1.9 - 2.6 Ohms. This is the resistance of the passenger side air bag squib ciruit as interpreted by the Sensing and Diagnostic Module.
Passenger SIS Status	--	Okay	The scan tool displays Okay or Not Okay. This is the current status of the Passenger SIS.
	--	Not Okay	
Primary Key Status	--	Valid	The scan tool displays if there is a passenger airbag suppression device used on this vehicle and if so, whether it is has an automatic, manual key switch or both.
	--	Invalid	
Received Primary Key	--	4711	The scan tool displays what the BCM is sending out as the primary key. The SDM then compares it to what it has stored. This should match the SDM Primary Key.

Run/Crank Signal	Ignition is in RUN/CRANK position	Active	The scan tool displays the current power mode of the SDM.
	Ignition is in OFF/ACC position	Inactive	
Seat Position Driver	Seat positioned toward the rear of the cabin	Rearward	The scan tool displays Rearward or Forward. This is the positional state of the drive seat.
	Seat positioned close to the steering wheel	Forward	
Secondary Key Status	--	Valid	The scan tool displays whether the Secondary Key is valid or invalid. This determines if the VIN stored in SDM memory matches what is stored in the BCM.
	--	Invalid	
System Power Mode	Ignition is in OFF position	Off	This scan tool displays the current position of the ignition cycle.
	Ignition is in ACC position	Accessory	
	Ignition is in RUN position	Run	
	Ignition is in CRANK position	Crank	
VIN Digit 2 - 5	--	Vehicle Dependant	The scan tool displays the Secondary Key which includes digits 2 though 5 of the VIN that the BCM sends to the SDM.
VIN Digit 6 - 8	--	Vehicle Dependant	The scan tool displays the Secondary Key which includes digits 6 through 8 of the VIN that the BCM sends to the SDM.
VIN Digit 9 - 12	--	Vehicle Dependant	The scan tool displays the Secondary Key which includes digits 9 through 12 of the VIN that the BCM sends to the SDM.
VIN Digit 13 - 15	--	Vehicle Dependant	The scan tool displays the Secondary Key which includes digits 13 through 15 of the VIN that the BCM sends to the SDM.
VIN Digit 16 - 17	--	Vehicle Dependant	The scan tool displays the Secondary Key which includes digits 16 and 17 of the VIN that the BCM sends to the SDM.
Warning Indicator	SRS warning indicator activated	On	The scan tool displays whether the SRS warning indicator has been requested ON or OFF
	SRS warning indicator deactivated	Off

Instrument Cluster Scan Tool Information

The scan tool data lists contain all the instrument panel, gages, and console related parameters that are available on the scan tool. The parameters in the list are arranged in alphabetical order. The data list column indicates the location of the parameter within the scan tool menu selections.

Use the scan tool data lists as directed by a diagnostic table or in order to supplement the diagnostic procedures. Begin all of the diagnostic procedures with the Diagnostic System Check - Vehicle.

Use the scan tool data lists only after the following is determined:

- There is no published DTC procedure nor published symptom procedure for the customer concern.
- The DTC or symptom procedure indicated by the diagnostic system check does not resolve the customer concern.

The typical data values are obtained from a correctly operating vehicle under the conditions specified in the first row of the scan tool data list table. Comparison of the parameter values from the suspect vehicle with the typical data values may reveal the source of the customer concern.

Parameter	**Operating Conditions**	**Expected Value**	**Definition**
Ignition is ON, engine OFF, and vehicle is stationary			
ABS Telltail	Systems check or fault with the system	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when doing a systems check or a fault is logged.
	Systems are normal	Off	
Alternator Telltail	Fault with the system	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when there is a fault with the system.
	Systems are normal	Off	
Backup System Power Mode	Back up power system activated	Enabled	This parameter displays the status of the backup system power mode.
	Back up power system deactivated	Disabled	
Battery Voltage	--	12 Volts	The scan tool displays 0-14 Volts. The scan tool displays approximately 12 Volts when the ignition is on
Brake Fluid Level Switch	Low brake fluid level	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when
	Normal brake		

	fluid level	Off	there is a fault with the system.
Brake System Telltail	Systems check or fault with the system	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when doing a systems check or a fault is logged.
	Systems are normal	Off	
Current Trip Display	--	Km	This parameter displays the total distance travelled so far.
Distance To Arrival	--	Km	This parameter displays the remaining distance till arrival, based off the user's selection.
Door Open Telltail	Door open or ajar	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when a door is open or not closed correctly.
	Door closed correctly	Off	
Drivers Side Seat Belt Telltail	Seat belt not being worn	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when doing a systems check or a fault is logged.
	Seat belt being worn	Off	
Engine Coolant Temperature	--	[ordm] C	This parameter displays the current temperature of the coolant in the vehicle in degrees.
Engine Speed	--	RPM	This parameter displays the speed of the crankshaft as calculated by the control module based on inputs from the crankshaft position (CKP) sensor. The scan tool will display the engine speed in revolutions per minute (RPM).
Fr. Fog Light Telltail	Front fog lamps activated	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when turned on.
	Front fog lamps deactivated	Off	
Fuel Used A	--	Litres	This parameter displays the total litres of fuel used since the trip computer was reset.
Fuel Used B	--	Litres	This parameter displays the total litres of fuel used since the trip computer was reset.
High Beam Telltail	High beam activated	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when turned on.
	High beam deactivated	Off	
	Ignition is in	Off	

Ignition Switch	OFF position		This parameter displays the current status of the ignition switch.
	Ignition is in ACC position	Off	
	Ignition is in RUN position	On	
	Ignition is in CRANK position	On	
Left Scroll Switch	--	Counts	This parameter displays the position of the left scroll switch.
Odometer	--	Km	This parameter displays the odometer reading which calculates the distance travelled based on information from the ECM.
Phone	Phone activated	On	This parameter displays the commanded state of a connected mobile phone.
	Phone deactivated	Off	
Rear Fog Light Telltail	Rear fog lights activated	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when turned on.
	Rear fog lights deactivated	Off	
Remaining Fuel	--	%/ L	This parameter displays the remaining fuel as either a percentage or in litres.
Right Scroll Switch	--	Counts	This parameter displays the position of the right scroll switch.
Shift Up Indicator	Shift up indicator activated	On	This parameter displays the status of the shift up light.
	Shift up indicated deactivated	Off	
SRS Air Bag Telltail	Systems check or fault with the system	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when doing a systems check or a fault is logged.
	Systems are normal	Off	
Steering Wheel Switch	Left scroll pressed	Menu Enter	This parameter displays the position of the steering wheel switch.
	Left scroll in idle position	Off	
System Power	Ignition is in OFF position	Off	This parameter displays the system power mode which is dependant on
	Ignition is in ACC position	ACC	

Mode	Ignition is in RUN position	Run	ignition position.
	Ignition is in CRANK position	Crank	
Time To Arrival	--	day(s)	This parameter displays the total days remaining till arrival.
Time To Arrival	--	00:00:00 (hh:mm:ss)	This parameter displays the time to arrival at a programmed destination.
Tyre Pressure Monitoring Telltail	Systems check or fault with the system	On	This parameter displays On, which will command the telltail lamp on the Instrument Cluster to illuminate when doing a systems check or a fault is logged.
	System is normal	Off	
Trip A Distance	--	Km	This parameter displays the total kilometers travelled since last reset.
Trip A Time	--	day(s)	This parameter will display the total days remaining till arrival.
Trip A Time	--	00:00:00 (hh:mm:ss)	This parameter will display the engine running time during this ignition cycle.
Trip B Distance	--	Km	This parameter displays the total kilometres travelled since last reset.
Trip B Time	--	day(s)	This parameter displays the total days remaining till arrival.
Trip B Time	--	00:00:00 (hh:mm:ss)	This parameter will display the engine running time during this ignition cycle.
Turn Left Signal Telltail	Turn left signal activated	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when the turn signal switch is activated.
	Turn left signal deactivated	Off	
Turn Right Signal Telltail	Turn right signal activated	On	This parameter displays On, which will command the telltail lamp on the instrument cluster to illuminate when the turn signal switch is activated.
	Turn left signal deactivated	Off	
Vehicle Speed	--	Km/h	This parameter indicates the vehicle speed calculated by the control module based on an input from the vehicle speed sensor (VSS). The scan tool will display a high value at higher vehicle speeds, and a low value at lower vehicle speeds.
	Low washer		

Washer Level Switch	level	On	This parameter displays the position of the washer level switch.
	Normal washer level	Off	

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Diagnostic Navigation | Vehicle Diagnostic Information | Specifications | Document ID: 2026144

Radio Scan Tool Information

Parameter	Operating Conditions	Expected Value	Definition
Ignition is ON, engine OFF, and vehicle is stationary			
Antenna	--	Main	
Audio Source	CD Mode Selected	CD	This parameter determines which mode the Infotainment is currently using.
	Tuner Mode Selected	Tuner	
Audio System	System On	On	This parameter determines if the Audio System is On or Off.
	System Off	Off	
Auxiliary Input	External Device Connected	Active	This parameter displays if their is an external device connected to the Infotainment unit.
	External Device Not Connected	Inactive	
Balance	Left 1 to 6	User Dependent	This parameter displays the current balance of the speaker on the left or right sides.
	Right 1 to 6	User Dependent	
Band	FM 1	FM 1	This parameter displays the currently selected Band.
	FM 2	FM 2	
	FM ASM	FM ASM	
	AM	AM	
	AM ASM	AM ASM	
Bass	STD	User Dependent	This parameter displays the current bass setting based off the user's selection.
	+1 to +6	User Dependent	
Battery Voltage	--	12 Volts	The scan tool displays 0-14 Volts. The scan tool displays approximately 12 Volts when the ignition is On.
Beeps	Beeps activated	On	This parameter displays if the audio unit will beep when buttons are pressed.
	Beeps deactivated	Off	
Brightness	STD	User Dependent	This parameter displays the currently selected brightness based off the users selection.
	-5 to +5	User Dependent	
CD Error	Problem with Unit	Yes	This parameter displays if there is a current error with the audio unit.
	No Problem with Unit	No	

CD Player Status	Pause button pressed while CD paused	Play	This parameter displays the status of the CD Player.
	Pause button pressed while CD playing	Pause	
	Audio system turned off or change of audio source	Stop	
	Track up button pressed	Track Up	
	Track down button pressed	Track Down	
	Reverse button pressed	Reverse	
	Cue button pressed	Cue	
CD Special Play Mode	Repeat button pressed	Repeat Track	This parameter displays the last CD special play mode that was selected by the user.
	Random button pressed	Random Track	
Colour	--	Vehicle Dependent	This parameter displays a numeric value. This number corresponds to the colour of the infotainment unit display.
Contrast	STD	User Dependent	This parameter displays the current contract setting, based off the user's selection.
	-5 to +5	User Dependent	
Current CD	--	Audio CD	This parameter displays the type of disc inserted into the CD Player.
	--	MP3	
Current CD Type	CDDA	User Dependent	This parameter displays whether the compact disc is CDDA or MP3.
	MP3	User Dependent	
Current Track	1 to 30	--	This parameter displays the current track on the CD been played.
Date	1 to 31	--	This parameter displays the current date stored in the infotainment unit.
Day	Monday - Sunday	--	This parameter displays the current day of the week stored in the unit.
DDL Bass Attenuation	0 to 60 dB	User Dependent	This parameter displays the current dynamic distortion bass level.
DDL Setting	Default Setting	Off	
	User dependent	Cur 1 to Cur 3	
			This parameter displays the current

DDL Volume	0 to 60 dB	0 dB	dynamic distortion volume level.
Dial Turns	Counts	1 Counts	This parameter displays the numbers of counts the dial has been turned.
Dial Type	Mode dial used	Mode	This parameter displays the last dial type to be used by the user.
	Multi-function dial used	Multi-function	
	Fan speed dial used	Fan Speed	
	Driver temp dial used	Driver Temp	
Display Format	--	12 Hour	This parameter displays the time format based on 12 hour or 24 hour format.
	--	24 Hour	
Display Illumination	1 to 100 %	User Dependent	This parameter displays the current illumination level based from the user's selection.
Drive Type	--	Single CD	This parameter displays the current drive type as selected by the user
Driver Identification	Programmed Key	Driver 1	This parameter displays the status of the current ignition key.
	Programmed Key	Driver 2	
Equalizer	On	User Dependent	This parameter displays if the user has turned On or Off the equalizer settings in the audio unit.
	Off	User Dependent	
Equalizer Boost	--	0	
Equalizer Preset	--	On	This parameter displays the current preset for the equalizer.
	--	Off	
Fader	STD	User Dependent	This parameter displays the current settings for the fader based off the user's selection.
	Front 1 to 6	User Dependent	
	Rear 1 to 6	User Dependent	
Fascia Button	Depends on Last button pressed.	--	This parameter displays the last fascia button pressed during the last ignition cycle.
Field Intensity	--	0-300 dBuV	The scan tool displays 0-300 dBuV. The signal from the antenna is measured in dBuV.
Frequency	87.5 to 108.00 FM	User Dependent	This parameter displays the currently selected radio frequency.
	522 to 1710 AM	User Dependent	
Hazards	Hazard button pressed	Active	This parameter displays whether the hazard lamps have been activated.
	Hazard button		

	depressed	Inactive	
Illumination	--	0-100%	
Illumination Mode	--	Auto	
Interior Illumination	--	0-100%	This parameter displays the interior illumination as a percentage. The highest percentage will have the interior lamps at their brightest.
Key Stuck	--	None	This parameter displays if their is currently a button stuck on the fascia plate.
Loudness	Loudness activated	On	This parameter displays if the loudness function has be turned On or Off by the user.
	Loudness deactivated	Off	
Month	--	Varies	This parameter displays the current month
Multipath	--	%	
Multipath	--	Yes	
	--	No	
Mute	Mute button pressed	On	This parameter displays if the audio unit mute button has been activated or deactivated.
	Mute button depressed	Off	
Navigation Audio Channel	--	Varies	This parameter displays the audio channel that is utilised for the navigation audio
Navigation	--	Activated	This parameter displays if the navigation is Activated or Not Activated.
	--	Not Activated	
Navigation Volume	--	dB	This parameter displays the correctly selected volume setting for the navigation system through the audio unit.
Play Time	--	hh:mm:ss	This parameter displays the play time of the CDDA/MP3.
Preset	1 to 6	User Dependent	This parameter displays the currently selected preset radio station.
Rear Aux	Rear aux activated	On	This parameter displays if the rear aux is On or Off
	Rear aux deactivated	Off	
Rear Controls	Rear controls activated	Active	This parameter displays if the rear seat controls are working correctly.
	Rear controls deactivated	Inactive	
Search Sensitivity	Local	User Dependent	This parameter displays the currently selected search sensitivity signal strength.
	Distant	User Dependent	

	Auto	User Dependent	
Single CD Loaded	CD Loaded into Unit	Yes	The scan tool will display whether their is a compact disc loading or not.
	No CD Laded into Unit	No	
Speed Dependent Volume	--	dB	This parameter displays the volume in dB of the infotainment unit dependent on the speed of the vehicle.
Speed Volume Curve	Default Setting	Off	This parameter displays the speed volume curve as defined by the user
	User Settings	Cur 1 to Cur 5	
Stereo Status	User dependent	Mono	This parameter displays if the audio system on stereo or mono mode based on the user's selection.
	User dependent	Stereo	
System Power Mode	Ignition is in OFF position	Off	This parameter displays the current ignition cycle the key is on.
	Ignition is in ACC position	Accessory	
	Ignition is in RUN position	Run	
	Ignition is in CRANK position	Crank	
Time	--	hh:mm:ss	This parameter displays the current time.
Total Track Time	--	hh:mm:ss	The scan tool will display the total time of the current song.
Treble	STD	User dependent	The scan tool will show the current treble setting as selected by the user.
	-6 to +6	User dependent	
Vehicle Speed	--	km/h	This parameter indicates the vehicle speed calculated by the control module based on an input from the vehicle speed sensor (VSS). The scan tool will display a high value at higher vehicle speeds, and a low value at lower vehicle speeds.
Voice In	Voice in activated	Active	
	Voice in deactivated	Inactive	
Volume	0 to 40	User dependent	The scan tool will show the current user selection.
Year	2000 to 2099	--	The scan tool will show the current year.

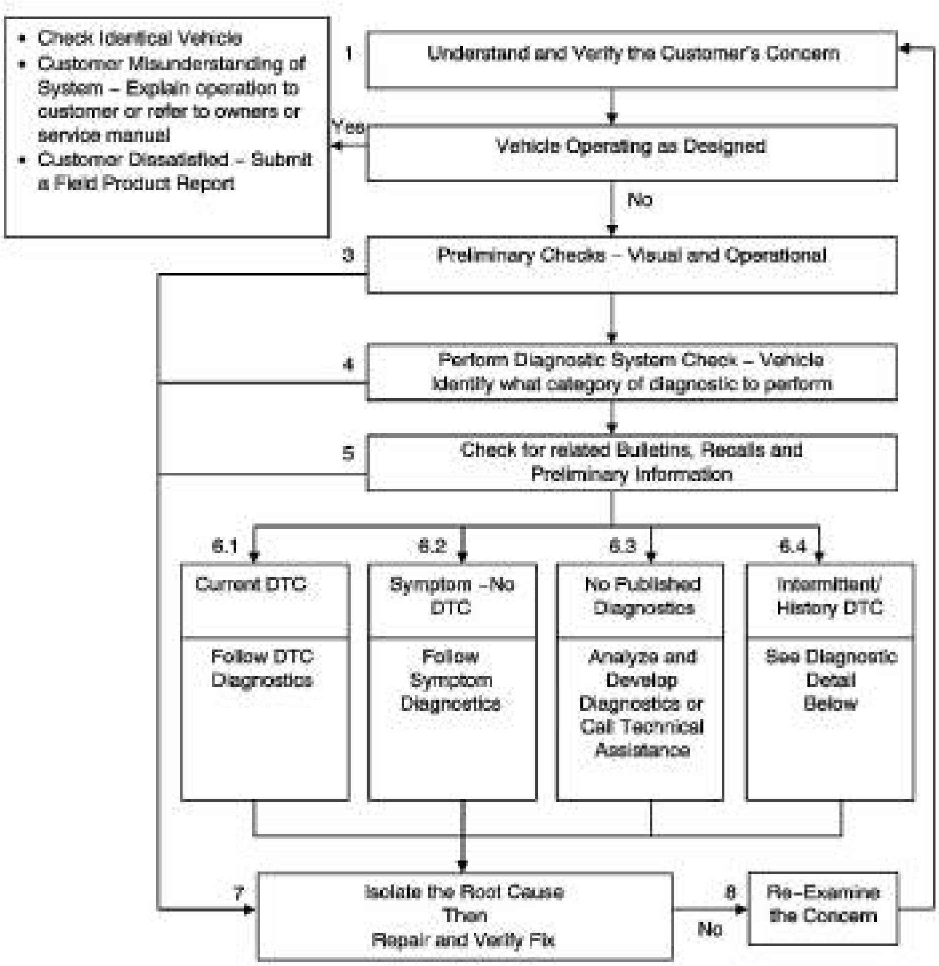
Strategy Based Diagnosis

The goal of Strategy Based Diagnosis is to provide guidance when you create a plan of action for each specific diagnostic situation. Following a similar plan for each diagnostic situation, you will achieve maximum efficiency when you diagnose and repair vehicles. Although each of the Strategy Based Diagnosis boxes is numbered, you are not required to complete every box in order to successfully diagnose a customer concern. The first step of your diagnostic process should always be Understand and Verify the Customer's Concern. The final step of your diagnostic process should be Repair and verify the Fix. Refer to the following chart for the correct Strategy Based Diagnosis.



2
• Check Identical Vehicle
• Customer Misunderstanding of System – Explain operation to customer or refer to owners or service manual
• Customer Dissatisfied – Submit a Field Product Report
1
Understand and Verify the Customer's Concern
Yes
Vehicle Operating as Designed
No
3
Preliminary Checks – Visual and Operational
4
Perform Diagnostic System Check – Vehicle
Identify what category of diagnostic to perform
5
Check for related Bulletins, Recalls and Preliminary Information
6.1
Current DTC
Follow DTC Diagnostics
6.2
Symptom –No DTC
Follow Symptom Diagnostics
6.3
No Published Diagnostics
Analyze and Develop Diagnostics or Call Technical Assistance
6.4
Intermittent/ History DTC
See Diagnostic Detail Below
7
Isolate the Root Cause Then Repair and Verify Fix
No
8
Re-Examine the Concern

1. Understand and Verify the Customer's Concern: The first part of this step is to obtain as much information as possible from the customer. Are there aftermarket accessories on the vehicle? When does the condition occur? Where does the condition occur? How long does the condition last? How often does the condition occur? In order to verify the concern, the technician should be familiar with the normal operation of the system and refer to the owner

or service manual for any information needed.

2. Vehicle Operating as Designed: This condition exists when the vehicle is found to operate normally. The condition described by the customer may be normal. Compare with another like vehicle that is operating normally under the same conditions described by the customer. Explain your findings and the operation of the system to the customer. If the customer is dissatisfied submit a Field Product Report.
3. Preliminary Checks: Conduct a thorough visual inspection. Review the service history. Detect unusual sounds or odors. Gather diagnostic trouble code (DTC) information in order to achieve an effective repair.
4. Perform Published Diagnostic System Check- Vehicle: The Diagnostic System Check - Vehicle verifies the proper operation of the system. This will lead the technician in an organized approach to diagnostics and identify what category of diagnostic to perform.
5. Check for related Bulletins, Recalls and Preliminary Information (PI).
6. Diagnostic categories:
    - 6.1. Current DTC: Follow the designated DTC diagnostic in order to make an effective repair. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.
    - 6.2. Symptom - No DTC: Select the appropriate symptom diagnostic. Follow the diagnostic steps or suggestions in order to complete the repair. Refer to Symptoms - Vehicle.
    - 6.3. No Published Diagnostics: Analyze the Concern. Develop a plan for the diagnostics. The service manual schematics will help you to see system power, ground, input, and output circuits. You can also identify splices and other areas where multiple circuits are tied together. Look at component locations to see if components, connectors or harnesses may be exposed to extreme temperature, moisture, or corrosives (road salt, battery acid, oil or other fluids). Utilize the wiring diagrams, system description and operation, and system circuit description.
    - 6.4. Intermittent/History DTC: An intermittent condition is one that does not occur continuously, may be difficult to duplicate, and will only occur when certain conditions are met. Generally, an intermittent is caused by faulty electrical connections and wiring, malfunctioning components, electromagnetic/radio frequency interference, driving conditions, or aftermarket equipment. The following approaches/tools may prove to be beneficial in locating and repairing an intermittent condition or history DTC.
        - Combining technicians knowledge with the available service information.
        - Evaluate the symptoms and conditions described by the customer on the Customer Concern Verification Sheets.
        - Follow the suggestions on Testing for Intermittent Conditions and Poor Connections.
        - Use the available scan tool, digital multi-meter, or J 42598 with data capturing capabilities.
7. Isolate the Root Cause then Repair and Verify Fix: After isolating the root cause, make the repairs and validate for the correct operation by performing the Diagnostic Repair Verification. Verifying that the DTC or symptom has been corrected may involve road testing the vehicle.
8. Re-examine the Concern: If a technician cannot successfully find or isolate the concern, a re-evaluation is necessary. Re-verify the concern. The concern could be an intermittent or normal condition.

Diagnostic System Check - Vehicle

Diagnostic Instructions

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Continue through the Diagnostic System Check until you are directed to follow a particular diagnostic or repair procedure. Once a repair has been completed, perform the Diagnostic Repair Verification and verify the customer concern has been corrected.

The diagnostic procedures within this manual are developed on the assumption that the following areas function as designed:

- The 12V battery is fully charged and cables are clean and tight. Refer to Battery Inspection/Test.
- Fuses are not open. Refer to Power Distribution Schematics and Electrical Center Identification Views.
- Ground circuits for the area of customer concern are clean, tight, and in the correct location. Refer to Ground Distribution Schematics and Harness Routing Views.
- All connections/connectors for the area of concern are fully seated. Refer to Component Connector End Views.
- There are no aftermarket devices that affect the operation of the system. Refer to Checking Aftermarket Accessories.
- The scan tool powers up. Refer to Scan Tool Does Not Power Up.

Diagnostic System Check

1. *VERIFY CUSTOMER CONCERN* -- Understand and validate the customer concern. Inspect the visible system components for obvious damage or conditions that may cause the concern.
2. *BULLETIN SEARCH* -- Check for related bulletins, recall/field actions and preliminary information.
3. *MECHANICAL CONCERNS* -- Verify the symptom is not exclusively a mechanical concern.

   If the symptom is exclusively a mechanical concern, refer to Symptoms - Vehicle.

   Note: Do not clear any DTCs unless instructed to do so by a diagnostic procedure. If any DTC is Powertrain related, select Capture Info to store DTC and Freeze Frame/Failure Records to the Scan Tool.

4. *CONTROL MODULE COMMUNICATION and DTC CHECK* -- Using a scan tool, perform the Vehicle DTC Information function and verify at least one control module communicates with the scan tool. Record on the Repair Order the following information:
   - Any control module that is not communicating.
   - Any DTC, including symptom byte, and the control module that has set the DTC.

   If the scan tool does not communicate with any control module on the vehicle, refer to Power Mode Mismatch.
5. *CONTROL MODULE INTERNAL PERFORMANCE FAULTS* -- Verify there are no current control

module Internal Hardware Performance DTCs set.

If any DTC of this type is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.

6. *CONTROL MODULE COMMUNICATION VERIFICATION* -- Verify the vehicle is built with any control module listed as not communicating, refer to Data Link References. All control modules should be communicating, as equipped.

   If the scan tool does not communicate with one or more control modules refer to Data Link References.

7. *COMMUNICATION and POWERMODE FAULTS* -- Verify there are no current control module Power Mode or Communication DTCs set..

   If any DTC of this type is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.

Note: The engine may start during this test. Ensure the vehicle is out of gear and the parking brake is applied. Turn the engine OFF as soon as the crank power mode parameter has been observed.

8. *POWER MODE VERIFICATION* -- Driver door open, observe the scan tool Power Mode parameter while cycling the ignition switch through all the power modes. Verify the current Power Mode parameter matches the actual ignition switch positions.

   If the Power Mode parameter does not match the actual ignition switch positions, refer to Power Mode Mismatch.

9. *ENGINE CRANK and RUN VERIFICATION* -- Verify that the engine cranks and runs.

   If the engine does not crank, refer to Symptoms - Engine Electrical.

   If the engine does not run, refer to Engine Cranks But Does Not Runfor the 2.8L, 3.0L, 3.2L, or 3.6L engine or Engine Cranks But Does Not Runfor the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine.

10. *REMAINING DTC REVIEW* -- Verify there are no other DTCs set.

    If other DTCs are set, diagnose them in the order listed below. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.

    10.1. Voltage DTCs

    10.2. Programming, Setup, Configuration or Software Performance DTCs

    10.3. Component related DTCs

    10.4. System related DTCs

    10.5. Any remaining DTCs

11. *SYMPTOM DIAGNOSIS* -- Diagnose any remaining customer concern. Refer to Symptoms - Vehicle.

Diagnostic Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 seconds.
5. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

   Or

   If the repair was symptom related, duplicate the conditions under which the customer concern occurred to verify the repair. If the customer concern reoccurs or another symptom is present, return to Symptoms - Vehicle and perform the appropriate symptom diagnostic.

Diagnostic Starting Point - Vehicle

Begin the system diagnosis with Diagnostic System Check - Vehicle. The Diagnostic System Check - Vehicle will provide the following information:

- The identification of the control modules which are not communicating through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and their status.

The use of the Diagnostic System Check - Vehicle will identify the correct procedures to begin vehicle diagnosis. These must be performed before system DTC or symptom diagnosis.

Diagnostic Trouble Code (DTC) List - Vehicle

This master DTC list includes all applicable DTCs in alphanumeric order with descriptors.

DTC	DTC Descriptor	Module That Sets the DTC	Diagnostic Procedure
B0012	Driver Frontal Deployment Loop Stage 1	SDM	DTC B0012 or B0013
B0013	Driver Frontal Deployment Loop Stage 2	SDM	DTC B0012 or B0013
B0014	Driver Side Deployment Loop	SDM	DTC B0014
B0015	Driver Pretensioner Deployment Stage 1 Loop	SDM	DTC B0015
B0016	Driver Curtain Deployment Loop Initiator	SDM	DTC B0016
B0019	Passenger Frontal Deployment Loop Stage 1	SDM	DTC B0019 or B0020
B0020	Passenger Frontal Deployment Loop Stage 2	SDM	DTC B0019 or B0020
B0021	Passenger Side Deployment Loop Stage 1	SDM	DTC B0021
B0022	Passenger Pretensioner Deployment Stage 1 Loop	SDM	DTC B0022
B0023	Passenger Curtain Deployment Loop Initiator	SDM	DTC B0023
B0052	Deployment Commanded	SDM	DTC B0052 or B0053
B0053	Deployment Commanded with Loop DTCs Present	SDM	DTC B0052 or B0053
B0055	Side Airbag Deployment Commanded	SDM	DTC B0055
B0072	Driver Seat Belt Sensor Circuit	SDM	DTC B0072
B0079	Driver Seat Position Sensor Circuit	SDM	DTC B0079
B0083	Front End Sensor 1	SDM	DTC B0083 or B0084
B0084	Front End Sensor 2	SDM	DTC B0083 or B0084
B0085	Left Front Side Impact Circuit	SDM	DTC B0085 or B0086
B0086	Right Front Side Impact Sensor Circuit	SDM	DTC B0085 or B0086
B013B	Coil Compressor Stroke Control Circuit	HVAC	DTC B013B
B0158	Outside Air Temperature Sensor Circuit	HVAC	DTC B0158 or B0168
	Passenger Compartment		

B0168	Temperature Sensor Circuit	HVAC	DTC B0158 or B0168
B0183	Left Solar Load Sensor 1 Circuit	HVAC	DTC B0183 or B0188
B0188	Right Solar Load Sensor 2 Circuit	HVAC	DTC B0183 or B0188
B0193	Blower Motor Feedback Circuit	HVAC	DTC B0193
B0198	Blower Motor Feedback Circuit	HVAC	DTC B0198 2
B0228	Air Intake Flow Actuator Fault (LHD) or Recirculation Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0238	Demist Actuator Fault (LHD) or Defogger Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0253	Face/Floor Actuator Fault (LHD) or Vent/Floor Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0283	Electric Rear Defrost Circuit	HVAC	DTC B0283
B0408	Drivers Side Air Mix Actuator (LHD) or Drivers Air Mix Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0418	Passenger Side Air Mix Actuator (LHD) or Passengers Air Mix Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0428	Rear Air Mix Door Motor Circuit	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0946	Suspension Control Selection Indicator Circuit	ESCM	DTC B0946
B094A	Service Suspension Control Indicator Circuit	ESCM	DTC B094A

B0954	Park Assist Sensor Front Left Outer Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0955	Park Assist Sensor Front Left Middle Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0956	Park Assist Sensor Front Right Middle Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0957	Park Assist Sensor Front Right Outer Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0958	Park Assist Sensor Rear Left Outer Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0959	Park Assist Sensor Rear Left Middle Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0960	Park Assist Sensor Rear Right Middle Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0961	Park Assist Sensor Rear Right Outer Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0967	Park Assist Switch Circuit	UPA	DTC B0967
B0968	Park Assist Indicator Circuit Malfunction	UPA	DTC B0968
B0970	Hazard Warning Switch Stuck	BCM	DTC B0970
B0983	Security System Indicator 2 Circuit	BCM	DTC B0983
B0996	Vehicle Identification Number Mismatch	Radio, RSE	DTC B0996, 1016, or B1271
B0997	Auxiliary Electronic Control Unit (ECU) 2 Performance	Radio	DTC B0997
	Memory Seat and Mirror Module Checksum Error	MSM	DTC B0997
B0998	Screen 1 EEPROM Failure	RSE	DTC B0998 or B0999
B0999	Screen 2 EEPROM Failure	RSE	DTC B0998 or B0999
B1000	Electronic Control Unit (ECU) Performance	BCM, IPC, MSM, RFA, SDM, TDM, Telematics, UPA	DTC B1000
B1001	Option Configuration Error	BCM, IPC	DTC B1001
		SDM	DTC B1001
B1008	Calibration Data Not Programmed	Telematics	DTC B1008
		UPA	DTC B1008
B1009	EEPROM Failure	RSE	DTC B1009
B1010	System Sensor Data Mismatch Invalid Odometer Signal	NIM	DTC B1010
B1011	System Disabled Over Temperature	NIM	DTC B1011
B1015	Vehicle Identification Number (VIN) Information Error	Telematics	DTC B1015 or DTC B1016

B1016	Vehicle Identification Number (VIN) Not Programmed	BCM	DTC B1016
		Radio	DTC B0996, 1016, or B1271
		SDM	DTC B1016
		Telematics	DTC B1015 or DTC B1016
B1019	System Configuration Error	Radio	DTC B1019
B101D	ECU Hardware Performance	NIM, Radio, RSE,	DTC B101D
B101E	ECU Software Performance	Radio	DTC B101E
B1020	Auxiliary Electronic Unit (ECU) Performance	NIM	DTC B1020
B1021	SIM Mismatch	Telematics	DTC B1021
B1023	Integral Switch Performance	Radio	DTC B1023
B1024	Printed Circuit Board (PCB) Temperature Sensor Fault	IPC	DTC B1024
B1025	Audio Output 1 Left Front Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1035	Audio Output 2 Right Front Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1045	Audio Output 3 Left Rear Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1055	Audio Output 4 Right Rear Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1240	CD-Player Malfunction	Radio	DTC B1240 or B1245
B1243	CD-Player Load or Eject Malfunction	Radio	DTC B1243 or B1248
		RSE	DTC B1243
B1244	CD-Player, Disc Upside Down	Radio	DTC B1244 or B1249
B1245	CD-Changer Malfunction	Radio	DTC B1240 or B1245
B1248	CD Changer Load/Unload Performance	Radio	DTC B1243 or B1248
B1249	CD-Changer, Disc Upside Down	Radio	DTC B1244 or B1249
B1271	Theft Locked	Radio	DTC B0996, 1016, or B1271
B1277	Microphone Circuit	Telematics	DTC B1277
B1287	Radio Mute Circuit	Telematics	DTC B1287
B1325	Device Power Circuit	HVAC	DTC B1325
		RSE	DTC B1325, B1330, or B1423
	System Voltage	SDM	DTC B1325
B1330	RSE Control Panel Supplied Power	RSE	DTC B1325, B1330, or B1423
B1335	Screen 1 Power Supply Voltage Circuit	RSE	DTC B1335 or B1340
B1340	Screen 2 Power Supply Voltage Circui	RSE	DTC B1335 or B1340
		BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443

B1370	Device Ignition 1 Circuit	SDM	DTC B1370
	Wake Up Circuit	MSM	DTC B1370
B1380	Device Ignition ACCESSORY Circuit	BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443
B138A	Device Voltage Reference Group 1 Outputs	UPA	DTC B138A
B1390	Button 1 Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B1400	Button 2 Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B1410	Button 3 Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B1423	Supply Voltage Circuit	RSE	DTC B1325, B1330, or B1423
B1428	Ignition Switched Power Relay 1 Circuit	BCM	DTC B1428
B1433	Ignition Switched Power Relay 2 Circuit	BCM	DTC B1433
B1440	Power Mode Master Input Circuit Malfunction	BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443
B1441	Device Ignition OFF, RUN, and CRANK Circuit	BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443
B1446	Backup Battery Timer Expired	Telematics	DTC B1446
B1447	Backup Battery Circuit	Telematics	DTC B1447
B1475	Retained Accessory Power Circuit	BCM	DTC B1475
B1516	Battery Current Sensor Performance	BCM	DTC B1516
B1517	Battery Voltage	BCM	DTC B1517
		Telematics	DTC B1517
B1527	High Parasitic Load Detected	BCM	DTC B1527
B1529	Control Module Voltage Reference Output 5 Circuit	BCM	DTC B1529
B1565	Mirror DIP Button Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B1735	Front Vertical Up Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1740	Front Vertical Down Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1745	Rear Vertical Up Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1750	Rear Vertical Down Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1755	Horizontal Forward Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1760	Horizontal Back Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820

B1815	Recline Up Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1820	Recline Down Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1825	Recline Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B1831	Lumbar Forward Switch Stuck	MSM	DTC B1831 or B1836
B1836	Lumbar Rearward Switch Stuck	MSM	DTC B1831 or B1836
B1851	Lumbar Position Sensor Fault	MSM	DTC B1851
B2355	Front Vertical Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B2365	Rear Vertical Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B2375	Horizontal Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B245A	Telematics Indicator 1 Circuit	Telematics	DTC B245A
B245B	Telematics Indicator 2 Circuit	Telematics	DTC B245B
B2461	Navigation Electronic Control Unit (ECU) Synchronous Signal Error	NIM	DTC B2461
B2462	Global Positioning System (GPS) Antenna Circuit	NIM, Telematics	DTC B2462
B2464	Navigation Player Decoding Error	Radio	DTC B2464
B2469	SIM Card Invalid	Telematics	DTC B2469
B2471	Telephone Number Error	Telematics	DTC B2471
B2476	Keypad Circuit	Telematics	DTC B2476
B2484	Global Positioning System Sensor Open Circuit	NIM	DTC B2484
B2530	Front Foglamps Control Circuit	BCM	DTC B2530
B2545	Backup Lamps Circuit	BCM	DTC B2545
B2555	Passenger Compartment Lamp Control Circuit	BCM	DTC B2555
B2575	Headlamp Low Beam Control Circuit	BCM	DTC B2575
B257A	Headlamp Switch Input Signals Mismatch	BCM	DTC B257A
B2580	Headlamp High Beam Control Circuit	BCM	DTC B2580
B2585	Parklamp Control Circuit	BCM	DTC B2585
B2610	Passenger Compartment Dimming 1 Circuit	BCM	DTC B2610
B2615	Passenger Compartment Dimming 2 Circuit	BCM	DTC B2615
	Display Dimming Pulse Width		

B2625	Modulation (PWM) Output Circuit	BCM	DTC B2625
B2645	Ambient Light Sensor Circuit	BCM	DTC B2645
B2652	Passenger Compartment Dimming 3 Circuit	BCM	DTC B2652
B2705	Gearshift Unlock Circuit	BCM	DTC B2705
B2730	Interior Trunk/Liftglass/Hatch Release Switch Circuit	BCM	DTC B2730
B2745	Traction Control Switch Circuit	BCM	DTC B2745
B2750	Horn Relay Coil Circuit	BCM	DTC B2750
B2755	Memory Button 1 Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B2760	Memory Button 2 Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B2765	Button M Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B2795	Suspension Control Select Switch Circuit	ESCM	DTC B2795
B2815	Steering Wheel Switch Circuit	IPC	DTC B2815
B2976	Driver Door Ajar Circuit	BCM	DTC B2976
B2991	Passenger Door Ajar Circuit	BCM	DTC B2991
B3006	Hood Ajar Circuit Plausability Failure	BCM	DTC B3006
B3055	No Transponder Modulation or No Transponder	TDM	DTC B3055
B3060	Unprogrammed Transponder Key Identification Code Received	TDM	DTC B3060
B3105	Keyless Entry System Key Not Programmed	RFA	DTC B3105
B3109	Keyless Entry Transmitter 1 Battery Low Voltage	RFA	DTC B3109
B3110	Keyless Entry Transmitter 2 Battery Low Voltage	RFA	DTC B3110
B3111	Keyless Entry Transmitter 3 Battery Low Voltage	RFA	DTC B3111
B3112	Keyless Entry Transmitter 4 Battery Low Voltage	RFA	DTC B3112
B3125	Left Front/Driver Door Only Unlock Circuit	BCM	DTC B3125, B3130, or B3135
B3130	All Door Unlock Circuit	BCM	DTC B3125, B3130, or B3135
B3135	All Door Lock Circuit	BCM	DTC B3125, B3130, or B3135
B3140	Driver Unlock Switch Circuit	BCM	DTC B3140 or B3150
B3150	Driver Lock Switch Circuit	BCM	DTC B3140 or B3150
B3265	Trunk/Hatch/Liftglass Release	BCM	DTC B3265

	Output Circuit		
B3410	AHLD Front Axle Sensor Signal Circuit	Headlamp Control Module	DTC B3410 or B3420
B3415	AHLD Front Axle Sensor Supply Circuit	Headlamp Control Module	DTC B3415
B3420	AHLD Rear Axle Sensor Signal Circuit	Headlamp Control Module	DTC B3410 or B3420
B3435	AHLD Left Servo Driver Circuit	Headlamp Control Module	DTC B3435 or B3440
B3440	AHLD Right Servo Driver Circuit	Headlamp Control Module	DTC B3435 or B3440
B3445	Stop Lamp Circuit	BCM	DTC B3445
B3531	Rear Air Mode Door Motor Circuit	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B3599	Memory Button 3 Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B370C	Rain Sensor Intensity Signal Circuit	BCM	DTC B370C or B370D
B370D	Rain Sensor Mode Control Circuit	BCM	DTC B370C or B370D
B3715	Front Wiper Relay Drive Circuit	BCM	DTC B3715
B3794	Cruise Control Function Request Circuit	BCM	DTC B3794
B3873	Front Washer Relay Circuit	BCM	DTC B3873
B3875	Wiper High Speed Relay Circuit	BCM	DTC B3875
B3907	Button Assembly Short to Battery	MSM	DTC B3907
B3922	Front Wiper Function Select Circuit	BCM	DTC B3922
B3924	DVD Player Theft Locked	RSE	DTC B3924
B3926	Screen 1 Theft Locked	RSE	DTC B3926 or B3927

P0011	Intake Camshaft Position Range/Performance Bank 1	ECM	DTC P0011, P0014, P0021, or P0024
P0013	Exhaust Camshaft Position Control Solenoid Circuit Malfunction Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P0014	Exhaust Camshaft Position Range/Performance Bank 1	ECM	DTC P0011, P0014, P0021, or P0024

P0016	Crankshaft/Intake Camshaft Position not Plausible Bank 1	ECM	DTC P0016, P0017, P0018, or P0019 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Crankshaft Position (CKP) Camshaft Position (CMP) Correlation		DTC P0016 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0017	Crankshaft/Exhaust Camshaft Position not Plausible Bank 1	ECM	DTC P0016, P0017, P0018, or P0019
P0018	Crankshaft/Intake Camshaft Position not Plausible Bank 2	ECM	DTC P0016, P0017, P0018, or P0019
P0019	Crankshaft/Exhaust Camshaft Position not Plausible Bank 2	ECM	DTC P0016, P0017, P0018, or P0019
P0020	Intake Camshaft Position Control Solenoid Circuit Malfunction Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P0021	Intake Camshaft Position Range/Performance Bank 2	ECM	DTC P0011, P0014, P0021, or P0024
P0023	Exhaust Camshaft Position Control Solenoid Circuit Malfunction Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P0024	Exhaust Camshaft Position Range/Performance Bank 2	ECM	DTC P0011, P0014, P0021, or P0024
P0030	O2 Sensor Heater Circuit Malfunction Bank 1 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Circuit Bank 1 Sensor 1		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0031	O2 Sensor Heater Circuit Low Voltage Bank 1 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0032	O2 Sensor Heater Circuit High Voltage Bank 1 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0036	O2 Sensor Heater Circuit Malfunction Bank 1 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Circuit Bank 2		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0037	O2 Sensor Heater Circuit Low Voltage Bank 1 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0038	O2 Sensor Heater Circuit High Voltage Bank 1 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
	O2 Sensor Signals not		

P0040	Plausible Bank 1 Sensor 1 & Bank 2 Sensor 1	ECM	DTC P0040 or P0041
P0041	O2 Sensor Signals not Plausible Bank 1 Sensor 2 & Bank 2 Sensor 2	ECM	DTC P0040 or P0041
P0050	O2 Sensor Heater Circuit Malfunction Bank 2 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Bank 2 Sensor 1		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0051	O2 Sensor Heater Circuit Low Voltage Bank 2 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0052	O2 Sensor Heater Circuit High Voltage Bank 2 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0053	O2 Sensor Heater Resistance Range/Performance Bank 1 Sensor 1	ECM	DTC P0053 or P0059 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Resistance Circuit Bank 1 Sensor 1		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0054	HO2S Heater Resistance Circuit Bank 1 Sensor 2	ECM	DTC P0030, P0036, P0053, P0054, P0135, or P0141
P0056	O2 Sensor Heater Circuit Malfunction Bank 2 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Bank 2 Sensor 2		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0057	O2 Sensor Heater Circuit Low Voltage Bank 2 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0058	O2 Sensor Heater Circuit High Voltage Bank 2 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0059	O2 Sensor Heater Resistance Range/Performance Bank 2 Sensor 1	ECM	DTC P0053 or P0059 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Resistance Bank 2 Sensor 1		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0060	HO2S Heater Resistance Bank 2 Sensor 2	ECM	DTC P0050, P0056, P0059, P0060, P0155, or P0161
P0068	Throttle Body Airflow Performance	ECM	DTC P0068 or P0121

P0100	Mass Air Flow Sensor Circuit Malfunction	ECM	DTC P0100, P0102, or P0103
P0101	Mass Air Flow Sensor Circuit Range/Performance	ECM	DTC P0101 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Mass Air Flow (MAF) Sensor Performance	ECM	DTC P0101 or P1101 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0102	Mass Air Flow Sensor Voltage Low	ECM	DTC P0100, P0102, or P0103 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Mass Air Flow (MAF) Sensor Circuit Low Frequency	ECM	DTC P0102 or P0103 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0103	Mass Air Flow Sensor Voltage High	ECM	DTC P0100, P0102, or P0103 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Mass Air Flow (MAF) Sensor Circuit High Frequency	ECM	DTC P0102 or P0103 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0106	Manifold Absolute Pressure (MAP) Sensor Performance	ECM	DTC P0106
P0107	Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage	ECM	DTC P0107 or P0108
P0108	Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage	ECM	DTC P0107 or P0108
P0111	Intake Air Temperature Sensor Circuit Range/Performance	ECM	DTC P0111-P0113
P0112	Intake Air Temperature Sensor Circuit Low Voltage	ECM	DTC P0111-P0113 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
			DTC P0112 or P0113 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0113	Intake Air Temperature Sensor Circuit High Voltage	ECM	DTC P0111-P0113 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
			DTC P0112 or P0113 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0115	Engine Coolant Temperature (ECT) Sensor Circuit	TCM	DTC P0115
P0116	Engine Coolant Temperature (ECT) Sensor Performance	ECM	DTC P0116 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0116 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0117	Engine Coolant Temperature (ECT) Sensor Circuit Low Voltage	ECM	DTC P0117 or P0118 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0117 or P0118 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine

P0118	Engine Coolant Temperature (ECT) Sensor Circuit High Voltage	ECM	DTC P0117 or P0118 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0117 or P0118 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0119	Engine Coolant Temperature Sensor Circuit Intermittent	ECM	DTC P0119
P0120	Throttle Position Sensor 1 Circuit	ECM	DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Throttle Position (TP) Sensor Circuit	TCM	DTC P0120
P0121	Throttle Position Sensor 1 Circuit Range/Performance	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Throttle Position (TP) Sensor 1 Performance	ECM	DTC P0068 or P0121 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0122	Throttle Position Sensor 1 Circuit Low Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0123	Throttle Position Sensor 1 Circuit High Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0128	Engine Coolant Temperature Below Thermostat Regulating Temperature	ECM	DTC P0128 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0128 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0130	O2 Sensor Circuit Malfunction Bank 1 Sensor 1	ECM	DTC P0130 or P0150
	O2 Sensor Circuit Low Voltage		DTC P0131 or P0151 for the 2.8L,

P0131	Bank 1 Sensor 1	ECM	3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 1 Sensor 1		DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0132	O2 Sensor Circuit High Voltage Bank 1 Sensor 1	ECM	DTC P0132 or P0152 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit High Voltage Bank 1 Sensor 1		DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0133	O2 Sensor Circuit Slow Response Bank 1 Sensor 1	ECM	DTC P0133 or P0153 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Slow Response Bank 1 Sensor 1		DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0134	HO2S Circuit Insufficient Activity Bank 1 Sensor 1	ECM	DTC P0134 or P0154 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0135	O2 Sensor Heater Circuit Range/Performance Bank 1 Sensor 1	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 1 Sensor 1		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0137	O2 Sensor Circuit Low Voltage Bank 1 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 1 Sensor 2		DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0138	O2 Sensor Circuit High Voltage Bank 1 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit High Voltage Bank 1 Sensor 2	ECM	DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P013A	HO2S Slow Response Rich to Lean Bank 1 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
P013C	HO2S Slow Response Rich to Lean Bank 2 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
P013E	HO2S Delayed Response Rich to Lean Bank 1 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
	O2 Sensor Circuit No Activity Detected Bank 1 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine

P0140	HO2S Circuit Insufficient Activity Bank 1 Sensor 2	ECM	DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0141	O2 Sensor Heater Circuit Range/Performance Bank 1 Sensor 2	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 1 Sensor 2	ECM	DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P014A	HO2S Delayed Response Rich to Lean Bank 2 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
P0150	O2 Sensor Circuit Malfunction Bank 2 Sensor 1	ECM	DTC P0130 or P0150
P0151	O2 Sensor Circuit Low Voltage Bank 2 Sensor 1	ECM	DTC P0131 or P0151 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 2 Sensor 1		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0152	O2 Sensor Circuit High Voltage Bank 2 Sensor 1	ECM	DTC P0132 or P0152 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit High Voltage Bank 2 Sensor 1		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0153	O2 Sensor Circuit Slow Response Bank 2 Sensor 1	ECM	DTC P0133 or P0153 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Slow Response Bank 2 Sensor 1		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0154	HO2S Circuit Insufficient Activity Bank 2 Sensor 1	ECM	DTC P0134 or P0154 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
			DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0155	O2 Sensor Heater Circuit Range/Performance Bank 2 Sensor 1	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 2 Sensor 1		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0157	O2 Sensor Circuit Low Voltage Bank 2 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 2 Sensor 2		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0158	O2 Sensor Circuit High Voltage Bank 2 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine

	HO2S Circuit High Voltage Bank 2 Sensor 2		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0160	O2 Sensor Circuit No Activity Detected Bank 2 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Insufficient Activity Bank 2 Sensor 2		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0161	O2 Sensor Heater Circuit Range/Performance Bank 2 Sensor 2	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 2 Sensor 2	ECM	DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0171	Fuel Trim System Lean Bank 1	ECM	DTC P0171, P0172, P0174, or P0175
P0172	Fuel Trim System Rich Bank 1	ECM	DTC P0171, P0172, P0174, or P0175
P0174	Fuel Trim System Lean Bank 2	ECM	DTC P0171, P0172, P0174, or P0175
P0175	Fuel Trim System Rich Bank 2	ECM	DTC P0171, P0172, P0174, or P0175
P0196	Engine Oil Temperature Sensor Range/Performance	ECM	DTC P0196, P0197, or P0198 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Oil Temperature Sensor Circuit Range/Performance	ECM	DTC P0196, P0197, or P0198 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0197	Engine Oil Temperature Voltage Low	ECM	DTC P0196, P0197, or P0198 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Oil Temperature Sensor Circuit Low Input	ECM	DTC P0196, P0197, or P0198 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0198	Engine Oil Temperature Voltage High	ECM	DTC P0196, P0197, or P0198 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Oil Temperature Sensor Circuit High Input	ECM	DTC P0196, P0197, or P0198 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0201	Injector 1 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
			DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262,

P0202	Injector 2 Control Circuit	ECM	P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0203	Injector 3 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0204	Injector 4 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0205	Injector 5 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
			DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262,

P0206	Injector 6 Control Circuit	ECM	P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0207	Injector 7 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208
P0208	Injector 8 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208
P0218	Transmission Fluid Overtemperature	TCM	• DTC P0218 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0218 for the 5L40-E/5L50-E transmission • DTC P0218 for the 6L50/6L80/6L90 transmission
P0219	Engine Overspeed Condition	ECM	DTC P0219
P0220	Throttle Position Sensor 2 Circuit	ECM	DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135
P0221	Throttle Position Sensor 2 Circuit Range/Performance	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223
P0222	Throttle Position Sensor 2 Circuit Low Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0223	Throttle Position Sensor 2 Circuit High Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0230	Fuel Pump Relay Control Circuit	ECM	DTC P0230
			DTC P0201, P0202, P0203, P0204,

P0261	Injector 1 Control Circuit Low Voltage	ECM	P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0262	Injector 1 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0264	Injector 2 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0265	Injector 2 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0267	Injector 3 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0268	Injector 3 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0270	Injector 4 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0271	Injector 4 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0273	Injector 5 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0274	Injector 5 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
	Injector 6 Control Circuit Low		DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262,

P0276	Voltage	ECM	P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0277	Injector 6 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0300	Engine Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0301	Cylinder 1 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0302	Cylinder 2 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0303	Cylinder 3 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0304	Cylinder 4 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0305	Cylinder 5 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine

P0306	Cylinder 6 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0307	Cylinder 7 Misfire Detected	ECM	DTC P0300-P0308
P0308	Cylinder 8 Misfire Detected	ECM	DTC P0300-P0308
P0315	Crankshaft Position System Variation Not Learned	ECM	DTC P0315
P0324	Knock Sensor Module Performance	ECM	DTC P0324 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0325	Knock Sensor (KS) Circuit Bank 1	ECM	DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333
P0326	Knock Sensor (KS) Performance Bank 1	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Knock Sensor (KS) Performance	ECM	DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0327	Knock Sensor (KS) Circuit Low Voltage Bank 1	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0328	Knock Sensor (KS) Circuit High Voltage Bank 1	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0330	Knock Sensor (KS) Circuit	ECM	DTC P0324, P0325, P0326, P0327,

	Bank 2		P0328, P0330, P0332, or P0333
P0331	Knock Sensor (KS) System Performance Bank 2	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333
P0332	Knock Sensor (KS) Circuit Low Voltage Bank 2	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0333	Knock Sensor (KS) Circuit High Voltage Bank 2	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0335	Crankshaft Position Sensor Circuit Malfunction	ECM	DTC P0335, P0336, or P0338 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Crankshaft Position (CKP) Sensor Circuit		DTC P0335 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0336	Crankshaft Position Sensor Signal Range/Performance	ECM	DTC P0335, P0336, or P0338 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Crankshaft Position (CKP) Sensor Performance		DTC P0336 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0338	Crankshaft Position Sensor Circuit High Duty Cycle	ECM	DTC P0335, P0336, or P0338 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
P0340	Camshaft Position (CMP) Sensor Circuit	ECM	DTC P0340
P0341	Intake Camshaft Position Sensor Range/Performance Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Camshaft Position (CMP) Sensor Performance	ECM	DTC P0341 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0342	Intake Camshaft Position Sensor Low Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0343	Intake Camshaft Position Sensor High Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0346	Intake Camshaft Position Sensor Range/Performance	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367,

	Bank 2		P0368, P0391, P0392, or P0393
P0347	Intake Camshaft Position Sensor Low Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0348	Intake Camshaft Position Sensor High Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0351	Ignition Coil Cylinder 1 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0352	Ignition Coil Cylinder 2 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0353	Ignition Coil Cylinder 3 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0354	Ignition Coil Cylinder 4 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
			DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L,

P0355	Ignition Coil Cylinder 5 Control Circuit	ECM	3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0356	Ignition Coil Cylinder 6 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0357	Ignition Coil Cylinder 7 Control Circuit	ECM	DTC P0351-P0358
P0358	Ignition Coil Cylinder 8 Control Circuit	ECM	DTC P0351-P0358
P0366	Exhaust Camshaft Position Sensor Range/Performance Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0367	Exhaust Camshaft Position Sensor Low Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0368	Exhaust Camshaft Position Sensor High Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0391	Exhaust Camshaft Position Sensor Range/Performance Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0392	Exhaust Camshaft Position Sensor Low Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0393	Exhaust Camshaft Position Sensor High Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0420	Catalyst System Low EfficiencyBank 1	ECM	DTC P0420 or P0430 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0420 or P0430 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0430	Catalyst System Low Efficiency Bank 2	ECM	DTC P0420 or P0430 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or

			DTC P0420 or P0430 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0443	Evaporative Emission Control System Purge Solenoid Circuit Malfunction	ECM	DTC P0443, P0458, or P0459 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0443 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0458	Evaporative Emission Control System Purge Solenoid Circuit Low Voltage	ECM	DTC P0443, P0458, or P0459
P0459	Evaporative Emission Control System Purge Solenoid Circuit High Voltage	ECM	DTC P0443, P0458, or P0459
P0461	Fuel Level Sensor 1 Performance	ECM	DTC P0461
P0462	Fuel Level Sensor 1 Circuit Low Voltage	ECM	DTC P0462
P0463	Fuel Level Sensor 1 Circuit HighVoltage	ECM	DTC P0463
P0480	Cooling Fan Relay 1 Control Circuit	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0480 or P0481 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0481	Cooling Fan Relay 2 Control Circuit	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0480 or P0481 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0500	Vehicle Speed Sensor Circuit Malfunction	ECM	DTC P0500
P0501	Vehicle Speed Sensor (VSS) Performance	ECM	DTC P0501 or P0502
P0502	Vehicle Speed Sensor (VSS) Circuit Low Voltage	ECM	DTC P0501 or P0502 for the Aisin AY6 transmission or DTC P0502 or P0503 for the Tremec 6-Speed transmission
P0503	Vehicle Speed Sensor (VSS)	ECM	DTC P0502 or P0503

	Circuit Intermittent		
P0506	Idle Speed Low	ECM	DTC P0506, P0507, or P050A for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0506 or P0507 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0507	Idle Speed High	ECM	DTC P0506, P0507, or P050A for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0506 or P0507 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P050A	Cold Start Idle Air Control (IAC) System Performance	ECM	DTC P0506, P0507, or P050A
P0521	Engine Oil Pressure (EOP) Sensor Performance	ECM	DTC P0521, P0522, or P0523
P0522	Engine Oil Pressure (EOP) Sensor Circuit Low Voltage	ECM	DTC P0521, P0522, or P0523
P0523	Engine Oil Pressure (EOP) Sensor Circuit High Voltage	ECM	DTC P0521, P0522, or P0523
P0532	Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit	ECM	DTC P0532 or P0533
P0533	Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit Low Voltage	ECM	DTC P0532 or P0533
P0560	System Voltage Malfunction	ECM	DTC P0560
P0562	System Voltage Low	ECM	DTC P0562
		TCM	• DTC P0562 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0562 for the 5L40-E/5L50-E transmission • DTC P0562 or P0563 for the 6L50/6L80/6L90 transmission
P0563	System Voltage High	ECM	DTC P0563
		TCM	• DTC P0563 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0563 for the 5L40-E/5L50-E transmission • DTC P0562 or P0563 for the 6L50/6L80/6L90 transmission
P0571	Cruise Control Brake Switch Circuit	ECM	DTC P0571
	Brake Switch Circuit 1 Low		

P0572	Voltage	ECM	DTC P0572
P0573	Brake Switch Circuit 1 High Voltage	ECM	DTC P0573
P0575	Cruise Control Enable Circuit Malfunction	ECM	DTC P0575
P0601	Control Module Read Only Memory (ROM) Error	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Read Only Memory (ROM)	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0601 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0602	Control Module Not Programmed	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Not Programmed	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0602 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
	Control Module Long Term Memory Reset	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or

			P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0603	Transmission Control Module (TCM) Long Term Memory Reset	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0603 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0604	Control Module Random Access Memory (RAM)	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Random Access Memory (RAM)	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0604 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0606	Control Module Internal Performance	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0607	Control Module Performance	ECM	DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610
P060D	Control Module Accelerator Pedal Position (APP) System Performance	ECM	DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610
P0615	Starter Relay Circuit Malfunction	ECM	DTC P0615
P0616	Starter Relay Control Circuit Low Voltage	ECM	DTC P0616 or P0617
	Starter Relay Control Circuit		

P0617	High Voltage	ECM	DTC P0616 or P0617
P0621	Alternator L-Terminal Circuit Malfunction	ECM	DTC P0621
P0622	Generator F-Terminal Circuit	ECM	DTC P0622
P0625	Generator F-Terminal Low Voltage	ECM	DTC P0625 or P0626
P0626	Generator F-Terminal High Voltage	ECM	DTC P0625 or P0626
P0627	Fuel Pump Relay Control Circuit	ECM	DTC P0627, P0628, or P0629
P0628	Fuel Pump Relay Control Circuit Low Voltage	ECM	DTC P0627, P0628, or P0629
P0629	Fuel Pump Relay Control Circuit High Voltage	ECM	DTC P0627, P0628, or P0629
P062F	Control Module Long Term Memory Performance	ECM	DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Long Term Memory Performance	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P062F for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0633	Theft Deterrent Key Not Programmed	ECM	DTC P0633
P0634	Transmission Control Module (TCM) Overtemperature	TCM	DTC P0634
P0638	Commanded versus Actual Throttle Position Correlation	ECM	DTC P0638, P2100, P2101, or P2119
P0641	5-Volt Reference 1 Circuit	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	5V Reference Circuit 1 Malfunction		DTC P0641 or P0651 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0642	5-Volt Reference 1 Circuit Low Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0643	5-Volt Reference 1 Circuit High Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0650	Malfunction Indicator (MI) Circuit Malfunction	ECM	DTC P0650 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0650 for the 4.8L, 5.3L, 6.0L,

			6.2L, or 7.0L engine
P0651	5-Volt Reference 2 Circuit	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	5V Reference Circuit 2 Malfunction	ECM	DTC P0641 or P0651 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0652	5-Volt Reference 2 Circuit Low Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0653	5-Volt Reference 2 Circuit High Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0658	Solenoid High Control Circuit Group 1 Low Voltage	TCM	DTC P0658 or P0659 for the 5L40-E/5L50-E transmission or DTC P0658 or P0659 for the 6L50/6L80/6L90 transmission
P0659	Solenoid High Control Circuit Group 1 High Voltage	TCM	DTC P0658 or P0659 for the 5L40-E/5L50-E transmission or DTC P0658 or P0659 for the 6L50/6L80/6L90 transmission
P0660	Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit	ECM	DTC P0660, P0661, or P0662
P0661	Intake Manifold Tuning (IMT) Solenoid Control Circuit Low Voltage	ECM	DTC P0660, P0661, or P0662
P0662	Intake Manifold Tuning (IMT) Solenoid Control Circuit High Voltage	ECM	DTC P0660, P0661, or P0662
P0667	Transmission Control Module (TCM) Temperature Sensor Performance	TCM	DTC P0667, P0668, or P0669
P0668	Transmission Control Module (TCM) Temperature Sensor Circuit Low Voltage	TCM	DTC P0667, P0668, or P0669
P0669	Transmission Control Module (TCM) Temperature Sensor Circuit High Voltage	TCM	DTC P0667, P0668, or P0669
P0685	Engine Control Ignition Relay Circuit Malfunction	ECM	DTC P0685, P0686, P0687, P0689, or P0690 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Controls Ignition Relay Control Circuit	ECM	DTC P0685, P0689, or P0690 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0686	Engine Control Ignition Relay Circuit Low Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690

P0687	Engine Control Ignition Relay Circuit High Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690
P0689	Engine Control Ignition Relay Feedback Circuit Low Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Controls Relay Feedback Circuit Low Voltage		DTC P0685, P0689, or P0690 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0690	Engine Control Ignition Relay Feedback Circuit High Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Controls Relay Feedback Circuit High Voltage		DTC P0685, P0689, or P0690 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0691	Cooling Fan Relay 1 Control Circuit Low Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0692	Cooling Fan Relay 2 Control Circuit High Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0693	Cooling Fan Relay 2 Control Circuit Low Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0694	Cooling Fan Relay 1 Control Circuit High Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0697	5-Volt Reference 3 Circuit	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0698	5-Volt Reference 3 Circuit Low Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0699	5-Volt Reference 3 Circuit High Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P06AC	Transmission Control Module (TCM) Power Up Temperature Sensor Performance	TCM	DTC P06AC, P06AD, or P06AE
P06AD	Transmission Control Module (TCM) Power Up Temperature Sensor Circuit Low Voltage	TCM	DTC P06AC, P06AD, or P06AE
P06AE	Transmission Control Module (TCM) Power Up Temperature Sensor Circuit High Voltage	TCM	DTC P06AC, P06AD, or P06AE
P0700	Transmission Control Module (TCM) Requested MIL Illumination	ECM	DTC P0700 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0700 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0703	Torque Converter / Brake Switch Circuit Malfunction	ECM	DTC P0703
P0704	Clutch Switch Circuit	ECM	DTC P0704
			• DTC P0711 for the 4L60-

P0711	Transmission Fluid Temperature (TFT) Sensor Performance	TCM	E/4L65-E/4L70-E transmission • DTC P0711 for the 5L40-E/5L50-E transmission • DTC P0711, P0712, or P0713 for the 6L50/6L80/6L90 transmission
P0712	Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage	ECM	DTC P0712 or P0713 for the Tremec 6-Speed transmission
		TCM	• DTC P0712 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0712 for the 5L40-E/5L50-E transmission • DTC P0711, P0712, or P0713 for the 6L50/6L80/6L90 transmission
P0713	Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage	ECM	DTC P0712 or P0713 for the Tremec 6-Speed transmission
		TCM	• DTC P0713 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0713 for the 5L40-E/5L50-E transmission • DTC P0711, P0712, or P0713 for the 6L50/6L80/6L90 transmission
P0716	Input Speed Sensor Performance	TCM	• DTC P0716 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0716 for the 5L40-E/5L50-E transmission • DTC P0716 or P0717 for the 6L50/6L80/6L90 transmission
P0717	Input Speed Sensor Circuit Low Voltage	TCM	• DTC P0717 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0717 for the 5L40-E/5L50-E transmission • DTC P0716 or P0717 for the 6L50/6L80/6L90 transmission
P0719	Brake Switch Circuit Low Voltage	TCM	DTC P0719
P0722	Output Speed Sensor Circuit Low Voltage	TCM	• DTC P0722 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0722 for the 5L40-E/5L50-E transmission • DTC P0722 or P0723 for the 6L50/6L80/6L90 transmission
			• DTC P0723 for the 4L60-

P0723	Output Speed Sensor Circuit Intermittent	TCM	E/4L65-E/4L70-E transmission • DTC P0723 for the 5L40-E/5L50-E transmission • DTC P0722 or P0723 for the 6L50/6L80/6L90 transmission
P0724	Brake Switch Circuit High Voltage	TCM	DTC P0724
P0727	Engine Speed No Signal	TCM	DTC P0727
P0741	Torque Converter Clutch (TCC) System - Stuck Off	TCM	• DTC P0741 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0741 for the 5L40-E/5L50-E transmission • DTC P0741 or P0742 for the 6L50/6L80/6L90 transmission
P0742	Torque Converter Clutch (TCC) System - Stuck On	TCM	• DTC P0742 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0742 for the 5L40-E/5L50-E transmission • DTC P0741 or P0742 for the 6L50/6L80/6L90 transmission
P0748	Pressure Control (PC) Solenoid Control Circuit	TCM	DTC P0748
P0751	1-2 Shift Solenoid (SS) Valve Performance - No First, Fourth or Fifth Gear	TCM	DTC P0751 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0751 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Valve Performance - Stuck Off		DTC P0751 for the 6L50/6L80/6L90 transmission
P0752	1-2 Shift Solenoid (SS) Valve Performance - No Second or Third Gear	TCM	DTC P0752 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0752 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Valve Performance - Stuck On		DTC P0752 for the 6L50/6L80/6L90 transmission
P0756	2-3 Shift Solenoid (SS) Valve Performance - No First or Second Gear	TCM	DTC P0756 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0756 for the 5L40-E/5L50-E transmission

	Shift Solenoid (SS) 2 Valve Performance - Stuck Off		DTC P0756 for the 6L50/6L80/6L90 transmission
P0757	2-3 Shift Solenoid (SS) Valve Performance - No Third, Fourth or Fifth Gear	TCM	DTC P0757 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0757 for the 5L40-E/5L50-E transmission
P0761	4-5 Shift Solenoid (SS) Valve Performance - No Fourth Gear	TCM	DTC P0761
P0762	4-5 Shift Solenoid (SS) Valve Performance - No Fifth Gear	TCM	DTC P0762
P0776	Clutch Pressure Control (PC) Solenoid 2 - Stuck Off	TCM	DTC P0776 or P0777
P0777	Clutch Pressure Control (PC) Solenoid 2 - Stuck On	TCM	DTC P0776 or P0777
P0787	3-2 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0787
P0788	3-2 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0788
P0796	Clutch Pressure Control (PC) Solenoid 3 - Stuck Off	TCM	DTC P0796 or P0797
P0797	Clutch Pressure Control (PC) Solenoid 3 - Stuck On	TCM	DTC P0796 or P0797
P0801	Reverse Lockout Solenoid Control Circuit	ECM	DTC P0801
P0803	Skip Shift Solenoid Control Circuit	ECM	DTC P0803
P0806	Clutch Pedal Position (CPP) Sensor Circuit Performance	ECM	DTC P0806 for the Aisin AY6 transmission or DTC P0806 for the Tremec 6-Speed transmission
P0807	Clutch Pedal Position (CPP) Sensor Circuit Low Voltage	ECM	DTC P0807 or P0808 for the Aisin AY6 transmission or DTC P0807 or P0808 for the Tremec 6-Speed transmission
P0808	Clutch Pedal Position (CPP) Sensor Circuit High Voltage	ECM	DTC P0807 or P0808 for the Aisin AY6 transmission or DTC P0807 or P0808 for the Tremec

			6-Speed transmission
P080A	Clutch Pedal Position (CPP) Sensor Circuit High Voltage	ECM	DTC P080A for the Aisin AY6 transmission or DTC P080A for the Tremec 6-Speed transmission
P0815	Upshift Switch Circuit	TCM	DTC P0815, P0816, or P0826 for the 5L40-E/5L50-E transmission or DTC P0815, P0816, or P0826 for the 6L50/6L80/6L90 transmission
P0816	Downshift Switch Circuit	TCM	DTC P0815, P0816, or P0826 for the 5L40-E/5L50-E transmission or DTC P0815, P0816, or P0826 for the 6L50/6L80/6L90 transmission
P0826	Up and Down Shift Switch Circuit	TCM	DTC P0815, P0816, or P0826 for the 5L40-E/5L50-E transmission or DTC P0815, P0816, or P0826 for the 6L50/6L80/6L90 transmission
P0842	Transmission Fluid Pressure (TFP) Switch 1 Circuit Low Voltage	TCM	DTC P0842 or P0843
P0843	Transmission Fluid Pressure (TFP) Switch 1 Circuit High Voltage	TCM	DTC P0842 or P0843
P0850	Park/Neutral Position (PNP) Switch Circuit	TCM	DTC P0850 for the 5L40-E/5L50-E transmission or DTC P0850-P0852 for the 6L50/6L80/6L90 transmission
P0851	Park/Neutral Position (PNP) Switch Circuit Low Voltage	ECM	DTC P0850-P0852 for the 6L50/6L80/6L90 transmission
P0852	Park/Neutral Position (PNP) Switch Circuit High Voltage	ECM	DTC P0850-P0852 for the 6L50/6L80/6L90 transmission
P0856	Engine Control Module (ECM) Traction Control Torque Request Circuit	ECM	DTC P0856

P0872	Transmission Fluid Pressure (TFP) Switch 3 Circuit Low Voltage	TCM	DTC P0872 or P0873
P0873	Transmission Fluid Pressure (TFP) Switch 3 Circuit High Voltage	TCM	DTC P0872 or P0873
P0877	Transmission Fluid Pressure (TFP) Switch 4 Circuit Low Voltage	TCM	DTC P0877 or P0878
P0878	Transmission Fluid Pressure (TFP) Switch 4 Circuit High Voltage	TCM	DTC P0877 or P0878
P0897	Transmission Fluid Life	TCM	DTC P0897
P0961	Line Pressure Control (PC) Solenoid System Performance	TCM	DTC P0961 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0961-P0963 for the 6L50/6L80/6L90 transmission
P0962	Line Pressure Control (PC) Solenoid Control Circuit Low Voltage	TCM	DTC P0961-P0963
P0963	Line Pressure Control (PC) Solenoid Control Circuit High Voltage	TCM	DTC P0961-P0963
P0965	Clutch Pressure Control (PC) Solenoid 2 System Performance	TCM	DTC P0965-P0967
P0966	Clutch Pressure Control (PC) Solenoid 2 Control Circuit Low Voltage	TCM	DTC P0965-P0967
P0967	Clutch Pressure Control (PC) Solenoid 2 Control Circuit High Voltage	TCM	DTC P0965-P0967
P0969	Clutch Pressure Control (PC) Solenoid 3 System Performance	TCM	DTC P0969-P0971
P0970	Clutch Pressure Control (PC) Solenoid 3 Control Circuit Low Voltage	TCM	DTC P0969-P0971
P0971	Clutch Pressure Control (PC) Solenoid 3 Control Circuit High Voltage	TCM	DTC P0969-P0971
P0973	1-2 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0973 for the 4L60-E/4L65-E/4L70-E transmission or

			DTC P0973 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Control Circuit Low Voltage		DTC P0973 or P0974 for the 6L50/6L80/6L90 transmission
P0974	1-2 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0974 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0974 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Control Circuit High Voltage		DTC P0973 or P0974 for the 6L50/6L80/6L90 transmission
P0976	2-3 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0976 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0976 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 2 Control Circuit Low Voltage		DTC P0976 or P0977 for the 6L50/6L80/6L90 transmission
P0977	2-3 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0977 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0977 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 2 Control Circuit High Voltage		DTC P0976 or P0977 for the 6L50/6L80/6L90 transmission
P0979	4-5 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0979
P0980	4-5 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0980
P0989	Transmission Fluid Pressure (TFP) Switch 5 Circuit Low Voltage	TCM	DTC P0989 or P0990
P0990	Transmission Fluid Pressure (TFP) Switch 5 Circuit High Voltage	TCM	DTC P0989 or P0990
P1011	Intake Camshaft Actuator Park Position Bank 1	ECM	DTC P1011-P1014
P1012	Exhaust Camshaft Actuator Park Position Bank 1	ECM	DTC P1011-P1014
P1013	Intake Camshaft Actuator Park Position Bank 2	ECM	DTC P1011-P1014
P1014	Exhaust Camshaft Actuator Park Position Bank 2	ECM	DTC P1011-P1014

P1101	Intake Air Flow System Performance	ECM	DTC P0101 or P1101
P1133	HO2S Insufficient Switching Bank 1 Sensor 1	ECM	DTC P0133, P0134, P0140, P1133, P2270, or P2271
P1153	HO2S Insufficient Switching Bank 2 Sensor 1	ECM	DTC P0153, P0154, P0160, P1153, P2272, or P2273
P1174	Fuel Trim Cylinder Balance Bank 1	ECM	DTC P1174 or P1175
P1175	Fuel Trim Cylinder Balance Bank 2	ECM	DTC P1174 or P1175
P1258	Engine Coolant Over Temperature - Protection Mode Active	ECM	DTC P1258
P1380	Misfire Detected - Rough Road Data Not Available	ECM	DTC P1380 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P1380 or P1381 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P1381	Misfire Detected - No Communication with Brake Control Module	ECM	DTC P1380 or P1381
P1400	Cold Start Emission Reduction Control System	ECM	DTC P1400
P1516	Throttle Actuator Control (TAC) Module Throttle Actuator Position Performance	ECM	DTC P1516, P2101, P2119, or P2176
P1551	Throttle Control Lower Position not Reached during Learning Mode	ECM	DTC P1551
P1631	Theft Deterrent Fuel Enable Signal Not Correct	ECM	DTC P1631
P1668	Generator L-Terminal Control Circuit	ECM	DTC P1668, P2500, or P2501
P167D	Control Module Ignition Coil Internal Circuit	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610
P1682	Ignition 1 Switch Circuit 2	ECM	DTC P1682
P1751	Shift Valve 1 Performance	TCM	DTC P1751
P1761	Up and Down Shift Switch Signal Circuit	TCM	DTC P1761
P1793	Wheel Speed Signal	TCM	DTC P1793
P1810	Transmission Fluid Pressure (TFP) Position Switch Circuit	TCM	DTC P1810
P1815	Transmission Fluid Pressure (TFP) Valve Position Switch -	TCM	DTC P1815 for the 4L60-E/4L65-E/4L70-E transmission or

	Start in Wrong Range		DTC P1815 for the 5L40-E/5L50-E transmission
P1816	Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Park/Neutral (P/N) with Drive Ratio	TCM	DTC P1816
P1818	Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Drive without Drive Ratio	TCM	DTC P1818
P1820	Internal Mode Switch A Circuit Low Voltage	TCM	DTC P1820
P1822	Internal Mode Switch B Circuit High Voltage	TCM	DTC P1822
P1823	Internal Mode Switch P Circuit Low Voltage	TCM	DTC P1823
P1825	Internal Mode Switch - Invalid Range	TCM	DTC P1825 or P1915
P1826	Internal Mode Switch C Circuit High Voltage	TCM	DTC P1826
P182E	Internal Mode Switch - Invalid Range	TCM	DTC P182E or P1915
P1831	Pressure Control (PC)/Shift Lock Solenoid Control Circuit Low Voltage	TCM	DTC P1831 for the 5L40-E/5L50-E transmission
P1832	Pressure Control (PC)/Shift Lock Solenoid Control Circuit High Voltage	TCM	DTC P1832 for the 5L40-E/5L50-E transmission
P1833	Torque Converter Clutch (TCC)/Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P1833
P1834	Torque Converter Clutch (TCC)/Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P1834
P1876	Up and Down Shift Switch Performance - Range Switch Not in D3	TCM	DTC P1876 for the 5L40-E/5L50-E transmission or DTC P1876 for the 6L50/6L80/6L90 transmission
P1915	Internal Mode Switch Does Not Indicate Park/Neutral (P/N) During Start	TCM	DTC P1825 or P1915 for the 5L40-E/5L50-E transmission
	Internal Mode Switch Start/Wrong Range		DTC P182E or P1915 for the 6L50/6L80/6L90 transmission
P2066	Fuel Level Sensor 2 Performance	ECM	DTC P2066

P2067	Fuel Level Sensor 2 Low Voltage	ECM	DTC P2067
P2068	Fuel Level Sensor 2 High Voltage	ECM	DTC P2068
P2072	Throttle Actuator Control System - Ice Blockage	ECM	DTC P2072
P2088	Intake Camshaft Position Control Solenoid Circuit Low Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2089	Intake Camshaft Position Control Solenoid Circuit High Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2090	Exhaust Camshaft Position Control Solenoid Circuit Low Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2091	Exhaust Camshaft Position Control Solenoid Circuit High Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2092	Intake Camshaft Position Control Solenoid Circuit Low Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2093	Intake Camshaft Position Control Solenoid Circuit High Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2094	Exhaust Camshaft Position Control Solenoid Circuit Low Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2095	Exhaust Camshaft Position Control Solenoid Circuit High Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2096	Post Catalyst O2 Sensor Fuel Trim Below Lower Limit Bank 1	ECM	DTC P2096 or P2098
P2097	Post Catalyst O2 Sensor Fuel Trim Above Upper Limit Bank 1	ECM	DTC P2097 or P2099
P2098	Post Catalyst O2 Sensor Fuel Trim Below Lower Limit Bank 2	ECM	DTC P2096 or P2098
P2099	Post Catalyst O2 Sensor Fuel Trim Above Upper Limit Bank 2	ECM	DTC P2097 or P2099
P2100	Throttle Control Motor Malfunction	ECM	DTC P0638, P2100, P2101, or P2119
P2101	Throttle Control Position Range/Performance	ECM	DTC P0638, P2100, P2101, or P2119 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Throttle Actuator Position Performance		DTC P1516, P2101, P2119, or P2176 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2105	Throttle Control Forced Engine Shutdown	ECM	DTC P2105

P2119	Closed Throttle Position Range/Performance	ECM	DTC P0638, P2100, P2101, or P2119 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Throttle Closed Position Performance		DTC P1516, P2101, P2119, or P2176 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2120	Accelerator Pedal Position Sensor 1 Circuit	ECM	DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138
P2122	Accelerator Pedal Position Sensor 1 Low Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2123	Accelerator Pedal Position Sensor 1 High Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2125	Accelerator Pedal Position Sensor 2 Circuit	ECM	DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138
P2127	Accelerator Pedal Position Sensor 2Low Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2128	Accelerator Pedal Position Sensor 2 High Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Throttle Position Sensor 1-2		DTC P0120, P0122, P0123, P0220,

P2135	Correlation	ECM	P0222, P0223, or P2135
P2138	Accelerator Pedal Position Sensor 1-2 Correlation	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2176	Throttle Actuator Control Lower Position Not Learned	ECM	DTC P2176 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Minimum Throttle Position Not Learned		DTC P1516, P2101, P2119, or P2176 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2177	Fuel Trim Lean during Cruising/Acceleration Bank 1	ECM	DTC P2177, P2179, P2187, or P2189
P2178	Fuel Trim Rich during Cruising/Acceleration Bank 1	ECM	DTC P2178, P2180, P2188, or P2190
P2179	Fuel Trim Lean during Cruising/Acceleration Bank 2	ECM	DTC P2177, P2179, P2187, or P2189
P2180	Fuel Trim Rich during Cruising/Acceleration Bank 2	ECM	DTC P2178, P2180, P2188, or P2190
P2187	Fuel Trim Lean during Idling/Deceleration Bank 1	ECM	DTC P2177, P2179, P2187, or P2189
P2188	Fuel Trim Rich during Idling/Deceleration Bank 1	ECM	DTC P2178, P2180, P2188, or P2190
P2189	Fuel Trim Lean during Idling/Deceleration Bank 2	ECM	DTC P2177, P2179, P2187, or P2189
P2190	Fuel Trim Rich during Idling/Deceleration Bank 2	ECM	DTC P2178, P2180, P2188, or P2190
P2227	Barometric Pressure Sensor Range/Performance	ECM	DTC P2227, P2228, or P2229
P2228	Barometric Pressure Sensor Voltage Low	ECM	DTC P2227, P2228, or P2229
P2229	Barometric Pressure Sensor Voltage High	ECM	DTC P2227, P2228, or P2229
P2232	HO2S Signal Circuit Shorted to Heater Circuit Bank 1 Sensor 2	ECM	DTC P2232 or P2235
P2235	HO2S Signal Circuit Shorted to Heater Circuit Bank 2 Sensor 2	ECM	DTC P2232 or P2235
P2270	O2 Sensor Lean/Rich Switch Signal Malfunction Bank 1 Sensor 2	ECM	DTC P2270 or P2272 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Lean Bank 1 Sensor 2		DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine

P2271	O2 Sensor Rich/Lean Switch Signal Malfunction Bank 1 Sensor 2	ECM	DTC P2271 or P2273 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Rich Bank 1 Sensor 2		DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2272	O2 Sensor Lean/Rich Switch Signal Malfunction Bank 2 Sensor 2	ECM	DTC P2270 or P2272 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Lean Bank 2 Sensor 2		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2273	O2 Sensor Rich/Lean Switch Signal Malfunction Bank 2 Sensor 2	ECM	DTC P2271 or P2273 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Rich Bank 2 Sensor 2		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2300	Ignition Coil Cylinder 1 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2301	Ignition Coil Cylinder 1 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2303	Ignition Coil Cylinder 2 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2304	Ignition Coil Cylinder 2 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2306	Ignition Coil Cylinder 3 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2307	Ignition Coil Cylinder 3 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2309	Ignition Coil Cylinder 4 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2310	Ignition Coil Cylinder 4 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316

P2312	Ignition Coil Cylinder 5 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2313	Ignition Coil Cylinder 5 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2315	Ignition Coil Cylinder 6 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2316	Ignition Coil Cylinder 6 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2500	Generator L-Terminal Circuit Low Voltage	ECM	DTC P1668, P2500, or P2501
P2501	Generator L-Terminal Circuit High Voltage	ECM	DTC P1668, P2500, or P2501
P250A	Engine Oil Level Sensor Circuit	ECM	DTC P250A
P2534	Ignition 1 Switch Circuit Low Voltage	TCM	• DTC P2534 for the 4L60-E/4L65-E/4L70-E transmission • DTC P2534 for the 5L40-E/5L50-E transmission • DTC P2534 for the 6L50/6L80/6L90 transmission
P2544	Transmission Torque Request Circuit	ECM	DTC P2544 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2544 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
		TCM	DTC P2544 for the 5L40-E/5L50-E transmission
P2610	Control Module Ignition Off Timer Performance	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2636	Fuel Transfer Pump Flow Insufficient	ECM	DTC P2636
	Transmission Torque Delivered		

P2637	Circuit	TCM	DTC P2637
P2670	Solenoid High Control Circuit Group 2 Low Voltage	TCM	DTC P2670 or P2671
P2671	Solenoid High Control Circuit Group 2 High Voltage	TCM	DTC P2670 or P2671
P2714	Clutch Pressure Control (PC) Solenoid 4 - Stuck Off	TCM	DTC P2714 or P2715
P2715	Clutch Pressure Control (PC) Solenoid 4 - Stuck On	TCM	DTC P2714 or P2715
P2719	Clutch Pressure Control (PC) Solenoid 4 System Performance	TCM	DTC P2719-P2721
P2720	Clutch Pressure Control (PC) Solenoid 4 Control Circuit Low Voltage	TCM	DTC P2719-P2721
P2721	Clutch Pressure Control (PC) Solenoid 4 Control Circuit High Voltage	TCM	DTC P2719-P2721
P2723	Clutch Pressure Control (PC) Solenoid 5 - Stuck Off	TCM	DTC P2723 or P2724
P2724	Clutch Pressure Control (PC) Solenoid 5 - Stuck On	TCM	DTC P2723 or P2724
P2728	Clutch Pressure Control (PC) Solenoid 5 System Performance	TCM	DTC P2728-P2730
P2729	Clutch Pressure Control (PC) Solenoid 5 Control Circuit Low Voltage	TCM	DTC P2728-P2730
P2730	Clutch Pressure Control (PC) Solenoid 5 Control Circuit High Voltage	TCM	DTC P2728-P2730
P2762	Torque Converter Clutch (TCC) Pressure Control Solenoid System Performance	TCM	DTC P2762, P2763, or P2764
P2763	Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit High Voltage	TCM	DTC P2763 for the 4L60-E/4L65-E/4L70-E transmission or DTC P2763 for the 5L40-E/5L50-E transmission
	Torque Converter Clutch (TCC) Pressure Control Solenoid Control Circuit Low Voltage		DTC P2762, P2763, or P2764 for the 6L50/6L80/6L90 transmission
	Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit Low Voltage		DTC P2764 for the 4L60-E/4L65-E/4L70-E transmission or

P2764		TCM	DTC P2764 for the 5L40-E/5L50-E transmission
	Torque Converter Clutch (TCC) Pressure Control Solenoid Control Circuit High Voltage		DTC P2762, P2763, or P2764 for the 6L50/6L80/6L90 transmission
P2769	Torque Converter Clutch (TCC) Enable Solenoid Control Circuit Low Voltage	TCM	DTC P2769
P2770	Torque Converter Clutch (TCC) Enable Solenoid Control Circuit High Voltage	TCM	DTC P2770
P3400	Cylinder Deactivation System Performance	ECM	DTC P3400
P3401	Cylinder 1 Deactivation Solenoid Control Circuit	ECM	DTC P3401, P3425, P3441, or P3449
P3425	Cylinder 4 Deactivation Solenoid Control Circuit	ECM	DTC P3401, P3425, P3441, or P3449
P3441	Cylinder 6 Deactivation Solenoid Control Circuit	ECM	DTC P3401, P3425, P3441, or P3449
P3449	Cylinder 7 Deactivation Solenoid Control Circuit	ECM	DTC P3401, P3425, P3441, or P3449
U0073	High Speed Communication Bus	--	DTC U0073
U0100 - U0249	CAN-Bus No Communication with XXX Control Module	--	DTC U0100-U0249
U1304	CAN-Bus No Communication with SIM (Seat Interface Module)	SIM	DTC U1304
U1401	No Communication with MSM (Memory Seat and Mirror Module)	SIM	DTC U1401
	Lost Communications Between AD and ADG	NIM	DTC U1401
U1814	Powertrain High Speed Communication Enable Circuit	BCM	DTC U1814
U2099	High Speed Communication Enable Circuit	BCM	DTC U2099
U2100	CAN-Bus Circuit Malfunction	--	DTC U2100
U2121	No Communication with Radio Display	Radio	DTC U2121
U2136	No Exterior Mirror Communication	MSM	DTC U2136
U2201	No Communication With DVD Player	RSE	DTC U2201
U2202	No Communication With Rear Control Panel	RSE	DTC U2202

U2203	No Communication With Screen 1	RSE	DTC U2203 or U2204
U2204	No Communication With Screen 2	RSE	DTC U2203 or U2204

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Emissions Related DTCs

Action Taken When the DTC Sets - Type A

- The control module illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Freeze Frame/Failure Records.

Action Taken When the DTC Sets - Type B

- The control module illuminates the MIL on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.
- The following applies to misfire DTCs:
  - If the control module detects a low level or an emission level misfire condition during 2 consecutive trips, the control module illuminates the MIL.
  - If the control module detects a high level or catalyst damaging misfire, the control module flashes the MIL at a rate of once per second.
  - If the control module detects a misfire during 2 non-consecutive trips, the stored conditions are compared with the current conditions. The control module illuminates the MIL when the following conditions occur:
    - The engine load is within 20 percent of the previous test that failed.
    - The engine speed is within 375 RPM of the previous test that failed.
    - The engine coolant temperature is in the same range of the previous test that failed.
- The following applies to fuel trim DTCs:
  - If the control module detects a fuel trim condition during 2 consecutive trips, the control module illuminates the MIL.
  - If the control module detects a fuel trim condition during 2 non-consecutive trips, the stored conditions are compared with the current conditions. The control module illuminates the MIL when the following conditions occur:
    - The engine load is within 20 percent of the previous test that failed.
    - The engine speed is within 375 RPM of the previous test that failed.
    - The engine coolant temperature is in the same range of the previous test that failed.

Conditions for Clearing the MIL/DTC - Type A or Type B

- The control module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Clear the MIL and the DTC with a scan tool.

Non-Emissions Related DTCs

Action Taken When the DTC Sets - Type C

- The control module stores the DTC information into memory when the diagnostic runs and fails.
- The MIL will not illuminate.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Failure Records.
- The driver information center, if equipped, may display a message.

Conditions for Clearing the DTC - Type C

- A current DTC Last Test Failed clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- Clear the DTC with a scan tool.

Action Taken When the DTC Sets - Type D

- The control module will take default actions but no DTC will be stored in Failure Records.
- The MIL or SVS will not illuminate.

Conditions for Clearing the DTC - Type D

Clear the DTC with a scan tool.

Diagnostic System Check - Vehicle

Diagnostic Instructions

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Continue through the Diagnostic System Check until you are directed to follow a particular diagnostic or repair procedure. Once a repair has been completed, perform the Diagnostic Repair Verification and verify the customer concern has been corrected.

The diagnostic procedures within this manual are developed on the assumption that the following areas function as designed:

- The 12V battery is fully charged and cables are clean and tight. Refer to Battery Inspection/Test.
- Fuses are not open. Refer to Power Distribution Schematics and Electrical Center Identification Views.
- Ground circuits for the area of customer concern are clean, tight, and in the correct location. Refer to Ground Distribution Schematics and Harness Routing Views.
- All connections/connectors for the area of concern are fully seated. Refer to Component Connector End Views.
- There are no aftermarket devices that affect the operation of the system. Refer to Checking Aftermarket Accessories.
- The scan tool powers up. Refer to Scan Tool Does Not Power Up.

Diagnostic System Check

1. *VERIFY CUSTOMER CONCERN* -- Understand and validate the customer concern. Inspect the visible system components for obvious damage or conditions that may cause the concern.
2. *BULLETIN SEARCH* -- Check for related bulletins, recall/field actions and preliminary information.
3. *MECHANICAL CONCERNS* -- Verify the symptom is not exclusively a mechanical concern.

   If the symptom is exclusively a mechanical concern, refer to Symptoms - Vehicle.

   Note: Do not clear any DTCs unless instructed to do so by a diagnostic procedure. If any DTC is Powertrain related, select Capture Info to store DTC and Freeze Frame/Failure Records to the Scan Tool.

4. *CONTROL MODULE COMMUNICATION and DTC CHECK* -- Using a scan tool, perform the Vehicle DTC Information function and verify at least one control module communicates with the scan tool. Record on the Repair Order the following information:
   - Any control module that is not communicating.
   - Any DTC, including symptom byte, and the control module that has set the DTC.

   If the scan tool does not communicate with any control module on the vehicle, refer to Power Mode Mismatch.
5. *CONTROL MODULE INTERNAL PERFORMANCE FAULTS* -- Verify there are no current control

module Internal Hardware Performance DTCs set.

If any DTC of this type is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.

6. *CONTROL MODULE COMMUNICATION VERIFICATION* -- Verify the vehicle is built with any control module listed as not communicating, refer to Data Link References. All control modules should be communicating, as equipped.

   If the scan tool does not communicate with one or more control modules refer to Data Link References.

7. *COMMUNICATION and POWERMODE FAULTS* -- Verify there are no current control module Power Mode or Communication DTCs set..

   If any DTC of this type is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.

Note: The engine may start during this test. Ensure the vehicle is out of gear and the parking brake is applied. Turn the engine OFF as soon as the crank power mode parameter has been observed.

8. *POWER MODE VERIFICATION* -- Driver door open, observe the scan tool Power Mode parameter while cycling the ignition switch through all the power modes. Verify the current Power Mode parameter matches the actual ignition switch positions.

   If the Power Mode parameter does not match the actual ignition switch positions, refer to Power Mode Mismatch.

9. *ENGINE CRANK and RUN VERIFICATION* -- Verify that the engine cranks and runs.

   If the engine does not crank, refer to Symptoms - Engine Electrical.

   If the engine does not run, refer to Engine Cranks But Does Not Runfor the 2.8L, 3.0L, 3.2L, or 3.6L engine or Engine Cranks But Does Not Runfor the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine.

10. *REMAINING DTC REVIEW* -- Verify there are no other DTCs set.

    If other DTCs are set, diagnose them in the order listed below. Refer to Diagnostic Trouble Code (DTC) List - Vehicle.

    10.1. Voltage DTCs
    10.2. Programming, Setup, Configuration or Software Performance DTCs
    10.3. Component related DTCs
    10.4. System related DTCs
    10.5. Any remaining DTCs

11. *SYMPTOM DIAGNOSIS* -- Diagnose any remaining customer concern. Refer to Symptoms - Vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Diagnostic Navigation | Vehicle Diagnostic Information | Diagnostic Information and Procedures |

Document ID: 2009600

Diagnostic Trouble Code (DTC) List - Vehicle

This master DTC list includes all applicable DTCs in alphanumeric order with descriptors.

DTC	DTC Descriptor	Module That Sets the DTC	Diagnostic Procedure
B0012	Driver Frontal Deployment Loop Stage 1	SDM	DTC B0012 or B0013
B0013	Driver Frontal Deployment Loop Stage 2	SDM	DTC B0012 or B0013
B0014	Driver Side Deployment Loop	SDM	DTC B0014
B0015	Driver Pretensioner Deployment Stage 1 Loop	SDM	DTC B0015
B0016	Driver Curtain Deployment Loop Initiator	SDM	DTC B0016
B0019	Passenger Frontal Deployment Loop Stage 1	SDM	DTC B0019 or B0020
B0020	Passenger Frontal Deployment Loop Stage 2	SDM	DTC B0019 or B0020
B0021	Passenger Side Deployment Loop Stage 1	SDM	DTC B0021
B0022	Passenger Pretensioner Deployment Stage 1 Loop	SDM	DTC B0022
B0023	Passenger Curtain Deployment Loop Initiator	SDM	DTC B0023
B0052	Deployment Commanded	SDM	DTC B0052 or B0053
B0053	Deployment Commanded with Loop DTCs Present	SDM	DTC B0052 or B0053
B0055	Side Airbag Deployment Commanded	SDM	DTC B0055
B0072	Driver Seat Belt Sensor Circuit	SDM	DTC B0072
B0079	Driver Seat Position Sensor Circuit	SDM	DTC B0079
B0083	Front End Sensor 1	SDM	DTC B0083 or B0084
B0084	Front End Sensor 2	SDM	DTC B0083 or B0084
B0085	Left Front Side Impact Circuit	SDM	DTC B0085 or B0086
B0086	Right Front Side Impact Sensor Circuit	SDM	DTC B0085 or B0086
B013B	Coil Compressor Stroke Control Circuit	HVAC	DTC B013B
B0158	Outside Air Temperature Sensor Circuit	HVAC	DTC B0158 or B0168
	Passenger Compartment		

B0168	Temperature Sensor Circuit	HVAC	DTC B0158 or B0168
B0183	Left Solar Load Sensor 1 Circuit	HVAC	DTC B0183 or B0188
B0188	Right Solar Load Sensor 2 Circuit	HVAC	DTC B0183 or B0188
B0193	Blower Motor Feedback Circuit	HVAC	DTC B0193
B0198	Blower Motor Feedback Circuit	HVAC	DTC B0198 2
B0228	Air Intake Flow Actuator Fault (LHD) or Recirculation Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0238	Demist Actuator Fault (LHD) or Defogger Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0253	Face/Floor Actuator Fault (LHD) or Vent/Floor Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0283	Electric Rear Defrost Circuit	HVAC	DTC B0283
B0408	Drivers Side Air Mix Actuator (LHD) or Drivers Air Mix Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0418	Passenger Side Air Mix Actuator (LHD) or Passengers Air Mix Door Motor Circuit (RHD)	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0428	Rear Air Mix Door Motor Circuit	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B0946	Suspension Control Selection Indicator Circuit	ESCM	DTC B0946
B094A	Service Suspension Control Indicator Circuit	ESCM	DTC B094A

B0954	Park Assist Sensor Front Left Outer Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0955	Park Assist Sensor Front Left Middle Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0956	Park Assist Sensor Front Right Middle Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0957	Park Assist Sensor Front Right Outer Circuit	UPA	DTC B0954, B0955, B0956, or B0957
B0958	Park Assist Sensor Rear Left Outer Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0959	Park Assist Sensor Rear Left Middle Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0960	Park Assist Sensor Rear Right Middle Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0961	Park Assist Sensor Rear Right Outer Circuit	UPA	DTC B0958, B0959, B0960, or B0961
B0967	Park Assist Switch Circuit	UPA	DTC B0967
B0968	Park Assist Indicator Circuit Malfunction	UPA	DTC B0968
B0970	Hazard Warning Switch Stuck	BCM	DTC B0970
B0983	Security System Indicator 2 Circuit	BCM	DTC B0983
B0996	Vehicle Identification Number Mismatch	Radio, RSE	DTC B0996, 1016, or B1271
B0997	Auxiliary Electronic Control Unit (ECU) 2 Performance	Radio	DTC B0997
	Memory Seat and Mirror Module Checksum Error	MSM	DTC B0997
B0998	Screen 1 EEPROM Failure	RSE	DTC B0998 or B0999
B0999	Screen 2 EEPROM Failure	RSE	DTC B0998 or B0999
B1000	Electronic Control Unit (ECU) Performance	BCM, IPC, MSM, RFA, SDM, TDM, Telematics, UPA	DTC B1000
B1001	Option Configuration Error	BCM, IPC	DTC B1001
		SDM	DTC B1001
B1008	Calibration Data Not Programmed	Telematics	DTC B1008
		UPA	DTC B1008
B1009	EEPROM Failure	RSE	DTC B1009
B1010	System Sensor Data Mismatch Invalid Odometer Signal	NIM	DTC B1010
B1011	System Disabled Over Temperature	NIM	DTC B1011
B1015	Vehicle Identification Number (VIN) Information Error	Telematics	DTC B1015 or DTC B1016

B1016	Vehicle Identification Number (VIN) Not Programmed	BCM	DTC B1016
		Radio	DTC B0996, 1016, or B1271
		SDM	DTC B1016
		Telematics	DTC B1015 or DTC B1016
B1019	System Configuration Error	Radio	DTC B1019
B101D	ECU Hardware Performance	NIM, Radio, RSE,	DTC B101D
B101E	ECU Software Performance	Radio	DTC B101E
B1020	Auxiliary Electronic Unit (ECU) Performance	NIM	DTC B1020
B1021	SIM Mismatch	Telematics	DTC B1021
B1023	Integral Switch Performance	Radio	DTC B1023
B1024	Printed Circuit Board (PCB) Temperature Sensor Fault	IPC	DTC B1024
B1025	Audio Output 1 Left Front Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1035	Audio Output 2 Right Front Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1045	Audio Output 3 Left Rear Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1055	Audio Output 4 Right Rear Circuit	Radio	DTC B1025, B1035, B1045, or B1055
B1240	CD-Player Malfunction	Radio	DTC B1240 or B1245
B1243	CD-Player Load or Eject Malfunction	Radio	DTC B1243 or B1248
		RSE	DTC B1243
B1244	CD-Player, Disc Upside Down	Radio	DTC B1244 or B1249
B1245	CD-Changer Malfunction	Radio	DTC B1240 or B1245
B1248	CD Changer Load/Unload Performance	Radio	DTC B1243 or B1248
B1249	CD-Changer, Disc Upside Down	Radio	DTC B1244 or B1249
B1271	Theft Locked	Radio	DTC B0996, 1016, or B1271
B1277	Microphone Circuit	Telematics	DTC B1277
B1287	Radio Mute Circuit	Telematics	DTC B1287
B1325	Device Power Circuit	HVAC	DTC B1325
		RSE	DTC B1325, B1330, or B1423
	System Voltage	SDM	DTC B1325
B1330	RSE Control Panel Supplied Power	RSE	DTC B1325, B1330, or B1423
B1335	Screen 1 Power Supply Voltage Circuit	RSE	DTC B1335 or B1340
B1340	Screen 2 Power Supply Voltage Circui	RSE	DTC B1335 or B1340
		BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443

B1370	Device Ignition 1 Circuit	SDM	DTC B1370
	Wake Up Circuit	MSM	DTC B1370
B1380	Device Ignition ACCESSORY Circuit	BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443
B138A	Device Voltage Reference Group 1 Outputs	UPA	DTC B138A
B1390	Button 1 Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B1400	Button 2 Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B1410	Button 3 Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B1423	Supply Voltage Circuit	RSE	DTC B1325, B1330, or B1423
B1428	Ignition Switched Power Relay 1 Circuit	BCM	DTC B1428
B1433	Ignition Switched Power Relay 2 Circuit	BCM	DTC B1433
B1440	Power Mode Master Input Circuit Malfunction	BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443
B1441	Device Ignition OFF, RUN, and CRANK Circuit	BCM	DTC B1370-B1379, B1380-B1389, or B1440-B1443
B1446	Backup Battery Timer Expired	Telematics	DTC B1446
B1447	Backup Battery Circuit	Telematics	DTC B1447
B1475	Retained Accessory Power Circuit	BCM	DTC B1475
B1516	Battery Current Sensor Performance	BCM	DTC B1516
B1517	Battery Voltage	BCM	DTC B1517
		Telematics	DTC B1517
B1527	High Parasitic Load Detected	BCM	DTC B1527
B1529	Control Module Voltage Reference Output 5 Circuit	BCM	DTC B1529
B1565	Mirror DIP Button Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B1735	Front Vertical Up Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1740	Front Vertical Down Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1745	Rear Vertical Up Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1750	Rear Vertical Down Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1755	Horizontal Forward Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1760	Horizontal Back Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820

B1815	Recline Up Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1820	Recline Down Switch Stuck	MSM	DTC B1735, B1740, B1745, B1750, B1755, B1760, B1815, or B1820
B1825	Recline Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B1831	Lumbar Forward Switch Stuck	MSM	DTC B1831 or B1836
B1836	Lumbar Rearward Switch Stuck	MSM	DTC B1831 or B1836
B1851	Lumbar Position Sensor Fault	MSM	DTC B1851
B2355	Front Vertical Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B2365	Rear Vertical Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B2375	Horizontal Position Sensor Fault	MSM	DTC B1825, B2355, B2365, or B2375
B245A	Telematics Indicator 1 Circuit	Telematics	DTC B245A
B245B	Telematics Indicator 2 Circuit	Telematics	DTC B245B
B2461	Navigation Electronic Control Unit (ECU) Synchronous Signal Error	NIM	DTC B2461
B2462	Global Positioning System (GPS) Antenna Circuit	NIM, Telematics	DTC B2462
B2464	Navigation Player Decoding Error	Radio	DTC B2464
B2469	SIM Card Invalid	Telematics	DTC B2469
B2471	Telephone Number Error	Telematics	DTC B2471
B2476	Keypad Circuit	Telematics	DTC B2476
B2484	Global Positioning System Sensor Open Circuit	NIM	DTC B2484
B2530	Front Foglamps Control Circuit	BCM	DTC B2530
B2545	Backup Lamps Circuit	BCM	DTC B2545
B2555	Passenger Compartment Lamp Control Circuit	BCM	DTC B2555
B2575	Headlamp Low Beam Control Circuit	BCM	DTC B2575
B257A	Headlamp Switch Input Signals Mismatch	BCM	DTC B257A
B2580	Headlamp High Beam Control Circuit	BCM	DTC B2580
B2585	Parklamp Control Circuit	BCM	DTC B2585
B2610	Passenger Compartment Dimming 1 Circuit	BCM	DTC B2610
B2615	Passenger Compartment Dimming 2 Circuit	BCM	DTC B2615
	Display Dimming Pulse Width		

B2625	Modulation (PWM) Output Circuit	BCM	DTC B2625
B2645	Ambient Light Sensor Circuit	BCM	DTC B2645
B2652	Passenger Compartment Dimming 3 Circuit	BCM	DTC B2652
B2705	Gearshift Unlock Circuit	BCM	DTC B2705
B2730	Interior Trunk/Liftglass/Hatch Release Switch Circuit	BCM	DTC B2730
B2745	Traction Control Switch Circuit	BCM	DTC B2745
B2750	Horn Relay Coil Circuit	BCM	DTC B2750
B2755	Memory Button 1 Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B2760	Memory Button 2 Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B2765	Button M Circuit Short to Battery	MSM	DTC B1390, B1400, B1410, or B2765
B2795	Suspension Control Select Switch Circuit	ESCM	DTC B2795
B2815	Steering Wheel Switch Circuit	IPC	DTC B2815
B2976	Driver Door Ajar Circuit	BCM	DTC B2976
B2991	Passenger Door Ajar Circuit	BCM	DTC B2991
B3006	Hood Ajar Circuit Plausability Failure	BCM	DTC B3006
B3055	No Transponder Modulation or No Transponder	TDM	DTC B3055
B3060	Unprogrammed Transponder Key Identification Code Received	TDM	DTC B3060
B3105	Keyless Entry System Key Not Programmed	RFA	DTC B3105
B3109	Keyless Entry Transmitter 1 Battery Low Voltage	RFA	DTC B3109
B3110	Keyless Entry Transmitter 2 Battery Low Voltage	RFA	DTC B3110
B3111	Keyless Entry Transmitter 3 Battery Low Voltage	RFA	DTC B3111
B3112	Keyless Entry Transmitter 4 Battery Low Voltage	RFA	DTC B3112
B3125	Left Front/Driver Door Only Unlock Circuit	BCM	DTC B3125, B3130, or B3135
B3130	All Door Unlock Circuit	BCM	DTC B3125, B3130, or B3135
B3135	All Door Lock Circuit	BCM	DTC B3125, B3130, or B3135
B3140	Driver Unlock Switch Circuit	BCM	DTC B3140 or B3150
B3150	Driver Lock Switch Circuit	BCM	DTC B3140 or B3150
B3265	Trunk/Hatch/Liftglass Release	BCM	DTC B3265

	Output Circuit		
B3410	AHLD Front Axle Sensor Signal Circuit	Headlamp Control Module	DTC B3410 or B3420
B3415	AHLD Front Axle Sensor Supply Circuit	Headlamp Control Module	DTC B3415
B3420	AHLD Rear Axle Sensor Signal Circuit	Headlamp Control Module	DTC B3410 or B3420
B3435	AHLD Left Servo Driver Circuit	Headlamp Control Module	DTC B3435 or B3440
B3440	AHLD Right Servo Driver Circuit	Headlamp Control Module	DTC B3435 or B3440
B3445	Stop Lamp Circuit	BCM	DTC B3445
B3531	Rear Air Mode Door Motor Circuit	HVAC	DTC B0228, B0238, B0253, B0408, B0418, B0428, or B3531
B3599	Memory Button 3 Stuck	MSM	DTC B1565, B2755, B2760, or B3599
B370C	Rain Sensor Intensity Signal Circuit	BCM	DTC B370C or B370D
B370D	Rain Sensor Mode Control Circuit	BCM	DTC B370C or B370D
B3715	Front Wiper Relay Drive Circuit	BCM	DTC B3715
B3794	Cruise Control Function Request Circuit	BCM	DTC B3794
B3873	Front Washer Relay Circuit	BCM	DTC B3873
B3875	Wiper High Speed Relay Circuit	BCM	DTC B3875
B3907	Button Assembly Short to Battery	MSM	DTC B3907
B3922	Front Wiper Function Select Circuit	BCM	DTC B3922
B3924	DVD Player Theft Locked	RSE	DTC B3924
B3926	Screen 1 Theft Locked	RSE	DTC B3926 or B3927
B3927	Screen 2 Theft Locked	RSE	DTC B3926 or B3927
B3933	Evaporator Temperature Sensor Circuit	HVAC	DTC B3933
B3935	Transponder Key Identification Error	TDM	DTC B3935
B3976	Unconfigured Transponder Key	TDM	DTC B3976
C0035	Front Left Wheel Speed Sensor Circuit	EBCM	DTC C0035-C0050
C0040	Front Right Wheel Speed Sensor Circuit	EBCM	DTC C0035-C0050

C0045	Rear Left Wheel Speed Sensor Circuit	EBCM	DTC C0035-C0050
C0050	Rear Right Wheel Speed Sensor Circuit	EBCM	DTC C0035-C0050
C0060	Left Front Antilock Braking System Solenoid Valve Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0065	Left Front Antilock Brake System Solenoid 2 Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0070	Right Front Antilock Braking System Solenoid Valve Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0075	Right Front Antilock Brake System Solenoid 2 Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0080	Left Rear Antilock Brake System Solenoid Valve Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0085	Left Rear Antilock Brake System Solenoid 2 Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0090	Right Rear Antilock Braking System Solenoid Valve Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0095	Right Rear Antilock Braking System Solenoid 2 Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0100	Rear Antilock Brake System Solenoid Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0105	Rear Antilock Brake System Solenoid 2 Circuit	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0110	Return Pump Circuit Malfunction	EBCM	DTC C0110
C0121	Valve Relay Circuit Malfunction	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0126	Low Brake Fluid Indicated	EBCM	DTC C0126
C0131	Antilock Brake System Pressure Circuit	EBCM	DTC C0131
C0141	Front Left/Front Right TC/ESP Priming Valve Circuit Malfunction	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0146	Front Left/Front Right TC/ESP Switch Over Valve Circuit Malfunction	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156

C0151	Rear Left/Rear Right TC/ESP Priming Valve Circuit Malfunction	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0156	Rear Left/Rear Right TC/ESP Switch Over Valve Circuit Malfunction	EBCM	DTC C0060-C0095, C0100, C0105, C0121, C0141, C0146, C0151, or C0156
C0161	Brake Switch Circuit	EBCM	DTC C0161
C0186	Lateral Acceleration Sensor	EBCM	DTC C0186 or C0196
C0196	Yaw Rate Sensor	EBCM	DTC C0186 or C0196
C0245	Wheel Speed Sensor Frequency	EBCM	DTC C0245
C0252	Implausible Control	EBCM	DTC C0252
C0277	Brake Pedal Position Sensor Circuit	BCM	DTC C0277 or C0890
C0297	Brake Applied Output Circuit	BCM	DTC C0297
C0460	Steering Angle Sensor Circuit	EBCM	DTC C0460
C0550	Electronic Control Unit (ECU) Performance	EBCM	DTC C0550
C0558	Calibration Data Not Programmed	ESCM	DTC C0558
C0561	CAN-Bus Invalid Data	EBCM	DTC C0561
C0565	Vehicle Identification Number (VIN) Not Programmed/Mismatch	EBCM	DTC C0565
C0569	System Configuration Error	EBCM	DTC C0569
		RFA	DTC C0569
C0575	Left Front Solenoid/Motor/Actuator Circuit	ESCM	DTC C0575, C0580, C0585, or C0590
C0580	Right Front Solenoid/Motor/Actuator Circuit	ESCM	DTC C0575, C0580, C0585, or C0590
C0585	Left Rear Solenoid/Motor/Actuator Circuit	ESCM	DTC C0575, C0580, C0585, or C0590
C0590	Right Rear Solenoid/Motor/Actuator Circuit	ESCM	DTC C0575, C0580, C0585, or C0590
C0615	Left Front Position Sensor Circuit	ESCM	DTC C0615, C0620, C0625, or C0630
C0620	Right Front Position Sensor Circuit	ESCM	DTC C0615, C0620, C0625, or C0630
C0625	Left Rear Position Sensor Circuit	ESCM	DTC C0615, C0620, C0625, or C0630
C0630	Right Rear Position Sensor Circuit	ESCM	DTC C0615, C0620, C0625, or C0630

C0696	Position Sensor Overcurrent 5-Volt Supply	ESCM	DTC C0696
C0750	Left Front Tire Pressure Sensor	RCDLR	DTC C0750, C0755, C0760, or C0765
C0755	Right Front Tire Pressure Sensor	RCDLR	DTC C0750, C0755, C0760, or C0765
C0760	Left Rear Tire Pressure Sensor	RCDLR	DTC C0750, C0755, C0760, or C0765
C0765	Right Rear Tire Pressure Sensor	RCDLR	DTC C0750, C0755, C0760, or C0765
C0890	Device Voltage Reference Output 3 Circuit	BCM	DTC C0277 or C0890
C0899	Power Supply Circuit Low Voltage	EBCM	DTC C0899
C0900	Power Supply Circuit High Voltage	EBCM	DTC C0900
C1209	Left Rear Wheel Speed Sensor Circuit High	EBCM, ECM	DTC C1209, C1223, C1227, or C1234
C1210	Right Rear Wheel Speed Sensor Circuit High	EBCM, ECM	DTC C1210, C1224, C1228, or C1235
C1223	Left Rear Wheel Speed Sensor Circuit	EBCM, ECM	DTC C1209, C1223, C1227, or C1234
C1224	Right Rear Wheel Speed Sensor Circuit	EBCM, ECM	DTC C1210, C1224, C1228, or C1235
C1227	Left Rear Wheel Speed Sensor Circuit Range/Performance	EBCM, ECM	DTC C1209, C1223, C1227, or C1234
C1228	Right Rear Wheel Speed Sensor Circuit Range/Performance	EBCM, ECM	DTC C1210, C1224, C1228, or C1235
C1234	Left Rear Wheel Speed Sensor Circuit Low	EBCM, ECM	DTC C1209, C1223, C1227, or C1234
C1235	Right Rear Wheel Speed Sensor Circuit Low	EBCM, ECM	DTC C1210, C1224, C1228, or C1235
P0008	Engine Position System Performance Bank 1	ECM	DTC P0008 or P0009
P0009	Engine Position System Performance Bank 2	ECM	DTC P0008 or P0009
P0010	Intake Camshaft Position Control Solenoid Circuit Malfunction Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P0011	Intake Camshaft Position Range/Performance Bank 1	ECM	DTC P0011, P0014, P0021, or P0024
P0013	Exhaust Camshaft Position Control Solenoid Circuit Malfunction Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P0014	Exhaust Camshaft Position Range/Performance Bank 1	ECM	DTC P0011, P0014, P0021, or P0024

P0016	Crankshaft/Intake Camshaft Position not Plausible Bank 1	ECM	DTC P0016, P0017, P0018, or P0019 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Crankshaft Position (CKP) Camshaft Position (CMP) Correlation		DTC P0016 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0017	Crankshaft/Exhaust Camshaft Position not Plausible Bank 1	ECM	DTC P0016, P0017, P0018, or P0019
P0018	Crankshaft/Intake Camshaft Position not Plausible Bank 2	ECM	DTC P0016, P0017, P0018, or P0019
P0019	Crankshaft/Exhaust Camshaft Position not Plausible Bank 2	ECM	DTC P0016, P0017, P0018, or P0019
P0020	Intake Camshaft Position Control Solenoid Circuit Malfunction Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P0021	Intake Camshaft Position Range/Performance Bank 2	ECM	DTC P0011, P0014, P0021, or P0024
P0023	Exhaust Camshaft Position Control Solenoid Circuit Malfunction Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P0024	Exhaust Camshaft Position Range/Performance Bank 2	ECM	DTC P0011, P0014, P0021, or P0024
P0030	O2 Sensor Heater Circuit Malfunction Bank 1 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Circuit Bank 1 Sensor 1		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0031	O2 Sensor Heater Circuit Low Voltage Bank 1 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0032	O2 Sensor Heater Circuit High Voltage Bank 1 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0036	O2 Sensor Heater Circuit Malfunction Bank 1 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Circuit Bank 2		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0037	O2 Sensor Heater Circuit Low Voltage Bank 1 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0038	O2 Sensor Heater Circuit High Voltage Bank 1 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
	O2 Sensor Signals not		

P0040	Plausible Bank 1 Sensor 1 & Bank 2 Sensor 1	ECM	DTC P0040 or P0041
P0041	O2 Sensor Signals not Plausible Bank 1 Sensor 2 & Bank 2 Sensor 2	ECM	DTC P0040 or P0041
P0050	O2 Sensor Heater Circuit Malfunction Bank 2 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Bank 2 Sensor 1		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0051	O2 Sensor Heater Circuit Low Voltage Bank 2 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0052	O2 Sensor Heater Circuit High Voltage Bank 2 Sensor 1	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0053	O2 Sensor Heater Resistance Range/Performance Bank 1 Sensor 1	ECM	DTC P0053 or P0059 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Resistance Circuit Bank 1 Sensor 1		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0054	HO2S Heater Resistance Circuit Bank 1 Sensor 2	ECM	DTC P0030, P0036, P0053, P0054, P0135, or P0141
P0056	O2 Sensor Heater Circuit Malfunction Bank 2 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Control Bank 2 Sensor 2		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0057	O2 Sensor Heater Circuit Low Voltage Bank 2 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0058	O2 Sensor Heater Circuit High Voltage Bank 2 Sensor 2	ECM	DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, or P0058
P0059	O2 Sensor Heater Resistance Range/Performance Bank 2 Sensor 1	ECM	DTC P0053 or P0059 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Resistance Bank 2 Sensor 1		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0060	HO2S Heater Resistance Bank 2 Sensor 2	ECM	DTC P0050, P0056, P0059, P0060, P0155, or P0161
P0068	Throttle Body Airflow Performance	ECM	DTC P0068 or P0121

P0100	Mass Air Flow Sensor Circuit Malfunction	ECM	DTC P0100, P0102, or P0103
P0101	Mass Air Flow Sensor Circuit Range/Performance	ECM	DTC P0101 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Mass Air Flow (MAF) Sensor Performance	ECM	DTC P0101 or P1101 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0102	Mass Air Flow Sensor Voltage Low	ECM	DTC P0100, P0102, or P0103 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Mass Air Flow (MAF) Sensor Circuit Low Frequency	ECM	DTC P0102 or P0103 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0103	Mass Air Flow Sensor Voltage High	ECM	DTC P0100, P0102, or P0103 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Mass Air Flow (MAF) Sensor Circuit High Frequency	ECM	DTC P0102 or P0103 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0106	Manifold Absolute Pressure (MAP) Sensor Performance	ECM	DTC P0106
P0107	Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage	ECM	DTC P0107 or P0108
P0108	Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage	ECM	DTC P0107 or P0108
P0111	Intake Air Temperature Sensor Circuit Range/Performance	ECM	DTC P0111-P0113
P0112	Intake Air Temperature Sensor Circuit Low Voltage	ECM	DTC P0111-P0113 for the 2.8L, 3.0L, 3.2L, or 3.6L engine DTC P0112 or P0113 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0113	Intake Air Temperature Sensor Circuit High Voltage	ECM	DTC P0111-P0113 for the 2.8L, 3.0L, 3.2L, or 3.6L engine DTC P0112 or P0113 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0115	Engine Coolant Temperature (ECT) Sensor Circuit	TCM	DTC P0115
P0116	Engine Coolant Temperature (ECT) Sensor Performance	ECM	DTC P0116 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0116 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0117	Engine Coolant Temperature (ECT) Sensor Circuit Low Voltage	ECM	DTC P0117 or P0118 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0117 or P0118 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine

P0118	Engine Coolant Temperature (ECT) Sensor Circuit High Voltage	ECM	DTC P0117 or P0118 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0117 or P0118 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0119	Engine Coolant Temperature Sensor Circuit Intermittent	ECM	DTC P0119
P0120	Throttle Position Sensor 1 Circuit	ECM	DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Throttle Position (TP) Sensor Circuit	TCM	DTC P0120
P0121	Throttle Position Sensor 1 Circuit Range/Performance	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Throttle Position (TP) Sensor 1 Performance	ECM	DTC P0068 or P0121 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0122	Throttle Position Sensor 1 Circuit Low Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0123	Throttle Position Sensor 1 Circuit High Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0128	Engine Coolant Temperature Below Thermostat Regulating Temperature	ECM	DTC P0128 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0128 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0130	O2 Sensor Circuit Malfunction Bank 1 Sensor 1	ECM	DTC P0130 or P0150
	O2 Sensor Circuit Low Voltage		DTC P0131 or P0151 for the 2.8L,

P0131	Bank 1 Sensor 1	ECM	3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 1 Sensor 1		DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0132	O2 Sensor Circuit High Voltage Bank 1 Sensor 1	ECM	DTC P0132 or P0152 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit High Voltage Bank 1 Sensor 1		DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0133	O2 Sensor Circuit Slow Response Bank 1 Sensor 1	ECM	DTC P0133 or P0153 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Slow Response Bank 1 Sensor 1		DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0134	HO2S Circuit Insufficient Activity Bank 1 Sensor 1	ECM	DTC P0134 or P0154 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0135	O2 Sensor Heater Circuit Range/Performance Bank 1 Sensor 1	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 1 Sensor 1		DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0137	O2 Sensor Circuit Low Voltage Bank 1 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 1 Sensor 2		DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0138	O2 Sensor Circuit High Voltage Bank 1 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit High Voltage Bank 1 Sensor 2	ECM	DTC P0131, P0132, P0137, or P0138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P013A	HO2S Slow Response Rich to Lean Bank 1 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
P013C	HO2S Slow Response Rich to Lean Bank 2 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
P013E	HO2S Delayed Response Rich to Lean Bank 1 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
	O2 Sensor Circuit No Activity Detected Bank 1 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine

P0140	HO2S Circuit Insufficient Activity Bank 1 Sensor 2	ECM	DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0141	O2 Sensor Heater Circuit Range/Performance Bank 1 Sensor 2	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 1 Sensor 2	ECM	DTC P0030, P0036, P0053, P0054, P0135, or P0141 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P014A	HO2S Delayed Response Rich to Lean Bank 2 Sensor 2	ECM	DTC P013A, P013C, P013E, or P014A
P0150	O2 Sensor Circuit Malfunction Bank 2 Sensor 1	ECM	DTC P0130 or P0150
P0151	O2 Sensor Circuit Low Voltage Bank 2 Sensor 1	ECM	DTC P0131 or P0151 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 2 Sensor 1		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0152	O2 Sensor Circuit High Voltage Bank 2 Sensor 1	ECM	DTC P0132 or P0152 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit High Voltage Bank 2 Sensor 1		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0153	O2 Sensor Circuit Slow Response Bank 2 Sensor 1	ECM	DTC P0133 or P0153 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Slow Response Bank 2 Sensor 1		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0154	HO2S Circuit Insufficient Activity Bank 2 Sensor 1	ECM	DTC P0134 or P0154 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
			DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0155	O2 Sensor Heater Circuit Range/Performance Bank 2 Sensor 1	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 2 Sensor 1		DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0157	O2 Sensor Circuit Low Voltage Bank 2 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Low Voltage Bank 2 Sensor 2		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0158	O2 Sensor Circuit High Voltage Bank 2 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine

	HO2S Circuit High Voltage Bank 2 Sensor 2		DTC P0151, P0152, P0157, or P0158 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0160	O2 Sensor Circuit No Activity Detected Bank 2 Sensor 2	ECM	DTC P0137, P0138, P0140, P0157, P0158, or P0160 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Circuit Insufficient Activity Bank 2 Sensor 2		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0161	O2 Sensor Heater Circuit Range/Performance Bank 2 Sensor 2	ECM	DTC P0135, P0141, P0155, or P0161 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Heater Performance Bank 2 Sensor 2	ECM	DTC P0050, P0056, P0059, P0060, P0155, or P0161 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0171	Fuel Trim System Lean Bank 1	ECM	DTC P0171, P0172, P0174, or P0175
P0172	Fuel Trim System Rich Bank 1	ECM	DTC P0171, P0172, P0174, or P0175
P0174	Fuel Trim System Lean Bank 2	ECM	DTC P0171, P0172, P0174, or P0175
P0175	Fuel Trim System Rich Bank 2	ECM	DTC P0171, P0172, P0174, or P0175
P0196	Engine Oil Temperature Sensor Range/Performance	ECM	DTC P0196, P0197, or P0198 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Oil Temperature Sensor Circuit Range/Performance	ECM	DTC P0196, P0197, or P0198 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0197	Engine Oil Temperature Voltage Low	ECM	DTC P0196, P0197, or P0198 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Oil Temperature Sensor Circuit Low Input	ECM	DTC P0196, P0197, or P0198 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0198	Engine Oil Temperature Voltage High	ECM	DTC P0196, P0197, or P0198 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Oil Temperature Sensor Circuit High Input	ECM	DTC P0196, P0197, or P0198 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0201	Injector 1 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
			DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262,

P0202	Injector 2 Control Circuit	ECM	P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0203	Injector 3 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0204	Injector 4 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0205	Injector 5 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
			DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262,

P0206	Injector 6 Control Circuit	ECM	P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0207	Injector 7 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208
P0208	Injector 8 Control Circuit	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0207, or P0208
P0218	Transmission Fluid Overtemperature	TCM	• DTC P0218 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0218 for the 5L40-E/5L50-E transmission • DTC P0218 for the 6L50/6L80/6L90 transmission
P0219	Engine Overspeed Condition	ECM	DTC P0219
P0220	Throttle Position Sensor 2 Circuit	ECM	DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135
P0221	Throttle Position Sensor 2 Circuit Range/Performance	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223
P0222	Throttle Position Sensor 2 Circuit Low Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0223	Throttle Position Sensor 2 Circuit High Voltage	ECM	DTC P0121, P0122, P0123, P0221, P0222, or P0223 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0120, P0122, P0123, P0220, P0222, P0223, or P2135 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0230	Fuel Pump Relay Control Circuit	ECM	DTC P0230
			DTC P0201, P0202, P0203, P0204,

P0261	Injector 1 Control Circuit Low Voltage	ECM	P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0262	Injector 1 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0264	Injector 2 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0265	Injector 2 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0267	Injector 3 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0268	Injector 3 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0270	Injector 4 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0271	Injector 4 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0273	Injector 5 Control Circuit Low Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0274	Injector 5 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
	Injector 6 Control Circuit Low		DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262,

P0276	Voltage	ECM	P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0277	Injector 6 Control Circuit High Voltage	ECM	DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277
P0300	Engine Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0301	Cylinder 1 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0302	Cylinder 2 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0303	Cylinder 3 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0304	Cylinder 4 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0305	Cylinder 5 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine

P0306	Cylinder 6 Misfire Detected	ECM	DTC P0300-P0306 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0300-P0308 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0307	Cylinder 7 Misfire Detected	ECM	DTC P0300-P0308
P0308	Cylinder 8 Misfire Detected	ECM	DTC P0300-P0308
P0315	Crankshaft Position System Variation Not Learned	ECM	DTC P0315
P0324	Knock Sensor Module Performance	ECM	DTC P0324 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0325	Knock Sensor (KS) Circuit Bank 1	ECM	DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333
P0326	Knock Sensor (KS) Performance Bank 1	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Knock Sensor (KS) Performance	ECM	DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0327	Knock Sensor (KS) Circuit Low Voltage Bank 1	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0328	Knock Sensor (KS) Circuit High Voltage Bank 1	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0330	Knock Sensor (KS) Circuit	ECM	DTC P0324, P0325, P0326, P0327,

	Bank 2		P0328, P0330, P0332, or P0333
P0331	Knock Sensor (KS) System Performance Bank 2	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333
P0332	Knock Sensor (KS) Circuit Low Voltage Bank 2	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0333	Knock Sensor (KS) Circuit High Voltage Bank 2	ECM	DTC P0326, P0327, P0328, P0331, P0332, or P0333 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0324, P0325, P0326, P0327, P0328, P0330, P0332, or P0333 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0335	Crankshaft Position Sensor Circuit Malfunction	ECM	DTC P0335, P0336, or P0338 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Crankshaft Position (CKP) Sensor Circuit		DTC P0335 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0336	Crankshaft Position Sensor Signal Range/Performance	ECM	DTC P0335, P0336, or P0338 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Crankshaft Position (CKP) Sensor Performance		DTC P0336 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0338	Crankshaft Position Sensor Circuit High Duty Cycle	ECM	DTC P0335, P0336, or P0338 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
P0340	Camshaft Position (CMP) Sensor Circuit	ECM	DTC P0340
P0341	Intake Camshaft Position Sensor Range/Performance Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Camshaft Position (CMP) Sensor Performance	ECM	DTC P0341 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0342	Intake Camshaft Position Sensor Low Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0343	Intake Camshaft Position Sensor High Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0346	Intake Camshaft Position Sensor Range/Performance	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367,

	Bank 2		P0368, P0391, P0392, or P0393
P0347	Intake Camshaft Position Sensor Low Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0348	Intake Camshaft Position Sensor High Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0351	Ignition Coil Cylinder 1 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0352	Ignition Coil Cylinder 2 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0353	Ignition Coil Cylinder 3 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0354	Ignition Coil Cylinder 4 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
			DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L,

P0355	Ignition Coil Cylinder 5 Control Circuit	ECM	3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0356	Ignition Coil Cylinder 6 Control Circuit	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0351-P0358 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0357	Ignition Coil Cylinder 7 Control Circuit	ECM	DTC P0351-P0358
P0358	Ignition Coil Cylinder 8 Control Circuit	ECM	DTC P0351-P0358
P0366	Exhaust Camshaft Position Sensor Range/Performance Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0367	Exhaust Camshaft Position Sensor Low Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0368	Exhaust Camshaft Position Sensor High Voltage Bank 1	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0391	Exhaust Camshaft Position Sensor Range/Performance Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0392	Exhaust Camshaft Position Sensor Low Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0393	Exhaust Camshaft Position Sensor High Voltage Bank 2	ECM	DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393
P0420	Catalyst System Low EfficiencyBank 1	ECM	DTC P0420 or P0430 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0420 or P0430 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0430	Catalyst System Low Efficiency Bank 2	ECM	DTC P0420 or P0430 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or

			DTC P0420 or P0430 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0443	Evaporative Emission Control System Purge Solenoid Circuit Malfunction	ECM	DTC P0443, P0458, or P0459 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0443 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0458	Evaporative Emission Control System Purge Solenoid Circuit Low Voltage	ECM	DTC P0443, P0458, or P0459
P0459	Evaporative Emission Control System Purge Solenoid Circuit High Voltage	ECM	DTC P0443, P0458, or P0459
P0461	Fuel Level Sensor 1 Performance	ECM	DTC P0461
P0462	Fuel Level Sensor 1 Circuit Low Voltage	ECM	DTC P0462
P0463	Fuel Level Sensor 1 Circuit HighVoltage	ECM	DTC P0463
P0480	Cooling Fan Relay 1 Control Circuit	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0480 or P0481 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0481	Cooling Fan Relay 2 Control Circuit	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0480 or P0481 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0500	Vehicle Speed Sensor Circuit Malfunction	ECM	DTC P0500
P0501	Vehicle Speed Sensor (VSS) Performance	ECM	DTC P0501 or P0502
P0502	Vehicle Speed Sensor (VSS) Circuit Low Voltage	ECM	DTC P0501 or P0502 for the Aisin AY6 transmission or DTC P0502 or P0503 for the Tremec 6-Speed transmission
P0503	Vehicle Speed Sensor (VSS)	ECM	DTC P0502 or P0503

	Circuit Intermittent		
P0506	Idle Speed Low	ECM	DTC P0506, P0507, or P050A for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0506 or P0507 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0507	Idle Speed High	ECM	DTC P0506, P0507, or P050A for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0506 or P0507 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P050A	Cold Start Idle Air Control (IAC) System Performance	ECM	DTC P0506, P0507, or P050A
P0521	Engine Oil Pressure (EOP) Sensor Performance	ECM	DTC P0521, P0522, or P0523
P0522	Engine Oil Pressure (EOP) Sensor Circuit Low Voltage	ECM	DTC P0521, P0522, or P0523
P0523	Engine Oil Pressure (EOP) Sensor Circuit High Voltage	ECM	DTC P0521, P0522, or P0523
P0532	Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit	ECM	DTC P0532 or P0533
P0533	Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit Low Voltage	ECM	DTC P0532 or P0533
P0560	System Voltage Malfunction	ECM	DTC P0560
P0562	System Voltage Low	ECM	DTC P0562
		TCM	• DTC P0562 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0562 for the 5L40-E/5L50-E transmission • DTC P0562 or P0563 for the 6L50/6L80/6L90 transmission
P0563	System Voltage High	ECM	DTC P0563
		TCM	• DTC P0563 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0563 for the 5L40-E/5L50-E transmission • DTC P0562 or P0563 for the 6L50/6L80/6L90 transmission
P0571	Cruise Control Brake Switch Circuit	ECM	DTC P0571
	Brake Switch Circuit 1 Low		

P0572	Voltage	ECM	DTC P0572
P0573	Brake Switch Circuit 1 High Voltage	ECM	DTC P0573
P0575	Cruise Control Enable Circuit Malfunction	ECM	DTC P0575
P0601	Control Module Read Only Memory (ROM) Error	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Read Only Memory (ROM)	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0601 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0602	Control Module Not Programmed	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Not Programmed	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0602 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
	Control Module Long Term Memory Reset	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or

P0603			P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Long Term Memory Reset	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0603 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0604	Control Module Random Access Memory (RAM)	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Random Access Memory (RAM)	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P0604 for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0606	Control Module Internal Performance	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0607	Control Module Performance	ECM	DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610
P060D	Control Module Accelerator Pedal Position (APP) System Performance	ECM	DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610
P0615	Starter Relay Circuit Malfunction	ECM	DTC P0615
P0616	Starter Relay Control Circuit Low Voltage	ECM	DTC P0616 or P0617
	Starter Relay Control Circuit		

P0617	High Voltage	ECM	DTC P0616 or P0617
P0621	Alternator L-Terminal Circuit Malfunction	ECM	DTC P0621
P0622	Generator F-Terminal Circuit	ECM	DTC P0622
P0625	Generator F-Terminal Low Voltage	ECM	DTC P0625 or P0626
P0626	Generator F-Terminal High Voltage	ECM	DTC P0625 or P0626
P0627	Fuel Pump Relay Control Circuit	ECM	DTC P0627, P0628, or P0629
P0628	Fuel Pump Relay Control Circuit Low Voltage	ECM	DTC P0627, P0628, or P0629
P0629	Fuel Pump Relay Control Circuit High Voltage	ECM	DTC P0627, P0628, or P0629
P062F	Control Module Long Term Memory Performance	ECM	DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Transmission Control Module (TCM) Long Term Memory Performance	TCM	• DTC P0601-P0604 or P062F for the 4L60-E/4L65-E/4L70-E transmission • DTC P062F for the 5L40-E/5L50-E transmission • DTC P0601-P0604 or P062F for the 6L50/6L80/6L90 transmission
P0633	Theft Deterrent Key Not Programmed	ECM	DTC P0633
P0634	Transmission Control Module (TCM) Overtemperature	TCM	DTC P0634
P0638	Commanded versus Actual Throttle Position Correlation	ECM	DTC P0638, P2100, P2101, or P2119
P0641	5-Volt Reference 1 Circuit	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	5V Reference Circuit 1 Malfunction		DTC P0641 or P0651 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0642	5-Volt Reference 1 Circuit Low Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0643	5-Volt Reference 1 Circuit High Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0650	Malfunction Indicator (MI) Circuit Malfunction	ECM	DTC P0650 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0650 for the 4.8L, 5.3L, 6.0L,

			6.2L, or 7.0L engine
P0651	5-Volt Reference 2 Circuit	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	5V Reference Circuit 2 Malfunction	ECM	DTC P0641 or P0651 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0652	5-Volt Reference 2 Circuit Low Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0653	5-Volt Reference 2 Circuit High Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0658	Solenoid High Control Circuit Group 1 Low Voltage	TCM	DTC P0658 or P0659 for the 5L40-E/5L50-E transmission or DTC P0658 or P0659 for the 6L50/6L80/6L90 transmission
P0659	Solenoid High Control Circuit Group 1 High Voltage	TCM	DTC P0658 or P0659 for the 5L40-E/5L50-E transmission or DTC P0658 or P0659 for the 6L50/6L80/6L90 transmission
P0660	Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit	ECM	DTC P0660, P0661, or P0662
P0661	Intake Manifold Tuning (IMT) Solenoid Control Circuit Low Voltage	ECM	DTC P0660, P0661, or P0662
P0662	Intake Manifold Tuning (IMT) Solenoid Control Circuit High Voltage	ECM	DTC P0660, P0661, or P0662
P0667	Transmission Control Module (TCM) Temperature Sensor Performance	TCM	DTC P0667, P0668, or P0669
P0668	Transmission Control Module (TCM) Temperature Sensor Circuit Low Voltage	TCM	DTC P0667, P0668, or P0669
P0669	Transmission Control Module (TCM) Temperature Sensor Circuit High Voltage	TCM	DTC P0667, P0668, or P0669
P0685	Engine Control Ignition Relay Circuit Malfunction	ECM	DTC P0685, P0686, P0687, P0689, or P0690 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Controls Ignition Relay Control Circuit	ECM	DTC P0685, P0689, or P0690 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0686	Engine Control Ignition Relay Circuit Low Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690

P0687	Engine Control Ignition Relay Circuit High Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690
P0689	Engine Control Ignition Relay Feedback Circuit Low Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Controls Relay Feedback Circuit Low Voltage		DTC P0685, P0689, or P0690 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0690	Engine Control Ignition Relay Feedback Circuit High Voltage	ECM	DTC P0685, P0686, P0687, P0689, or P0690 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Engine Controls Relay Feedback Circuit High Voltage		DTC P0685, P0689, or P0690 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0691	Cooling Fan Relay 1 Control Circuit Low Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0692	Cooling Fan Relay 2 Control Circuit High Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0693	Cooling Fan Relay 2 Control Circuit Low Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0694	Cooling Fan Relay 1 Control Circuit High Voltage	ECM	DTC P0480, P0481, P0691, P0692, P0693, or P0694
P0697	5-Volt Reference 3 Circuit	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0698	5-Volt Reference 3 Circuit Low Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P0699	5-Volt Reference 3 Circuit High Voltage	ECM	DTC P0641-P0643, P0651-P0653, or P0697-P0699
P06AC	Transmission Control Module (TCM) Power Up Temperature Sensor Performance	TCM	DTC P06AC, P06AD, or P06AE
P06AD	Transmission Control Module (TCM) Power Up Temperature Sensor Circuit Low Voltage	TCM	DTC P06AC, P06AD, or P06AE
P06AE	Transmission Control Module (TCM) Power Up Temperature Sensor Circuit High Voltage	TCM	DTC P06AC, P06AD, or P06AE
P0700	Transmission Control Module (TCM) Requested MIL Illumination	ECM	DTC P0700 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0700 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P0703	Torque Converter / Brake Switch Circuit Malfunction	ECM	DTC P0703
P0704	Clutch Switch Circuit	ECM	DTC P0704
			• DTC P0711 for the 4L60-

P0711	Transmission Fluid Temperature (TFT) Sensor Performance	TCM	E/4L65-E/4L70-E transmission • DTC P0711 for the 5L40-E/5L50-E transmission • DTC P0711, P0712, or P0713 for the 6L50/6L80/6L90 transmission
P0712	Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage	ECM	DTC P0712 or P0713 for the Tremec 6-Speed transmission
		TCM	• DTC P0712 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0712 for the 5L40-E/5L50-E transmission • DTC P0711, P0712, or P0713 for the 6L50/6L80/6L90 transmission
P0713	Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage	ECM	DTC P0712 or P0713 for the Tremec 6-Speed transmission
		TCM	• DTC P0713 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0713 for the 5L40-E/5L50-E transmission • DTC P0711, P0712, or P0713 for the 6L50/6L80/6L90 transmission
P0716	Input Speed Sensor Performance	TCM	• DTC P0716 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0716 for the 5L40-E/5L50-E transmission • DTC P0716 or P0717 for the 6L50/6L80/6L90 transmission
P0717	Input Speed Sensor Circuit Low Voltage	TCM	• DTC P0717 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0717 for the 5L40-E/5L50-E transmission • DTC P0716 or P0717 for the 6L50/6L80/6L90 transmission
P0719	Brake Switch Circuit Low Voltage	TCM	DTC P0719
P0722	Output Speed Sensor Circuit Low Voltage	TCM	• DTC P0722 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0722 for the 5L40-E/5L50-E transmission • DTC P0722 or P0723 for the 6L50/6L80/6L90 transmission
			• DTC P0723 for the 4L60-

P0723	Output Speed Sensor Circuit Intermittent	TCM	E/4L65-E/4L70-E transmission • DTC P0723 for the 5L40-E/5L50-E transmission • DTC P0722 or P0723 for the 6L50/6L80/6L90 transmission
P0724	Brake Switch Circuit High Voltage	TCM	DTC P0724
P0727	Engine Speed No Signal	TCM	DTC P0727
P0741	Torque Converter Clutch (TCC) System - Stuck Off	TCM	• DTC P0741 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0741 for the 5L40-E/5L50-E transmission • DTC P0741 or P0742 for the 6L50/6L80/6L90 transmission
P0742	Torque Converter Clutch (TCC) System - Stuck On	TCM	• DTC P0742 for the 4L60-E/4L65-E/4L70-E transmission • DTC P0742 for the 5L40-E/5L50-E transmission • DTC P0741 or P0742 for the 6L50/6L80/6L90 transmission
P0748	Pressure Control (PC) Solenoid Control Circuit	TCM	DTC P0748
P0751	1-2 Shift Solenoid (SS) Valve Performance - No First, Fourth or Fifth Gear	TCM	DTC P0751 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0751 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Valve Performance - Stuck Off		DTC P0751 for the 6L50/6L80/6L90 transmission
P0752	1-2 Shift Solenoid (SS) Valve Performance - No Second or Third Gear	TCM	DTC P0752 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0752 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Valve Performance - Stuck On		DTC P0752 for the 6L50/6L80/6L90 transmission
P0756	2-3 Shift Solenoid (SS) Valve Performance - No First or Second Gear	TCM	DTC P0756 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0756 for the 5L40-E/5L50-E transmission

	Shift Solenoid (SS) 2 Valve Performance - Stuck Off		DTC P0756 for the 6L50/6L80/6L90 transmission
P0757	2-3 Shift Solenoid (SS) Valve Performance - No Third, Fourth or Fifth Gear	TCM	DTC P0757 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0757 for the 5L40-E/5L50-E transmission
P0761	4-5 Shift Solenoid (SS) Valve Performance - No Fourth Gear	TCM	DTC P0761
P0762	4-5 Shift Solenoid (SS) Valve Performance - No Fifth Gear	TCM	DTC P0762
P0776	Clutch Pressure Control (PC) Solenoid 2 - Stuck Off	TCM	DTC P0776 or P0777
P0777	Clutch Pressure Control (PC) Solenoid 2 - Stuck On	TCM	DTC P0776 or P0777
P0787	3-2 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0787
P0788	3-2 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0788
P0796	Clutch Pressure Control (PC) Solenoid 3 - Stuck Off	TCM	DTC P0796 or P0797
P0797	Clutch Pressure Control (PC) Solenoid 3 - Stuck On	TCM	DTC P0796 or P0797
P0801	Reverse Lockout Solenoid Control Circuit	ECM	DTC P0801
P0803	Skip Shift Solenoid Control Circuit	ECM	DTC P0803
P0806	Clutch Pedal Position (CPP) Sensor Circuit Performance	ECM	DTC P0806 for the Aisin AY6 transmission or DTC P0806 for the Tremec 6-Speed transmission
P0807	Clutch Pedal Position (CPP) Sensor Circuit Low Voltage	ECM	DTC P0807 or P0808 for the Aisin AY6 transmission or DTC P0807 or P0808 for the Tremec 6-Speed transmission
P0808	Clutch Pedal Position (CPP) Sensor Circuit High Voltage	ECM	DTC P0807 or P0808 for the Aisin AY6 transmission or DTC P0807 or P0808 for the Tremec

			6-Speed transmission
P080A	Clutch Pedal Position (CPP) Sensor Circuit High Voltage	ECM	DTC P080A for the Aisin AY6 transmission or DTC P080A for the Tremec 6-Speed transmission
P0815	Upshift Switch Circuit	TCM	DTC P0815, P0816, or P0826 for the 5L40-E/5L50-E transmission or DTC P0815, P0816, or P0826 for the 6L50/6L80/6L90 transmission
P0816	Downshift Switch Circuit	TCM	DTC P0815, P0816, or P0826 for the 5L40-E/5L50-E transmission or DTC P0815, P0816, or P0826 for the 6L50/6L80/6L90 transmission
P0826	Up and Down Shift Switch Circuit	TCM	DTC P0815, P0816, or P0826 for the 5L40-E/5L50-E transmission or DTC P0815, P0816, or P0826 for the 6L50/6L80/6L90 transmission
P0842	Transmission Fluid Pressure (TFP) Switch 1 Circuit Low Voltage	TCM	DTC P0842 or P0843
P0843	Transmission Fluid Pressure (TFP) Switch 1 Circuit High Voltage	TCM	DTC P0842 or P0843
P0850	Park/Neutral Position (PNP) Switch Circuit	TCM	DTC P0850 for the 5L40-E/5L50-E transmission or DTC P0850-P0852 for the 6L50/6L80/6L90 transmission
P0851	Park/Neutral Position (PNP) Switch Circuit Low Voltage	ECM	DTC P0850-P0852 for the 6L50/6L80/6L90 transmission
P0852	Park/Neutral Position (PNP) Switch Circuit High Voltage	ECM	DTC P0850-P0852 for the 6L50/6L80/6L90 transmission
P0856	Engine Control Module (ECM) Traction Control Torque Request Circuit	ECM	DTC P0856

P0872	Transmission Fluid Pressure (TFP) Switch 3 Circuit Low Voltage	TCM	DTC P0872 or P0873
P0873	Transmission Fluid Pressure (TFP) Switch 3 Circuit High Voltage	TCM	DTC P0872 or P0873
P0877	Transmission Fluid Pressure (TFP) Switch 4 Circuit Low Voltage	TCM	DTC P0877 or P0878
P0878	Transmission Fluid Pressure (TFP) Switch 4 Circuit High Voltage	TCM	DTC P0877 or P0878
P0897	Transmission Fluid Life	TCM	DTC P0897
P0961	Line Pressure Control (PC) Solenoid System Performance	TCM	DTC P0961 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0961-P0963 for the 6L50/6L80/6L90 transmission
P0962	Line Pressure Control (PC) Solenoid Control Circuit Low Voltage	TCM	DTC P0961-P0963
P0963	Line Pressure Control (PC) Solenoid Control Circuit High Voltage	TCM	DTC P0961-P0963
P0965	Clutch Pressure Control (PC) Solenoid 2 System Performance	TCM	DTC P0965-P0967
P0966	Clutch Pressure Control (PC) Solenoid 2 Control Circuit Low Voltage	TCM	DTC P0965-P0967
P0967	Clutch Pressure Control (PC) Solenoid 2 Control Circuit High Voltage	TCM	DTC P0965-P0967
P0969	Clutch Pressure Control (PC) Solenoid 3 System Performance	TCM	DTC P0969-P0971
P0970	Clutch Pressure Control (PC) Solenoid 3 Control Circuit Low Voltage	TCM	DTC P0969-P0971
P0971	Clutch Pressure Control (PC) Solenoid 3 Control Circuit High Voltage	TCM	DTC P0969-P0971
P0973	1-2 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0973 for the 4L60-E/4L65-E/4L70-E transmission or

			DTC P0973 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Control Circuit Low Voltage		DTC P0973 or P0974 for the 6L50/6L80/6L90 transmission
P0974	1-2 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0974 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0974 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 1 Control Circuit High Voltage		DTC P0973 or P0974 for the 6L50/6L80/6L90 transmission
P0976	2-3 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0976 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0976 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 2 Control Circuit Low Voltage		DTC P0976 or P0977 for the 6L50/6L80/6L90 transmission
P0977	2-3 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0977 for the 4L60-E/4L65-E/4L70-E transmission or DTC P0977 for the 5L40-E/5L50-E transmission
	Shift Solenoid (SS) 2 Control Circuit High Voltage		DTC P0976 or P0977 for the 6L50/6L80/6L90 transmission
P0979	4-5 Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P0979
P0980	4-5 Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P0980
P0989	Transmission Fluid Pressure (TFP) Switch 5 Circuit Low Voltage	TCM	DTC P0989 or P0990
P0990	Transmission Fluid Pressure (TFP) Switch 5 Circuit High Voltage	TCM	DTC P0989 or P0990
P1011	Intake Camshaft Actuator Park Position Bank 1	ECM	DTC P1011-P1014
P1012	Exhaust Camshaft Actuator Park Position Bank 1	ECM	DTC P1011-P1014
P1013	Intake Camshaft Actuator Park Position Bank 2	ECM	DTC P1011-P1014
P1014	Exhaust Camshaft Actuator Park Position Bank 2	ECM	DTC P1011-P1014

P1101	Intake Air Flow System Performance	ECM	DTC P0101 or P1101
P1133	HO2S Insufficient Switching Bank 1 Sensor 1	ECM	DTC P0133, P0134, P0140, P1133, P2270, or P2271
P1153	HO2S Insufficient Switching Bank 2 Sensor 1	ECM	DTC P0153, P0154, P0160, P1153, P2272, or P2273
P1174	Fuel Trim Cylinder Balance Bank 1	ECM	DTC P1174 or P1175
P1175	Fuel Trim Cylinder Balance Bank 2	ECM	DTC P1174 or P1175
P1258	Engine Coolant Over Temperature - Protection Mode Active	ECM	DTC P1258
P1380	Misfire Detected - Rough Road Data Not Available	ECM	DTC P1380 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P1380 or P1381 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P1381	Misfire Detected - No Communication with Brake Control Module	ECM	DTC P1380 or P1381
P1400	Cold Start Emission Reduction Control System	ECM	DTC P1400
P1516	Throttle Actuator Control (TAC) Module Throttle Actuator Position Performance	ECM	DTC P1516, P2101, P2119, or P2176
P1551	Throttle Control Lower Position not Reached during Learning Mode	ECM	DTC P1551
P1631	Theft Deterrent Fuel Enable Signal Not Correct	ECM	DTC P1631
P1668	Generator L-Terminal Control Circuit	ECM	DTC P1668, P2500, or P2501
P167D	Control Module Ignition Coil Internal Circuit	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610
P1682	Ignition 1 Switch Circuit 2	ECM	DTC P1682
P1751	Shift Valve 1 Performance	TCM	DTC P1751
P1761	Up and Down Shift Switch Signal Circuit	TCM	DTC P1761
P1793	Wheel Speed Signal	TCM	DTC P1793
P1810	Transmission Fluid Pressure (TFP) Position Switch Circuit	TCM	DTC P1810
P1815	Transmission Fluid Pressure (TFP) Valve Position Switch -	TCM	DTC P1815 for the 4L60-E/4L65-E/4L70-E transmission or

	Start in Wrong Range		DTC P1815 for the 5L40-E/5L50-E transmission
P1816	Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Park/Neutral (P/N) with Drive Ratio	TCM	DTC P1816
P1818	Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Drive without Drive Ratio	TCM	DTC P1818
P1820	Internal Mode Switch A Circuit Low Voltage	TCM	DTC P1820
P1822	Internal Mode Switch B Circuit High Voltage	TCM	DTC P1822
P1823	Internal Mode Switch P Circuit Low Voltage	TCM	DTC P1823
P1825	Internal Mode Switch - Invalid Range	TCM	DTC P1825 or P1915
P1826	Internal Mode Switch C Circuit High Voltage	TCM	DTC P1826
P182E	Internal Mode Switch - Invalid Range	TCM	DTC P182E or P1915
P1831	Pressure Control (PC)/Shift Lock Solenoid Control Circuit Low Voltage	TCM	DTC P1831 for the 5L40-E/5L50-E transmission
P1832	Pressure Control (PC)/Shift Lock Solenoid Control Circuit High Voltage	TCM	DTC P1832 for the 5L40-E/5L50-E transmission
P1833	Torque Converter Clutch (TCC)/Shift Solenoid (SS) Control Circuit Low Voltage	TCM	DTC P1833
P1834	Torque Converter Clutch (TCC)/Shift Solenoid (SS) Control Circuit High Voltage	TCM	DTC P1834
P1876	Up and Down Shift Switch Performance - Range Switch Not in D3	TCM	DTC P1876 for the 5L40-E/5L50-E transmission or DTC P1876 for the 6L50/6L80/6L90 transmission
P1915	Internal Mode Switch Does Not Indicate Park/Neutral (P/N) During Start	TCM	DTC P1825 or P1915 for the 5L40-E/5L50-E transmission
	Internal Mode Switch Start/Wrong Range		DTC P182E or P1915 for the 6L50/6L80/6L90 transmission
P2066	Fuel Level Sensor 2 Performance	ECM	DTC P2066

P2067	Fuel Level Sensor 2 Low Voltage	ECM	DTC P2067
P2068	Fuel Level Sensor 2 High Voltage	ECM	DTC P2068
P2072	Throttle Actuator Control System - Ice Blockage	ECM	DTC P2072
P2088	Intake Camshaft Position Control Solenoid Circuit Low Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2089	Intake Camshaft Position Control Solenoid Circuit High Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2090	Exhaust Camshaft Position Control Solenoid Circuit Low Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2091	Exhaust Camshaft Position Control Solenoid Circuit High Voltage Bank 1	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2092	Intake Camshaft Position Control Solenoid Circuit Low Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2093	Intake Camshaft Position Control Solenoid Circuit High Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2094	Exhaust Camshaft Position Control Solenoid Circuit Low Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2095	Exhaust Camshaft Position Control Solenoid Circuit High Voltage Bank 2	ECM	DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095
P2096	Post Catalyst O2 Sensor Fuel Trim Below Lower Limit Bank 1	ECM	DTC P2096 or P2098
P2097	Post Catalyst O2 Sensor Fuel Trim Above Upper Limit Bank 1	ECM	DTC P2097 or P2099
P2098	Post Catalyst O2 Sensor Fuel Trim Below Lower Limit Bank 2	ECM	DTC P2096 or P2098
P2099	Post Catalyst O2 Sensor Fuel Trim Above Upper Limit Bank 2	ECM	DTC P2097 or P2099
P2100	Throttle Control Motor Malfunction	ECM	DTC P0638, P2100, P2101, or P2119
P2101	Throttle Control Position Range/Performance	ECM	DTC P0638, P2100, P2101, or P2119 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Throttle Actuator Position Performance		DTC P1516, P2101, P2119, or P2176 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2105	Throttle Control Forced Engine Shutdown	ECM	DTC P2105

P2119	Closed Throttle Position Range/Performance	ECM	DTC P0638, P2100, P2101, or P2119 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Throttle Closed Position Performance		DTC P1516, P2101, P2119, or P2176 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2120	Accelerator Pedal Position Sensor 1 Circuit	ECM	DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138
P2122	Accelerator Pedal Position Sensor 1 Low Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2123	Accelerator Pedal Position Sensor 1 High Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2125	Accelerator Pedal Position Sensor 2 Circuit	ECM	DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138
P2127	Accelerator Pedal Position Sensor 2Low Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2128	Accelerator Pedal Position Sensor 2 High Voltage	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
	Throttle Position Sensor 1-2		DTC P0120, P0122, P0123, P0220,

P2135	Correlation	ECM	P0222, P0223, or P2135
P2138	Accelerator Pedal Position Sensor 1-2 Correlation	ECM	DTC P2122, P2123, P2127, P2128, or P2138 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2120, P2122, P2123, P2125, P2127, P2128, or P2138 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2176	Throttle Actuator Control Lower Position Not Learned	ECM	DTC P2176 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	Minimum Throttle Position Not Learned		DTC P1516, P2101, P2119, or P2176 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2177	Fuel Trim Lean during Cruising/Acceleration Bank 1	ECM	DTC P2177, P2179, P2187, or P2189
P2178	Fuel Trim Rich during Cruising/Acceleration Bank 1	ECM	DTC P2178, P2180, P2188, or P2190
P2179	Fuel Trim Lean during Cruising/Acceleration Bank 2	ECM	DTC P2177, P2179, P2187, or P2189
P2180	Fuel Trim Rich during Cruising/Acceleration Bank 2	ECM	DTC P2178, P2180, P2188, or P2190
P2187	Fuel Trim Lean during Idling/Deceleration Bank 1	ECM	DTC P2177, P2179, P2187, or P2189
P2188	Fuel Trim Rich during Idling/Deceleration Bank 1	ECM	DTC P2178, P2180, P2188, or P2190
P2189	Fuel Trim Lean during Idling/Deceleration Bank 2	ECM	DTC P2177, P2179, P2187, or P2189
P2190	Fuel Trim Rich during Idling/Deceleration Bank 2	ECM	DTC P2178, P2180, P2188, or P2190
P2227	Barometric Pressure Sensor Range/Performance	ECM	DTC P2227, P2228, or P2229
P2228	Barometric Pressure Sensor Voltage Low	ECM	DTC P2227, P2228, or P2229
P2229	Barometric Pressure Sensor Voltage High	ECM	DTC P2227, P2228, or P2229
P2232	HO2S Signal Circuit Shorted to Heater Circuit Bank 1 Sensor 2	ECM	DTC P2232 or P2235
P2235	HO2S Signal Circuit Shorted to Heater Circuit Bank 2 Sensor 2	ECM	DTC P2232 or P2235
P2270	O2 Sensor Lean/Rich Switch Signal Malfunction Bank 1 Sensor 2	ECM	DTC P2270 or P2272 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Lean Bank 1 Sensor 2		DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine

P2271	O2 Sensor Rich/Lean Switch Signal Malfunction Bank 1 Sensor 2	ECM	DTC P2271 or P2273 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Rich Bank 1 Sensor 2		DTC P0133, P0134, P0140, P1133, P2270, or P2271 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2272	O2 Sensor Lean/Rich Switch Signal Malfunction Bank 2 Sensor 2	ECM	DTC P2270 or P2272 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Lean Bank 2 Sensor 2		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2273	O2 Sensor Rich/Lean Switch Signal Malfunction Bank 2 Sensor 2	ECM	DTC P2271 or P2273 for the 2.8L, 3.0L, 3.2L, or 3.6L engine
	HO2S Signal Stuck Rich Bank 2 Sensor 2		DTC P0153, P0154, P0160, P1153, P2272, or P2273 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2300	Ignition Coil Cylinder 1 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2301	Ignition Coil Cylinder 1 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2303	Ignition Coil Cylinder 2 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2304	Ignition Coil Cylinder 2 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2306	Ignition Coil Cylinder 3 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2307	Ignition Coil Cylinder 3 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2309	Ignition Coil Cylinder 4 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2310	Ignition Coil Cylinder 4 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316

P2312	Ignition Coil Cylinder 5 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2313	Ignition Coil Cylinder 5 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2315	Ignition Coil Cylinder 6 Circuit Low Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2316	Ignition Coil Cylinder 6 Circuit High Voltage	ECM	DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316
P2500	Generator L-Terminal Circuit Low Voltage	ECM	DTC P1668, P2500, or P2501
P2501	Generator L-Terminal Circuit High Voltage	ECM	DTC P1668, P2500, or P2501
P250A	Engine Oil Level Sensor Circuit	ECM	DTC P250A
P2534	Ignition 1 Switch Circuit Low Voltage	TCM	• DTC P2534 for the 4L60-E/4L65-E/4L70-E transmission • DTC P2534 for the 5L40-E/5L50-E transmission • DTC P2534 for the 6L50/6L80/6L90 transmission
P2544	Transmission Torque Request Circuit	ECM	DTC P2544 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P2544 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
		TCM	DTC P2544 for the 5L40-E/5L50-E transmission
P2610	Control Module Ignition Off Timer Performance	ECM	DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 for the 2.8L, 3.0L, 3.2L, or 3.6L engine or DTC P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, or P2610 for the 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engine
P2636	Fuel Transfer Pump Flow Insufficient	ECM	DTC P2636
	Transmission Torque Delivered

DTC Symptom Description

A DTC symptom is a 2-digit number which adds additional detail to a DTC. The DTC symptom provides additional information without requiring a large increase in the number of new DTCs.

DTC Symptom Categories

The DTC symptom is made up of 2 alphanumeric digits. The first digit following the DTC indicates the DTC symptom category. There are 16 possible categories available in the range of 0 through the letter F. Currently there are 8 categories in use, 0 through 7. These 8 categories together with their definitions are given below.

Category Number	Category Name	Category Description
0	General Electrical Failures	This category includes standard wiring failure modes, direct current quantities related by Ohm's Law and quantities related to amplitude, frequency or rate of change, and wave shape.
1	Additional General Electrical Failures	This category includes the overflow from the previous category.
2	FM/PWM (Frequency/Pulse Width Modulated) Failures	This category includes faults related to frequency modulated and pulse width modulated inputs and outputs of the electronic control module (ECU). This category also includes faults where position is determined by counts.
3	ECU Internal Failures	This category includes faults related to memory, software, and internal electrical circuitry; requiring ECU replacement.
4	ECU Programming Failures	This category includes faults related to operational software, calibrations, and options, remedied by programming the ECU.
5	Algorithm Based Failures	This category includes faults based on comparing two or more input parameters for plausibility or comparing a single parameter to itself with respect to time.
6	Mechanical Failures	This category includes faults detected by inappropriate motion in response to an ECU controlled output.
7	Bus Signal/Message Failures	This category includes faults related to bus hardware and signal integrity. This category is also used when the physical input for a signal is located in one ECU and another ECU diagnoses the circuit.
8-F	Reserved by Document	Not in use at this time.

DTC Symptom Subtypes

The second digit of the DTC symptom is the subtype of the DTC symptom. These subtypes and their categories, together with their definitions, are given in the following table. DTC symptom 00 is a special case. If 00 is displayed, only the base code number and its description apply.

Information regarding the fault will be provided in the code setting criteria.

Example

The DTC symptoms associated with each DTC provide more information about the fault that caused that DTC. An example of a DTC displayed can be B1451 05 where the B1451 is the DTC, and 05 after the space represents the DTC symptom. While the DTC indicates that the fault is in the accessory power circuit, this DTC symptom indicates the circuit is shorted to battery or open. Another possible symptom for this code is B1451 02, where B1451 indicates the accessory power circuit, and 02 indicates the circuit is shorted to ground.

DTC Symptom	DTC Symptom Description
00	No Additional Information
01	Short to Battery
02	Short to Ground
03	Voltage Below Threshold
04	Open Circuit
05	Short to Battery or Open
06	Short to Ground or Open
07	Voltage Above Threshold
08	Signal Invalid
09	Rate of Change Above Threshold
0A	Rate of Change Below Threshold
0B	Current Above Threshold
0C	Current Below Threshold
0D	Resistance Above Threshold
0E	Resistance Below Threshold
0F	Erratic
10	Reserved
11	Above Maximum Threshold
12	Below Minimum Threshold
13	Voltage Low/High Temperature
14	Voltage High/Low Temperature
15	Signal Rising Time Failure
16	Signal Falling Time Failure
17	Signal Shape/Waveform Failure
18	Signal Amplitude Less Than Minimum
19	Signal Amplitude Greater Than Maximum
1A	Bias Level Out of Range
1F	Intermittent
21	Incorrect Period
22	Low Time Less Than Minimum
23	Low Time Greater Than Maximum

24	High Time Less Than Minimum
25	High Time Greater Than Maximum
26	Frequency Too Low
27	Frequency Too High
28	Incorrect Frequency
29	Too Few Pulses
2A	Too Many Pulses
2B	Missing Reference
2C	Reference Compare Error
31	General Checksum Failure
32	General Memory Failure
33	Special Memory Failure
34	RAM Failure
35	ROM Failure
36	EEPROM Failure
37	Watchdog/Safety Processor Failure
38	Supervision Software Failure
39	Internal Electronic Failure
41	Operational Software/Calibration Data Set Not Programmed
42	Calibration Data Set Not Programmed
43	EEPROM Error
44	Security Access Not Activated
45	Variant Not Programmed
46	Vehicle Configuration Not Programmed
47	VIN Not Programmed
48	Theft/Security Data Not Programmed
49	RAM Error
4A	Checksum Error
4B	Calibration Not Learned
51	Calculation Failure
52	Compare Failure
53	Temperature Low
54	Temperature High
55	Expected Number of Transitions/Events Not Reached
56	Allowable Number of Transitions/Events Exceeded
57	Expected Reaction After Event Did Not Occur
58	Incorrect Reaction After Event
59	Circuit/Component Protection Time-Out
61	Actuator Stuck
62	Actuator Stuck Open

63	Actuator Stuck Closed
64	Actuator Slipping
65	Emergency Position Not Reachable
71	Invalid Serial Data Received (Signal Validity Bit Indicates Failure)
72	Alive Counter Incorrect/Not Updated
73	Parity Error
74	Value of Signal Protection Calculation Incorrect
75	Signal Above Allowable Range
76	Signal Below Allowable Range
7F	Erratic

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Propeller Shaft Rubber Coupling to Propeller Shaft Retaining Bolts and Nuts.	20 N-m +55°	15 lb ft +55°
Centre Bearing to Body Retaining Bolts.	22 N-m	16 lb ft
Propeller Shaft Rubber Coupling to Propeller Shaft Yoke Retaining Bolts and Nuts.	20 N-m +55°	15 lb ft +55°
Propeller Shaft Coupling to Differential Flange Retaining Bolts.	115 N-m	85 lb ft
Propeller Shaft Rubber Coupling to Transmission Flange Retaining Bolts and Nuts (torque bolt, hold nut).	100 N-m	72 lb ft

Adhesives, Fluids, Lubricants, and Sealers

Application	Type of Material
Slip Yoke Splines	Molybdenum Disulphide Grease

Diagnostic Starting Point - Propeller Shaft

Begin the system diagnosis by reviewing Propeller Shaft Description and Operation. Reviewing the description and operation information will help you determine the correct symptom and diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Propeller Shaft, in order to identify the correct procedure for diagnosing the system and where the procedure is located.

Knock or Clunk Noise

Checks	Action
DEFINITION: Knocking or clunking noise occurs when operating the vehicle in high gear or coasting in neutral at 16 km/h (10 mph).	
The universal joint is worn or damaged.	Replace the complete propeller shaft. Refer to Propeller Shaft Replacement .
The rubber coupling is damaged.	Replace the rubber coupling. Refer to Rear Propeller Shaft Coupling Replacement .
The rubber coupling to propeller shaft retaining bolts and nuts are loose.	Tighten the bolts to specifications. Refer to Fastener Tightening Specifications .
The rubber coupling is damaged.	Replace the rubber coupling. Refer to Rear Propeller Shaft Coupling Replacement .
The center bearing is damaged.	Replace the center bearing. Refer to Propeller Shaft Center Support Bearing Replacement .
The side gear in the differential is worn or oversize.	Replace the differential case and/or the side gears. Refer to Differential Replacement .

Scraping Noise

Checks	Action
DEFINITION: A scraping noise occurs when driving the vehicle at various speeds.	
The heat shield, exhaust or other part is touching the propeller shaft.	Correct the interference as necessary.
The pinion flange slinger or the centre bearing is rubbing.	Correct the interference as necessary.

Shudder on Acceleration at Low Speed

Checks	Action
DEFINITION: When the vehicle is accelerating at low speed a shudder occurs.	
The centre bearing rubber cushion is worn or damaged.	Replace the centre bearing assembly. Refer to Rear Propeller Shaft Coupling Replacement .
The universal joint is worn, damaged or too stiff.	Replace the centre bearing assembly. Refer to Universal Joint Replacement .
The rubber coupling to propeller shaft retaining nuts and bolts are loose.	Tighten the rubber coupling to propeller shaft retaining nuts and bolts to specifications. Refer to Fastener Tightening Specifications .
The angle across the universal joints is too high.	Determine the cause of the excessive driveline angle. Check engine and transmission mounts, centre bearing mounting bracket, subframe and differential mounts.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Propeller Shaft | Diagnostic Information and Procedures | **Document ID: 1987141**

Squeak Noise

Checks	Action
DEFINITION: When driving the vehicle at various speeds a squeaking sound occurs.	
The universal joint is worn or damaged.	Replace the complete propeller shaft. Refer to Propeller Shaft Replacement.

Symptoms - Propeller Shaft

Before beginning diagnosis, review the system Description and Operation in order to familiarise yourself with the system function. Refer to Propeller Shaft Description and Operation.

Classifying the Symptom

Propeller Shaft symptoms can usually be classified into the following categories:

- Noises.
- Vibrations.

Visual/Physical Inspection

- Inspect the system for aftermarket devices which could affect the operation of the propeller shaft.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Universal Joint Noise.
- Ping, Snap, or Click Noise.
- Knock or Clunk Noise.
- Scraping Noise.
- Squeak Noise.

Universal Joint Noise

Problem	Action
The universal joint is worn or damaged.	Replace the complete propeller shaft. Refer to Propeller Shaft Replacement.
The universal joint has lost lubricant.	Replace the complete propeller shaft. Refer to Propeller Shaft Replacement.
The rubber coupling to transmission or differential flange retaining bolts and/or nuts are loose.	Tighten the bolts to specifications. Refer to Fastener Tightening Specifications.

Propeller Shaft Replacement

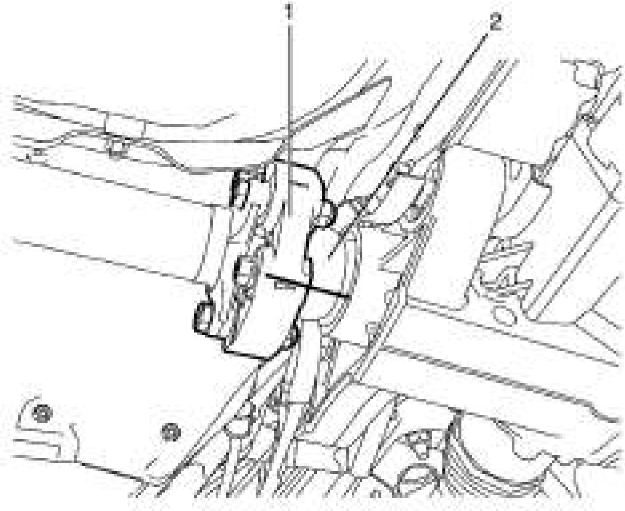
Removal Procedure

1. Select park/1st gear position in the transmission and apply the park brake.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

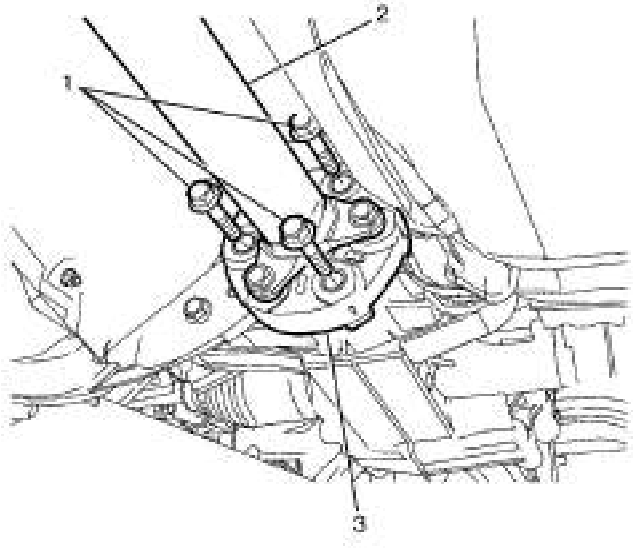
   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
4. Remove the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center .



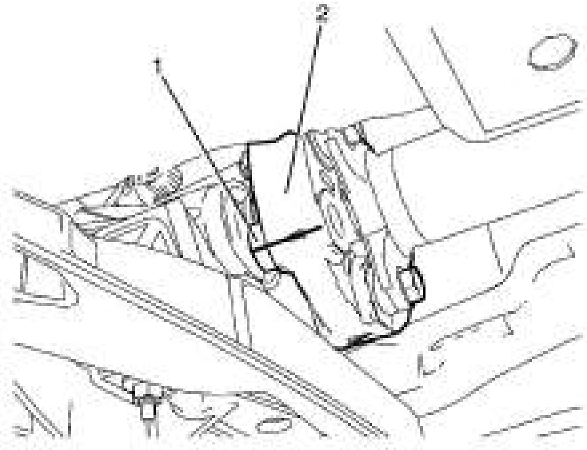
Important: Observe the orientation of the rubber couplings with reference to the differential flange and the transmission flange. This will minimise the potential of incorrect propeller shaft installation.

5. Mark the rubber coupling (1) in relation to the differential flange (2).



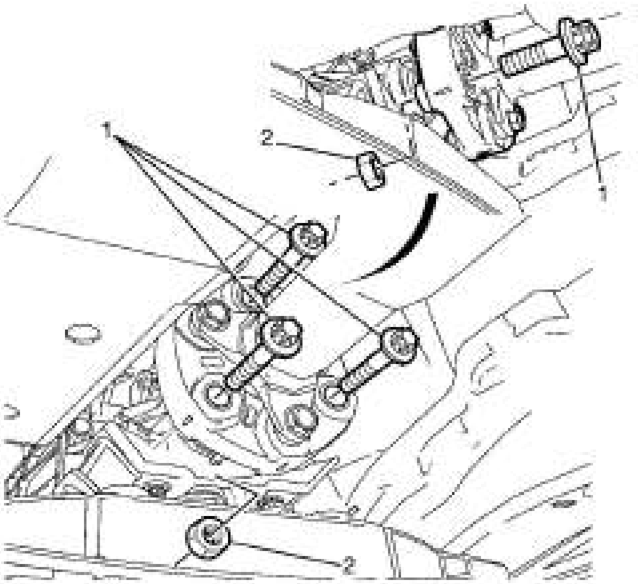
Important: With the aid of an assistant or suitable jack support the propeller shaft (2).

6. Remove the rubber coupling to differential flange retaining bolts (1).



Important: Observe the orientation of the rubber couplings with reference to the differential flange and the transmission flange. This recommendation will minimise the potential of incorrect propeller shaft installation.

7. Mark the rubber coupling (2) in relation to the transmission flange (1).

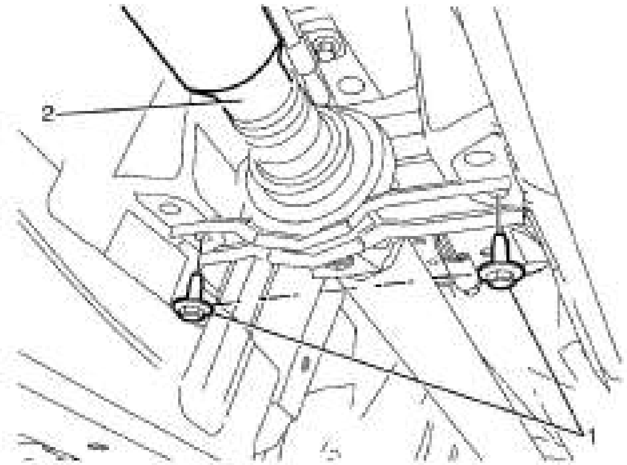


Important: With the aid of an assistant or suitable jack support the propeller shaft.

Important: Torque prevailing nuts with are single use parts and must be discarded after removal.

8. Remove the rubber coupling to transmission flange retaining bolts (1) and torque prevailing nuts (2).

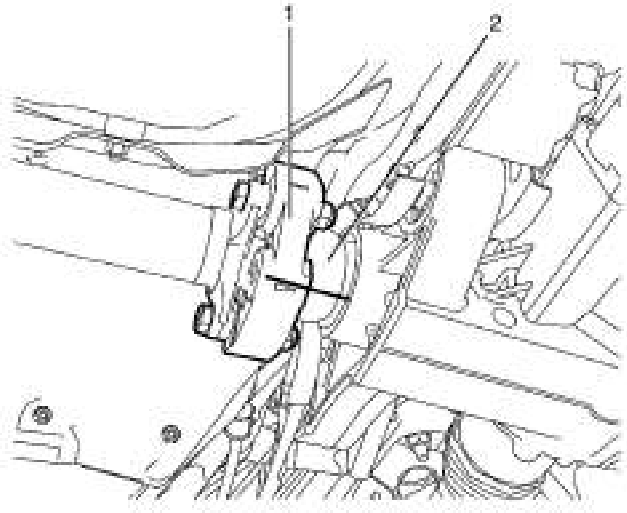
   Discard the nuts.



Important: With the aid of an assistant or suitable jack support the propeller shaft (2).

9. Remove the centre bearing to body retaining bolts (1).
10. Disconnect the propeller shaft (2) from the differential flange.
11. Remove the propeller shaft (2) from the vehicle.
12. Inspect the propeller shaft (2) assembly for excessive wear and/or damage. Inspect the following:
    - Propeller shaft. For replacement refer to Propeller Shaft Replacement .
    - Rubber coupling. For replacement refer to Rear Propeller Shaft Coupling Replacement .
    - Centre bearing. For replacement refer to Propeller Shaft Center Support Bearing Replacement .
    - Universal joint. For replacement refer to Universal Joint Replacement .

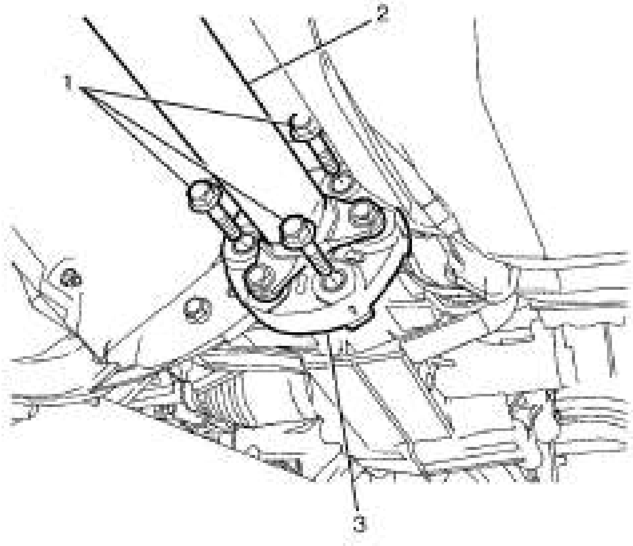
Installation Procedure



Important: Align the marks on the rubber coupling (1) to differential flange (2) made prior to removal.

1. Connect the rubber coupling (1) to the differential flange (2).

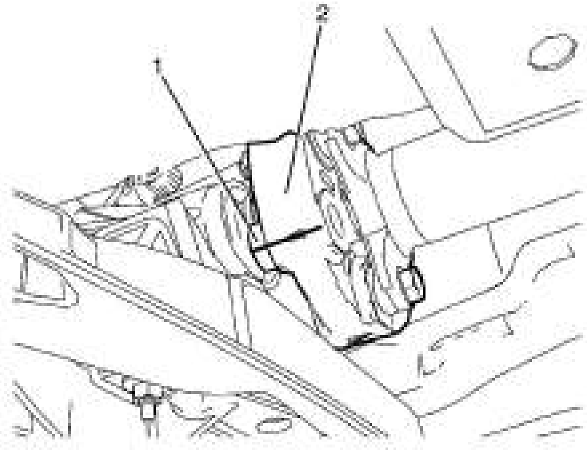
Notice: Refer to Fastener Notice in the Preface section.



Important: With the aid of an assistant or suitable jack support the propeller shaft (2) to the differential flange (3).

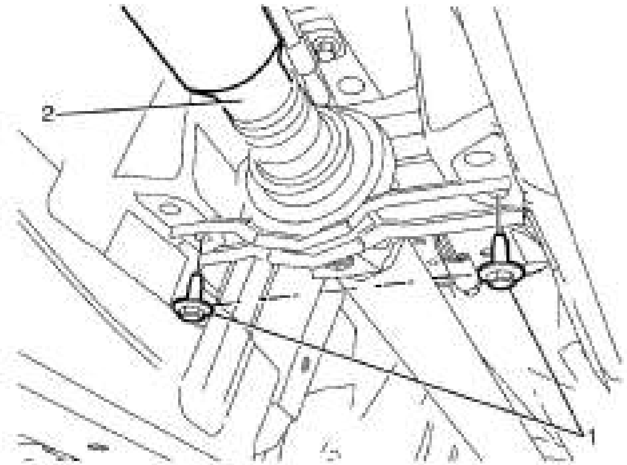
2. Install the rubber coupling to differential flange retaining bolts (1).

Tighten
Tighten the bolts to 115 N-m (85 lb ft).



Important: Align the marks on the rubber coupling (2) to transmission flange (1) made prior to removal.

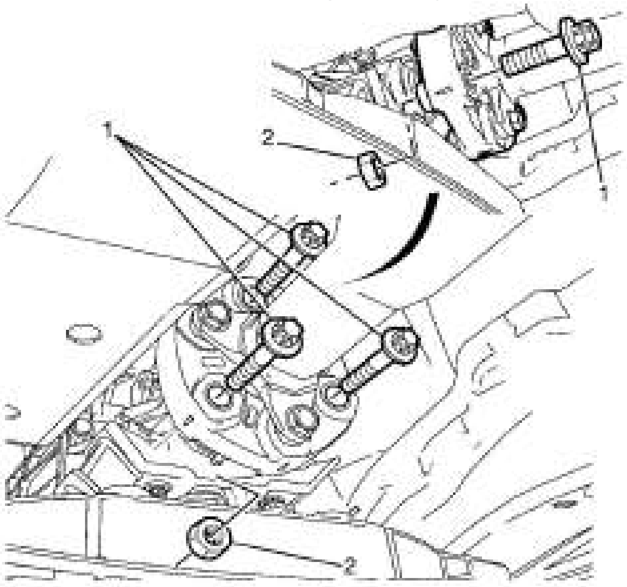
3. Connect the rubber coupling (2) to transmission flange (1).



Important: With the aid of an assistant or suitable jack support the propeller shaft (2).

Important: The centre bearing to body retaining bolts (1) must not be fully tightened at this stage.

4. Install the centre bearing to body retaining bolts (1).

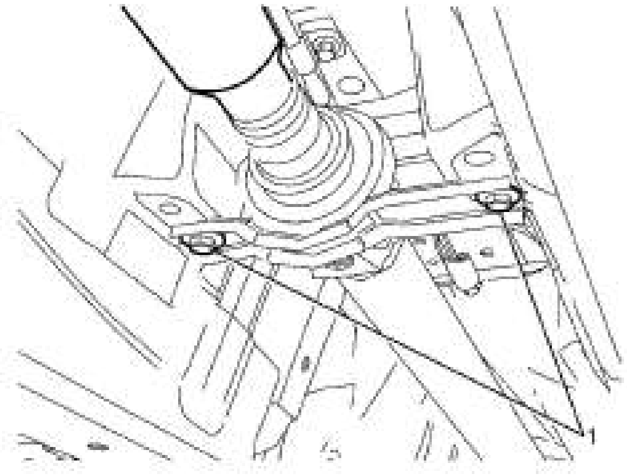


Important: With the aid of an assistant or suitable jack support the propeller shaft.

5. Install the rubber coupling to transmission flange bolts (1) and NEW torque prevailing nuts (2).

Tighten

Tighten the bolts and nuts to 100 N-m (72 lb ft).



6. Tighten the centre bearing to body retaining bolts (1).

   Tighten

   Tighten the bolts to 22 N-m (16 lb ft).

7. Install the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center .
8. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
9. Remove the safety stands.
10. Lower the vehicle to the ground.

Two-Piece Propeller Shaft Replacement

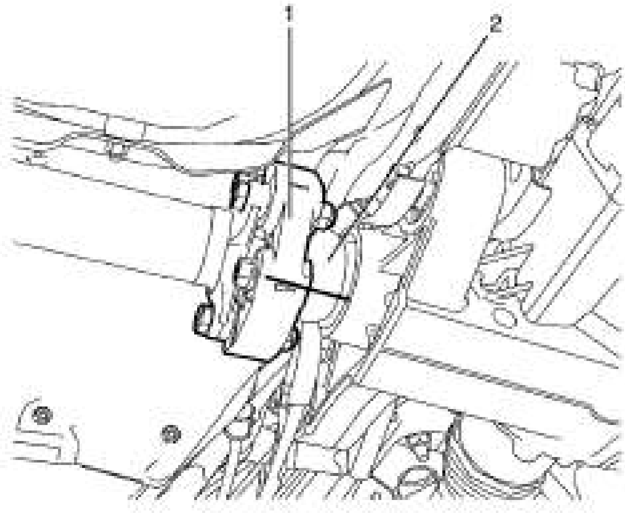
Removal Procedure

1. Select park/1st gear position in the transmission and apply the park brake.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

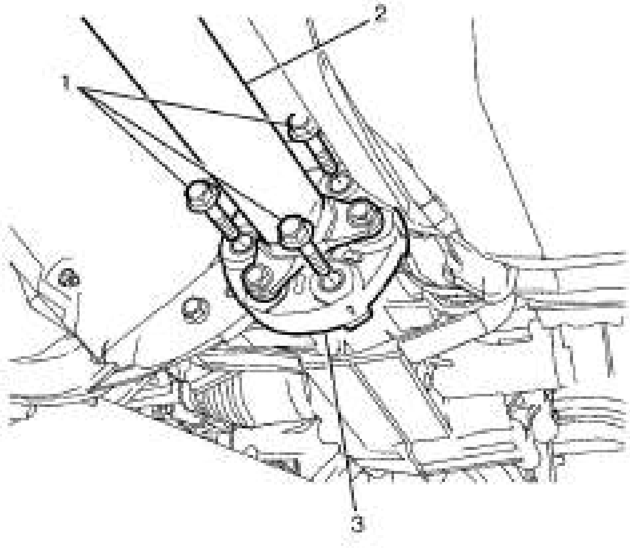
   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.
4. Remove the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center.



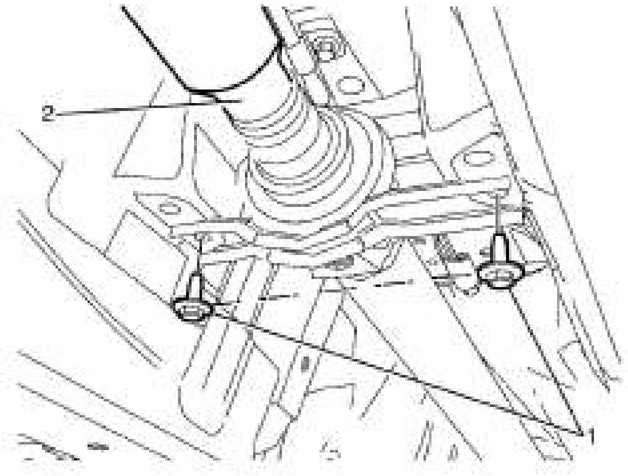
Important: Observe the orientation of the rubber couplings with reference to the differential flange and the transmission flange. This will minimise the potential of incorrect propeller shaft installation.

5. Mark the rubber coupling (1) in relation to the differential flange (2).



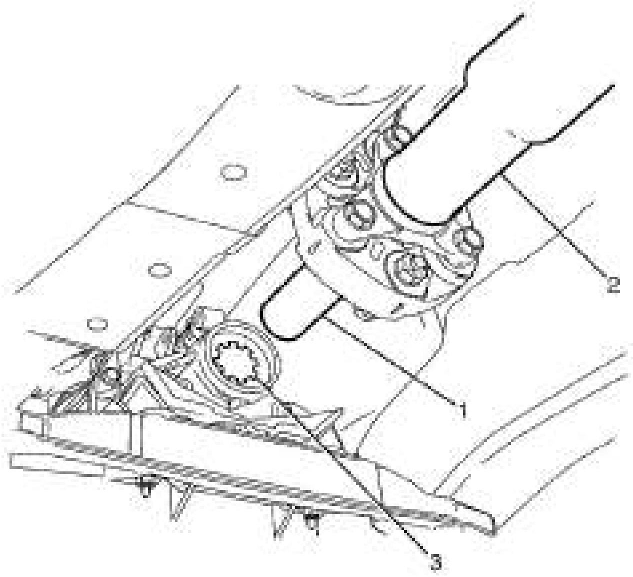
Important: With the aid of an assistant or suitable jack support the propeller shaft (2).

6. Remove the rubber coupling to differential bolts (1).



Important: With the aid of an assistant or suitable jack support the propeller shaft (2).

7. Remove the centre bearing to body retaining bolts (1).
8. Disconnect the propeller shaft (2) from the differential flange.
9. Place a suitable container under the transmission in order to collect draining fluid.



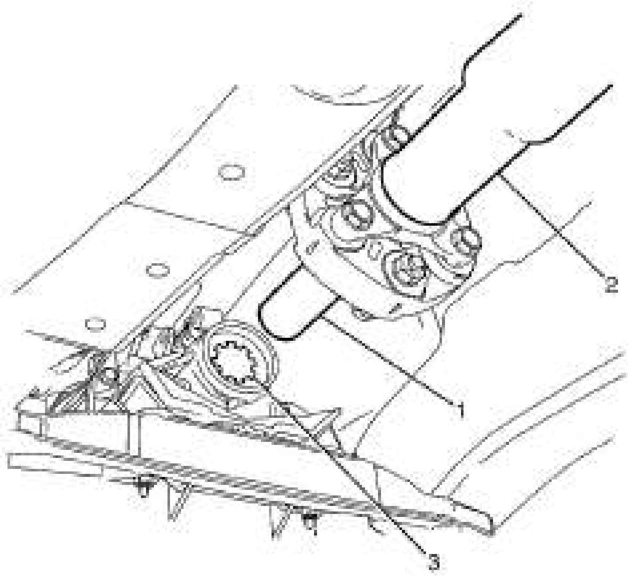
Important: Do not damage the oil seal when disconnecting the propeller shaft (2) from the transmission. Cuts or abrasions will damage the oil seal and result in lubricant leakage from this area.

Important: Support the propeller shaft front yoke (1) and move the propeller shaft (2) rearward to disconnect the propeller shaft front yoke (1) from the transmission shaft splines (3).

10. With the aid of an assistant remove the propeller shaft (2) from the vehicle.
11. Insert a suitable plug to the transmission shaft splines (3) to prevent loss of transmission lubricant.
12. Inspect the propeller shaft (2) for excessive wear and/or damage. Inspect the following:
    - Propeller shaft. For replacement refer to Propeller Shaft Replacement.
    - Rubber coupling. For replacement refer to Rear Propeller Shaft Coupling Replacement.
    - Centre Bearing. For replacement refer to Propeller Shaft Center Support Bearing Replacement.
    - Universal joint. For replacement refer to Universal Joint Replacement.

Installation Procedure

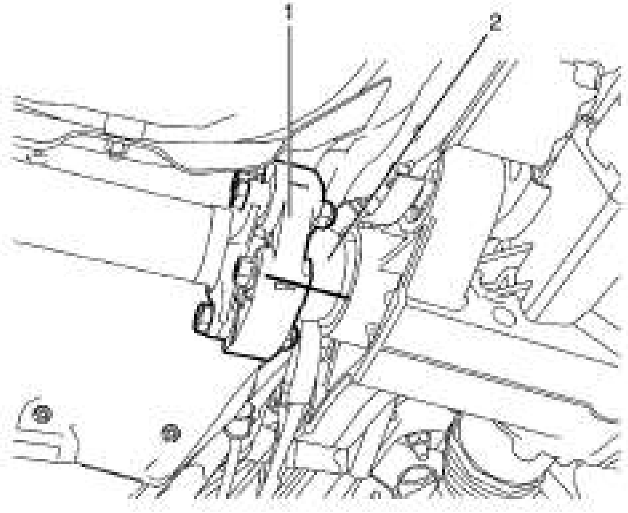
1. Remove the transmission plug installed prior to prevent loss of lubricant.



Important: Do not to damage the oil seal when installing the propeller shaft (2) to the transmission. Cuts or abrasions will damage the oil seal and result in lubricant leakage from this area.

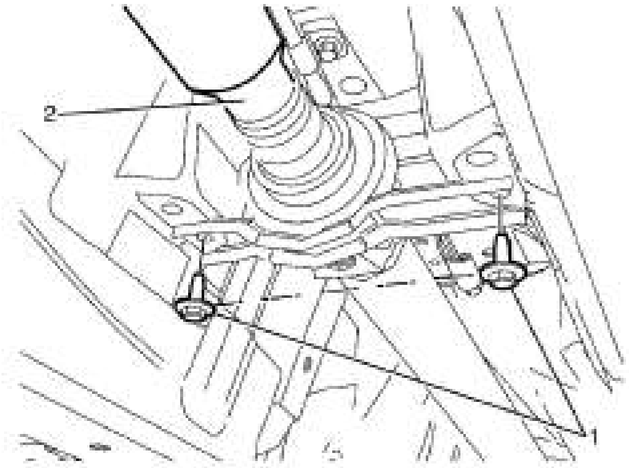
Important: Support the propeller shaft yoke (1) and install the propeller shaft (2) forward to connect the propeller shaft yoke (1) to the transmission output shaft splines (3).

2. With the aid of an assistant install the propeller shaft (2) to the transmission.



Important: Align the marks on rubber coupling (1) to the differential flange (2) made prior to removal.

3. Connect the rubber coupling (1) to the differential flange (2).

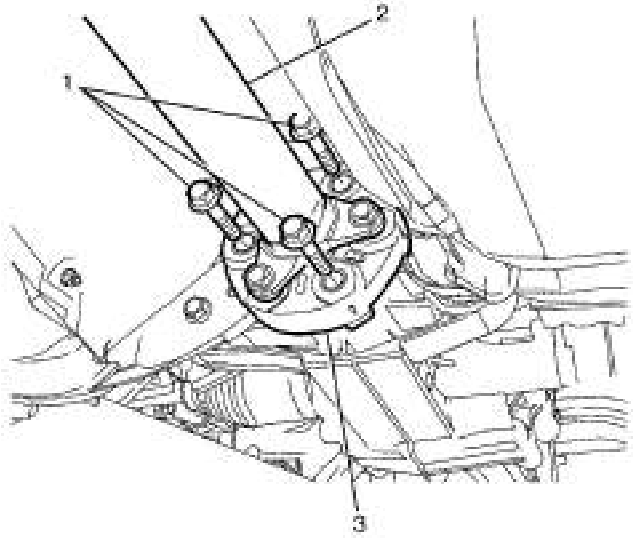


Important: With the aid of an assistant or suitable jack support the propeller shaft (2).

Important: The centre bearing to body retaining bolts (1) must not be fully tightened at this stage.

4. Install the centre bearing to body retaining bolts (1).

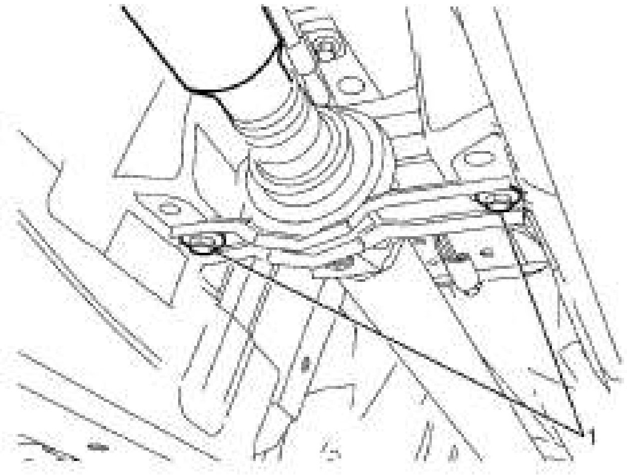
Notice: Refer to Fastener Notice in the Preface section.



Important: With the aid of an assistant or suitable jack support the propeller shaft (2) to the differential flange (3).

5. Install the rubber coupling to differential flange retaining bolts (1).

   Tighten
   Tighten the bolts to 115 N-m (85 lb ft).



6. Tighten the centre bearing to body retaining bolts (1).

   Tighten
   Tighten the bolts to 22 N-m (15 lb ft).

7. Install the propeller shaft heat shield. Refer to Exhaust Heat Shield Replacement - Center.
8. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.
9. Remove the safety stands.
10. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Propeller Shaft | Repair Instructions | **Document ID: 2005737**

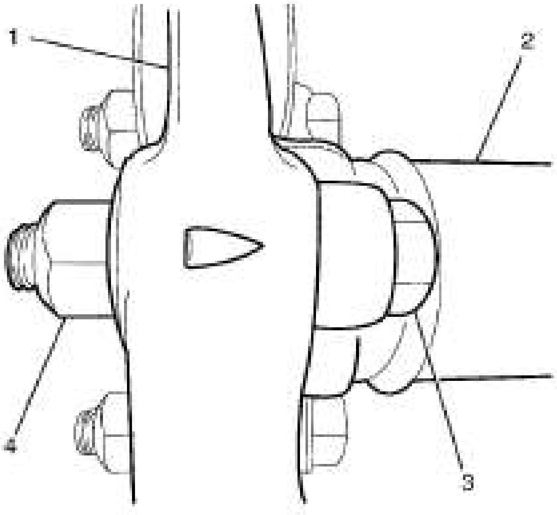
Rear Propeller Shaft Coupling Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the propeller shaft from the vehicle. Refer to Propeller Shaft Replacement.



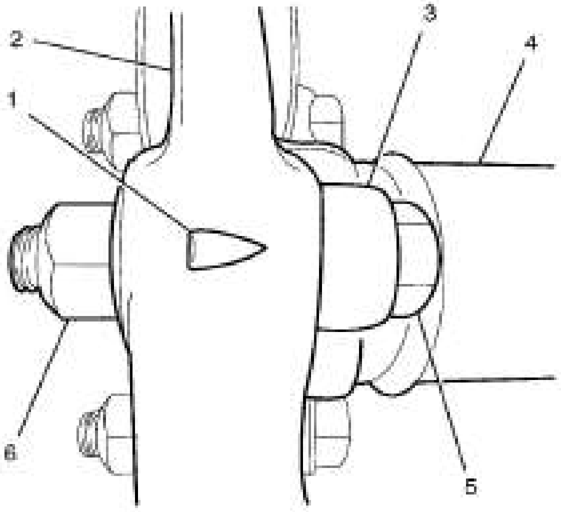
Important: Torque prevailing nuts with are single use parts and must be discarded after removal.

3. Remove the rubber coupling to propeller shaft retaining bolts (3) and torque prevailing nuts (4).

   Discard the nuts.

4. Remove the rubber coupling (1) from the propeller shaft (2).

Installation Procedure



Important: The triangular mark (1) on the rubber coupling (2) must face towards the propeller shaft flange lug (3).

1. Install the rubber coupling (2) to the propeller shaft (4).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the rubber coupling to propeller shaft retaining bolts (5) and NEW torque prevailing nuts (6).

   Tighten
   Tighten the bolts and nuts to 20 N-m +55° (15 lb ft +55°).

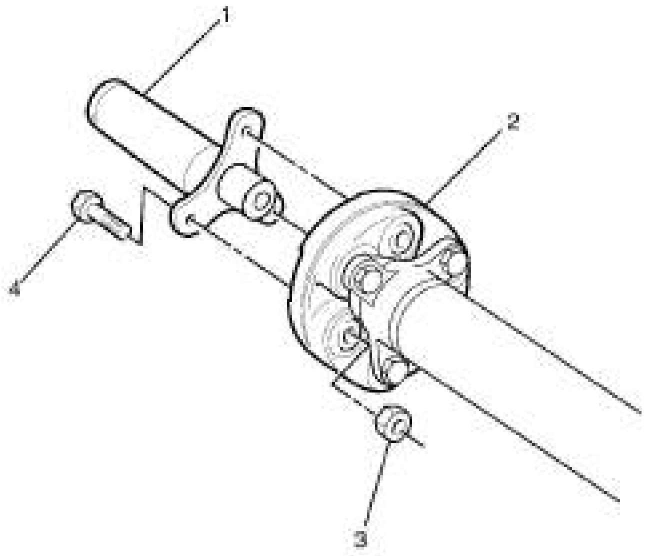
3. Install the propeller shaft to the vehicle. Refer to Propeller Shaft Replacement.
4. Remove the safety stands.
5. Lower the vehicle to the ground.

Removal Procedure - Front Slip Joint

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the propeller shaft from the vehicle. Refer to Propeller Shaft Replacement.

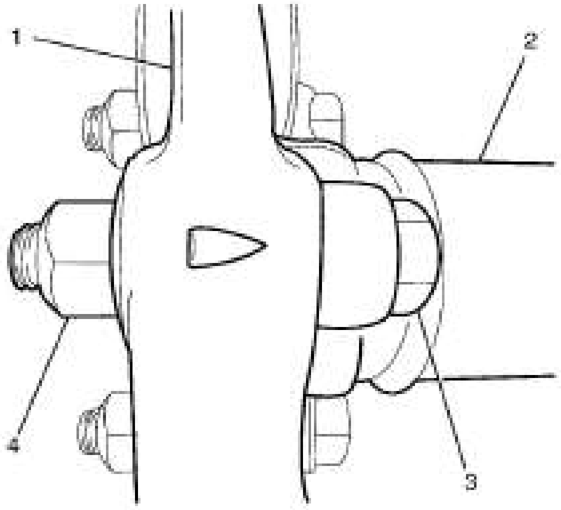


Important: Torque prevailing nuts with are single use parts and must be discarded after removal.

3. Remove the rubber coupling to propeller shaft yoke retaining bolts (4) and torque prevailing nuts (3).

   Discard the nuts.

4. Remove the propeller shaft yoke (1) from the rubber coupling (2).



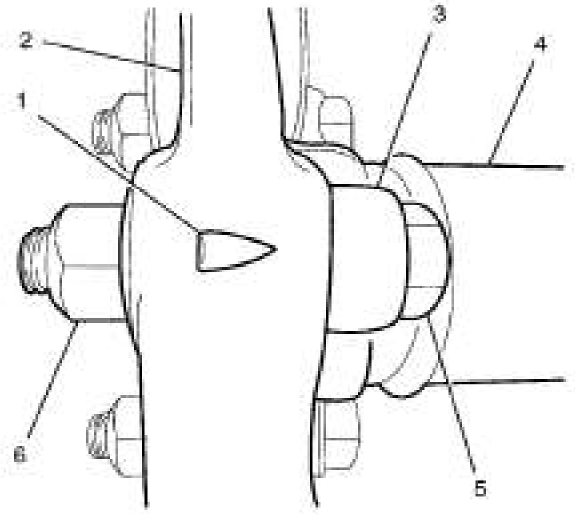
Important: Torque prevailing nuts with are single use parts and must be discarded after removal.

5. Remove the rubber coupling to propeller shaft retaining bolts (3) and torque prevailing nuts (4).

   Discard the nuts.

6. Remove the rubber coupling (1) from the propeller shaft (2).

Installation Procedure - Front Slip Joint



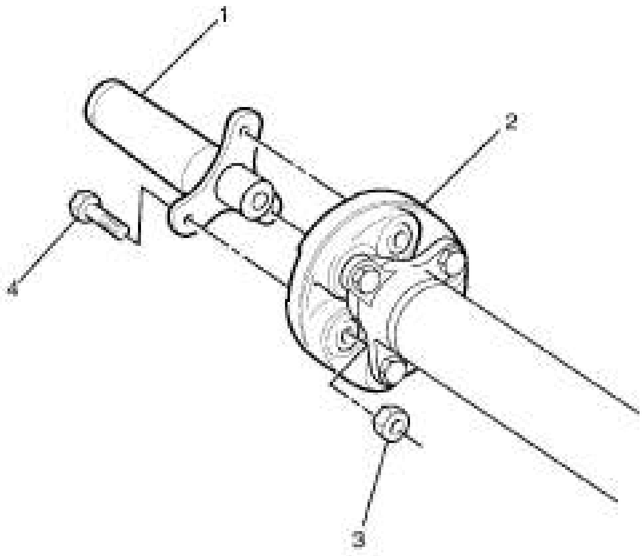
Important: The triangular mark (1) on the propeller shaft rubber coupling (2) must align with the propeller shaft flange lug (3).

1. Install the rubber coupling (2) to the propeller shaft (4).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the rubber coupling to propeller shaft retaining bolts (5) and NEW torque prevailing nuts (6).

   Tighten
   Tighten the bolts and nuts to 20 N-m +55° (15 lb ft +55°).



3. Install the propeller shaft yoke (1) to the rubber coupling (2).
4. Install the propeller shaft yoke to rubber coupling retaining bolts (4) and NEW torque prevailing nuts (3).

   Tighten
   Tighten the bolts and nuts to 20 N-m +55° (15 lb ft +55°).

5. Install the propeller shaft to the vehicle. Refer to Propeller Shaft Replacement.
6. Remove the safety stands.
7. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Propeller Shaft | Repair Instructions | **Document ID: 1997043**

Propeller Shaft Center Support Bearing Replacement

Tools Required

- J 21426 Installer.
- J-22912-01 Press Plates.
- J 22610 Keystone Pliers.
- J 5590 Bearing and Seal Driver.

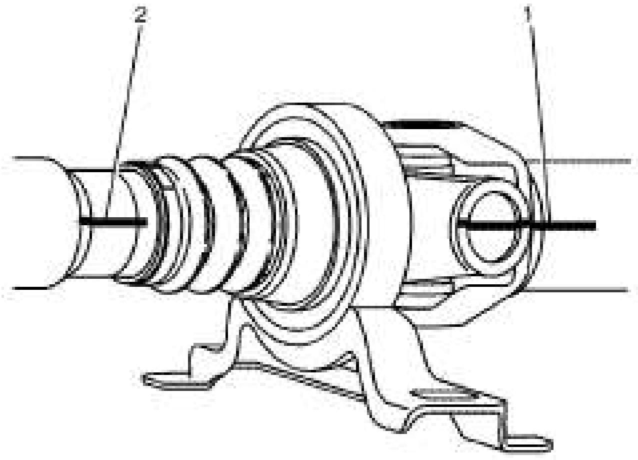
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the propeller shaft from the vehicle. Refer to Propeller Shaft Replacement .

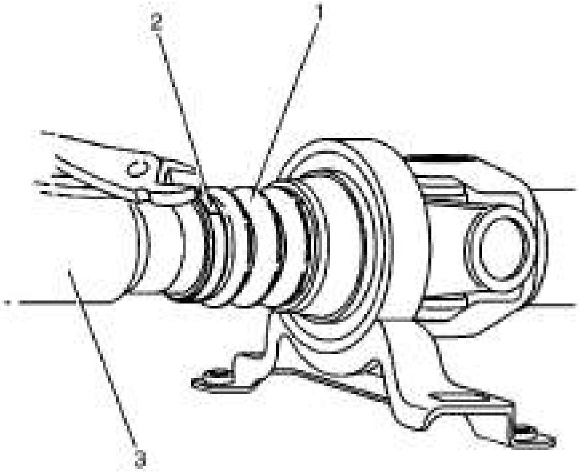
Notice: Refer to General Repair Instructions in the Preface section.



Important: Correct alignment during assembly is critical in order to maintain correct balance.

Important: The propeller shaft splines are not keyed, therefore, alignment marks are necessary for assembly.

3. Mark the position of the propeller shaft rear section (1) in relation to the propeller shaft front section (2).

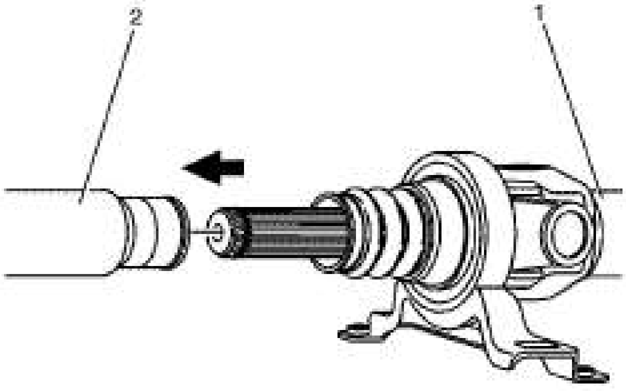


Important: The dust boot clamp is a single use part and must be discarded after use.

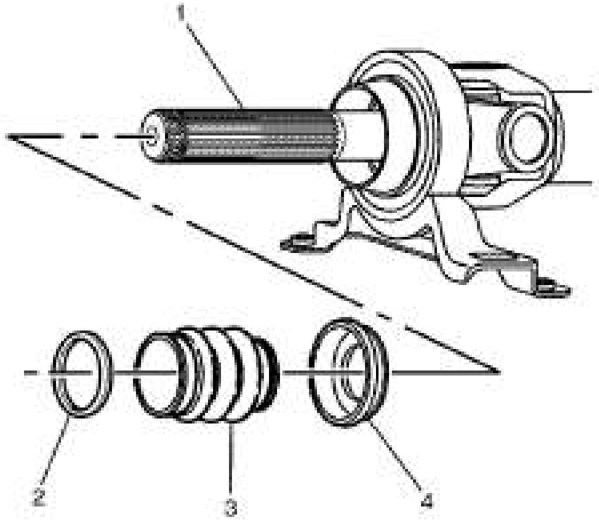
4. Remove the dust boot to propeller shaft front section clamp (2).

   Discard the dust boot clamp.

5. Detach the dust boot (1) from the propeller shaft (3).



6. Separate the propeller shaft rear section (1) from the propeller shaft front section (2).



Important: The spline retention O-ring (2) is a single use part and must be discarded after use.

7. Remove the spline retention O-ring (2) from the propeller shaft (1).

   Discard the spline retention O-ring.

   Important: The dust boot (3) is a single use part and must be discarded after use.

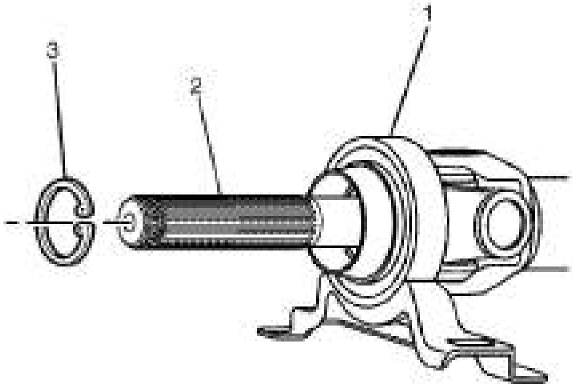
8. Remove the dust boot (3) from the propeller shaft (1).

   Discard the dust boot.

   Important: The centre bearing slinger (4) is a single use part and must be discarded after use.

9. Remove the centre bearing slinger (4) from the propeller shaft (1).

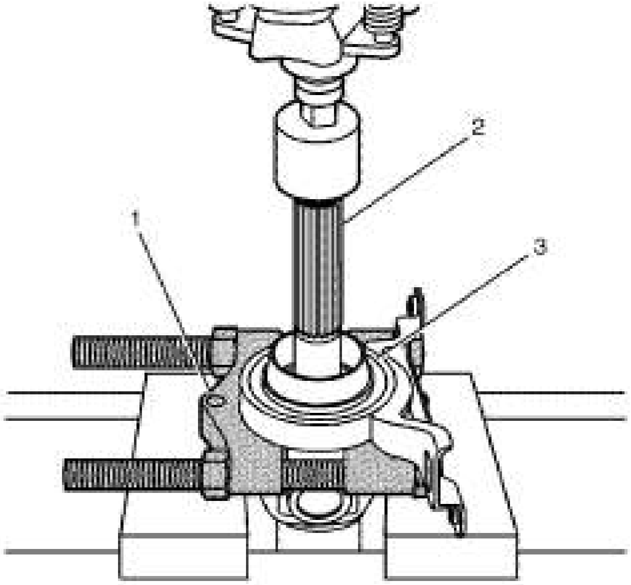
   Discard the centre bearing slinger.



Important: The circlip (3) is a single use part and must be discarded after use.

10. Remove the propeller shaft (2) to centre bearing (1) retaining circlip (3).

    Discard the circlip.

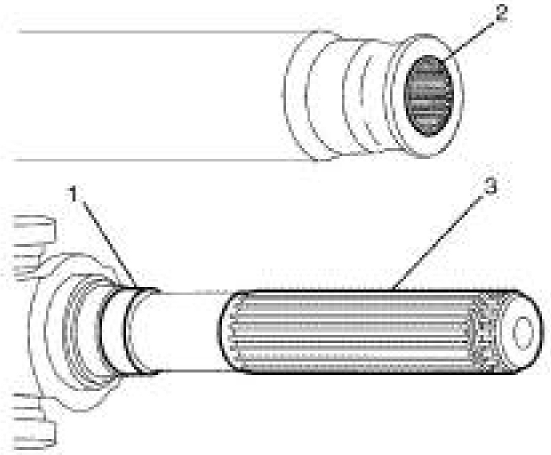


Important: Observe the orientation and depth of the centre bearing (3) in relation to the propeller shaft (2).

Important: Install the J-22912-01 (1) to the rear propeller shaft (2) behind the centre bearing (3). Place the rear propeller shaft (2) in a suitable press and remove the centre bearing (3).

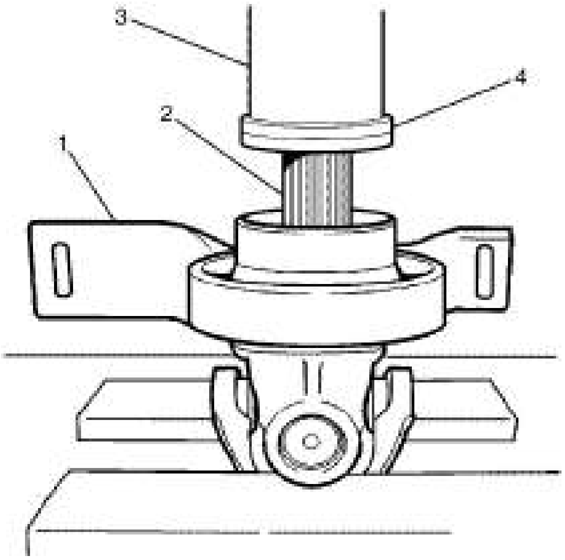
11. Remove the centre bearing (3) from the propeller shaft (2).

Clean and Inspect



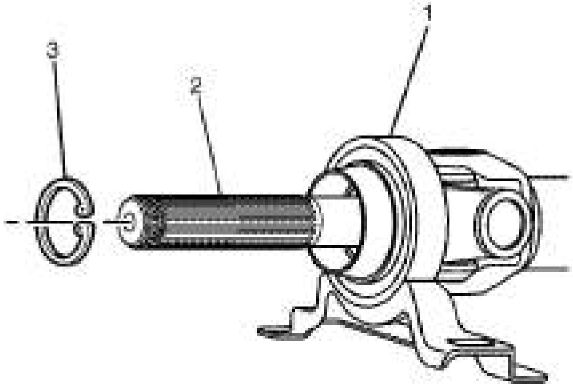
1. Clean the grease from the front propeller shaft spline (2) and rear propeller shaft spline (3).
2. Check the front propeller shaft spline (2) and rear propeller shaft spline (3) for damage and/or wear.
3. Remove any corrosion or debris from the bearing area (1).

Installation Procedure

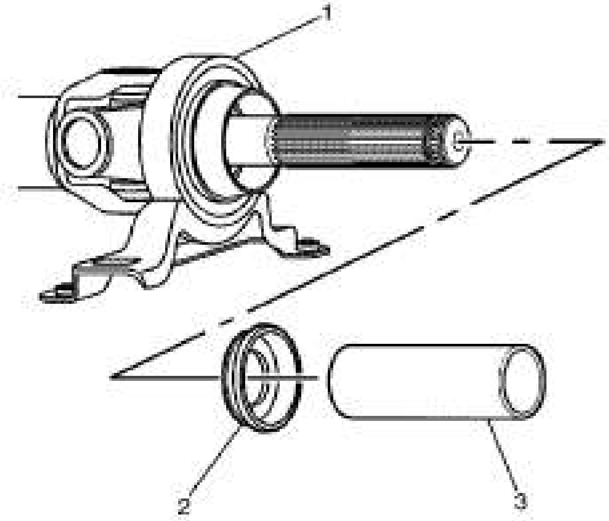


Important: Use a suitable press to install the centre bearing (1) with J 5590 Bearing and Seal Driver (3) and adaptor (4) until it seats and the circlip groove is visible.

1. Install the centre bearing (1) to the propeller shaft (2).

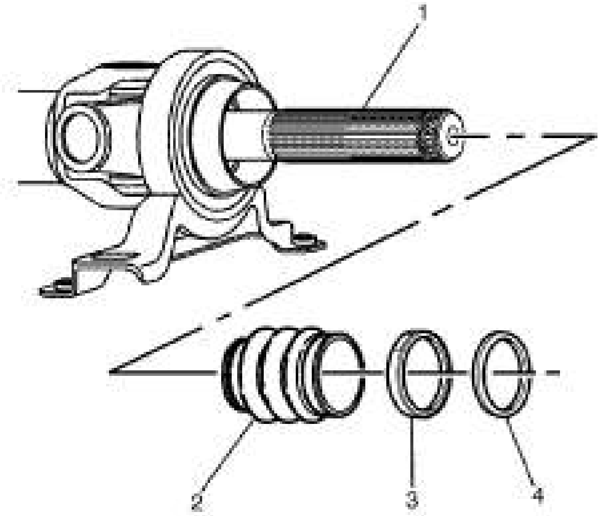


2. Install the propeller shaft (2) to centre bearing (1) NEW retaining circlip (3).



Important: Install the centre bearing slinger (1) with J 21426 (3) until it seats fully onto the centre bearing (1).

3. Install the NEW centre bearing slinger (2).



Important: Lubricate the propeller shaft splines (1) with 1-2 grams of molybdenum disulphide grease. Refer to Adhesives, Fluids, Lubricants, and Sealers .

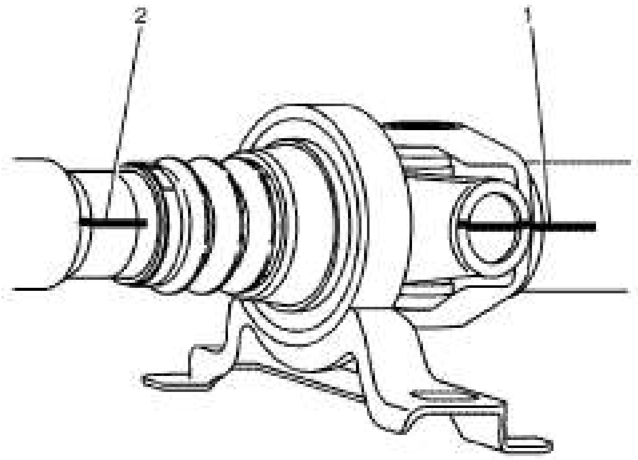
4. Lubricate the propeller shaft splines (1).

Important: The NEW dust boot clamp (3) must not to be fully tightened at this stage.

5. Install the NEW dust boot (2) and NEW dust boot clamp (3) to propeller shaft rear section (1). Do not fully tighten the dust boot clamp.

Important: The O-ring must be located into the groove on the spline.

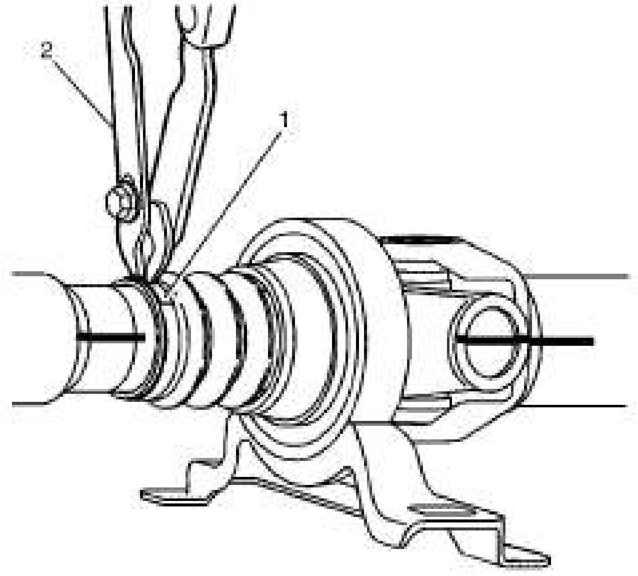
6. Install the NEW spline sealing O-ring (4) to the propeller shaft (1).



Important: Correct alignment during assembly is critical in order to maintain correct balance.

Important: Align the marks on the rear propeller shaft (1) and the front propeller shaft (2) made prior to ensure correct assembly balance.

7. Connect the propeller shaft rear section (1) to the propeller shaft front section (2).
8. Attach the NEW dust boot (3) to the propeller shaft front section (2).



9. Tighten the NEW dust boot clamp (1) using J 22610 keystone pliers (2).
10. Install the propeller shaft to the vehicle. Refer to Propeller Shaft Replacement .
11. Remove the safety stands.
12. Lower the vehicle to the ground.

Universal Joint Replacement

The cross type universal joint type is non-serviceable, as the bearing cups are set and retained by staking. This requires sophisticated equipment to make sure of concentricity of the installed universal joint. If the universal joint is worn or damaged replace complete propeller shaft. Refer to Propeller Shaft Replacement.

Propeller Shaft Description and Operation

The propeller shaft is a two piece tube supported by a sealed for life centre bearing and non-servicable universal joint. Only vehicles fitted with 4-speed transmissions have a splined slip yoke at the front of the propeller shaft which slides directly into the transmission. The splined slip yoke type propeller shaft has a sealed for life centre bearing and non-servicable universal joint. It has a rubber coupling at each end joining the propeller shaft to the transmission and the differential. All propeller shafts are fixed to the rubber couplings by 3 bolts and 3 torque prevailing nuts which are discarded when removed. Torque prevailing nuts have a low friction coating to ensure no damage to the coupling when assembled, correct nuts must be used. The rubber couplings are then mounted to the differential with 3 bolts and the transmission with 3 bolts and 3 torque prevailing nuts which are also discarded when removed. The centre bearing assembly is fixed to the body with 2 bolts. The two-piece propeller shaft is used to transmit power from the transmission to the differential. The centre bearing and rubber couplings are used to support and connect the propeller shaft and decrease vibration, noise and harshness.

Diagnostic Starting Point - Rear Drive Axle

Begin the system diagnosis by reviewing Rear Drive Axle Description and Operation. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Rear Drive Axle. In order to identify the correct procedure for diagnosing the system and where the procedure is located.

Symptoms - Rear Drive Axle

Before beginning diagnosis, review the system Description and Operation in order to familiarise yourself with the system function. Refer to Rear Drive Axle Description and Operation .

Symptom Identification

Important: Guide to typical rear axle noises, and common sources that are often confused with rear axle noise

- Rear Drive Axle Gears - typically a whine type noise occurs with drivetrain under load, and varies with vehicle and engine speed, and amount of throttle application. Other typical type of noise is a clunk which is most pronounced when the foot is abruptly lifted from the accelerator pedal, or when the pedal is abruptly depressed from its free position while driving at relatively low speeds.
- Rear Drive Axle Bearings - typically a grinding/growl type noise that does not vary with vehicle speed, but does vary with drivetrain load. Will also be apparent during coast, but will not if allowed to coast with transmission in neutral.
- Transmission Gears - whine type noise that typically does not occur when transmission gear is selected achieves a 1:1 ratio during driving.
- Transmission Bearings - typically a grinding/growl type noise that does not vary with vehicle speed, but does vary with drivetrain load. Will also be apparent during coast, but will not if allowed to coast with transmission in neutral.
- Tyres - typically a roar type noise, but can also present itself as a whine that varies with inflation pressure, tread condition and road surfac. Does not vary with vehicle speed, engine speed, or drivetrain load.
- Engine - typically a whine type noise, that is apparent at certain engine speeds regardless of whether driving vehicle or revving engine whilst vehicle is stationary.
- Wheel Bearing or Wheel Drive Shafts - typically a grinding/growl type noise and will be heard across entire vehicle speed range regardless of whether accelerating, decelerating. If vehicle is allowed to coast with transmission in neutral, and noise is still apparent then this is typically the cause.

Classifying the Symptom

Important: Very often, rear drive axles are considered noisy, when in reality, the noise is emanating from some other source, such as tyres, front wheel bearings, rear wheel bearings, manual transmission rear bearings, engine noises, muffler roar, automatic transmission or power steering pumps.

All rear drive axles have some slight humming noise. This will vary with the type of body construction, load and tyre pressure.

Noise which emanates from any one of these can quite easily be confused with a rear drive axle noise and unless a series of elimination tests are carried out to definately confirm the real source of the noise, differential assemblies may be, and often are replaced or repaired unnecessarily.

Differential symptoms can be classified into the following categories:

- Gear related noises.
- Bearing related noises.
- Fluid leaks.

Visual / Physical Inspection

- Inspect the system for aftermarket devices which could affect the operation of the differential.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Check for the correct lubricant level and the correct specification.
- Verify the exact operating conditions under which the concern exists. Note factors such as vehicle speed, road conditions, ambient temperature, and other specifics.
- Compare the driving characteristics or sounds, if applicable, to a known good vehicle and make sure you are not trying to correct a normal condition.

System Testing

1. Check the rear drive axle oil level.
2. If oil level is correct then check oil condition.

   Drain and fill as required.
3. If oil is in good condition check for foreign particle contamination.

   Drain and fill as required.
4. If oil is not contaminated with foreign particles then check oil for water contamination.

   Drain and fill as required.
5. If the oil is not contaminated with water, or if noise continues, then road test the vehicle.
6. Pre test: drive at low speed until thoroughly familiar with vehicle noises by which time the rear drive axle should have reached normal operating tempreture.
7. Determine driving conditions at which noise occurs: Accelerate with a light throttle from a low speed (use highest gear possible so as to avoid gear changes during the road test) to the maximum speed allowable (110km/h if possible). Release foot from accelerator and allow vehicle to coast to a stop. Listen and note any noises/issues heard/felt, and also record vehicle and engine speed, and whether accelerating or coasting when the condition occurs.
8. Eliminate transmission gear noise: Accelerate with a light throttle from the lowest speed possible whilst maintaining a 1:1 direct ratio to maximum speed allowable (110km/h if possible). Release foot from accelerator and coast to a stop. Listen and note any noises/issues heard/felt, and also record vehicle and engine speed, and whether accelerating or coasting when the condition occurs.
9. Investigate if noise if responsive to drive train load: Accelerate with a moderate throttle (load) from the lowest speed possible whilst maintaining a 1:1 direct ratio to a maximum speed allowable (110km/h if possible). Release foot from accelerator and coast with the transmission in neutral (this removes load from the rear drive axle) to a stop. Listen and note any noises/issues heard/felt, and also record vehicle and engine speed, and whether accelerating or coasting when the condition occurs.
10. Investigate if noise is related to tyres: Drive at same conditions on varying road surfaces, and safe to do so repeat with elevated tyre pressures.
11. Investigate if noise is related to engine: Note the vehicle RPM and speed where the condition occurs, when reaching the correct conditions, shift gears in order to change the engine RPM. note if noise is still evident, if it is not then generally not engine related.
12. If road test confirms likely rear drive axle noise, then repair or replace the unit as required.

Repair Instructions

- Rear Axle Lubricant Level Inspection
- Differential Oil Replacement
- Differential Replacement

Noisy in Drive

Cause	Correction
Important: Inspect the differential oil level prior to performing system diagnosis. Refer to Rear Axle Lubricant Level Inspection.	
Gear whine within Rear Drive Axle.	1. If oil level is correct then check the condition of the oil. Drain and fill as required. 2. If the oil is in good condition check for foreign particle contamination. Drain and fill as required. 3. If the oil is not contaminated with foreign particles then check for water contamination. Drain and fill as required. 4. If the oil is not contaminated with water, or if the noise continues, then road test the vehicle. 5. If result of the road test confirms likely Rear Drive Axle noise, then repair or replace the unit as required. If result of a road test confirms likely that noise is not related to the Rear Drive Axle, then refer to relevant component subsection for further diagnosis.
Bearing noise within Rear Drive Axle.	1. If oil level is correct then check the condition of the oil. Drain and fill as required. 2. If the oil is in good condition check for foreign particle contamination. Drain and fill as required. 3. If the oil is not contaminated with foreign particles then check for water contamination. Drain and fill as required. 4. If the oil is not contaminated with water, or if the noise continues, then road test the vehicle. 5. If result of the road test confirms likely Rear Drive Axle noise, then repair or replace the unit as required. If result of a road test confirms likely that noise is not related to the Rear Drive Axle, then refer to relevant component subsection for further diagnosis.

Intermittent Noise

Cause	Correction
Important: Inspect the differential oil level prior to performing system diagnosis. Refer to Rear Axle Lubricant Level Inspection .	
Worn or damaged differential mount and/or mounts.	Replace the differential mount and/or mounts as required. Refer to Differential Carrier Bushing Replacement - Rear in Rear Drive Axle.
Incorrect differential oil.	Replace with the correct differential oil. Refer to Lubrication Specifications .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Rear Drive Axle | Diagnostic Information and Procedures | **Document ID: 1978700**

Noisy When Coasting

Cause	Correction
Important: Inspect the differential oil level prior to performing system diagnosis. Refer to Rear Axle Lubricant Level Inspection.	
Gear whine noise within Rear Drive Axle.	1. If oil level is correct then check the condition of the oil. Drain and fill as required. 2. If the oil is in good condition check for foreign particle contamination. Drain and fill as required. 3. If the oil is not contaminated with foreign particles then check for water contamination. Drain and fill as required. 4. If the oil is not contaminated with water, or if the noise continues, then road test the vehicle. 5. If result of the road test confirms likely Rear Drive Axle noise, then repair or replace the unit as required. If result of a road test confirms likely that noise is not related to the Rear Drive Axle, then refer to relevant component subsection for further diagnosis.
Bearing noise within Rear Drive Axle.	1. If oil level is correct then check the condition of the oil. Drain and fill as required. 2. If the oil is in good condition check for foreign particle contamination. Drain and fill as required. 3. If the oil is not contaminated with foreign particles then check for water contamination. Drain and fill as required. 4. If the oil is not contaminated with water, or if the noise continues, then road test the vehicle. 5. If result of the road test confirms likely Rear Drive Axle noise, then repair or replace the unit as required. If result of a road test confirms likely that noise is not related to the Rear Drive Axle, then refer to relevant component subsection for further diagnosis.

Noisy on Turns

Cause	Correction
Important: Inspect the differential oil level prior to performing system diagnosis. Refer to Rear Axle Lubricant Level Inspection .	
Worn differential mount and/or mounts.	Replace the differential mounts and/or mounts as required. Refer to Differential Carrier Bushing Replacement - Rear .
Worn wheel drive shaft constant velocity joints.	Replace the constant velocity joints as required. Refer to Wheel Drive Shaft Inner Joint and Boot Replacement and Wheel Drive Shaft Outer Joint and Boot Replacement .
Worn wheel bearings.	Replace the wheel bearings as required. Refer to Wheel Bearings Diagnosis .
Incorrect differential oil.	Fill to the correct level with the correct differential oil. Refer to Lubrication Specifications and Rear Axle Lubricant Level Inspection .

Differential Carrier Bushing Replacement - Rear

Tools Required

AU-592 Bushing Remover/Installer.

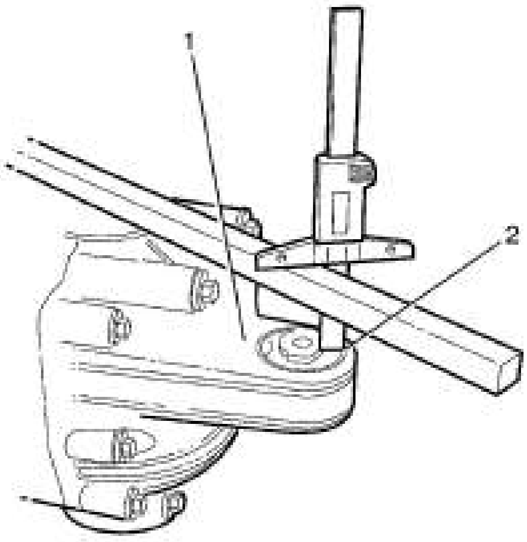
Important: All three bushings of the differential are different although they appear the same. Make sure that the correct part number is used. Mount orientation is critical for noise and vibration performance.

Removal Procedure-Rear Differential Carrier Assembly Bushing

Caution: Refer to Vehicle Lifting Caution in the Preface section.

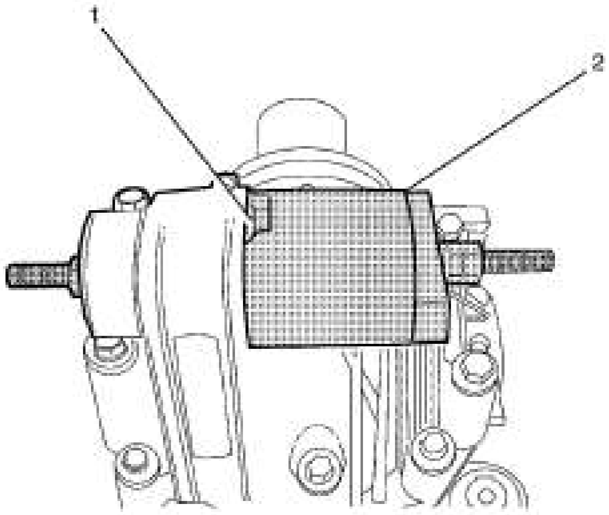
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove both rear wheel assemblies. Refer to Tire and Wheel Removal and Installation .
3. Disconnect the propeller shaft and rubber coupling from the differential flange. Refer to Propeller Shaft Replacement .
4. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
5. Remove both wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement .
6. Remove the differential assembly. Refer to Differential Replacement .



Important: Observe and mark the orientation of the rear bushing (1) with reference to the original position. This recommendation will minimise the potential of incorrect rear bushing installation.

7. Measure the installation depth of the rear bushing (2) in relation to the differential (1).

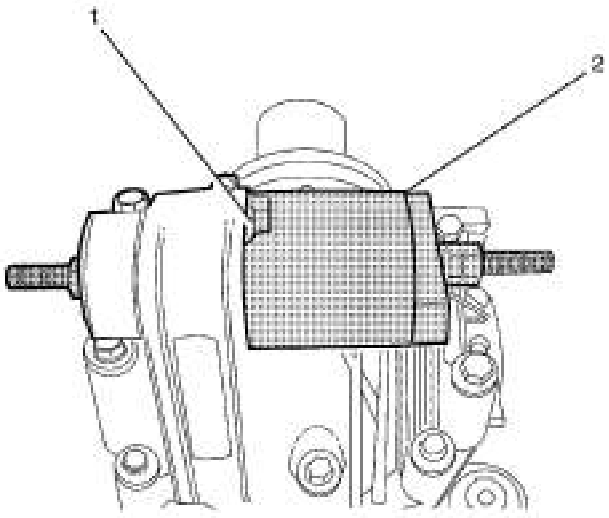


Important: The rear bushing (1) is a single use part and must be discarded after use.

8. Remove the rear bushing (1) from the differential using AU-592 (2).

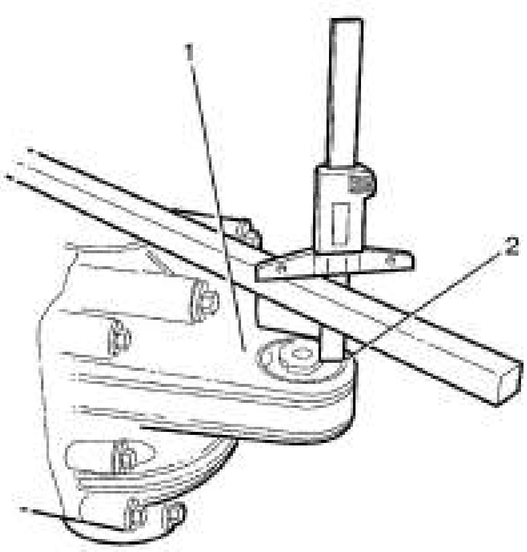
   Discard the rear bushing.

Installation Procedure-Rear Differential Carrier Assembly Bushing



Important: Before installing, the rear bushing (1) must be correctly aligned and oriented. Mount orientation is critical for noise and vibration performance. The depth to which the bushing is going to travel must also be maintained.

1. Pull the rear bushing (1) into the differential using the AU-592 (2).



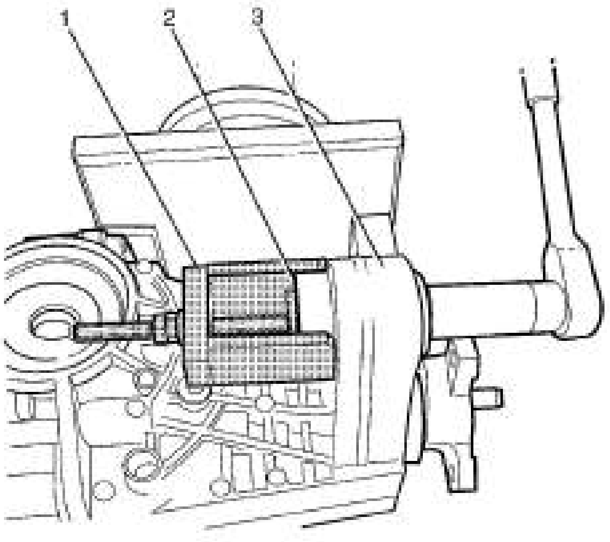
2. Pull the rear bushing (2) into the differential (1) until the measured installation depth is reached.
3. Install the differential assembly. Refer to Differential Replacement .
4. Connect the propeller shaft and rubber coupling to the differential flange. Refer to Propeller Shaft Replacement .
5. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
6. Install both wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement .
7. Install both rear wheel assemblies. Refer to Tire and Wheel Removal and Installation .
8. Remove the safety stands.
9. Lower the vehicle to the ground.

Removal Procedure-Front Right Differential Carrier Assembly Bushing

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove both rear wheel assemblies. Refer to Tire and Wheel Removal and Installation .
3. Disconnect the propeller shaft and rubber coupling from the differential flange. Refer to Propeller Shaft Replacement .
4. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
5. Remove both wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement .
6. Remove the differential assembly. Refer to Differential Replacement .



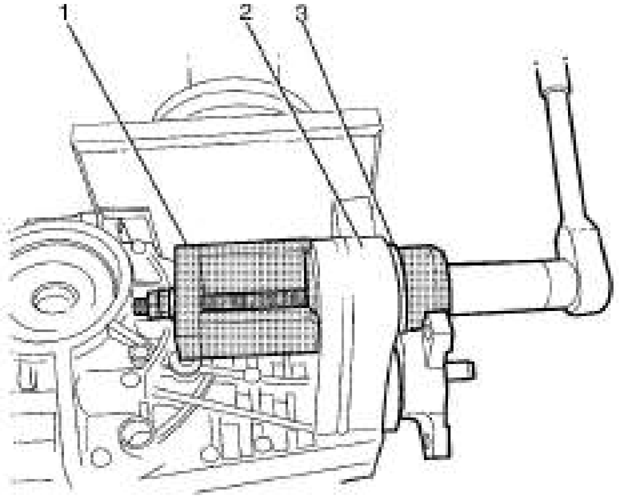
Important: Observe and mark the orientation of the bushing with reference to the original position. This will minimise the potential of incorrect bushing installation.

Important: The front right bushing (2) is a single use part and must be discarded after use.

7. Remove the front right bushing (2) from the differential (3) using AU-592 (1).

   Discard the bushing.

Installation Procedure-Front Right Differential Carrier Assembly Bushing



Important: Before installing, the front right bushing (3) must be correctly aligned and oriented. Mount orientation is critical for noise and vibration performance.

1. Pull the front right bushing (3) to the differential (2) using AU-592 (1).
2. Pull the front right bushing (3) until it is flush fitted.
3. Install the differential assembly. Refer to Differential Replacement .
4. Connect the propeller shaft and rubber coupling to the differential flange. Refer to Propeller Shaft Replacement .
5. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
6. Install the wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement .
7. Install the rear wheel assemblies. Refer to Tire and Wheel Removal and Installation .
8. Remove the safety stands.
9. Lower the vehicle to the ground.

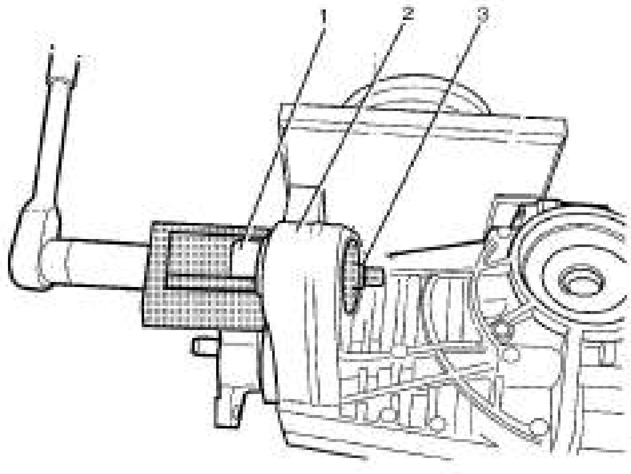
Removal Procedure-Front Left Differential Carrier Assembly Bushing

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

Important: The left differential carrier bushing has to be pressed in the opposite direction to the right due to clearance.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the rear wheel assemblies. Refer to Tire and Wheel Removal and Installation .
3. Disconnect the propeller shaft and rubber coupling from the differential flange. Refer to Propeller Shaft Replacement .
4. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
5. Remove the wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement .
6. Remove the differential assembly. Refer to Differential Replacement .



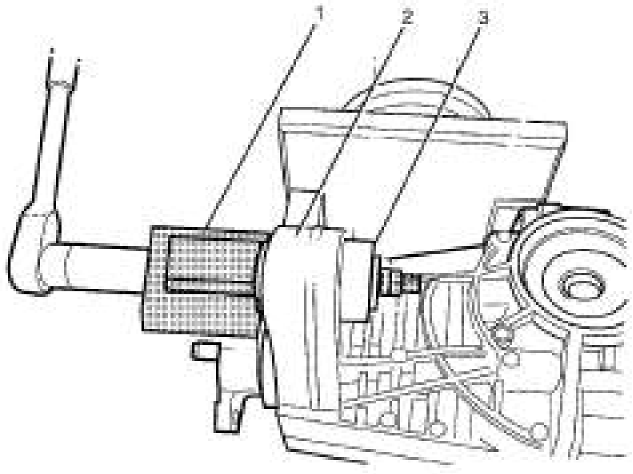
Important: Observe and mark the orientation of the bushing with reference to the original position. This will minimise the potential of incorrect bushing installation.

Important: The front left front bushing (1) is a single use part and must be discarded after use.

7. Remove the front left bushing (1) from the differential (2) using AU-592 (3).

   Discard the bushing.

Installation Procedure-Front Left Differential Carrier Assembly Bushing



Important: Before installing, the bushing (1) must be correctly aligned and oriented. Mount orientation is critical for noise and vibration performance.

1. Pull the front left bushing (3) to the differential (2) using AU-592 (1).
2. Pull the front left bushing (3) until it is flush fitted.
3. Install the differential assembly. Refer to Differential Replacement .
4. Connect the propeller shaft and rubber coupling to the differential flange. Refer to Propeller Shaft Replacement .
5. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
6. Install the wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement .
7. Install the rear wheel assemblies. Refer to Tire and Wheel Removal and Installation .
8. Remove the safety stands.
9. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Rear Drive Axle | Repair Instructions | **Document ID: 1995601**

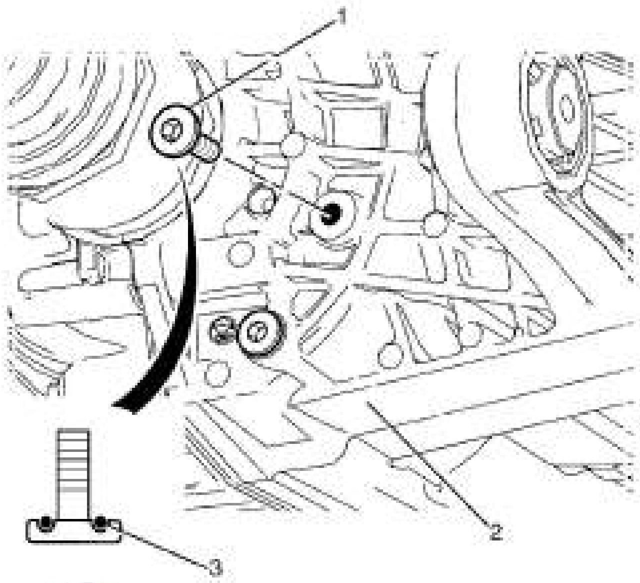
Differential Oil Replacement

Draining Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

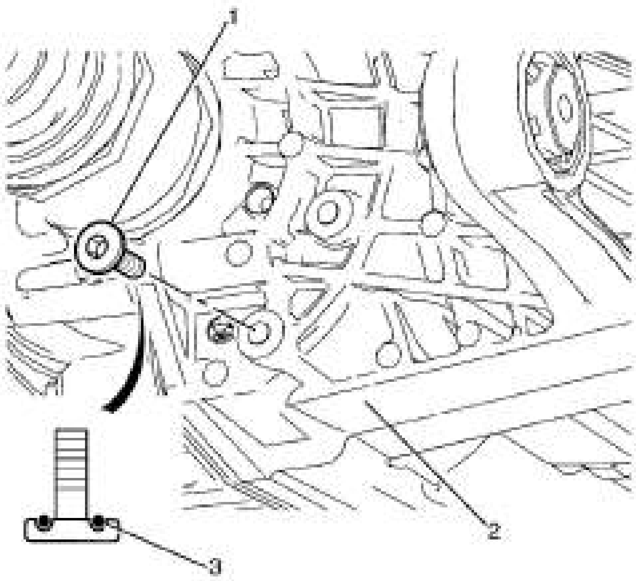
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Place a large suitable container under the differential in order to collect draining differential fluid.



Important: Clean the area around the differential plug (1) to prevent the entry of foreign particles into the differential (2).

Important: The differential fill plug (1) and O-ring (3) come as an assembly, the O-ring (3) cannot be replaced separately.

3. Remove the differential fill plug (1) from the differential (2).
4. Inspect the differential fill plug (1) and O-ring (3) for excessive wear and/or damage. Replace as necessary.



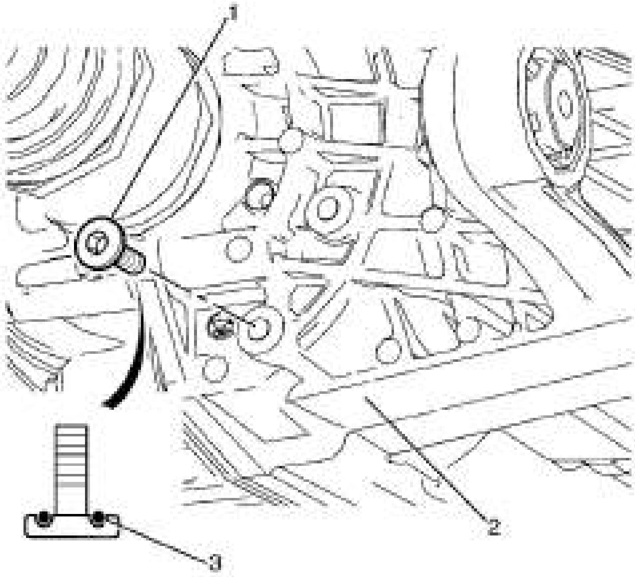
Important: Clean the area around the differential plug (1) to prevent the entry of foreign particles into the differential (2).

Important: The differential drain plug (1) and O-ring (3) come as an assembly, the O-ring (3) cannot be replaced separately.

5. Remove the differential drain plug (1) from the differential (2).
6. Inspect the differential drain plug (1) and O-ring (3) for excessive wear and/or damage. Replace as necessary.
7. Allow the differential fluid to drain completely.

Filling Procedure

Notice: Refer to Fastener Notice in the Preface section.



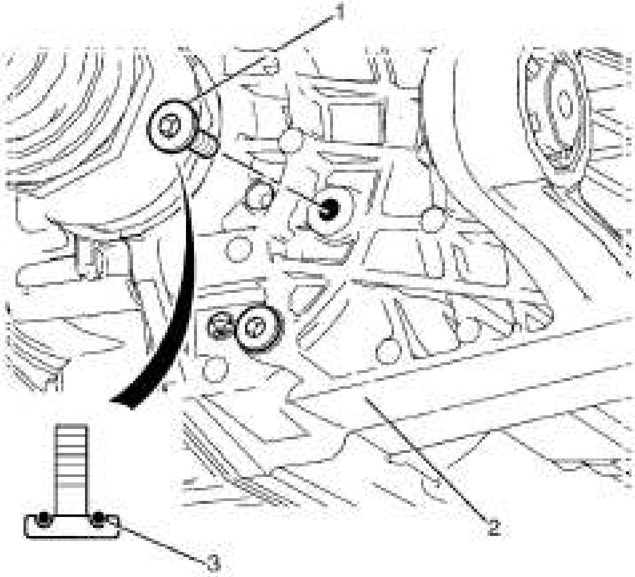
1. Install the differential drain plug (1) and O-ring (3) to the differential (2).

   Tighten
   Tighten the differential drain plug to 35 N-m (26 lb ft).

   Important: When adding fluid or making a complete fluid change, always use the correct differential fluid. Failure to use the correct fluid may cause gear damage and/or fluid leaks. For fluid specifications refer to Lubrication Specifications .

   Important: The differential fluid level must be level with the bottom of the fill plug hole to no lower than 6 mm (0.25 in) below the opening.

2. Fill the differential to the correct level.



3. Install the differential fill plug (1) and O-ring (3) to the differential (2).

   Tighten
   Tighten the differential fill plug to 35 N-m (26 lb ft).

4. Remove safety stands.
5. Lower the vehicle to the ground.

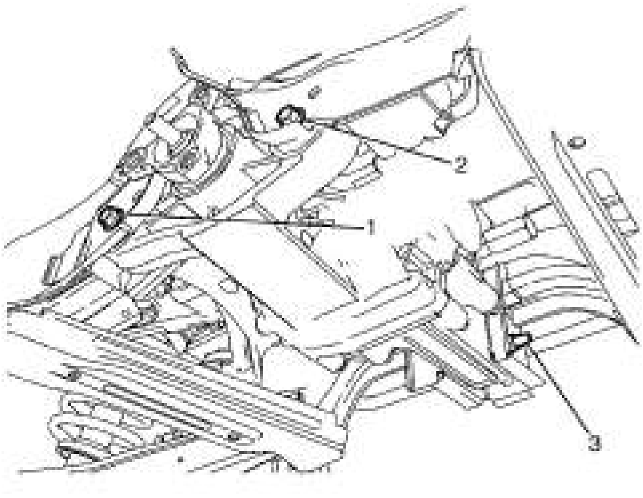
Differential Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear tyre and wheel assemblies. Refer to Tire and Wheel Removal and Installation.
3. Drain differential oil. Refer to Differential Oil Replacement.
4. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.
5. Remove the propeller shaft and rubber coupling from differential flange. Refer to Propeller Shaft Replacement.
6. Remove the wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement.
7. Support the differential with a suitable jack.



Important: Nuts with micro-encapsulated thread sealant are single use parts and must be discarded after removal.

8. Remove the differential retaining bolts and nuts (1), (2) and (3) from the rear suspension.

Important: With a suitable jack support the differential.

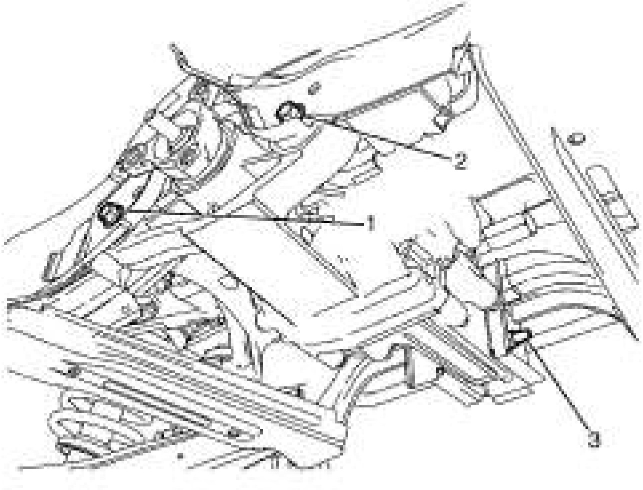
9. Remove the differential from the vehicle.

Installation Procedure

Important: With a suitable jack raise and support the differential.

1. Position the differential to the vehicle.

Notice: Refer to Fastener Notice in the Preface section.



Important: With a suitable jack support the differential.

2. Install the differential retaining bolts and nuts (1), (2) and (3) to the rear suspension.

   Tighten
   Tighten the differential to body retaining bolts and nuts (1) to 80 N-m (59 lb ft).

   Tighten
   Tighten the differential to body retaining bolts and nuts (2) to 100 N-m (74 lb ft).

   Tighten
   Tighten the differential to body retaining bolts and nuts (3) to 100 N-m (74 lb ft).

3. Install the propeller shaft and rubber coupling to the differential flange. Refer to Propeller Shaft Replacement.
4. Install the wheel drive shaft assemblies. Refer to Wheel Drive Shaft Replacement.
5. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement.
6. Install the rear wheel assemblies. Refer to Tire and Wheel Removal and Installation.
7. Fill differential oil. Refer to Differential Oil Replacement.
8. Remove the safety stands.
9. Lower the vehicle to the ground.

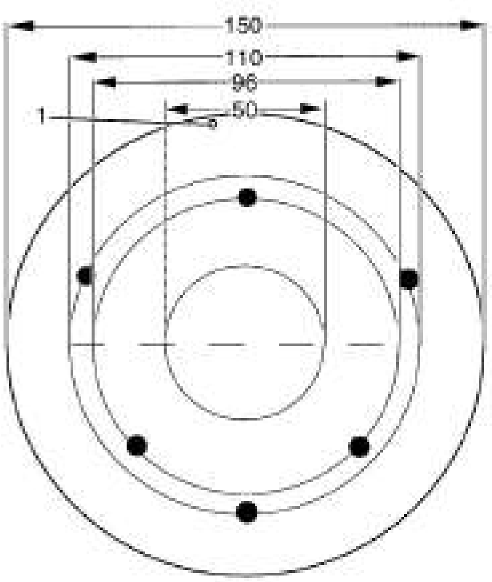
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Rear Drive Axle | Repair Instructions | **Document ID: 1995597**

Drive Pinion Flange / Yoke and / or Oil Seal Replacement

Tools Required

- E-308 Seal Remover.
- DT-48727 Seal Installer.
- 6613 Universal Pulley Holder OTC.

Removal Procedure -- Pinion Flange



1. A pre-fabricated tool will need to made prior to starting this procedure. Follow the steps below:
   - Make from a 13mm piece of wood.
   - Drill a hole at (1) and attach a one metre length of string at this point, knotted at one end.
   - Drill three 8.5mm holes at a PCD of 96mm and 120 degrees apart.
   - Drill three 8.5mm holes at a PCD of 110mm and 120 degrees apart.
   - Drill a 50mm hole in the centre of the tool.

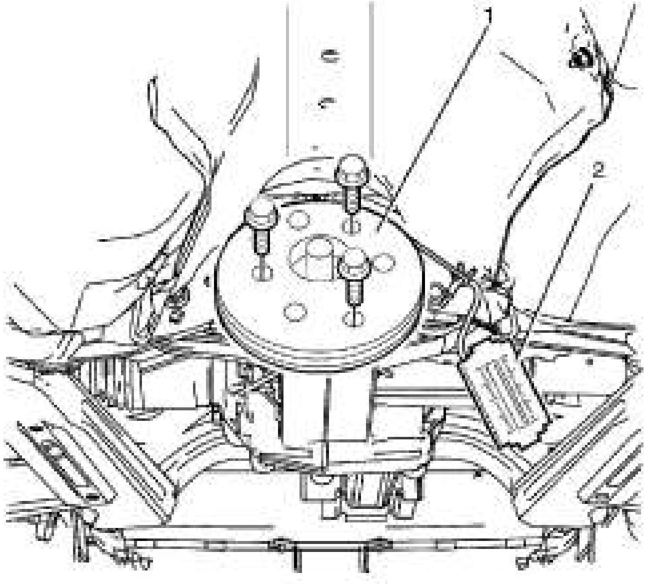
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

   Caution: Refer to Safety Glasses Caution in the Preface section.

2. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle .
3. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
4. Remove the rear tyre and wheel assemblies. Refer to Tire and Wheel Removal and

Installation .

5. Disconnect the propeller shaft and rubber coupling from the differential pinion flange. Refer to Propeller Shaft Replacement .
6. Secure the propeller shaft with a wire to protect it from damage.



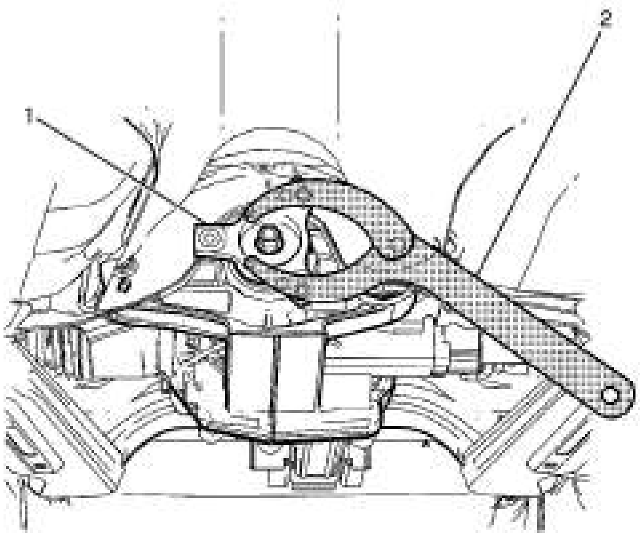
Important: Make sure that the hand brake is off and the brake rotors freely rotate.

7. Install the pre-fabricated tool (1) to the pinion flange.
8. Attach the spring balance (2) to the string of the pre-fabricated tool (1).

Important: The torque reading will different for in and out of the vehicle measurement.

Important: The torque reading is required to correctly reset pinion pre-load on assembly.

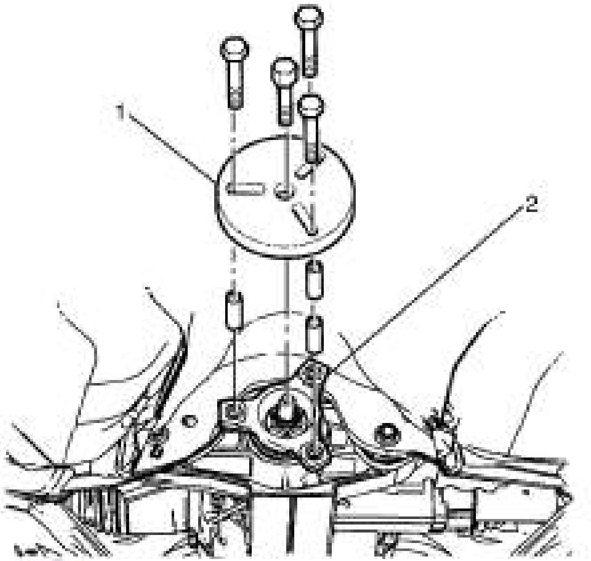
9. Pull the spring balance (2) and record the reading.
   - Example:
   - With a pulley diameter of 150 mm, the radius is 75 mm, which equals .075 m. With a spring balance reading of 25 N, the pre-load equals .075 m x 25 N = 1.875 N.m.



10. Install the 6613 (2) to the pinion flange (1).
11. While holding the 6613 (2) remove the prevailing torque pinion flange retaining nut from the differential.

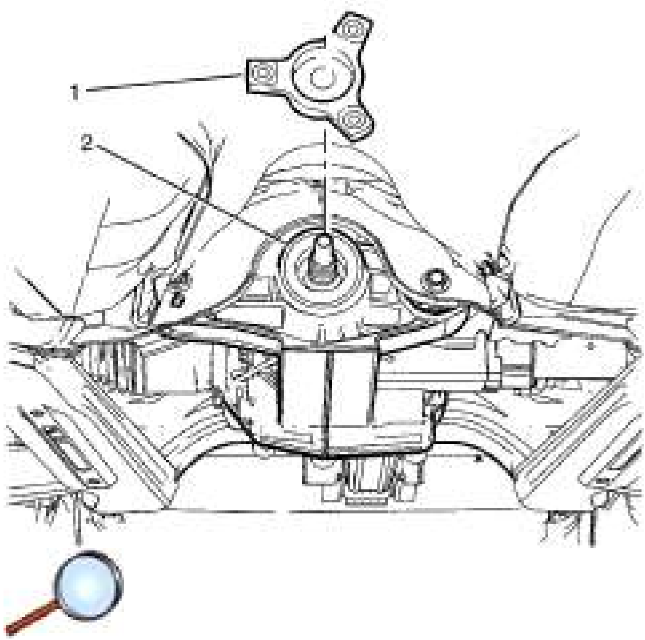
    Discard the prevailing torque pinion flange retaining nut.

12. Remove the 6613 (2) from the pinion flange (1).



Important: Use a suitable puller (1) to remove the pinion flange (2).

13. Install the puller (1) to the pinion flange (2).
14. Place a large suitable container under the differential in order to collect draining fluid.
15. Use the puller (1) to remove the pinion flange (2).



16. Remove the pinion flange (1) from the differential (2).

Important: The pinion flange oil seal should be replaced when replacing the pinion flange.

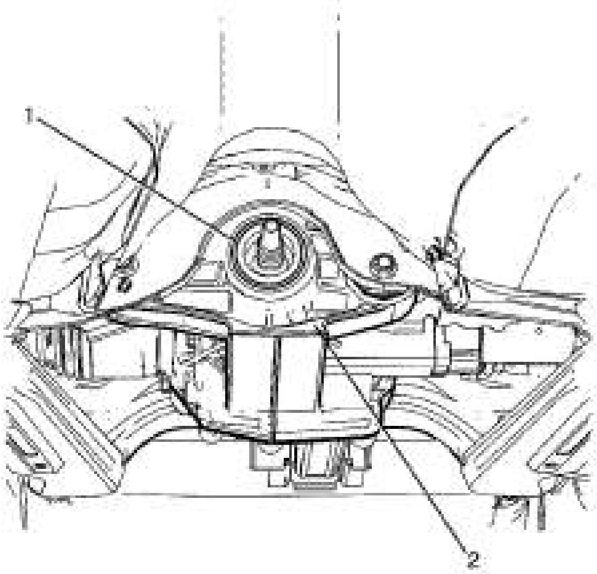
17. Check the pinion flange oil seal for wear and/or damage. Replace if necessary.

Removal Procedure -- Oil Seal

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
3. Disconnect the propeller shaft and rubber coupling from the differential flange. Refer to Propeller Shaft Replacement .
4. Remove the differential pinion flange. Refer to Drive Pinion Flange/Yoke and/or Oil Seal Replacement .



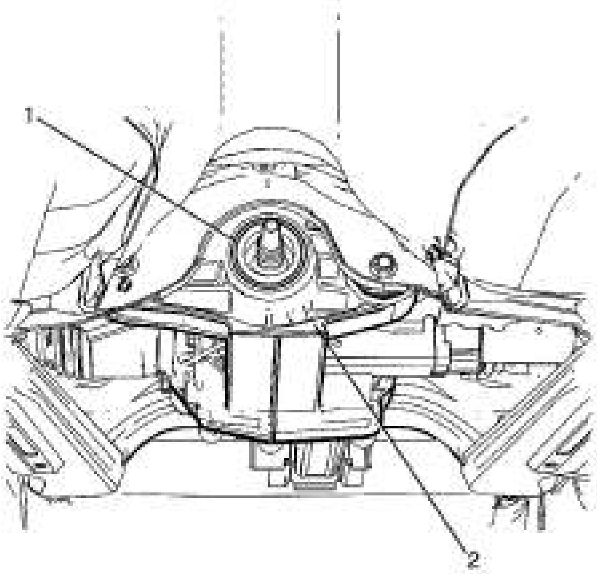
Important: Do not damage any sealing surfaces when removing the pinion flange oil seal (1). Cuts or abrasions will damage the assembly and result in lubricant leakage from this area.

Important: The pinion flange oil seal (1) is a single use part and must be discarded after use.

5. Use E-308 to remove the pinion flange oil seal (1) from the differential (2).

   Discard the pinion flange oil seal.

Installation Procedure -- Oil Seal



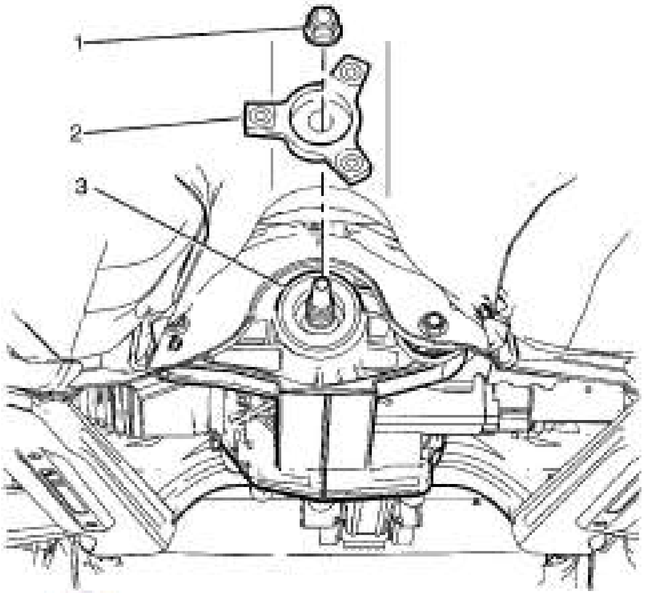
1. Lubricate the NEW pinion flange oil seal (1) with the correct grease. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Important: Do not damage any sealing surfaces when fitting the pinion flange oil seal. Cuts or abrasions will damage the assembly and result in lubricant leakage from this area.

Important: Use DT-48727 to obtain correct seal depth.

2. Install the NEW pinion flange oil seal (1) to the differential (2) with DT-48727 .
3. Install the pinion flange. Refer to Drive Pinion Flange/Yoke and/or Oil Seal Replacement .
4. Connect the propeller shaft and rubber coupling to the differential flange. Refer to Propeller Shaft Replacement .
5. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
6. Check differential fluid. Refer to Rear Axle Lubricant Level Inspection .
7. Remove safety stands.
8. Lower the vehicle to the ground.

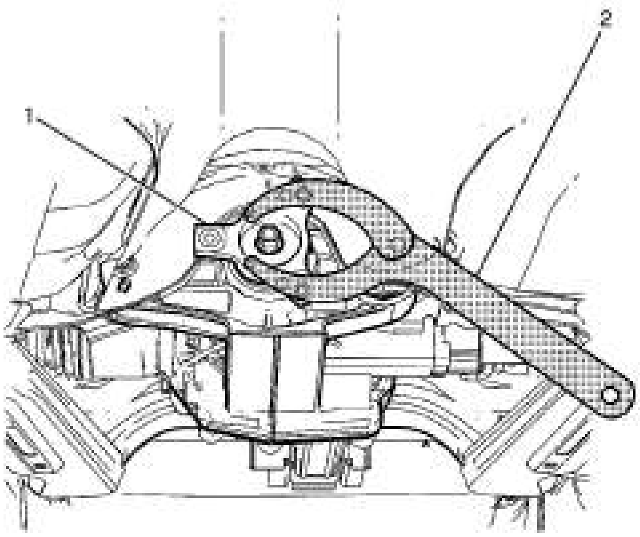
Installation Procedure -- Pinion Flange



1. Position the pinion flange (2) to the differential (3).
2. Lubricate the contact surface of the NEW prevailing torque pinion flange retaining nut (1) with correct grease. Refer to Adhesives, Fluids, Lubricants, and Sealers .
3. Apply loctite 2701 (alternative loctite 648) to the thread of the NEW prevailing torque pinion flange retaining nut (1).

Important: Do not fully tighten the NEW prevailing torque pinion flange retaining nut at this stage.

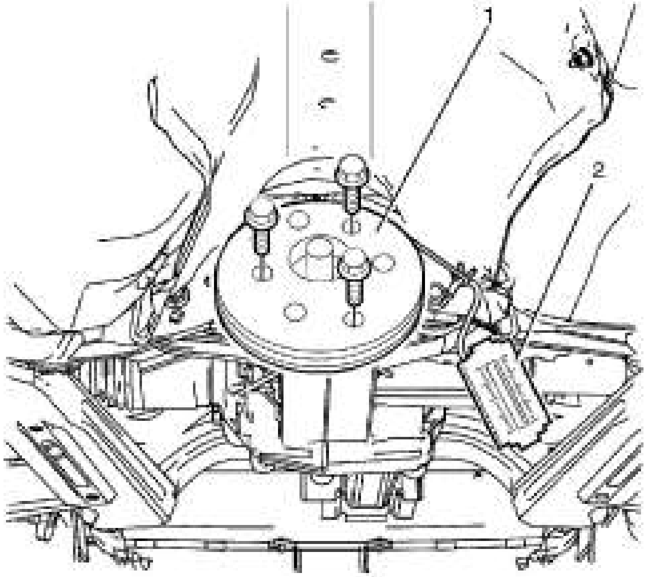
4. Install the NEW prevailing torque pinion flange retaining nut (1) to the differential (3).



5. Install the 6613 (2) to the pinion flange (1).

Important: Do NOT over tighten the NEW prevailing torque pinion flange retaining nut. If the prevailing torque pinion flange retaining nut is over tightened the differential will have to be disassembled.

6. Tighten the NEW prevailing torque pinion flange retaining nut carefully until the pinion flange has no play.
7. Remove the 6613 (2) from the pinion flange (1).



Important: The torque reading will different for in and out of the vehicle measurement.

8. Install the pre-fabricated tool (1) to the pinion flange.

9. Attach the spring balance (2) to the string of the pre-fabricated tool (1).
10. Turning torque must be equal to the value recorded in the removal procedure.

    Important: Do NOT over tighten the prevailing torque pinion flange retaining nut. If the prevailing torque pinion flange retaining nut is over tightened the differential will have to be disassembled.

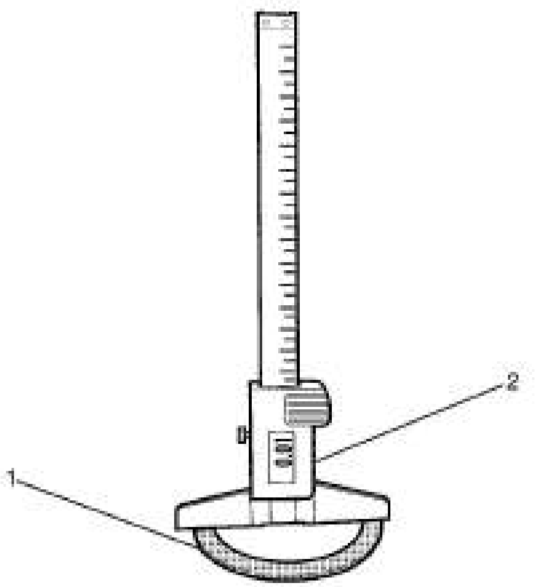
11. If the turning torque is below the value recorded in the removal procedure, tighten the NEW prevailing torque pinion flange retaining nut in small steps and check turning torque until specified turning torque is reached.
12. If the turning torque is above the value recorded in the removal procedure a NEW collapsible spacer must be fitted. Refer to Rear Axle Disassembled Views .
13. Make sure the pinion gear is free from excessive Loctite.
14. Install the propeller shaft and rubber coupling to differential flange retaining bolts. Refer to Propeller Shaft Replacement
15. Install the intermediate exhaust assembly. Refer to Exhaust Crossover Pipe Replacement .
16. Check differential fluid level. Refer to Rear Axle Lubricant Level Inspection .
17. Remove safety stands.
18. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Rear Drive Axle | Repair Instructions | **Document ID: 1995635**

Rear Axle Assemble

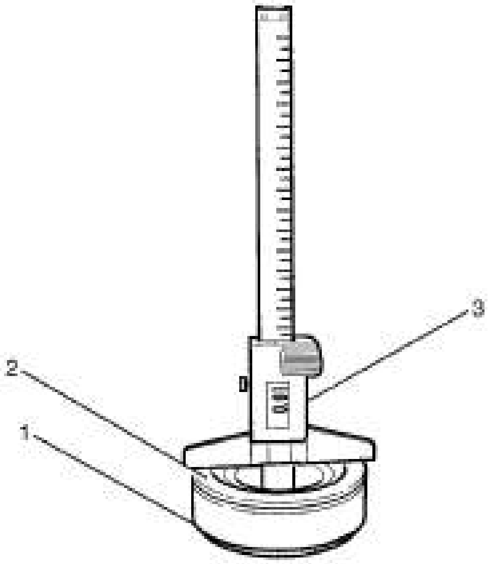
Tools Required

- DT-48723 Pinion Head Bearing Cup Installer.
- DT-48725 Pinion Tail Bearing Cup Installer.
- DT-48722 Left Axle Seal Installer.
- DT-48721 Right Axle Seal Installer.
- DT-48727 Pinion Seal Installer.
- DT-48728 Differential Bearing Installer.
- DT-48806 Pinion Bearing Measurement Spacer.
- DT-48807 Pinion Head Bearing Installer.



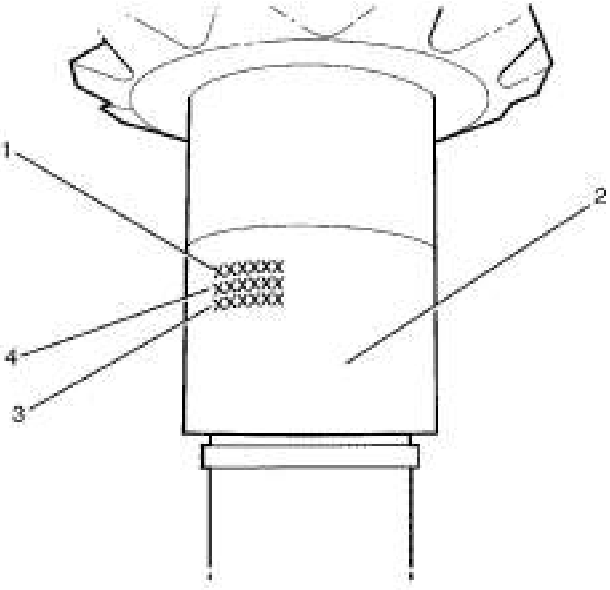
Important: Use DT-48806 otherwise bearing height cannot be measured correctly.

1. Measure the thickness of DT-48806 (1) using a depth gauge (2).(e.g - 3.67mm).
2. Record the thickness of the DT-48806 (1).



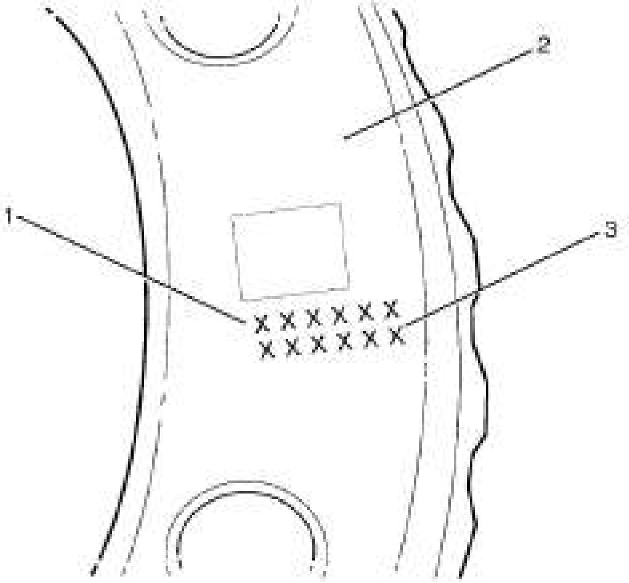
Important: Rotate the pinion head bearing (2) to settle for correct measurement.

3. Measure the thickness of the DT-48806 (1) and the pinion head bearing (2) with the depth gauge (3) (e.g - 33.925mm).
4. Record the thickness of the DT-48806 (1) and pinion head bearing (2).
5. Subtract the thickness of DT-48806 (1) 3.67mm from the total thickness of the pinion bearing measurement spacer (1) and the pinion bearing (2) 33.925mm to determine the pinion head bearing (2) thickness.
6. Example - The pinion head bearing (2) thickness is 33.925mm - 3.67mm = 30.255mm

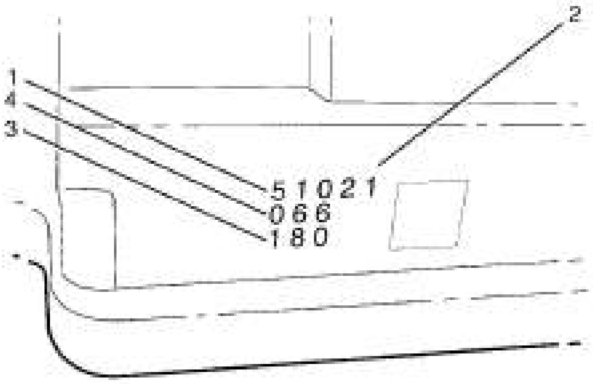


7. Record the serial number (1), set number (3) and size (4) which are stamped into the pinion gear (2).
8. Example:

- Serial Number A0200008 (1)
- Pinion Size 106.475mm (4)
- Set Number 260125 (3)



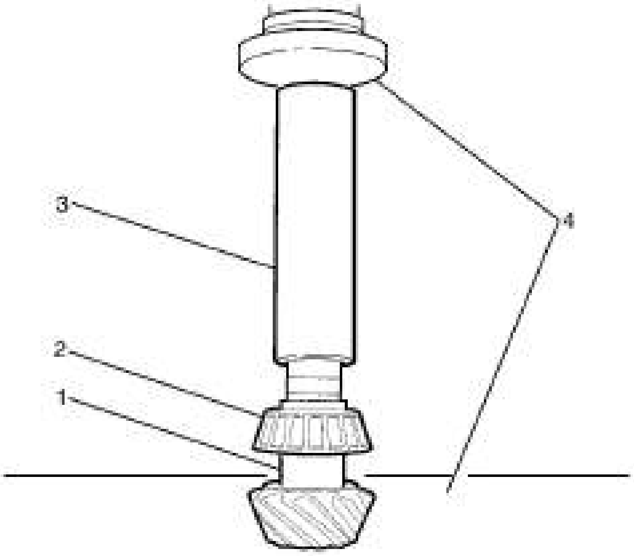
9. Check that the serial number (1) and set number (3) which are stamped into the ring gear (2) match those of the pinion set in step 7.
10. Example:
    - Serial Number A0200008 (1)
    - Set Number 260125 (3)



Important: The identification number (1, 3, and 4) is stamped into the differential housing

(2).

11. Identify the differential housing.
    - Manufacturing date (1).
    - Item number (4).
    - Size equals 138 plus the number on the housing. Example - 138.180mm (3).
12. Record the differential housing size. Example - 138.180mm
13. Determine the thickness of the pinion shim.
    - Add the pinion plus the bearing Example - 106.475mm + 30.255mm = 136.730mm.
    - Subtract the pinion plus the head bearing from the housing size, also subtract the correction factor. The correction factor is .05mm. Example 138.180 - 136.730 - 0.05 = 1.40mm thickness shim required.
14. Position the correct shim onto the pinion head.



Important: Use DT-48807 (3) to aid in pinion bearing (2) installation.

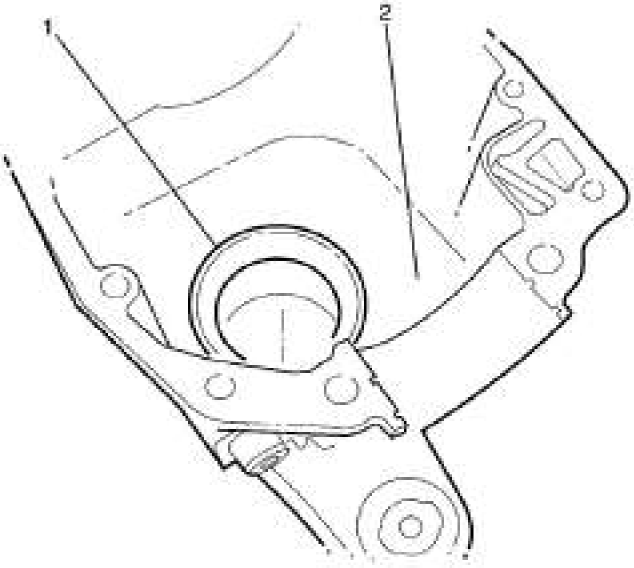
Important: Position the pinion gear (1) onto an aluminium plate in suitable press (4) before pressing the pinion head bearing (2) to prevent damage to the pinion (1).

15. Position the NEW pinion head bearing (2) onto the pinion gear (1).

Important: Use a suitable press (4) to install the NEW differential pinion head bearing (2).

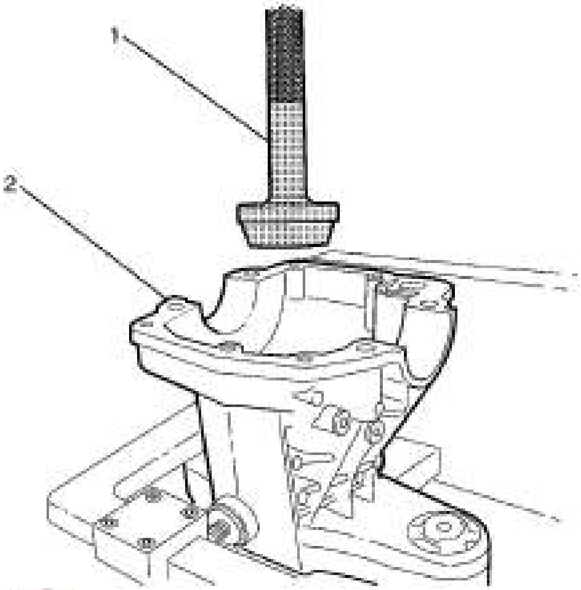
16. Press the NEW pinion head bearing (2) onto the pinion gear using DT-48807 (3).
17. Clean the ring gear and the contact area of the differential.

Caution: Refer to Safety Glasses Caution in the Preface section.

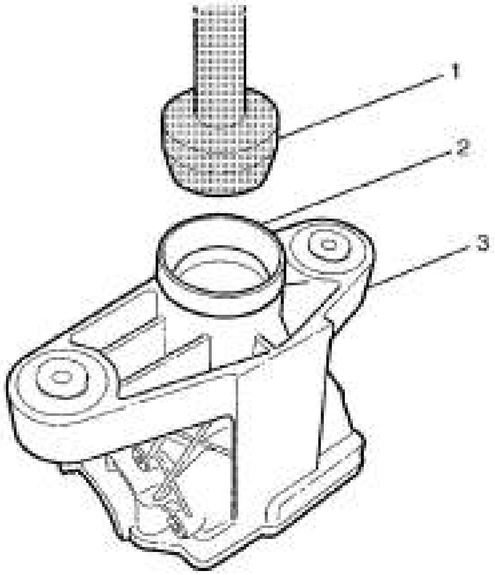


Important: To make fitting easier cool the bearing cups (2).

18. Position the NEW head bearing cup (1) into the differential housing (2).

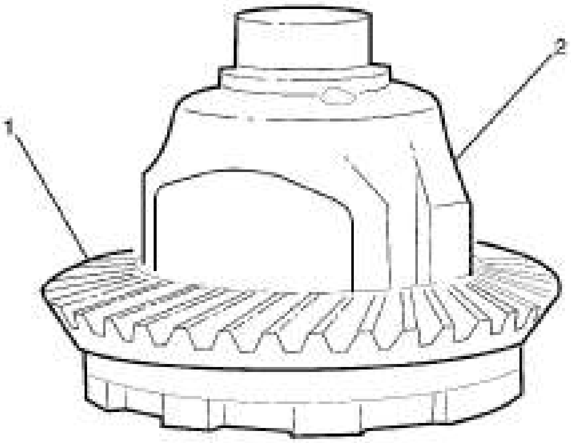


19. Press the NEW head bearing cup in with DT-48723 (1) and rotate until it fits tightly in the front differential housing (2).
20. Use a feeler gauge to make sure the NEW head bearing cup is seated correctly.



Important: To make fitting easier cool the bearing cup (2).

21. Position the NEW tail bearing cup (2) to the differential housing (3).
22. Press the NEW tail bearing cup in with DT-48725 (1) and rotate until it fits tightly in the front differential housing (2).
23. Use a feeler gauge to make sure the NEW tail bearing cup is seated correctly.



Important: Warm the ring gear (1) evenly using a hotplate until it fits over the differential (2).

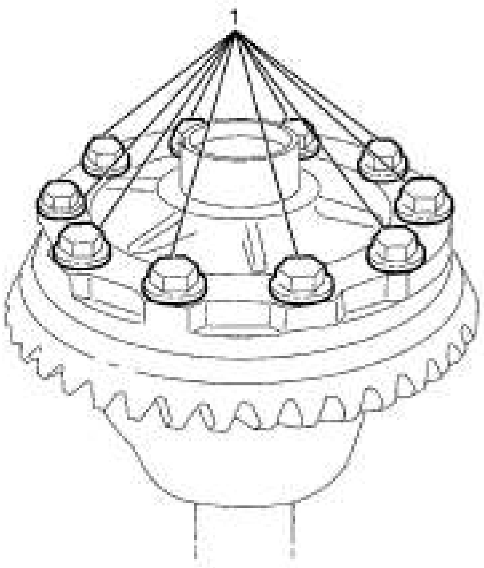
24. Position the ring gear (1) to the differential (2).

Important: Do not fully tighten the NEW ring gear to differential retaining bolts at this stage.

Important: The ring gear has to cool before the ring gear to differential retaining bolts can be tightened.

25. Install two NEW ring gear to differential retaining bolts.

Notice: Refer to Fastener Notice in the Preface section.

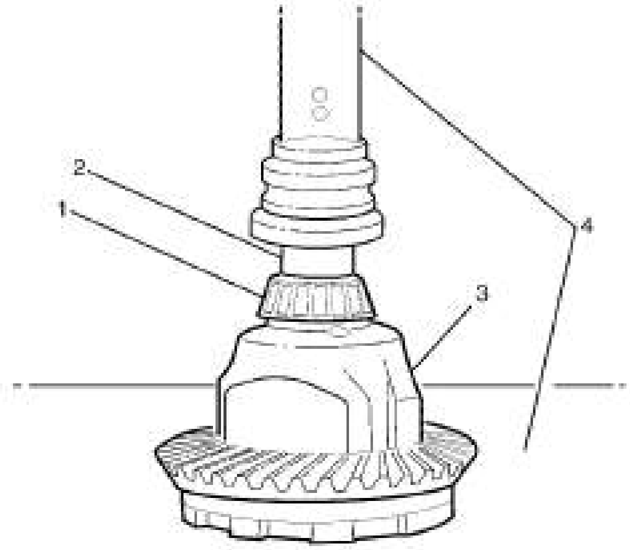


Important: The ring gear has to cool before the ring gear to differential retaining bolts (1) can be tightened.

Important: Tighten the ring gear to differential retaining bolts (1) working diagonally.

26. Install the remaining NEW ring gear to differential retaining bolts (1).

Tighten
Tighten the bolts to 125 N-m (96 lb ft).

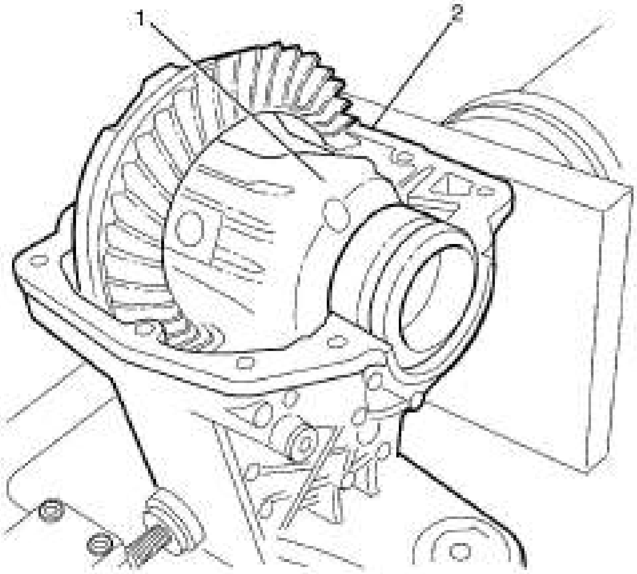


Important: Use a suitable press (4) to install the right differential bearing (1).

27. Press the right differential bearing (1) to the differential (3) with DT-48728 (2).

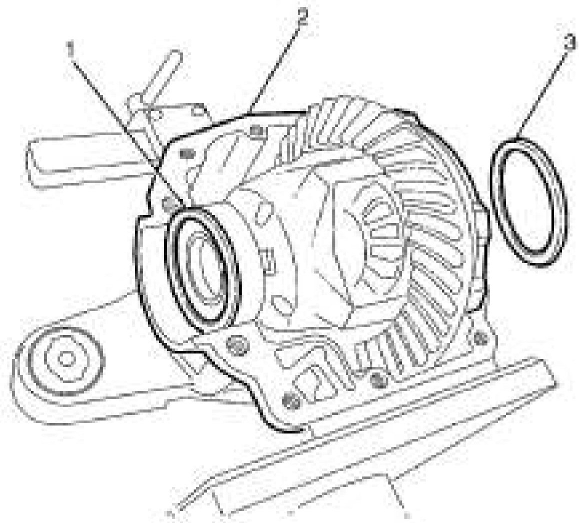
Important: Use a suitable press (4) to install the left differential bearing.

28. Rotate and press the left bearing to the differential with DT-48728 (2).

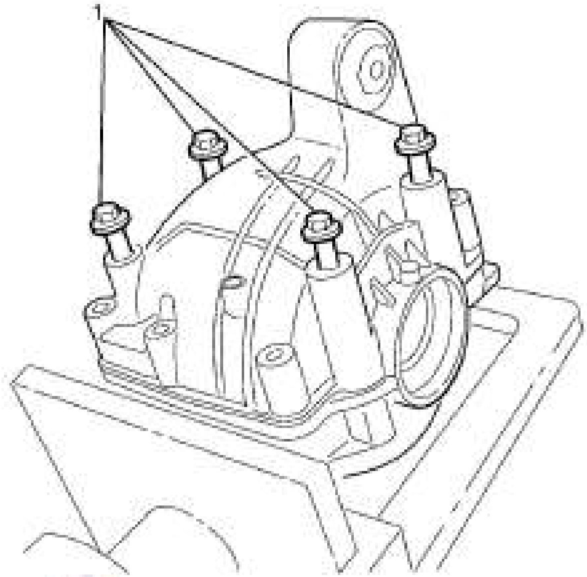


Important: Position the differential (1) to the differential housing (2) using a suitable tool or with the aid of an assistant.

29. Position the differential (1) to the differential housing (2).

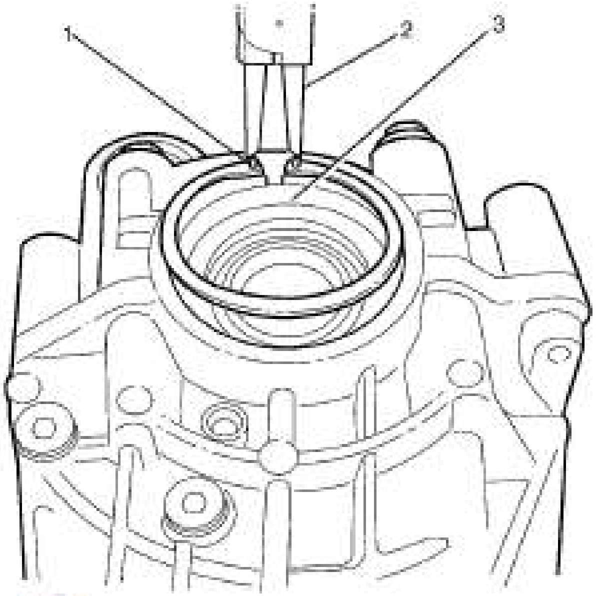


30. Position the left shim (3) and right shim (1) to the original position in the differential housing (2).



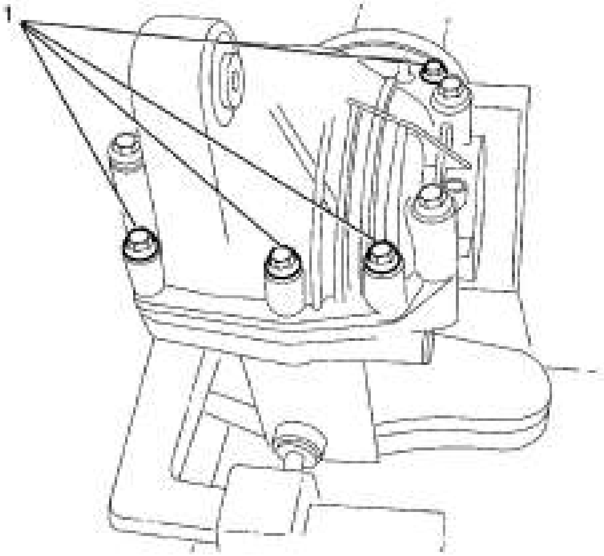
Important: Do not fully tighten the bearing bolts (1) is stage. The differential has to be able to move freely within the differential housing to allow fitment of the circlip.

31. Position the differential housing cover to the differential housing and retain with the 4 bearing bolts (1).
32. Turn the differential assembly left through 90° for the differential to slide down in the housing.



Important: Align the opening of the circlip (1) with the opening on the differential housing.

33. Install the circlip (1) to the differential (3) with circlip pliars (2).
34. Make sure the circlip (1) is fitted correctly.

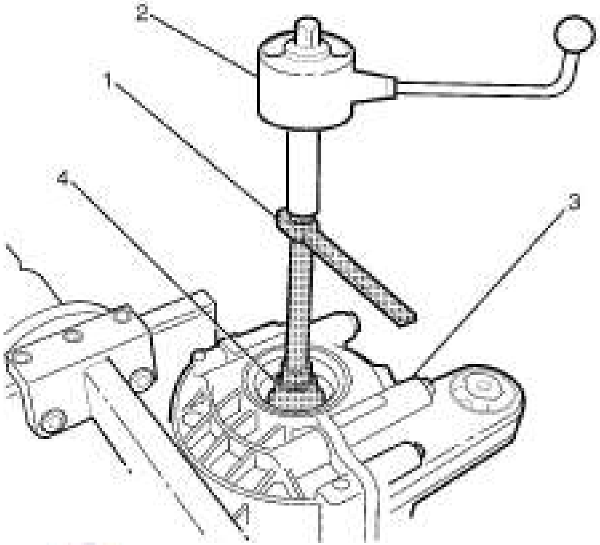


Important: Tighten the differential housing cover to differential housing retaining bolts (1) working diagonally.

35. Install the remaining differential housing cover to differential housing retaining bolts (1).

Tighten
Tighten the housing bolts to 53 N-m (39 lb ft).

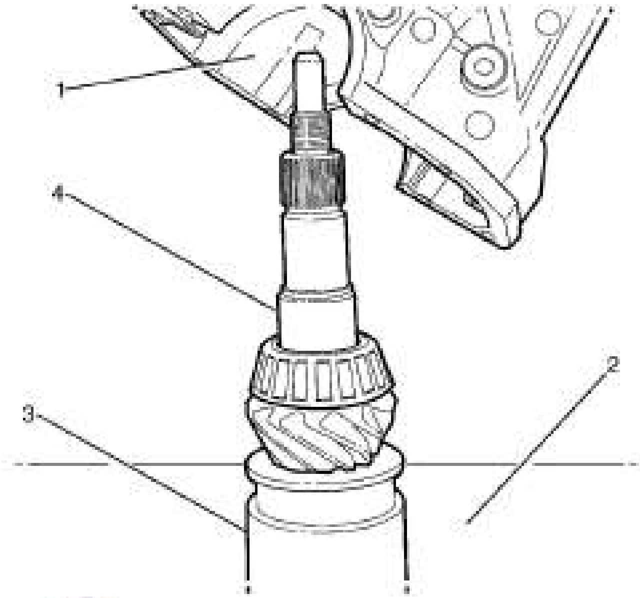
Tighten
Tighten the bearing bolts to 153 N-m (112 lb ft).



36. Position the backlash tool (1, 4) to the differential assembly (3).
37. Secure the backlash tool (1) to the differential assembly (3) by adjusting the spreading nut (4).
38. Mount the turning torque gauge (2) to the backlash tool (1).
39. Rotate the turning torque gauge (2) clockwise and record reading.

Important: This figure is for NEW bearings only.

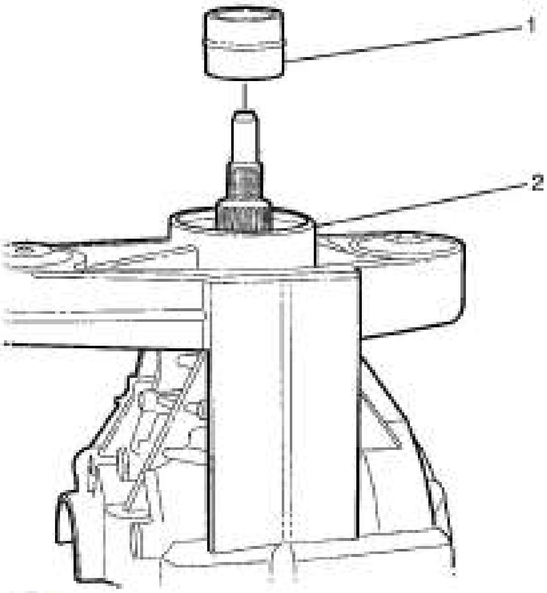
40. Turning torque should be between 2.0 to 3.3 Nm (27 lb in).
41. If the measured turning torque is outside the tolerance:
    - Remove the rear differential housing.
    - If turning torque is too high or too low, fit a thinner or thicker shim respectively.
    - Repeat from steps 5-11 from the disassembly procedure then from step 27 onwards in the assembly procedure.
    - Check turning torque. Repeat until the turning torque is correct.
42. Remove differential assembly. Repeat steps 5 through 11 from the disassembly procedure.



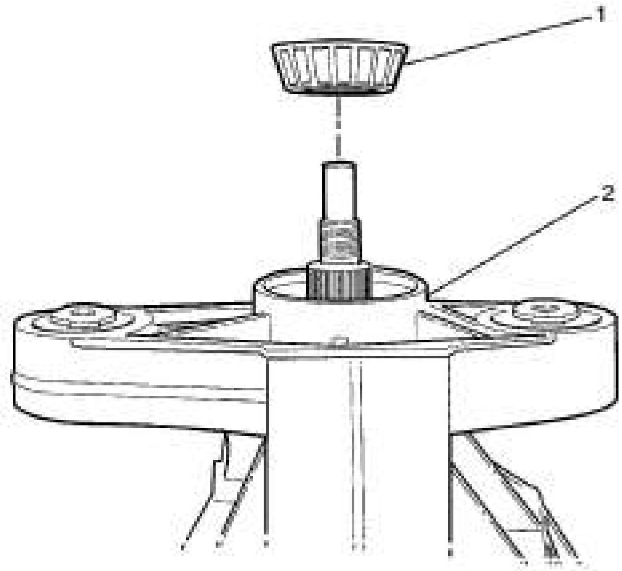
43. Position the pinion (4) on DT-48728 (3) in a suitable press (2).

    Important: The differential housing (1) must not rest on the press (2). Use a suitable supporting tool (3) to elevate pinion (4).

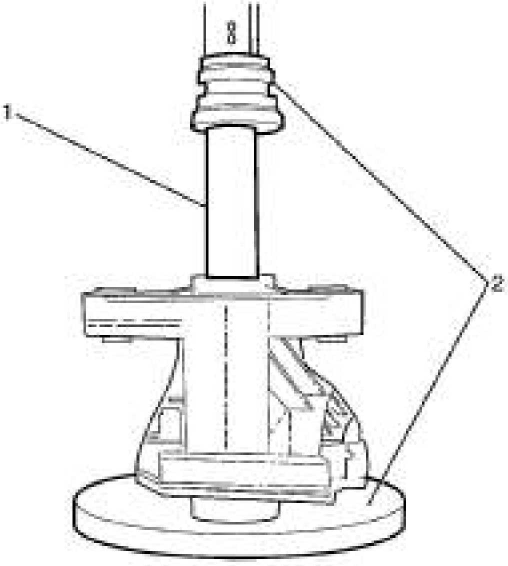
44. Position the differential housing (1) over the pinion gear (4).



45. Position a NEW collapsible spacer (1) to the differential (2).

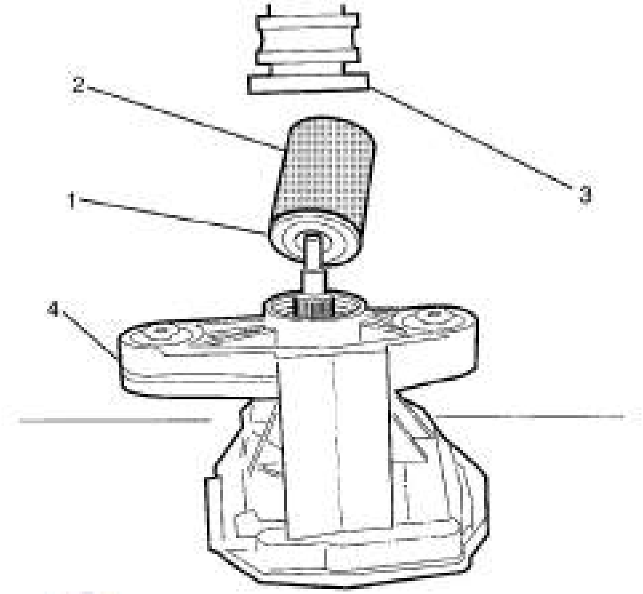


46. Position the pinion tail bearing (1) to the differential housing (2).



Important: Take care to only press the tail bearing until it rests on the collapsible spacer so that it is not damaged.

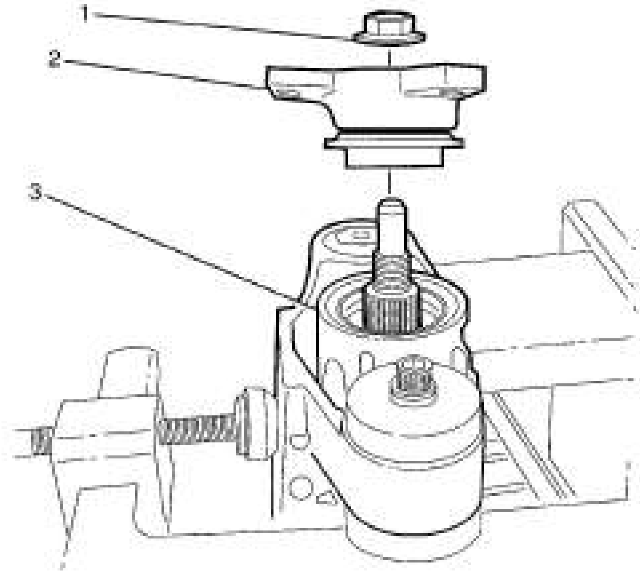
47. Use a suitable press (2) and DT-48723 (1) to press the tail bearing until it rests against the collapsible spacer.
48. Remove the supporting tool so that the differential housing rests on the table.



49. Lubricate the NEW pinion flange seal (1) with correct grease. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Important: Use DT-48727 to install the seals to correct depth.

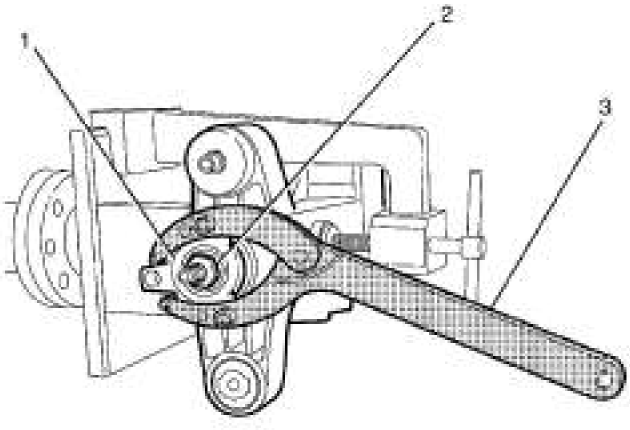
50. Install the pinion flange seal (1) to the differential housing (4) with DT-48727 (2) in a suitable press (3).
51. Mount the differential housing (4) on a suitable holding device.



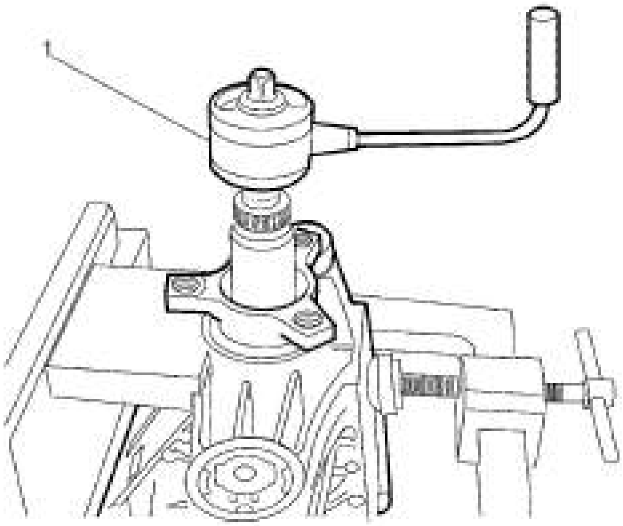
52. Position the pinion flange (2) to the differential (3).
53. Lubricate the contact surface of the prevailing torque pinion flange retaining nut (1) with correct grease. Refer to Adhesives, Fluids, Lubricants, and Sealers .
54. Apply correct loctite to the thread of the NEW prevailing torque pinion flange retaining nut (1).

Important: Do not fully tighten the NEW prevailing torque pinion flange retaining nut at this stage. Overtightening will require disassembly and fitment of a new collapsible spacer and possibly bearings.

55. Install the NEW prevailing torque pinion flange retaining nut (1) to the differential (3).



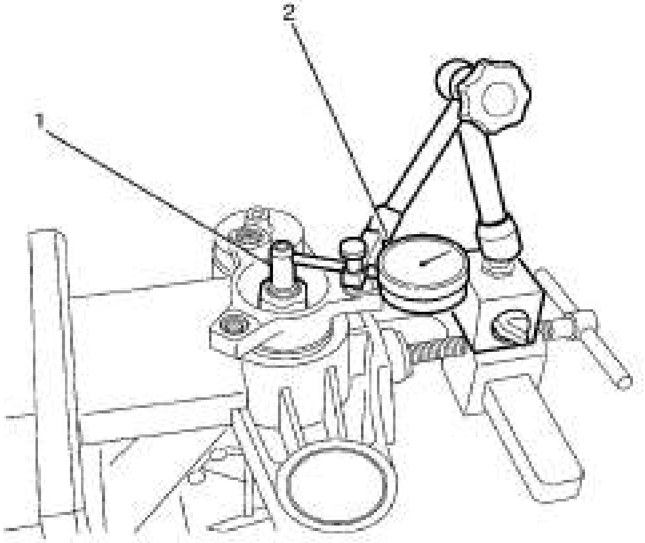
56. Install the universal pulley holder (3) to the pinion flange (1).
57. Tighten the prevailing torque pinion flange retaining nut (2) carefully until it has no play.
58. Remove the universal pulley holder from the pinion flange (1).
59. Turn the differential assembly through 90°.



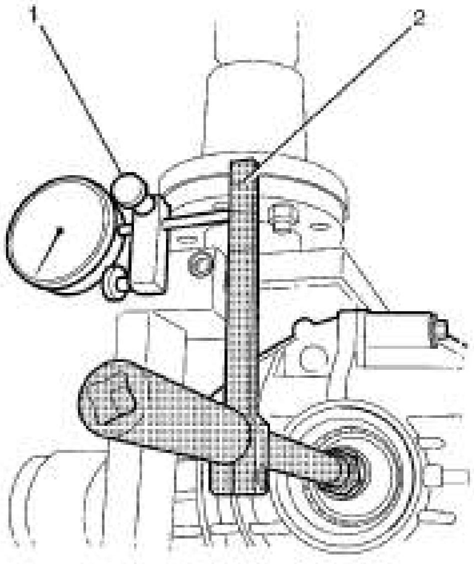
60. Position the turning torque gauge (1) to the prevailing torque pinion flange nut.
61. Turn the turning torque gauge (1) in a clockwise direction and record reading.

Important: This torque figure is for NEW bearings only.

62. Turning torque should be between 2.2 and 2.7 Nm (20-25 lb in).
63. If the turning torque is below specified tolerance, tighten the prevailing torque pinion flange retaining nut in small steps and check turning torque until specified turning torque is reached.
64. If the turning torque is above specified tolerance disassemble, fit new collapsible spacer and repeat until correct specification is achieved.



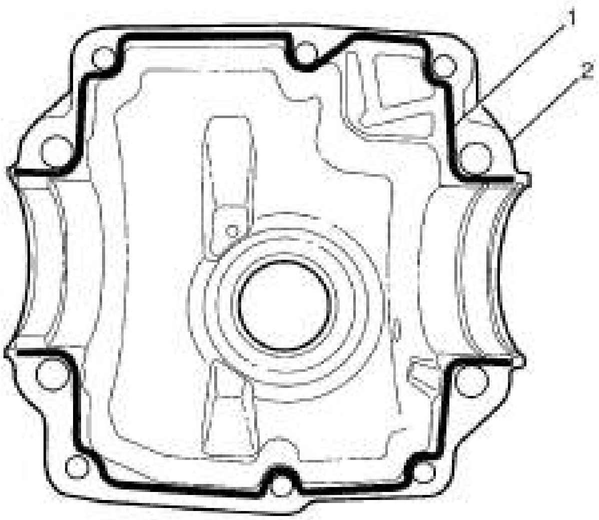
65. Position a dial gauge (2) to measure the concentric running on centering while turning the pinion (1).
66. If the measured value is above .1mm remove the pinion flange and re-install at a different angle. Repeat steps 52-66 in the assembly procedure. Make sure the turning torque is .1-.2 N-m higher than recorded in step 63 but not higher than 2.7 N-m.



67. Position the backlash tool (2) to the differential assembly.

Important: The location of the dial gauge on the backlash tool (2) arm corresponds to the edge of the ring gear (210mm)

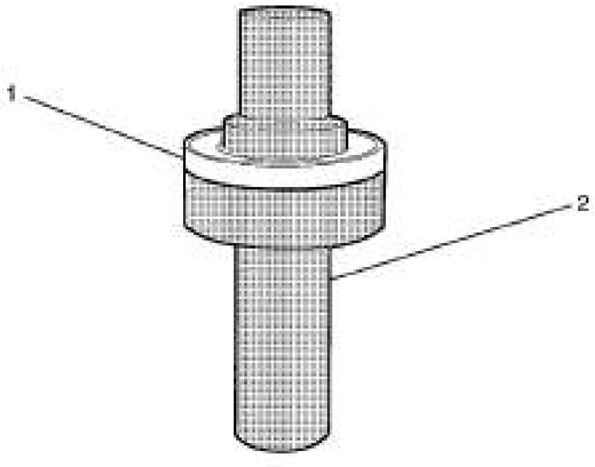
68. Position the dial gauge (1) to the backlash tool (2).
69. Use a suitable tool to move the backlash tool (2) within the backlash and record the reading.
70. Backlash must be between .07 and .18 mm.
71. If the backlash is not between the specified tolerance, it must be adjusted with differential shims otherwise turning torque set during steps 38-43 will be changed.
72. If a .05 mm thinner shim is used on the right a .05 mm thicker shim has to be added to the left.
73. Remove the rear differential housing. Refer to steps 5 and 6 in the disassembly procedure.



74. Clean the mating faces of the differential housings (2).

Important: Apply a 1mm liquid seal bead (1) to the differential housing. Use the graphic as a template.

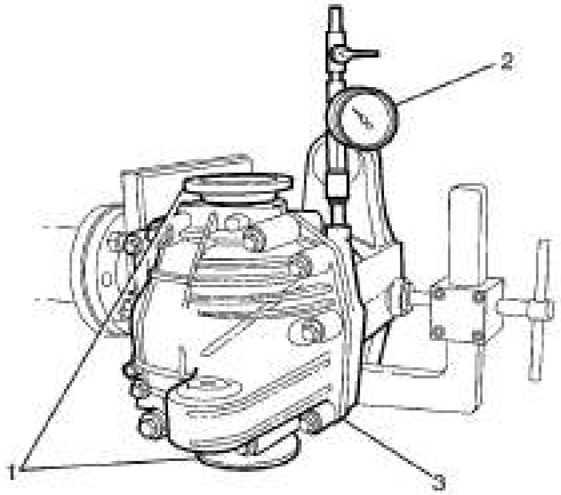
75. Apply a 1mm liquid seal bead (loctite 5910).(1) to the mating face of the differential housing. Refer to Adhesives, Fluids, Lubricants, and Sealers .
76. Install the differential housing cover to the differential housing. Refer to steps 26 through 33.



Important: The left and right rear axle shaft seals are different sizes so there are 2 different size installers. Make sure that the correct seal installer is used for the correct seal.

Important: Fill the space between the dust lip and the seal lip with the correct grease.

77. Install the left and right rear axle shaft seals (1) using DT-48722 and DT-48721 (2).



78. Install two rear axle flanges or two sealing plugs (1) to seal the differential (3).

Important: Set the air pressure regulator to .4 bar before connecting.

79. Remove the oil drain plug and install the air pressure regulator (2).
80. Connect the air supply to the regulator (2) and pressurise the differential (3) to .4 bar.

81. Disconnect the air supply from the regulator (2).
82. The pressure should not decrease from .4 bar within 3 minutes. If the pressure decreases, locate and repair leakage.
83. Install the differential (3) to the vehicle. Refer to Differential Replacement .
84. Fill the differential fluid. Refer to the filling procedure in Differential Oil Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Rear Drive Axle | Repair Instructions | **Document ID: 1995576**

Rear Axle Disassemble

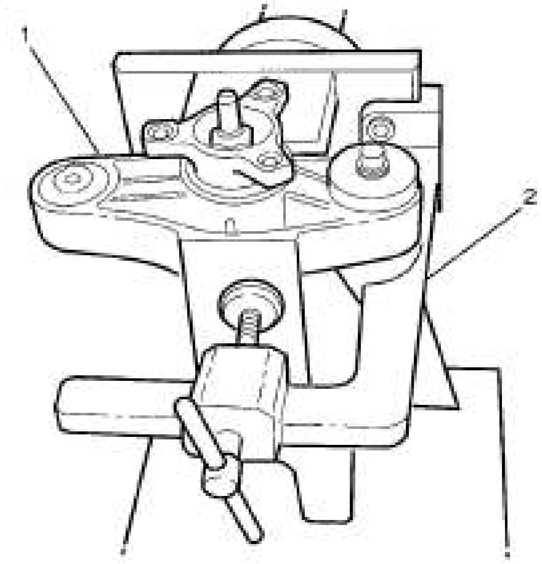
Tools Required

- E-308 Seal Remover.
- 205-116 Carrier Bearing Puller Including Plug.
- DT-48805 Pinion Tail Bearing Cup Remover.
- DT-48725 Pinion Head Bearing Cup Removal Kit.
- DT-48726 Pinion Head Bearing Cup Remover.

Caution: Refer to Safety Glasses Caution in the Preface section.

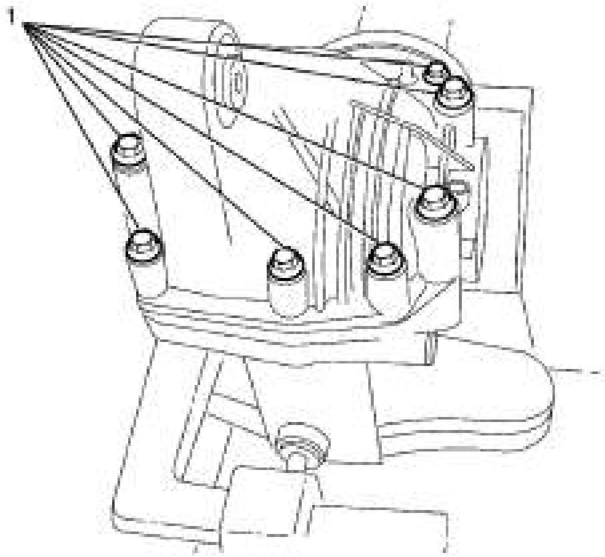
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Drain the differential fluid. Refer to the draining procedure in Differential Oil Replacement .
3. Remove the differential from the vehicle. Refer to Differential Replacement .

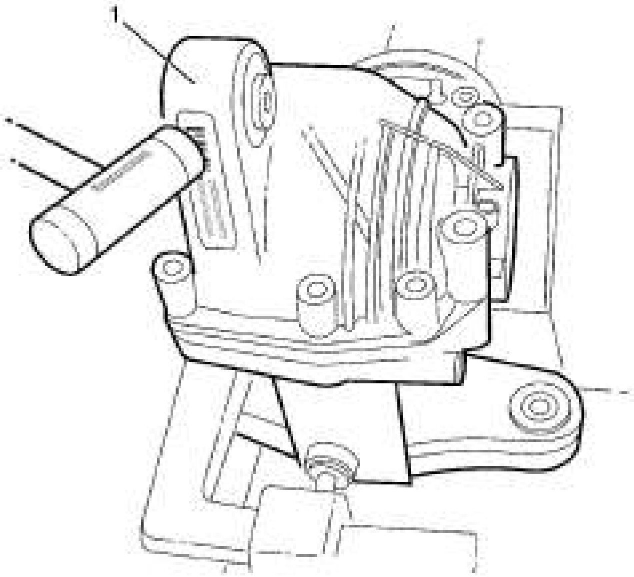


Important: The holding device must be able to rotate.

4. Mount the differential assembly (1) to a suitable holding device (2).

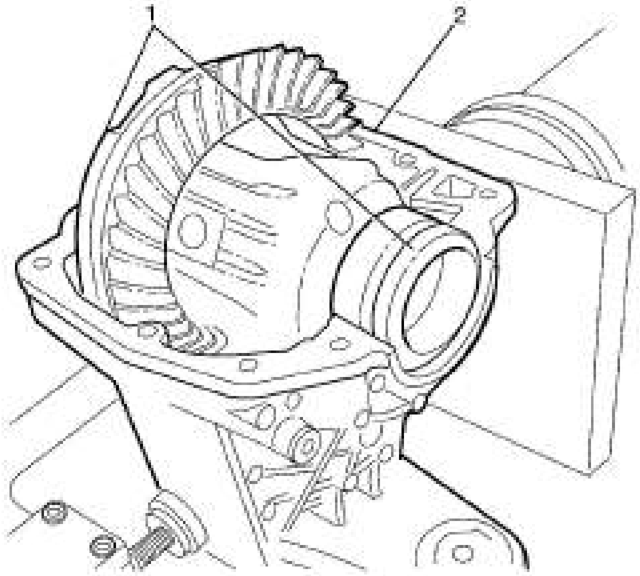


5. Remove the differential housing cover to differential housing retaining bolts (1).



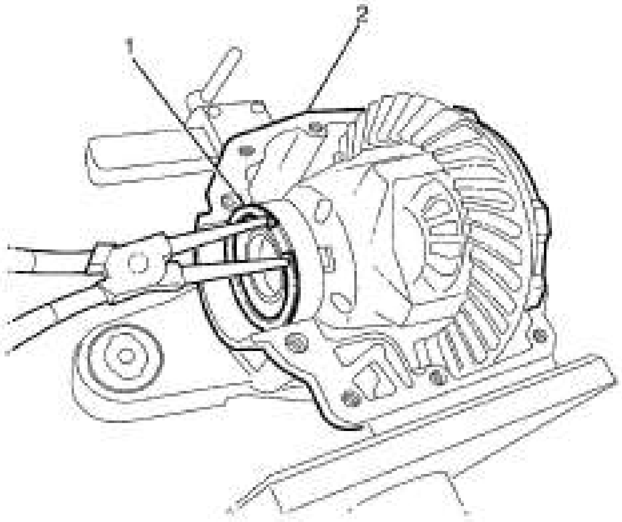
Important: Use a soft faced hammer to aid in separating the differential housing cover from the rear differential housing (1).

6. Remove the rear differential housing cover (1).

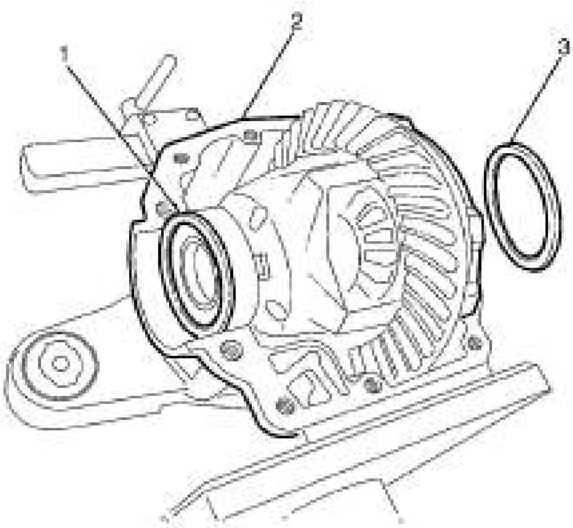


7. Remove the left and right axle shaft seals (1) from the differential (2).

   Discard the axle shaft seals.

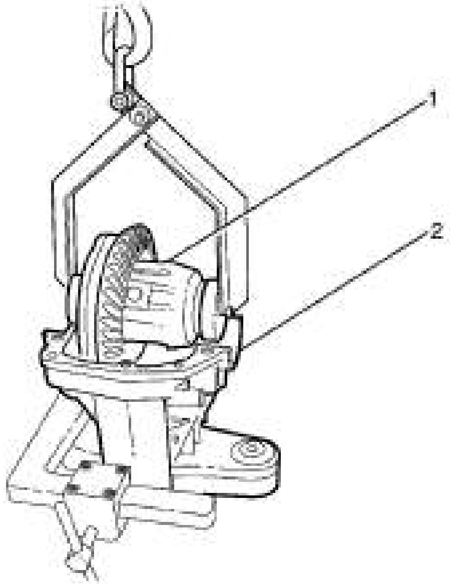


8. Remove the circlip (1) from the differential (2).



Important: Mark the left shim (3) and right shim (1) before removing for correct refitting.

9. Remove the left shim (3) and right shim (1) from the differential (2).

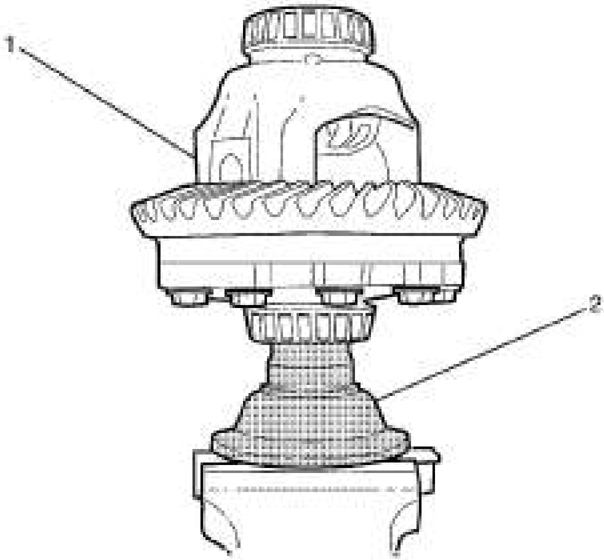


Important: Remove the differential (1) using a suitable tool or with the aid of an assistant.

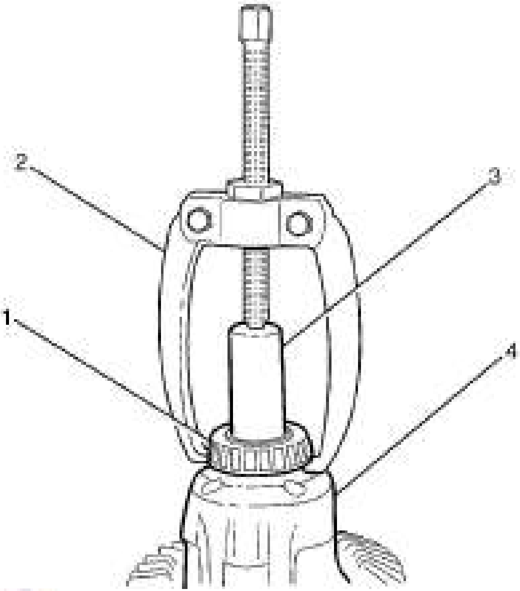
10. Remove the differential (1) from the differential housing (2).

Important: Place a suitable container to catch remaining differential fluid.

11. Allow remaining differential fluid to drain.



12. Position the differential (1) onto a suitable holding device (2).



Important: Use a suitable puller (2) and 205-116 (3) to remove the right bearing (1).

13. Remove the right bearing (1) from the differential (4).

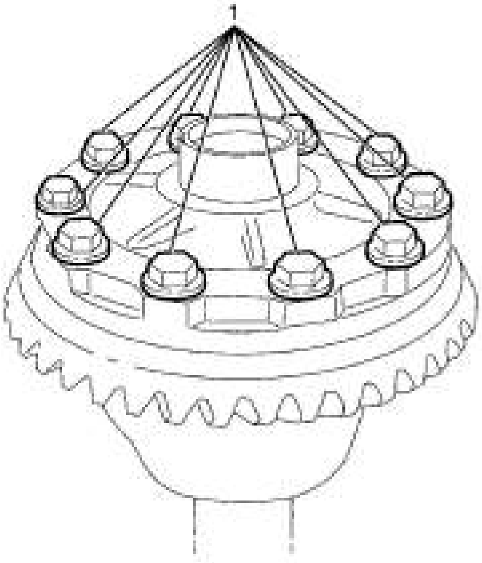
    Discard the right bearing.

14. Turn the differential (4) over on the holding tool with the aid of an assistant.

    Important: Use a suitable puller (2) and 205-116 (3) to remove the left bearing.

15. Remove the left bearing from the differential (4).

Discard the left bearing.



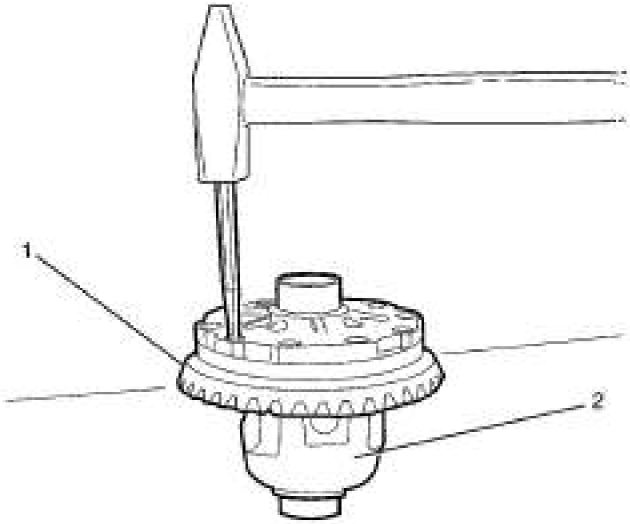
16. Remove the ring gear to differential retaining bolts (1).

    Discard ring gear to differential retaining bolts.

17. Remove the differential from the holding device.

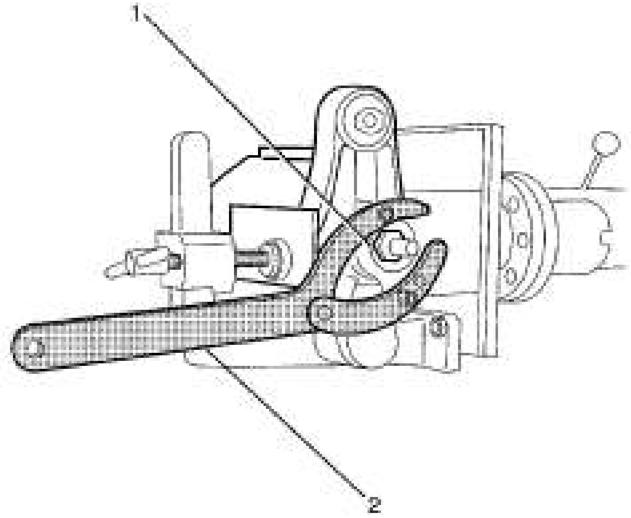
    Important: Make sure there is soft material between the differential and the bench top.

18. Place the differential onto a bench top.



Important: Use suitable tools or a suitable press to remove the ring gear (1) from the differential (2). Take care not to damage the ring gear retaining bolt hole threads.

19. Remove the ring gear (1) from the differential (2).



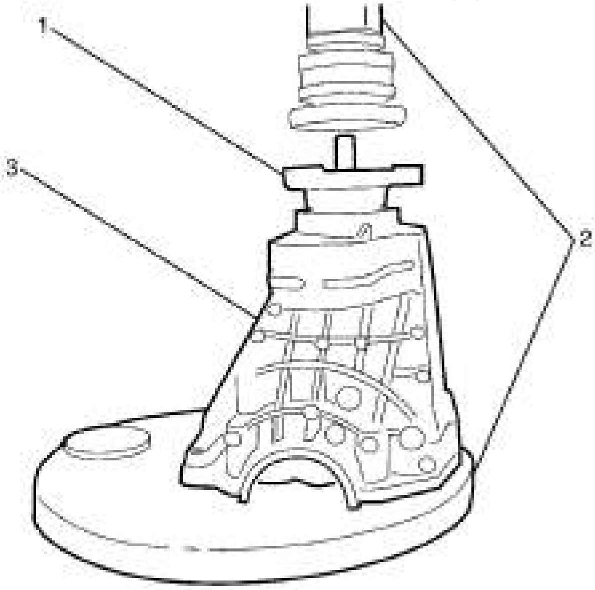
20. Install the universal holding tool (2) to the pinion flange (1).

Important: Hold the pinion flange with universal holding tool (2).

21. Remove the pinion flange to prevailing torque pinion flange retaining nut (1).

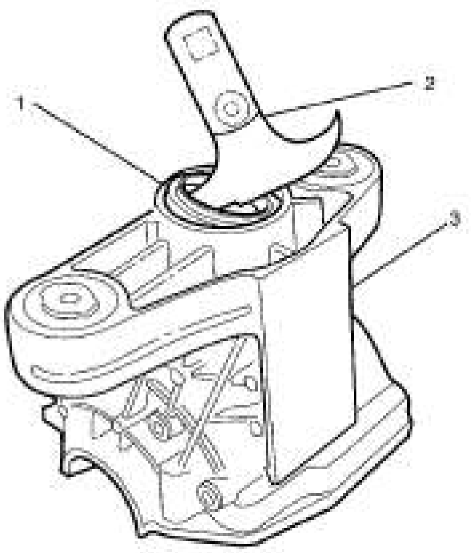
Discard the prevailing torque pinion flange retaining nut.

22. Remove the universal holding tool (2) from the pinion flange (1).



Important: The pinion flange (1) can be removed with a suitable puller or with a press (2). Support the pinion or place a soft cloth under the pinion to prevent damage when removing.

23. Remove the pinion flange (1) from the differential housing (3).
24. Remove the pinion from the differential housing (3).



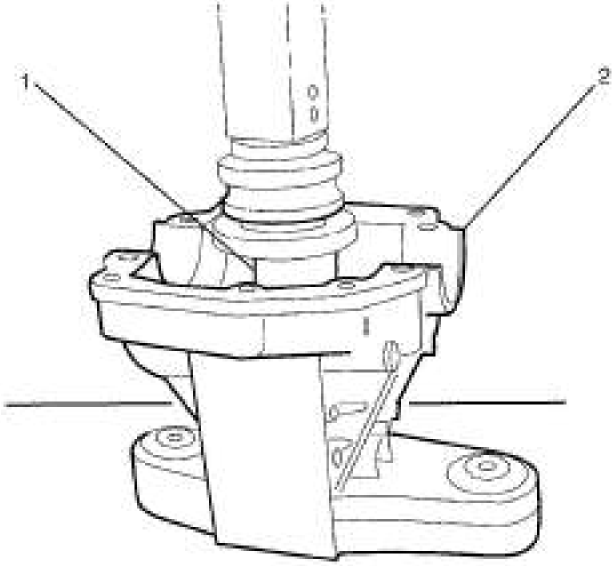
Important: Do not damage any sealing surfaces when removing the axle shaft oil seal (1). Cuts or abrasions will damage the assembly and result in lubricant leakage from this area.

25. Using a E-308 (2), remove the pinion flange oil seal (1) from the differential housing (3).

    Discard the pinion flange oil seal.

26. Remove the tail bearing from the differential housing (3).

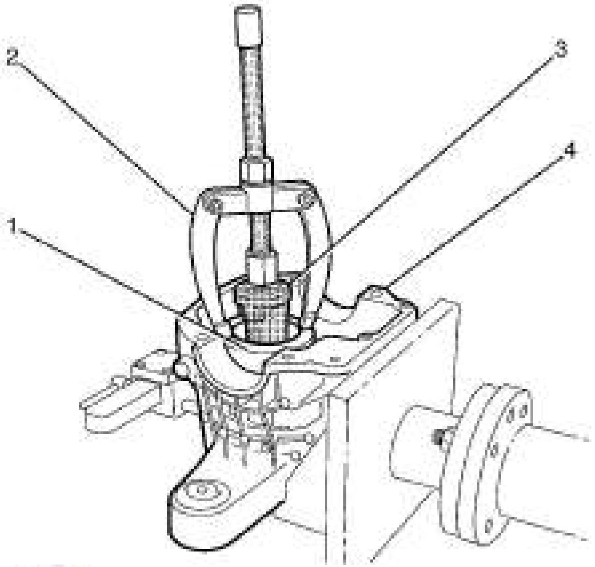
    Discard the tail bearing.



Important: Use a suitable press and DT-48805 to remove the tail bearing cup.

27. Position the DT-48805 (1) to the differential housing (2) and press out the tail bearing cup.
28. Remove the tail bearing cup from the differential housing (2).

    Discard the tail bearing cup.

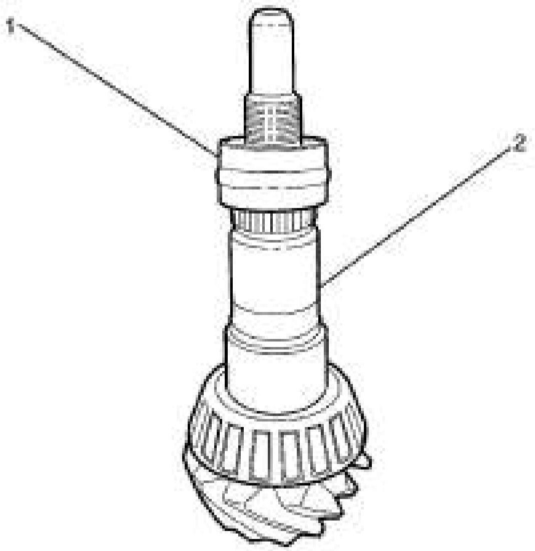


Important: Use DT-48725 (1, 2) and DT-48726 (3) to remove the head bearing cup.

29. Position DT-48726 (3) to the differential housing (4) and pull out the head bearing cup.

30. Remove the head bearing cup from the differential housing (4).

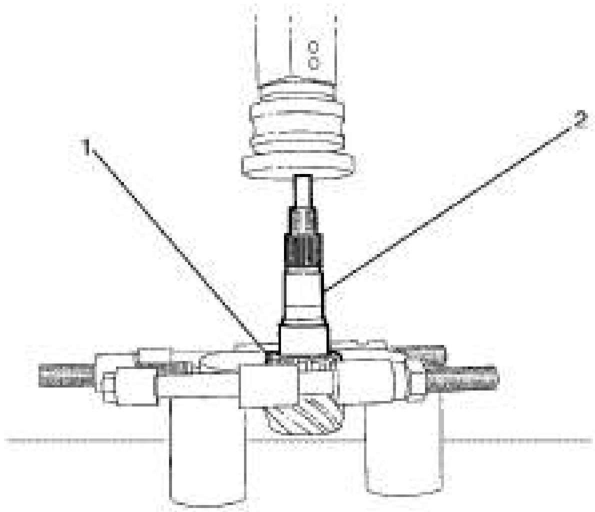
    Discard the head bearing cup.



Important: Do not reuse the collapsible spacer (1).

31. Remove the collapsible spacer (1) from the pinion gear (2).

    Discard the collapsible spacer.



Important: Use a suitable press and press plates to remove the pinion head bearing (1).

32. Remove the pinion head bearing (1) from the pinion gear (2).

    Discard the pinion head bearing.

33. Remove the pinion shim from the pinion gear (2).
34. Clean loctite from the pinion gear thread.

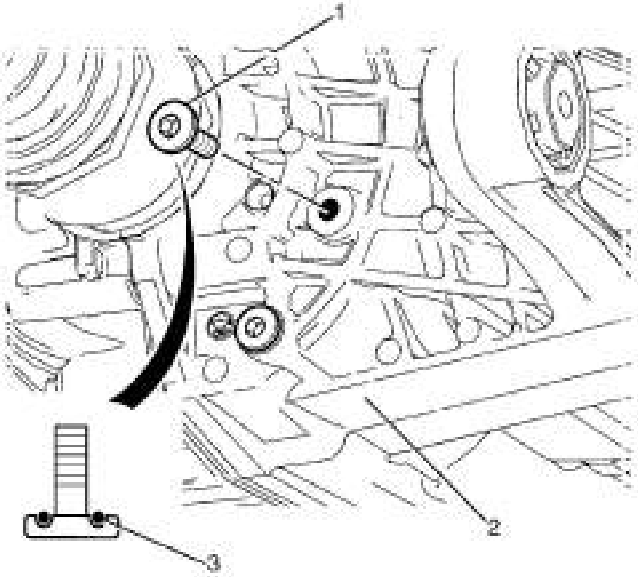
Rear Axle Lubricant Level Inspection

Inspection Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



Important: The differential fill plug (1) and O-ring (3) come as an assembly, the O-ring (3) cannot be replaced separately.

Important: Clean the area around the differential fill plug (1) to prevent the entry of foreign particles into the differential (2).

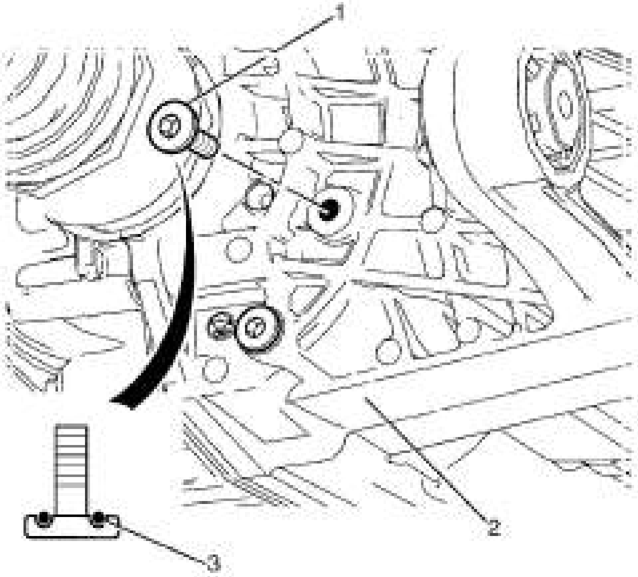
2. Remove the differential fill plug (1) from the differential (2).
3. Inspect the differential fill plug (1) and O-ring (3) for excessive wear and/or damage. Replace as necessary.

Important: The differential fluid level must be level with the bottom of the differential fill plug hole to no lower than 6 mm (0.25 in) below the opening.

Important: When adding differential fluid or making a complete differential fluid change, always use the correct differential fluid. Failure to use the correct differential fluid may cause gear damage and/or differential fluid leaks. For differential fluid specifications refer to Lubrication Specifications .

4. Check the differential fluid level.
5. Add new differential fluid if necessary.

Notice: Refer to Fastener Notice in the Preface section.



6. Install the differential fill plug (1) and O-ring (3) to the differential (2).

   Tighten
   Tighten the differential fill plug to 35 N-m (26 lb ft).

7. Remove the safety stands.
8. Lower the vehicle to the ground.

Limited Slip Differential Description and Operation

The limited slip differential performs the same functions as the conventional type differential. However, should the one wheel begin to spin, it transfers driving force to the wheel with traction. It does this with a 5 plate clutch set up in the differential.

Rear Drive Axle Description and Operation

The differential assembly is a cast aluminium two-piece housing design. The differential is mounted to the rear suspension assembly by three rubber mounts, one either side of the pinion flange at the front and the third at the rear of the housing. The differential housing retaining bolts are located around the outside of the housing with the four larger bolts are also bearing retaining bolts. The internal components incorporate a hypoid gear set, ring gear and pinion, carrier assembly and pinion housing assembly. Pinion bearing pre-load is created through a collapsible spacer. Torque is transferred from the propeller shaft to the differential via the pinion flange which is splined to the hypoid pinion. The torque is then transferred from the pinion through the ring gear, differential case, differential pinions, side gears, and then via splines to the wheel drive shafts.

Diagnostic Starting Point - Wheel Drive Shafts

Begin the system diagnosis by reviewing Wheel Drive Shafts Description and Operation. Reviewing the description and operation information will help you determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing the description and operation information will also help you determine if the condition described by the customer is normal operation. Refer to Symptoms - Wheel Drive Shafts. In order to identify the correct procedure for diagnosing the system and where the procedure is located.

Symptoms - Wheel Drive Shafts

Before beginning diagnosis, review the system description and operation in order to familiarise yourself with the system function. Refer to Wheel Drive Shafts Description and Operation.

Classifying the Symptom

Wheel drive shaft symptoms can usually be classified into the following categories:

- Noises.
- Vibrations.

Visual/Physical Inspection

- Inspect the system components for obvious damage or conditions which could cause the symptom.
- Inspect the system for aftermarket devices which could affect the operation of the wheel drive shaft.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Clunk When Accelerating from Coast.
- Shudder or Vibration During Acceleration.

Clunk When Accelerating from Coast

A clunk noise when accelerating from coast or a standing start may be caused by a worn or damaged constant velocity joint. The common cause of constant velocity joint damage is the loss of lubricating grease and/or the presence of foreign material and contaminates in the constant velocity joint. This usually occurs as a result of a torn or damaged joint boot.

Carefully inspect the joint boot for cuts, tears or other signs of damage that may allow the loss of the lubricating grease and/or the entry of contaminates. If there is no damage to the joint boots, remove the wheel drive shaft from the vehicle and inspect the constant velocity joints. Rotate the constant velocity joints in a circular motion. Do not allow the constant velocity joint inner races to become disengaged from the outer race housings, or damage to the constant velocity joints will occur. The movement of the constant velocity joints should be smooth and even. If any binding or impeded motion is felt, the constant joint requires replacement.

Shudder or Vibration During Acceleration

A shudder/vibration, or a groan/scraping noise during acceleration may be caused by a worn or damaged constant velocity joint. The common cause of constant velocity joint damage is the loss of lubricating grease and/or the presence of foreign material and contaminates in the constant velocity joint. This usually occurs as a result of a torn or damaged constant velocity joint boot.

Carefully inspect the joint boot for cuts, tears or other signs of damage that may allow the loss of the lubricating grease and/or the entry of contaminates. If the boot is torn check for contact with foreign matter or other parts in the surrounding area. If there is no damage to the joint boots, remove the wheel drive shaft from the vehicle and inspect the constant velocity joints. Rotate the constant velocity joints in a circular motion. Do not allow the constant velocity joint inner races to become disengaged from the outer race housings, or damage to the constant velocity joints will occur. The movement of the constant velocity joints should be smooth and even. If any binding or impeded motion is felt, the constant velocity joint requires replacement.

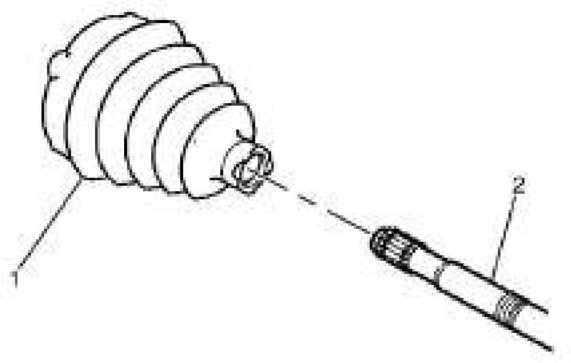
Rear Wheel Drive Shaft Inner Joint Boot Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the wheel drive shaft from the vehicle. Refer to Wheel Drive Shaft Replacement.
3. Remove the inner constant velocity joint. Refer to Wheel Drive Shaft Inner Joint and Boot Replacement.



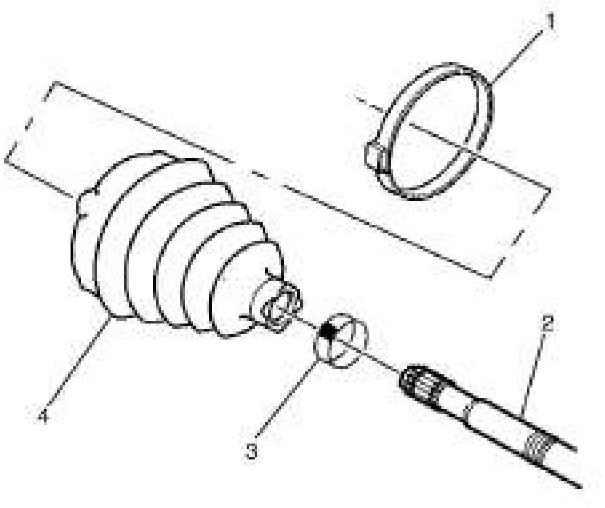
4. Remove the inner joint boot (1) from the interconnecting shaft (2).

   Discard the inner joint boot.

   Important: All traces of old grease and any contaminates must be removed.

5. Clean the grease from the interconnecting shaft (2).

Installation Procedure



Important: The inner constant velocity joint NEW small retaining clamp (3) and NEW large retaining clamp (1) must not be fully tightened at this stage.

1. Install the NEW large retaining clamp (1) and the NEW small retaining clamp (3) to the NEW inner joint boot (4).

   Do not fully tighten clamp.

2. Install the NEW inner joint boot (4) along the interconnecting shaft (2).
3. Install the inner constant velocity joint. Refer to Wheel Drive Shaft Inner Joint and Boot Replacement.
4. Install the wheel drive shaft to the vehicle. Refer to Wheel Drive Shaft Replacement.
5. Remove the safety stands.
6. Lower the vehicle to the ground.

Rear Wheel Drive Shaft Outer Joint Boot Replacement

Tool Required

J 22610 Keystone Pliers.

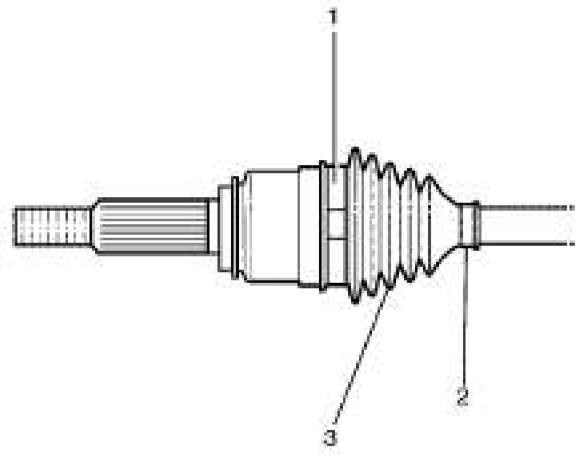
Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Important: When the outer joint boot is replaced the inner joint boot must always be replaced.

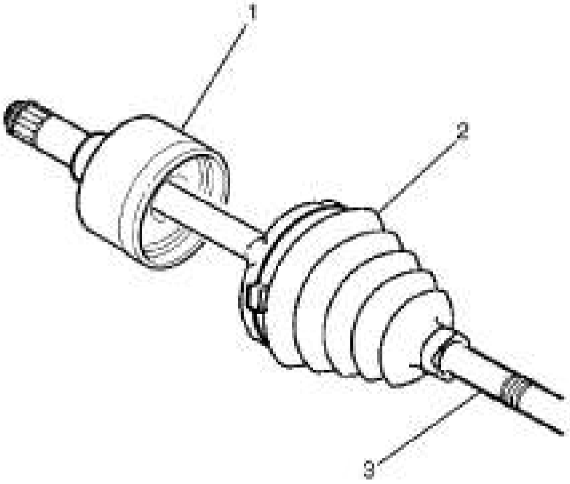
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the wheel drive shaft from the vehicle. Refer to Wheel Drive Shaft Replacement .
3. Remove inner constant velocity joint and joint boot. Refer to Wheel Drive Shaft Inner Joint and Boot Replacement .



Important: The outer joint boot small retaining clamp (2) and outer joint boot large retaining clamp (1) are single use parts and must be discarded after use.

4. Remove the outer joint boot large retaining clamp (1) and the outer joint boot small retaining clamp (2) from the outer joint boot (3).

   Discard the clamps.



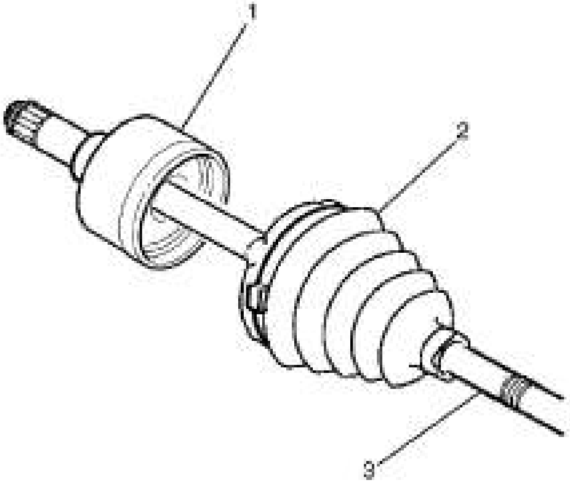
5. Remove the outer joint boot (2) from the outer constant velocity joint (1) along the interconnecting shaft (3).

   Discard the outer joint boot.

   Important: All traces of old grease and any contaminates must be removed.

6. Clean the grease from the interconnecting shaft (3) and outer constant velocity joint (1).

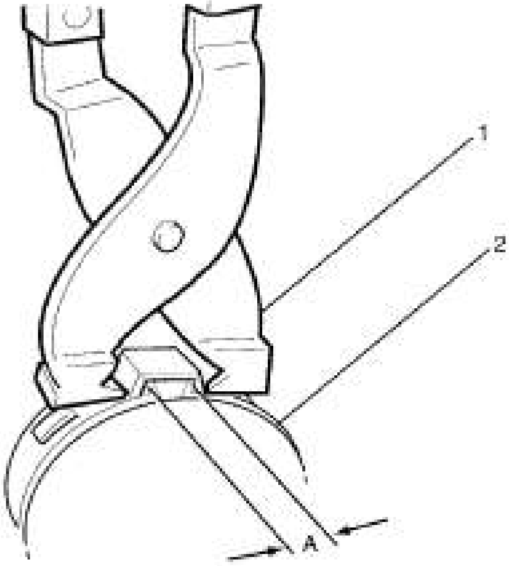
Installation Procedure



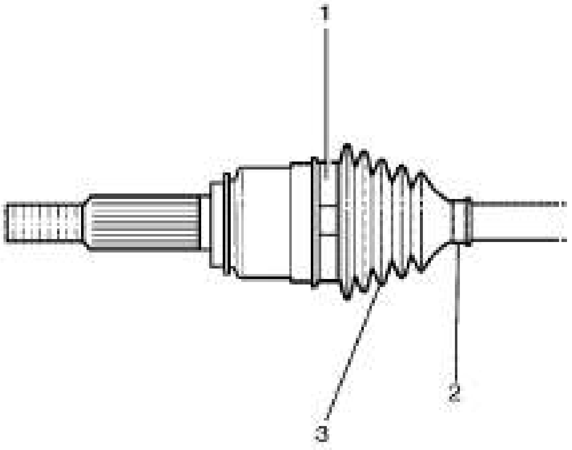
1. Install the NEW outer joint boot (2) along the interconnecting shaft (3).

   Important: Install grease into the outer constant velocity joint (1) and the NEW outer joint boot (2). Refer to Adhesives, Fluids, Lubricants, and Sealers .

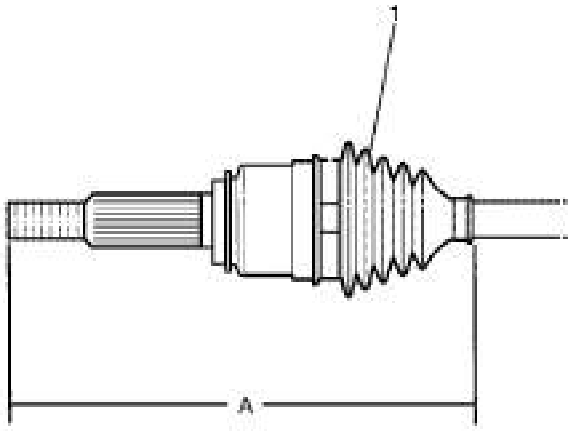
2. Install the NEW outer joint boot (2) to the outer constant velocity joint (1).



3. Use J 22610 (1) to crimp retaining clamp (2). The crimped distance (A) must be between 1.2 - 4mm.



4. Position the NEW outer joint boot large retaining clamp (1) and the NEW outer joint boot small retaining clamp (2) to the NEW outer joint boot (3).
5. Crimp the NEW outer joint boot large retaining clamp (1) and NEW outer joint boot small retaining clamp (2) to the NEW outer joint boot (3).



Important: The NEW outer joint boot (1) must not be dimpled, stretched, or deformed. Always equalise the air pressure in the NEW outer joint boot with the joint in the centre of its plunge position and shape properly by hand.

6. The outer constant velocity joint dimension A is 248 mm (9.8 in) for V6 and 254.3 mm (10 in) for V8.
7. Fully cycle the outer constant velocity joint several times to disperse grease throughout the outer constant velocity joint.
8. Install the inner constant velocity joint and joint boot. Refer to Wheel Drive Shaft Inner Joint and Boot Replacement .
9. Install the wheel drive shaft to the vehicle. Refer to Wheel Drive Shaft Replacement .
10. Remove the safety stands.
11. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Wheel Drive Shafts | Repair Instructions | Document ID: 1987920

Wheel Drive Shaft Inner Joint and Boot Replacement

Tools Required

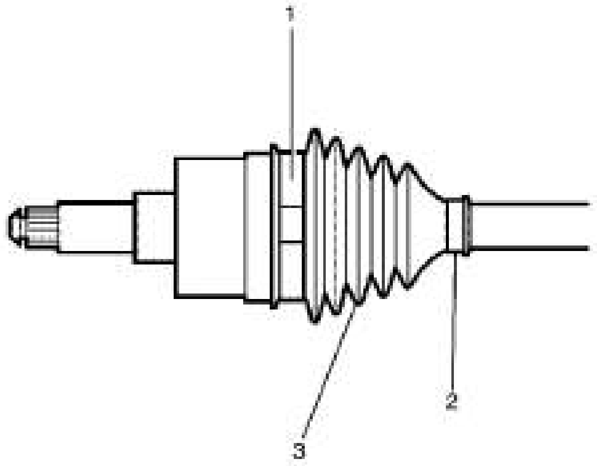
J 22610 Keystone Pliers.

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

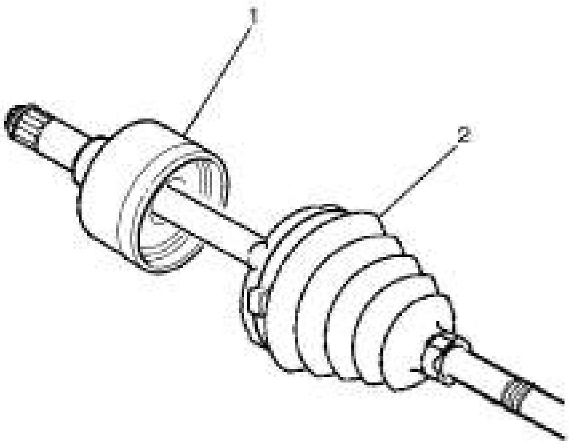
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the wheel drive shaft from the vehicle. Refer to Wheel Drive Shaft Replacement .



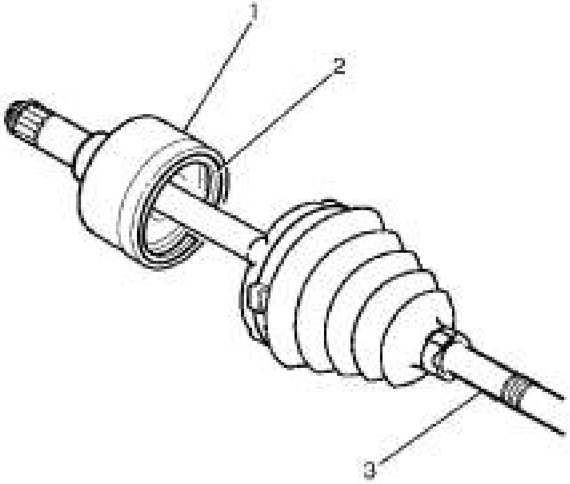
Important: The inner joint boot small retaining clamp (2) and the inner joint boot large retaining clamp (1) are single use parts and must be discarded after use.

3. Remove the inner joint boot small retaining clamp (1) and the large retaining clamp (2) from the inner joint boot (3).

   Discard the clamps.



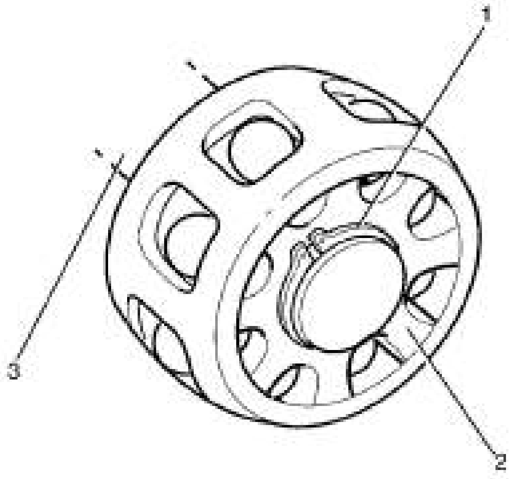
4. Move the inner joint boot (2) from the inner constant velocity joint (1) along the interconnecting shaft (3).



5. Remove the circlip (2) from the outer race of the inner constant velocity joint (1).

   Important: Take care as inner constant velocity balls can fall out when the inner constant velocity joint outer race (1) is removed.

6. Remove the inner constant velocity joint outer race (1) from the interconnecting shaft (3).

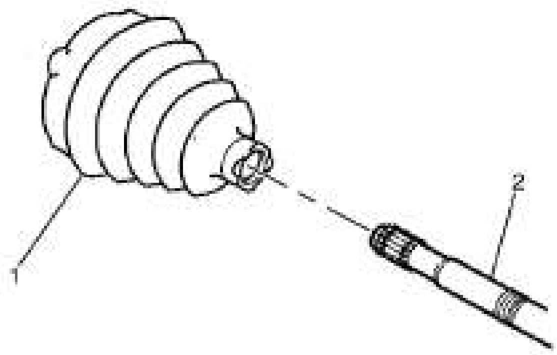


Important: The circlip (1) is a single use part and must be discarded after use.

7. Remove the circlip (1) from the inner constant velocity joint inner race (2).

   Discard the circlip.

8. Remove the inner constant velocity joint inner race (2) from the interconnecting shaft (3).

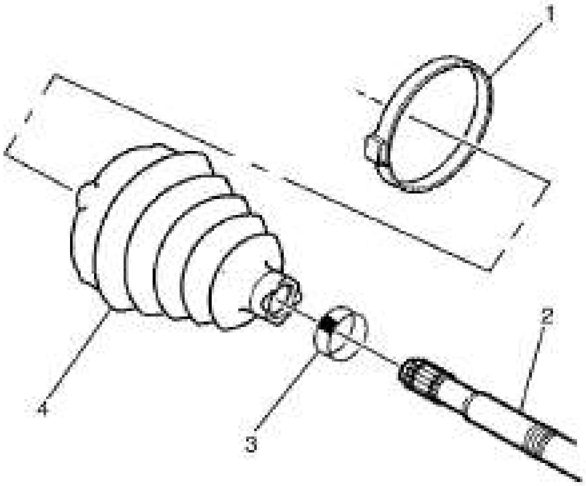


9. Remove the inner joint boot (1) from the interconnecting shaft (2).

   Important: All traces of old grease and any contaminates must be removed.

10. Clean the grease from the interconnecting shaft (2).

Installation Procedure

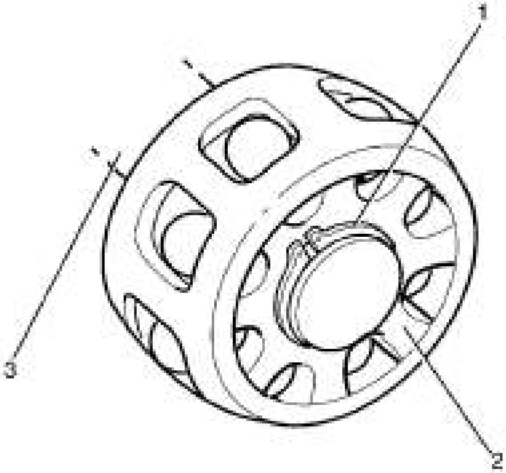


Important: The NEW inner joint boot large retaining clamp (1) and the NEW inner joint boot small retaining clamp (3) must not be fully tightened at this stage.

1. Install the NEW inner joint boot large retaining clamp (1) and the NEW inner joint boot small retaining clamp (3) to the NEW inner joint boot (4).

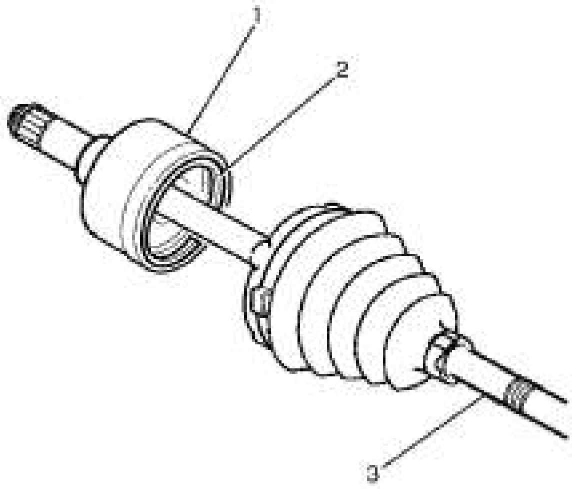
   Do not fully tighten clamps.

2. Install the NEW inner joint boot (4) along the interconnecting shaft (2).

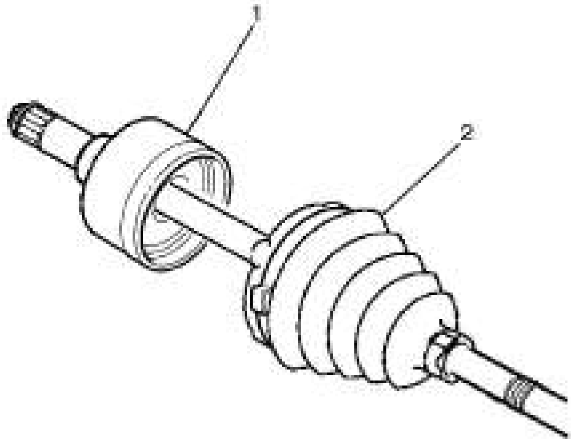


Important: Pack grease around the inner constant velocity balls to aid in holding in place. Refer to Adhesives, Fluids, Lubricants, and Sealers .

3. Install the inner race (2) to the interconnecting shaft (3).
4. Install the NEW inner race snap ring (1) to the interconnecting shaft (3).

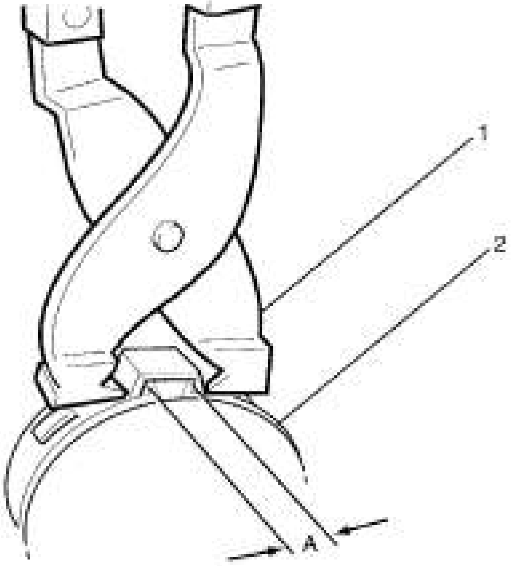


5. Install the inner constant velocity joint outer race (1) to the interconnecting shaft (3).
6. Install the NEW inner constant velocity joint outer race circlip (2) to the outer race of the inner constant velocity joint (1).



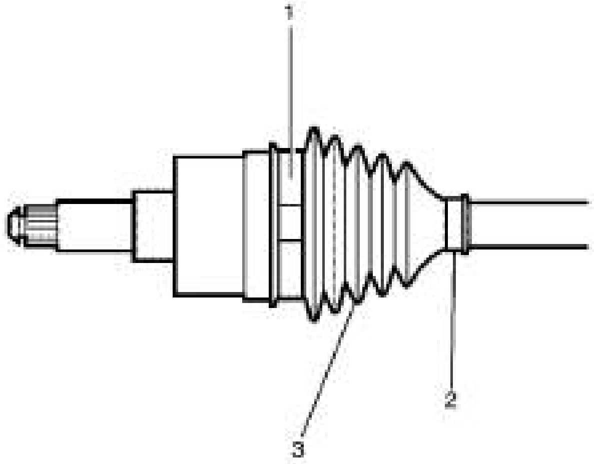
Important: Install grease into the inner constant velocity joint (1) and the NEW inner joint boot (2). Refer to Adhesives, Fluids, Lubricants, and Sealers .

7. Install the NEW inner joint boot (2) to the constant velocity joint (1).

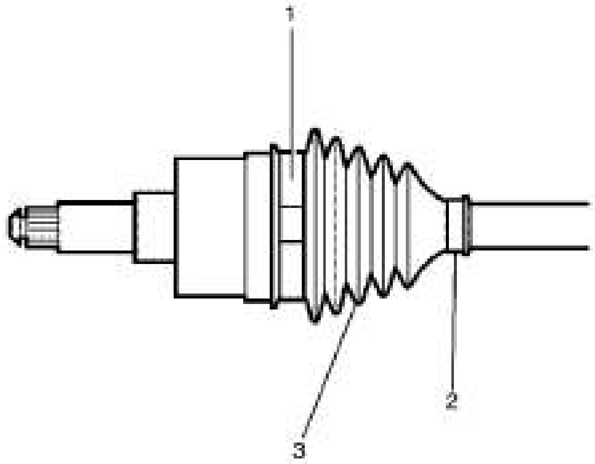


8. Use J 22610 (1) to crimp retaining clamp (2). The crimped distance (A) must be between 1.2 - 4mm.

Notice: Refer to Fastener Notice in the Preface section.

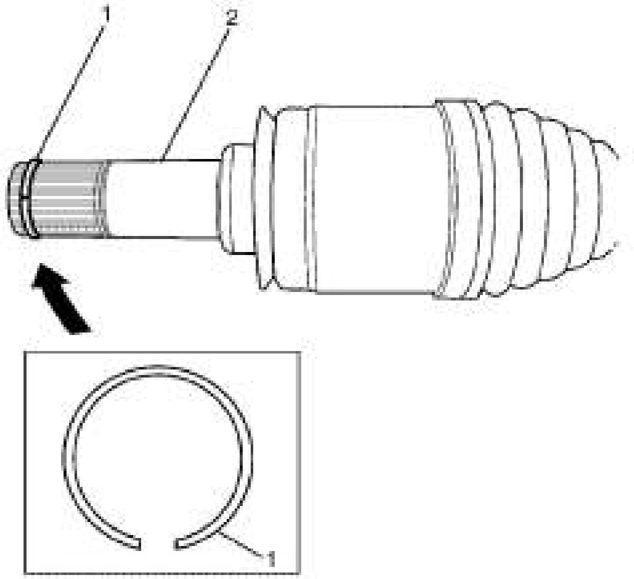


9. Crimp the NEW inner joint boot large retaining clamp (1) and NEW inner joint boot small retaining clamp (2) to the NEW inner joint boot (3).



Important: The NEW inner joint boot (1) must not be dimpled, stretched, or deformed. Always equalise the air pressure in the NEW inner boot with the joint in the centre of its plunge position and shape correctly by hand.

10. The inner constant velocity joint dimension A is 280.3 mm (11.04 in) for V8 and 281.8 mm (11.09 in) for V6.



11. Install the NEW snap ring (1) to the inner constant velocity joint (2).
12. Fully cycle the inner constant velocity joint (2) several times to disperse grease throughout the inner constant velocity joint (2).
13. Install the wheel drive shaft to the vehicle. Refer to Wheel Drive Shaft Replacement .
14. Remove the safety stands.
15. Lower the vehicle to the ground.

Wheel Drive Shaft Outer Joint and Boot Replacement

Removal Procedure

Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Important: Outer constant velocity joint and axle shaft can not be separated and are replaced as a complete assembly.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the wheel drive shaft from the vehicle. Refer to Wheel Drive Shaft Replacement.
3. Remove inner constant velocity joint and joint boot. Refer to Wheel Drive Shaft Inner Joint and Boot Replacement.
4. Discard wheel drive shaft assembly.

Installation Procedure

1. Install outer joint boot to NEW outer constant velocity joint and axle shaft assembly. Refer to Rear Wheel Drive Shaft Outer Joint Boot Replacement.
2. Install the inner constant velocity joint and joint boot. Refer to Wheel Drive Shaft Inner Joint and Boot Replacement.
3. Install the wheel drive shaft to the vehicle. Refer to Wheel Drive Shaft Replacement.
4. Remove the safety stands.
5. Lower the vehicle to the ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driveline/Axle | Wheel Drive Shafts | Repair Instructions | **Document ID: 1992446**

Wheel Drive Shaft Replacement

Tools Required

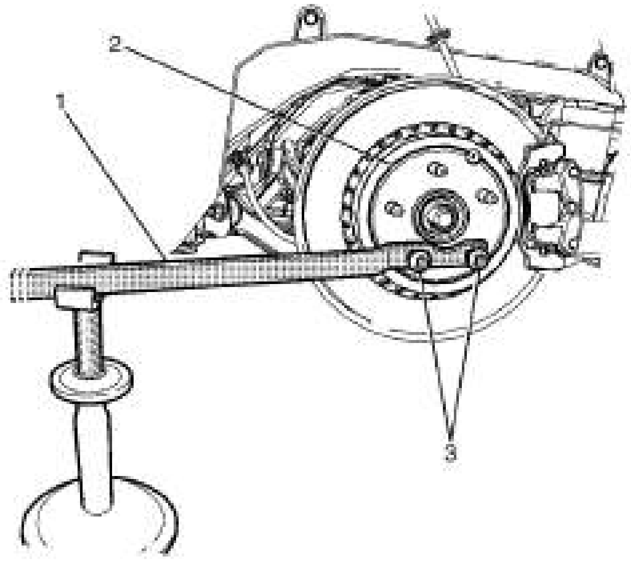
- KM-468 Holding Tool.
- J-22912-01 Press Plates.
- J 22610 Keystone Pliars.
- 7208 Rear Axle Remover.

Removal Procedure

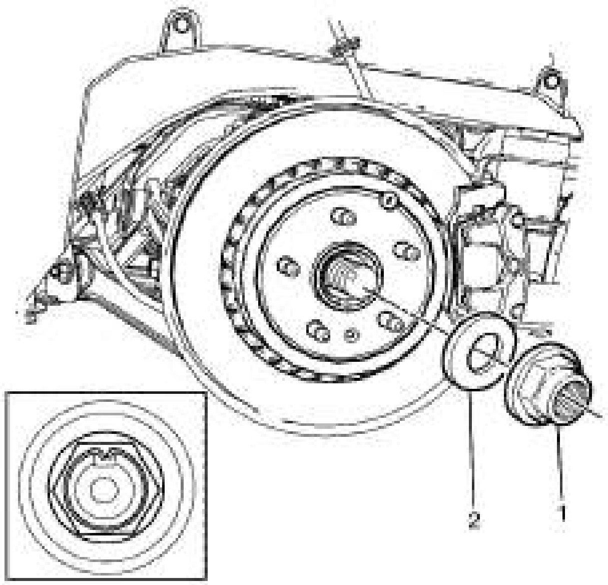
Caution: Refer to Safety Glasses Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the rear tyre and wheel assemblies. Refer to Tire and Wheel Removal and Installation.



3. Install the KM-468 (1) to the wheel hub (2) with two inverted wheel nuts (3).
4. Support the KM-468 (1) outer end on a safety stand.



Important: Use a suitable tool to release the crimping on the wheel drive shaft retaining nut.

Important: The wheel drive shaft retaining nut (1) must be discarded after removal.

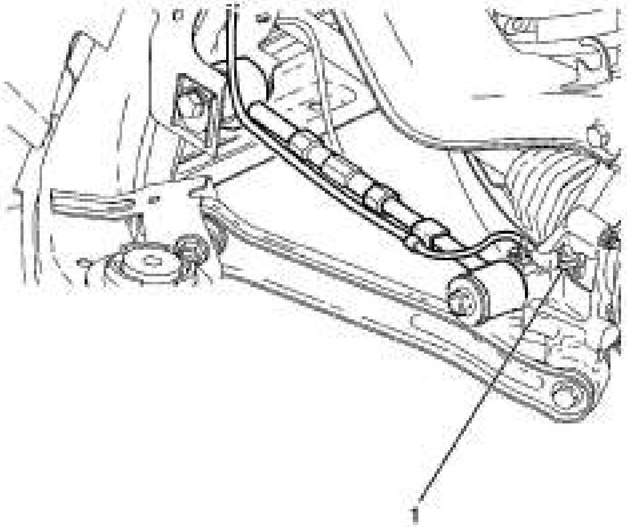
5. Remove the wheel drive shaft retaining nut (1).

   Discard the nut.

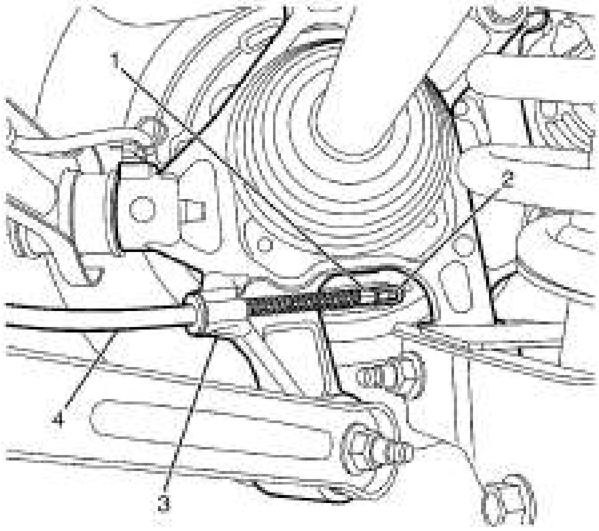
6. Remove the wheel drive shaft washer (2).

   Discard the washer.

7. Remove the KM-468 from the wheel hub.



8. Disconnect the wheel speed sensor electrical connector (1).
9. Detach the wheel speed sensor wiring harness mounting clip (2) from the knuckle (3).

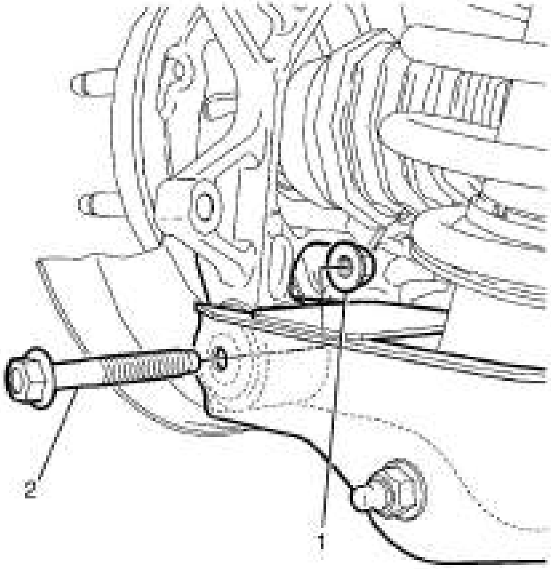


Important: Using a suitable tool, detach the rear park brake cable and clevis (1) from the park brake actuator (2) by pivoting the rear park brake cable and clevis (1) rearward.

10. Detach the rear park brake cable and clevis (1) from the park brake actuator (2).

Important: Remove the outer cable (4) from the rear knuckle (3) by pulling the outer cable (4) forward.

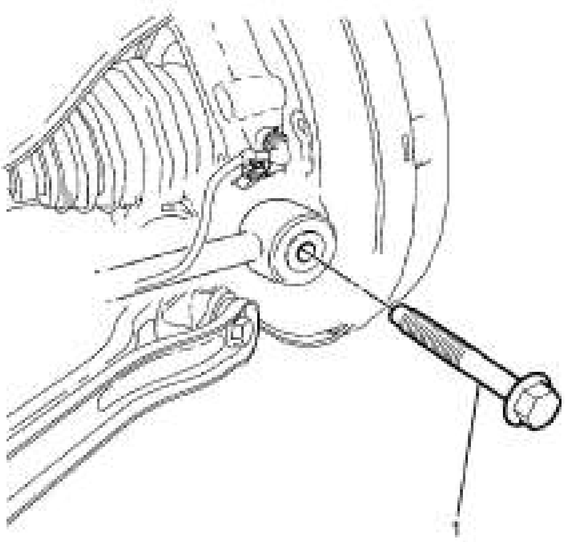
11. Remove the outer cable (4) from the rear knuckle (3).



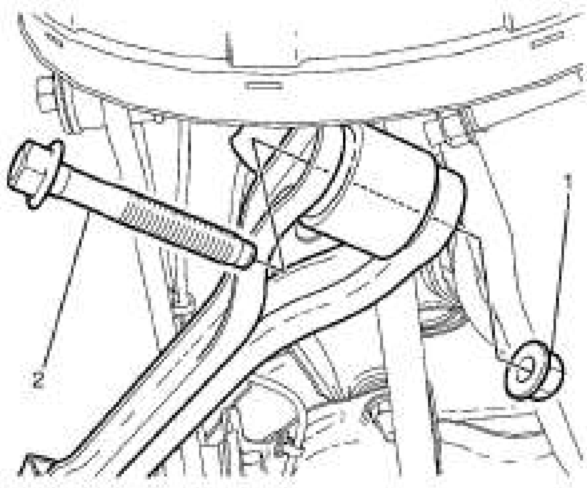
Important: Nuts with micro-encapsulated thread sealant must be discarded after removal.

12. Remove the lower control arm to knuckle retaining bolt (2) and nut (1).

    Discard the nut.

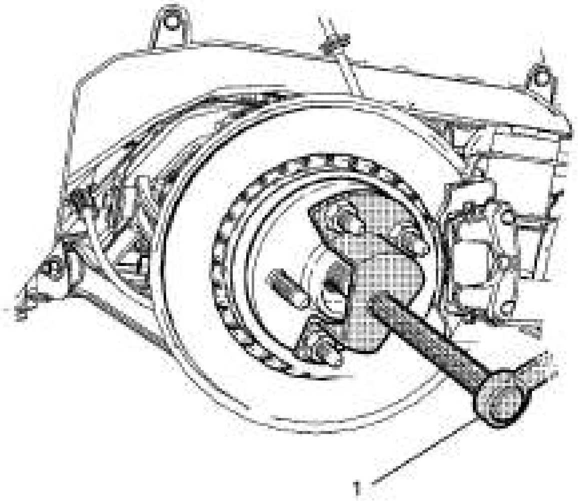


13. Remove the I-Link to knuckle retaining bolt (1) and washer (2).



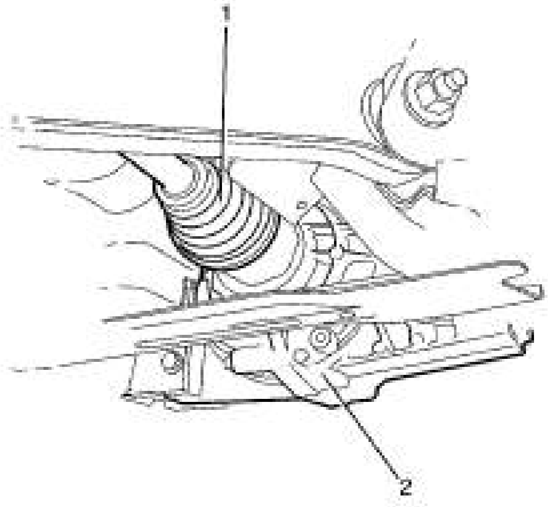
14. Remove the Y-Link to the knuckle retaining bolt (2) and nut (1).

Discard the nut.



Important: Do not hammer the end of the wheel drive shaft to remove use 7208 .

15. Use 7208 to remove the wheel drive shaft (1) from the wheel hub assembly (2).
16. Place a suitable container under the differential in order to collect draining fluid.



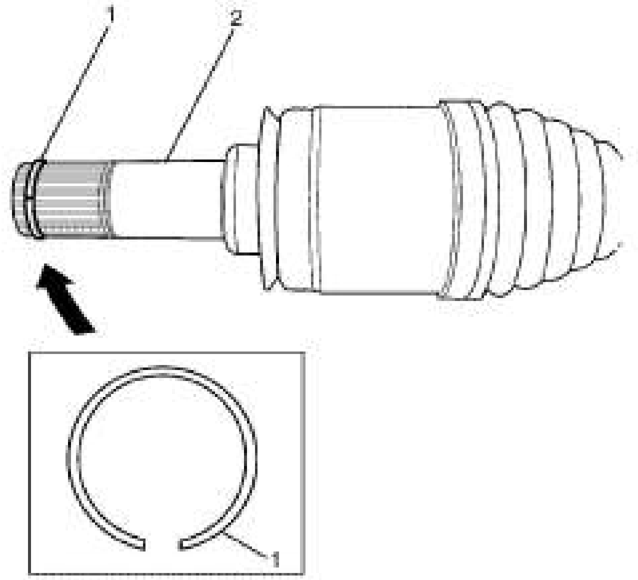
Important: Do not pull on the interconnecting shaft as it will pull apart the inboard joint.

Important: Do not damage the axle seal when disconnecting the wheel drive shaft (1) from the differential (2). Cuts or abrasions will damage the axle seal and result in lubricant leakage from this area.

Important: Use a suitable tool to pry the inner constant velocity joint out of the differential to release the snap ring.

Important: Support the wheel drive shaft when removing as the rear subframe may cut the inner constant velocity boot.

17. Disconnect the wheel drive shaft (1) from the differential (2).
18. Remove the wheel drive shaft (1) from the vehicle.



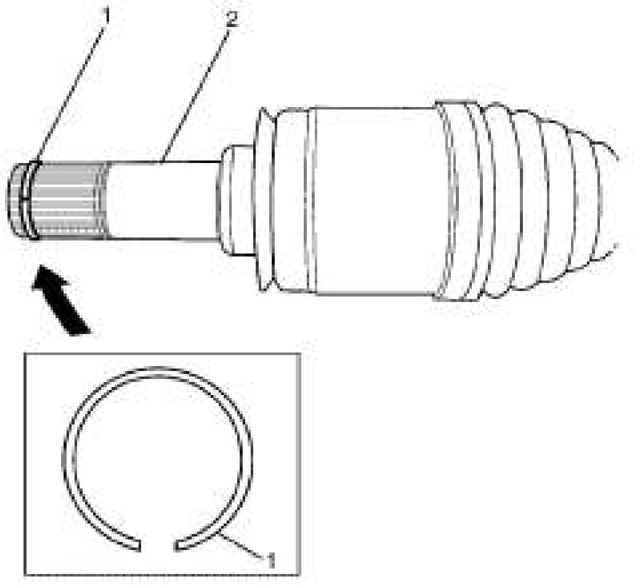
Important: The snap ring (1) is a single use part and must be discarded after removal.

19. Remove the snap ring (1) from the inner constant velocity joint (2).

    Discard the snap ring.

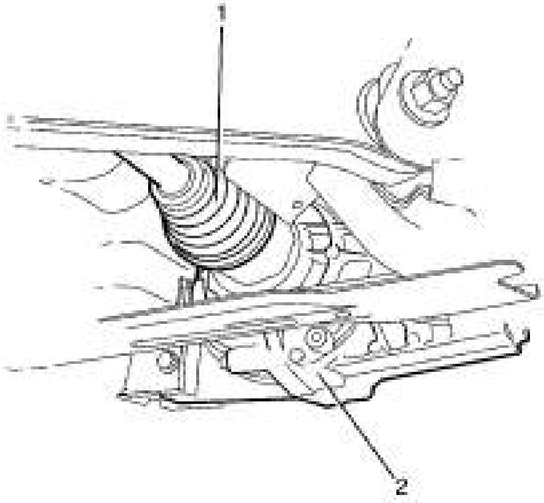
20. Inspect the wheel drive shaft assembly for excessive wear and/or damage. Inspect the following:
    - Wheel Drive Shaft.
    - Inner Joint Boot. For replacement refer to Rear Wheel Drive Shaft Inner Joint Boot Replacement.
    - Inner Constant Velocity Joint. For replacement refer to Wheel Drive Shaft Inner Joint and Boot Replacement.
    - Outer Joint Boot. For replacement refer to Rear Wheel Drive Shaft Outer Joint Boot Replacement.
    - Outer Constant Velocity Joint. For replacement refer to Wheel Drive Shaft Outer Joint and Boot Replacement.

Installation Procedure



Important: The gap in the snap ring (1) must be at the bottom.

1. Install the NEW snap ring (1) to the wheel drive inner constant velocity joint (2).



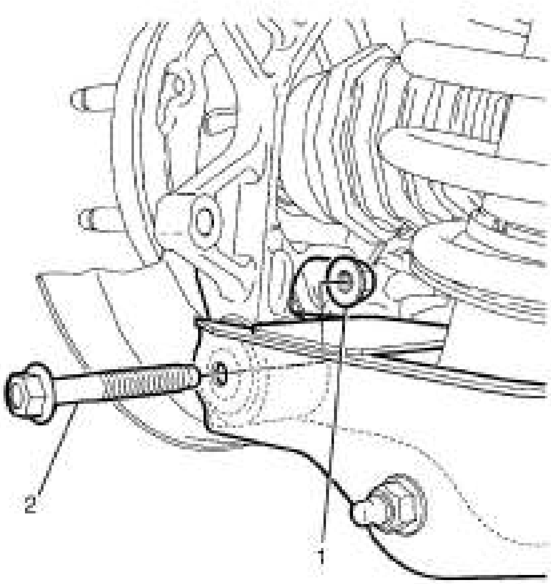
Important: Do not damage the axle seal when installing the wheel drive shaft (1) to the differential (2). Cuts or abrasions will damage the axle seal and result in subsequent lubricant leakage from this area.

2. Install the wheel drive shaft (1) to the differential (2).

Important: Pull the wheel hub assembly outwards to position the wheel drive shaft through the wheel hub assembly.

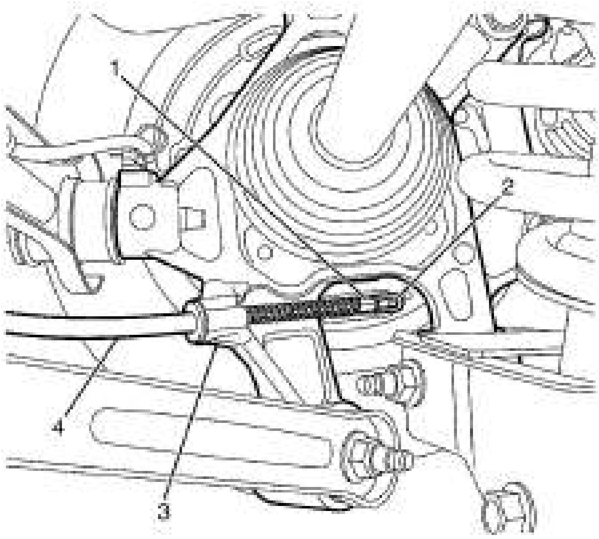
3. Position the wheel drive shaft through the wheel hub assembly.

Notice: Refer to Fastener Notice in the Preface section.



4. Install the lower control arm to knuckle retaining bolt (2) and NEW nut (1).

Tighten
Tighten the bolt and nut to 105 N·m (77 lb ft).

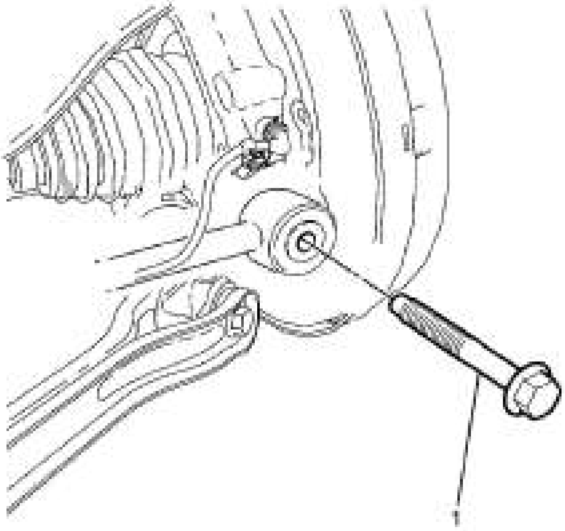


5. Install the rear park brake cable (4) into the rear knuckle (3).

   Make sure that the rear park brake cables (4) are properly seated.

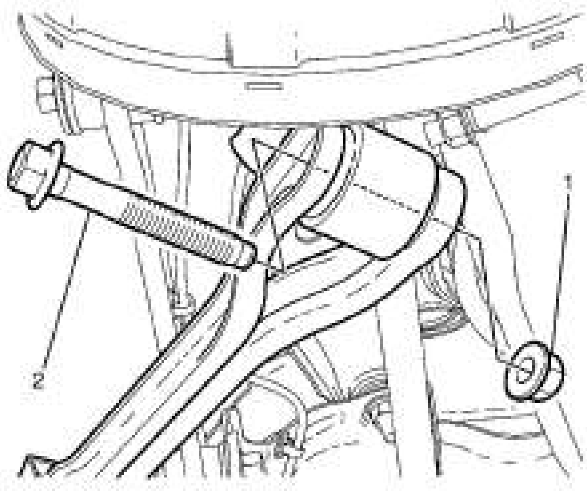
   Important: Attach the rear park brake cable and clevis (1) to the park brake actuator (2) by pivoting the rear park brake cable and clevis (1) rearward using pliers.

6. Attach the rear park brake cable and clevis (1) to the park brake actuator (2).



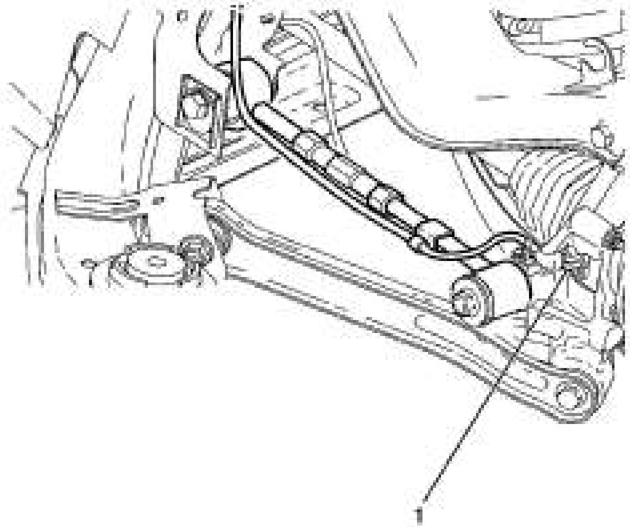
7. Install the I-Link to knuckle retaining bolt (1) and washer (2).

   Tighten
   Tighten the bolt to 105 N·m (77 lb ft).



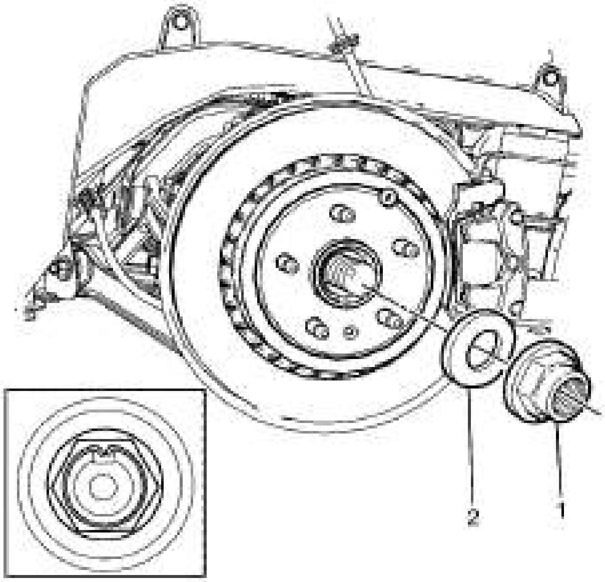
8. Install the Y-Link to the knuckle retaining bolt (2) and NEW nut (1).

   Tighten
   Tighten the bolt and nut to 170 N·m (126 lb ft).

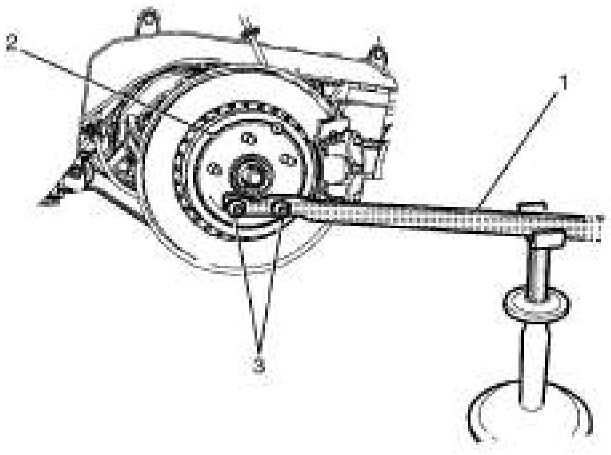


Important: The wheel speed sensor cable must be secured to protect it from damage.

9. Connect the wheel speed sensor electrical connector (1).



10. Install the NEW wheel drive shaft washer (2) to the wheel hub assembly.
11. Install the NEW wheel drive shaft nut (1) to the wheel hub assembly.



12. Install the KM-468 (1) to the wheel hub assembly (2) with two inverted wheel nuts (3).
13. Support the KM-468 (1) outer end on a safety stand.

Notice: Refer to Fastener Notice in the Preface section.

Important: There are two suitable methods of tightening the wheel drive shaft retaining nut. DO NOT EXCEED THE SPECIFIED TIGHTENING VALUES, otherwise premature bearing failure may result.

14. Preferred Method

Tighten
Tighten the nut on first pass to 150 N·m (111 lb ft).

Loosen
Loosen the nut on second pass by 180 Degrees.

Tighten
Tighten the nut on third pass to 425 N·m (313 lb ft)

Crimp nut.

Alternate Method

Tighten
Tighten the nut on first pass to 150 N·m (111 lb ft).

Loosen
Loosen the nut on second pass by 180 Degrees.

Tighten

Tighten the nut on the third pass to 50 N·m (37 lb ft)

Tighten
Tighten the nut on the forth pass by 45 Degrees

Crimp nut.

15. Remove the KM-468 (1).
16. Use a suitable tool to crimp the NEW wheel drive shaft nut to the wheel drive shaft keyway.
17. Install the rear wheel. Refer to Tire and Wheel Removal and Installation.
18. Check the differential fluid level. Refer to Rear Axle Lubricant Level Inspection.
19. Remove the safety stands.
20. Lower the vehicle to the ground.

Wheel Drive Shafts Description and Operation

The wheel drive shaft assemblies are flexible assemblies consisting of an inner and outer constant velocity joint connected by a interconnecting shaft. The inner constant velocity joint is flexible and can move in and out. The inner constant velocity joint is replaceable. The outer constant velocity joint is flexible, but cannot move in or out. The outer constant velocity joint is pressed onto the interconnecting shaft and is replaced as a complete outer constant velocity joint and interconnecting shaft assembly. Both constant velocity joints use rubber joint boots to protect and seal the constant velocity joints from dirt, water, and atmospheric conditions. The joint boots also contain lubricating grease required by the constant velocity joints for lubrication and quiet operation. Inner and outer joint boot kits are available and can be replaced individually as required. The inner constant velocity joints incorporate a male spline and interlock with the differential gears using barrel type snap rings. The snap rings are replaced after removal. The outer constant velocity joint is secured to the wheel/hub assembly with a locking nut and washer. The nut must be peened over into the keyway of the outer constant velocity joint stem to secure. The nut is discarded after removal. The wheel drive shafts transmit power from the differential to the wheel hubs. The constant velocity joints enable the wheel drive shafts to transmit the power with a flexible and quiet operation.

#PIC3011E: OnStar Voice Recognition Operation Issues - keywords information intermittent microphone performance voice - (Jun 18, 2008)

Subject: OnStar® Voice Recognition Operation Issues

Models: All 2000-2009 OnStar® Equipped vehicles

This PI was superseded to update model year and diagnostic information. Please discard PIC3011D.

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

When using the OnStar® voice recognition dialing, the customer may report that the system does not respond properly to some numbers and/or commands.

Recommendation/Instructions:

Dealers should test the OnStar® voice recognition (VR) system with the customer in the vehicle to verify the condition. It is helpful for the technician to also operate the VR to confirm that the system does respond with the customer present. If available, the dealer should also have the customer try the voice recognition in an identical vehicle. If the OnStar® system properly responds to any command for the user, the hardware is assumed to be good. In rare instances a specific command or number may not respond properly for any user. Only in these rare occasions would hardware be suspect.

The customer should be directed to the operational characteristics in the OnStar® Users Guide. They may also be directed to contact OnStar® Customer Assistance, who can provide additional guidance with system operation and voice recognition tips. Dealers may also refer to OnStar Description and Operation in service information (eSI) and go to the section labeled "General Tips for Better Speech Recognition". This information is available in eSI for most vehicles and can be useful when working through the concern with some customers.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a

© 2010 General Motors Corporation. All rights reserved.

""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, DO NOT assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. See your GM dealer for information on whether your vehicle may benefit from the information.

#PIC3597F: Disabled OnStar System Identification - keywords blue button communication deactivated digital disabled information led no operation red - (Jul 23, 2008)

Subject: **Disabled OnStar® system identification**

Models: **All OnStar® equipped vehicles**

This PI was superseded to update text referenceing Bulletin. Please discard PIC3597E.

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition / Concern:

A customer may report that the OnStar® does not connect, status LED is not illuminated or a disabled system message is heard. This may be due to the OnStar® system being disabled.

Recommendation / Instructions:

OnStar® will deactivate vehicles where the customer has chosen not to renew their OnStar® subscription after expiration, when the initial activation has never taken place or the vehicle has an analog only system that was disabled due to the analog sunset (see the current version of service bulletin 05-08-46-006). As a part of the OnStar® renewal communications, customers are notified that the OnStar® system in their vehicle will be deactivated unless they elect to renew the account. Customers who had an analog only system were notified that their systems would be disabled once the analog sunset (February 2008) was reached.

In most cases a check with the Tech 2 will find no current or history DTCs as well a MIN of 1234567890 or 7348436002 (after 2/3/08) may be listed.

After the vehicle has been successfully deactivated, customers will experience the following when attempting to contact OnStar® from their vehicle:

Blue OnStar® key: depending on vehicle hardware, the customer will either connect to a sales advisor or will hear an automated demonstration message. If the demonstration message is heard the customer needs to press the OnStar® button again to make a call for activation.

Gen 6 and newer systems may not have the OnStar® LED illuminated. The technician may not be able to activate the green LED with the "Green LED" test option in the Tech 2. This is a normal condition for a deactivated version 6.0 and newer system. No further action is needed unless the customer has or wants to renew their OnStar® account.

Note: If the customer wants to activate OnStar®, press the OnStar blue button. The LED will illuminate and start flashing, Allow the call to complete (this may take several minutes). Once the call completes request a unit configuration and retest the system.

Emergency key: A demo message will be played indicating the service has been deactivated. (on 1999 models, the operation of this key does not change with deactivation.)

Note: When successfully deactivated, the OnStar® system will not attempt to connect to the OnStar center if the vehicle's airbags deploy.

Certain vehicles that have never had an active OnStar® account may mimic the symptoms of a cellular or vehicle hardware concern, once they have been deactivated as they may not be able to establish a connection to the OnStar® center.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, DO NOT assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. See your GM dealer for information on whether your vehicle may benefit from the information.

#PIC4310C: Unable To Connect To OnStar Handsfree Calling Digital Hardware - keywords cellt cellular communication droppedcall failedtovoice information intermittent OPC operation no noconnect performance region - (Jun 18, 2008)

Subject:	**Unable to connect to OnStar or use OnStar handsfree calling Digital Hardware**
Models:	**All OnStar equipped vehicles**

This PI was superseded to update Recommendation/Instructions. Please discard PIC4310B.

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

The OnStar Blue button, emergency -red button or/and HFC (call answer/end button) key press results in: Cell messages, progression tones (1 every 6 seconds), dropped calls or failed to voice call. A possible cause could be a lack/limited cellular coverage or outage in the area. Incorrect PRL or incorrect home SID may cause this concern.

Recommendation/Instructions:

The following information is to be retrieved with the Tech2 before calling General Motors Technical Assistance.

It is imperative that when retrieving ALL following information the vehicle is Outside in an Open Area

Module ID 2

8 Digit GM part number:

Electronic Serial Number:

VCI Module Station ID:

Module ID:

Data Display

Signal Strength:

Signal Type:

Trans ID:

Cellular Information

Call mode:

Current System ID:

Digital Home NID:

Digital Home SID:

PRL Outdated Status:

PRL Version Number:

Off Board Navigation (Gen 7):

> Module Set Up >Program Phone Number

MIN:

MDN:

Perform an outbound OnStar personal call:

Results:

OnStar key press

Results:

Can the vehicle receive a call?

Results:

Test the Emergency Button:

If answered tell adviser you have no Emergency and you are testing the OnStar

After retrieving the above information with tech 2 with the vehicle outside please look at the following information.

If Current SID reads 40000 or 03353, Call Mode 0, 13, 60, and Signal Strength of 0 or 106 the Cell Antenna Circuit need to be tested.

When testing a Fluke Meter is preferred (J 39200) and have set on an Auto Ranging Scale. When making note of value also note the scale the meter is displaying. When testing the Cell Antenna circuit to disconnect antenna from VCIM and measure pin/shield. Note: Blue is always GPS and the Screw On Connector or Violet or White is the Cellular. Please document if you connect to the OnStar center with no data (failed to Voice) at any time.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, DO NOT assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. #PIC4564A: Handsfree Calling Inop With Demo Message On OnStar Keypress - keywords 05-08-46-006N blue button communication digital disabled message no OPC operation vs3bgen6 vs3bgen7 - (Apr 10, 2008)

Subject: **Handsfree Calling inop with demo message on OnStar® keypress**

Models: **All 2000 - 2009 OnStar® equipped vehicles with GEN 6 or GEN 7 hardware**

This PI was superseded to update model years and bulletin reference information. Please discard PIC4564.

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

It has been determined that all vehicles that have Gen 6.X (Gen 6.0, 6.05, 6.06, 6.05R, 6.11, 6.15, 6.4) or 7.X (7.0, 7.04, 7.045, 7.0L, 7.1L) could have a concern where the OnStar® Handsfree Calling (OHFC) may be inoperative as well as the demo message being heard when the OnStar® blue button is pressed.

This is due to the module being reset to its default configuration through an internal trigger in the VCIM or by a call into the vehicle by OnStar® to disable the system for an identified concern.

Recommendation/Instructions:

Important: Do not perform a Set-up new OnStar®/VCIM setup on this vehicle as they may cause the concern. If a Set-up new OnStar®/VCIM setup was not performed, perform the following diagnostics:

1. Verify that the OnStar® account was not canceled/deactivated where this may be a normal condition.
2. Check to see if the customer received a letter referencing B02-08-46-007C. If so, follow bulletin directions.
3. If neither step 1 or 2 applies, contact the General Motors Technical Assistance Center (GMTAC) for further assistance.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. #PIC4600A: Information Required Before Ordering A New OnStar VCIM For A DTC B1000 - keywords blue button communication message no noconnect operation - (Sep 19, 2008)

Subject:	**Information required before ordering a new OnStar® VCIM for a DTC B1000**
Models:	**2002 through 2009 OnStar® equipped vehicles**

This PI was superseded to update model years and text. Please discard PIC4600.

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

Before ordering a VCIM for a DTC B1000, GMTAC has been requested to document specific information about the DTC. Dealer technicians will find most of this information using the TECH2.

Recommendation/Instructions:

GM TAC will need to verify the original customer concern that led to the discovery of the DTC B1000 with the technician. Some of the questions GM TAC may ask are "What happens when an OnStar® key press is made?", "Does the system connect on a key press?", "Does OnStar® have a current GPS location on a key press?"

On GM LAN vehicles the sub code must be recorded. example B1000 SYM00

If available on the TECH2 for the vehicle, technicians should select the following menu and record the data from the VCIM:

(Will not be available on the Chevrolet Colorado and Trailblazer; GMC Canyon and Envoy, Hummer H3)

Body/Vehicle Communications Interface Module/Special Functions/ B1000 Data

DPID 11 Byte1:

DPID 11 Byte2:

DPID 11 Byte3:

Dealers should also review service bulletin 03-08-46-004D and record all relevant module information to expedite the order process.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. #PIC4801A: OnStar Turn By Turn / TBT Feature Inoperative - keywords blue button calibration call cellular communication data digital navigation operation performance - (Aug 1, 2008)

Subject: OnStar® Turn By Turn / TBT Feature Inoperative

Models: All 2006-2009 OnStar Gen 7 and Gen 8 equipped vehicles with TBT

This PI was superseded to update model years and text. Please discard PIC4801.

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

OnStar Center is unable to provide Turn by Turn services

Recommendation/Instructions:

Turn by Turn inop Diagnostic information:

Turn by Turn feature only available on Gen 7 or higher VCIM

OnStar system must be activated and configured in order to have Turn by Turn services.

Vehicle must have Anti-Lock Brakes System to have Turn by Turn feature.

Vehicle must be in a cellular market that supports Turn by Turn, Packet Data market.

Vehicle must be able to get a GPS location.

Verify no DTCs are present in vehicle ABS and VCIM.

The following information is to be retrieved with the Tech 2 before calling General Motors Technical Assistance.

#PIC4889: OnStar Deactivated Returned To Stock New Vehicle Inventory - keywords activation button deactivated disabled inventory keypress letter - (Jun 5, 2008)

Subject:	**OnStar® deactivated Returned to Stock New Vehicle Inventory.**
Models:	**All GM Vehicles Returned to Stock & Equipped with OnStar® (RPO UE1)**

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

OnStar® has recently discovered a software anomaly affecting vehicles that have been returned to dealer stock, following an incomplete sale of the vehicle. If a customer delivery record was created and the vehicle subsequently returned to stock, the OnStar® system may have been inadvertently disabled. Records indicate many of these returned to stock (RTS) vehicles still remain in dealer inventories. Due to the nature of disablement, these vehicles cannot be contacted by OnStar® and will require a blue OnStar® button press to enable the necessary actions to take place will correct this condition.

Recommendation/Instructions:

OnStar® will notify, by mail, affected customers who may have since purchased one these previously returned to stock vehicles with directions to perform a blue button press to complete the vehicle and account configuration process.

Dealers are requested to perform a blue button press on inventoried vehicles. A list of affected vehicles is going out to dealers VIA DCS messaging. Additional information is forthcoming.

To check the OnStar system simply perform a blue button press. If the "Connecting to Onstar" message is immediately heard the system is fully configured and no further action is required. If an automated message is heard when the button is pressed, the vehicle requires a reconfiguration and a second button press will connect the vehicle to an advisor at the OnStar Center. You will be transferred to the technical support group, who will assist you in the configuration of the customer's vehicle.

No part replacement is required and the configuration process will complete the vehicle and account set-up process.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". #PIC4935: OnStar Power Consumption - keywords battery digital discharge drain draw parasitic VCIM - (Jul 23, 2008)

Subject: OnStar® Power Consumption

Models: 2000 - 2009 OnStar Equipped vehicles with Digital Hardware

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition / Concern:

During battery parasitic drain testing, there may be some confusion as to the normal power consumption reading from the OnStar® system.

Recommendation / Instructions:

When performing current draw tests it is important to understand the power cycles of the various OnStar® systems. All OnStar® customers with currently active vehicles have digital/analog cellular capability. A green status LED on the OnStar® keypad normally indicates an active OnStar® account. A red LED indicates a system DTC. On Gen 6 and later systems, a clear, or "dark" LED may indicated the OnStar® system has been deactivated or may possibly have a no power concern/no communication.

The OnStar® system will stay powered up after ignition off for an extended time in order to allow for remote services like door unlock, horn honk, light flash, etc to take place as requested by the customer. Power cycle (also referred to as DRX) times vary depending on the generation of the OnStar® system. Technicians may identify the system generation by using a Tech 2 (Body>VCIM>Module ID Information>Module Information 2) or by using www.onstarenrollment.com.

All Gen 6, Gen 7, and 8 systems are powered up continuously for 48 hours from ignition off. After the 48 hours the Gen 6 and some Gen 7 power off; Gen 7.xxL, and all Gen 8 systems will enter a 9 minute OFF 1 minute ON power cycle for an additional 72 hours. At the beginning and end of the 1 minute ON stage, you may or may not experience a short spike of current at the beginning and at the end. This allows for calls from OnStar to be received by the system. After 120 hours from ignition off, these systems then completely power off.

The expected current draw of the OnStar® module is:

- IGN ON - 240 to 400 mA
- IGN OFF - 3 to 20 mA for 48 hours
- IGN OFF - after 48 hours (120 hours on specified VCPs) - 0.2 to 0.8 mA

- During extended voltage monitoring for platform battery parasitic it is possible that you may see a voltage spike caused by a cellular registration call that was triggered by the local cellular system, or that OnStar® has set a monthly trigger for a vehicle data upload call for the OnStar® Vehicle Diagnostic email upload. Note that in analog cellular markets all module generations completely power down after 48 hours. You can contact Technical Assistance to find out if your dealership cellular market or the customer's home cellular market still has analog service.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, DO NOT assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. #PIC4944: Unable To Program Replacement VCIM - keywords module ogen8 onstar programming service sps tech2 techline tis2web UE1 vs3bgen7 - (Aug 1, 2008)

Subject:	**Unable to program replacement VCIM**
Models:	**All 2009 MY vehicles with OnStar® (UE1)**

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition / Concern:

After replacement of an OnStar® VCIM on any 2009 MY vehicle the technician may find they cannot perform the module setup (SPS) through TIS2WEB. They may also find no VCIM setup in the TECH2.

Recommendation / Instructions:

The software calibration for the VCIM is currently not loaded in TIS2WEB for most 2009 MY vehicles. This calibration is expected to be loaded by mid August 2008.

If after a VCIM is replaced the calibration is not available in TIS2WEB, dealers are to contact TECHLINE for assistance with this issue.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". #PIT4720: Odometer Servicing When The Odometer Cannot be Set to the Actual Mileage - keywords cluster ipc mile program - (Sep 26, 2008)

Subject: **Odometer Servicing When the Odometer Cannot be Set to the Actual Mileage - keywords Cluster IPC Mile Program**

Models: **2009 and Prior Passenger Cars and Trucks**

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

When replacing or servicing the IPC/odometer the exchange center is unable to program the actual mileage on the odometer or the actual mileage is unknown.

Recommendation/Instructions:

Refer the dealer to the GM SERVICE POLICIES AND PROCEDURES MANUAL section 3.2.4 ODOMETER SERVICING

3.2.4 ODOMETER SERVICING

Various laws require that when an odometer is serviced, repaired or replaced, the mileage indicated is to remain the same as before this service, repair, or replacement. Where the odometer can not register the same mileage as before, the odometer shall be adjusted to read zero and a notice in writing shall be attached to the driver's door frame of the vehicle.

It is the general practice of ACDelco Service Centers to return repaired speedometers to their customers showing the original mileage reading on the odometer as received. This practice will apply whether or not the odometer unit is replaced. Therefore, a notice for the vehicle door frame indicating that an odometer has been set to zero normally will not be required.

In those unusual instances when the odometer cannot be set to the actual vehicle mileage, it must be set at zero and a label such as indicated below, must be affixed to the driver's door frame or the vehicle by dealer. Odometer Repair Notice Label may be obtained through GMSPO (Catalog Group 8.808).

Note: The above applies to GM Vehicles and Saab 9-7X only. For all other Saab vehicles, parts are available through normal spare parts.

Diagnostic Starting Point - Cellular, Entertainment, and Navigation

Begin the system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check - Vehicle will provide the following information:

- The identification of the control modules which command the system
- The ability of the control modules to communicate through the serial data circuit
- The identification of any stored DTCs and their status

The use of the Diagnostic System Check - Vehicle will identify the correct procedure for diagnosing the system and where the procedure is located.

Bluetooth Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

Circuit / System Description

The Bluetooth Module is a cellular device that is powered by a fused, battery positive, voltage circuit and allows a cordless link between a cellular phone and the Bluetooth car kit. The Bluetooth Module is not connected to serial data. It communicates with the cellular telephone via low-power radio waves. Due to the low power of the signal, approximately 1 milliwatt, a cellular telephone must be within 10 meters (32 feet) of the vehicle's Bluetooth Module to identify it and so that pairing between the cellular telephone and the Bluetooth car kit can take place.

In order to use hands-free calling, the cellular phone must be paired to the vehicle. Up to five devices can be paired to the vehicle at one time, but only one can be connected at any given time. To pair a phone, the customer must know how to operate the Bluetooth ® functionality of their phone.

Diagnostic Aids

- The purpose of this diagnostic is to verify the ability of the Bluetooth module to pair and connect to a Bluetooth ® device.
- The Bluetooth system cannot be diagnosed using Tech 2, however it is possible to carry out a self-test on the system. To carry out the test press the Phone button on the steering wheel remote control 4 times consecutively with the ignition on. If the Blue tooth module is functioning correctly a series of notes will be played through the audio system. This tests that the Blue Tooth module is present and functioning and tests the output of the Blue Tooth module through the audio system. This test cannot be performed while a Blue Tooth phone is paired with the vehicle

Circuit/System Verification

1. Turn OFF bluetooth on all of the cell phones that are paired with the vehicle.
2. Ignition ON, press the bluetooth button 4 times consecutively. Verify that a series of chimes are heard clearly through the radio.

   If there was no audible tone heard, refer to Circuit/System Testing - Button Malfunction

   If the audio was distorted, refer to Circuit/System Testing - Audio Distortion
3. Turn ON the bluetooth function for the cell phone that will be paired with the vehicle.
4. Follow the instructions provided in the Vehicle Owners Manual and cell phones manual for pairing. Verify successful pairing with the cell phone.

   If pairing is not successful, repeat the pairing process. If pairing is still not successful, replace the Bluetooth module.
5. Refer to Diagnostic Aids.

Circuit/System Testing

Button Malfunction

1. Ignition ON, while depressing the Bluetooth button on the steering wheel control switches, observe the Instrument Panel Cluster (IPC) and verify the illumination of the phone symbol.

   If the symbol does not illuminate, refer to Steering Wheel Controls Malfunction
2. Ignition OFF, disconnect the harness connector at the Bluetooth module.
3. Test for less than 10 Ω between the ground circuit terminal 15 and ground.

   If greater than specified range, test the circuit for an open/high resistance.
4. Test for B+ between the B+ circuit terminal 16 and ground.

   If less than specified range, test the circuit for a short to ground or an open/high resistance.
5. Ignition ON, test for less than 1V between the bluetooth signal circuit terminal 6 and ground.

   If greater than the specified value, test the circuit for a short to voltage. If the circuit tests normal, replace the IPC.
6. Ignition ON, test for infinite resistance between the bluetooth signal circuit terminal 6 and ground.

   If less than the specified value, test the circuit for a short to ground. If the circuit tests normal, replace the IPC.
7. Ignition ON, while pressing the bluetooth button on the steering wheel, test for less than 10 Ω between the bluetooth signal circuit terminal 6 and ground.

   If greater than the specified value, test the circuit for an open/high resistance. If the circuit tests normal, replace the IPC.

8. If all circuits test normal, replace the Bluetooth module.

Audio Distortion

1. Ignition OFF, disconnect the X4 harness connector at the radio.
2. Ignition ON, press the bluetooth button 4 times consecutively and test for a varying mV A/C voltage between the following signal circuit terminals listed below and ground.
   - telephone audio signal (+) circuit terminal 9
   - telephone audio signal (-) circuit terminal 1

   If the varying mV A/C voltage is not present, test the circuit for a short to voltage, short to ground, or for an open/high resistance. If the circuits test normal, replace the bluetooth module.
3. Ignition ON, press the bluetooth button 4 times consecutively and test for less than 10 Ω between the mute signal circuit terminal 10 and ground.

   If greater then specified value, test the circuit for an open/high resistance. If the circuit tests normal, replace the bluetooth module.
4. If all circuits test normal, replace the radio.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for Bluetooth module replacement, setup, and programming

Cellular Telephone Will Not Connect To Bluetooth Car Kit

Diagnostic Fault Information

Important: Always perform the Diagnostic System Check - Vehicle. Refer to Diagnostic System Check - Vehicle , prior to using this diagnostic procedure.

Circuit / System Description

The Bluetooth Module is a cellular device that is powered by a fused, battery positive, voltage circuit and allows a cordless link between a cellular telephone and the Bluetooth car kit. The Bluetooth Module is not connected to the GMLAN system. It communicates with the cellular telephone via low-power radio waves. Due to the low power of the signal, approximately 1 milliwatt, a cellular telephone must be within 10 meters (32 feet) of the vehicle's Blue Tooth Module to identify the Bluetooth Module.. When a paired cellular telephone and the Bluetooth car kit come within range of one another and the ignition is turned to the ON position and/or the bluetooth button is pressed, an electronic conversation automatically takes place and the devices form a personal-area network (PAN), or piconet, in the vehicle.

Description and Operation

Cellular Telephone Description and Operation

Electrical Information Reference

Circuit / System Verification

Important: Perform this diagnostic if the paired cellular telephone and the Bluetooth Module cannot be connected.

Ignition ON, get in the vehicle with the paired cellular telephone and activate Bluetooth function on the cellular telephone and press the Bluetooth button on the steering wheel. Verify that the paired cellular telephone is not connected to the Bluetooth car kit.

Circuit / System Testing

1. Drive the vehicle to a location where there is minimal traffic. Make sure there are no other paired cellular telephones in the vehicle or in the 10 meter (32 feet) vicinity of the vehicle.
2. Pair and connect a cellular telephone that has previously worked in a Bluetooth car kit. Refer to Cellular Telephone Description and Operation .

   If pairing and connection takes place, Refer to the cellular telephone's owner manual to allow authorised automatic connection.

   If pairing is unsuccessful, refer to Cellular Telephone Will Not Pair Up With Bluetooth Car Kit

Repair Instructions

Perform the Diagnostic Repair Verification .

Cellular Telephone Will Not Pair Up With Bluetooth Car Kit

Diagnostic Fault Information

Important: Always perform the Diagnostic System Check - Vehicle. Refer to Diagnostic System Check - Vehicle in Vehicle Diagnostic Information, prior to using this diagnostic procedure.

Circuit/System Description

The Bluetooth Module is a cellular device that is powered by a fused, battery positive, voltage circuit and allows a cordless link between a cellular telephone and the Bluetooth car kit. The Bluetooth Module is not connected to the GMLAN system. It communicates with the cellular telephone via low-power radio waves. Due to the low power of the signal, approximately 1 milliwatt, a cellular telephone must be within 10 meters (32 feet) of the vehicle's Blue Tooth Module to identify the Bluetooth Module so that pairing between the cellular telephone and the Bluetooth car kit can take place.

Circuit/System Verification

Important: Perform this diagnostic if the cellular telephone and the Bluetooth Module cannot be paired.

Ignition ON, get in the vehicle with the cellular telephone and activate Bluetooth function on the cellular telephone and search for Bluetooth devices. Verify that the cellular telephone cannot pick up a device labelled Vehicle BT.

Circuit/System Testing

1. Drive the vehicle to a location where there is minimal traffic. Make sure there are no other paired cellular telephones in the vehicle or in the 10 meter (32 feet) vicinity of the vehicle.
2. Ignition ON, activate Bluetooth function on a cellular telephone, with a known to be operating Bluetooth function, and search for Bluetooth devices.

   If no Bluetooth devices are found, continue.
3. Press the Bluetooth button 4 times and listen for a series of chimes through the speakers.

   If a series of chimes was heard through the speakers, replace the Bluetooth module.
4. Connect a DMM between the supply voltage circuit terminals and the ground circuit terminals.

   If 12 volts is present, replace the Bluetooth module.

DTC B0996, B1016, or B1271

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B0996: Vehicle Identification Number Mismatch

DTC B1016: Vehicle Identification Number Not Programmed

DTC B1271: Theft Locked

Circuit Description

This DTC is generated by the module when the Theft Lock is activated. This occurs when the VIN as received over the data communication circuit and the VIN as stored in the module memory do not match. This also occurs when no VIN is received over the data communication circuit. The only circuit required is the communication line.

Conditions for Running the DTC

This DTC test runs when the radio changes from OFF to ON.

Conditions for Setting the DTC

This DTC is generated by the module when the VIN as received over the data communication circuit and the VIN as stored in the module memory do not match. This also occurs if no VIN is received over the data communication circuit.

Action Taken When the DTC Sets

The radio does not function. The radio display will indicate that Theftlock is active.

Conditions for Clearing the DTC

Re-calibration with the correct calibrations for the vehicle and cycling the radio to OFF then to ON will clear the DTC if there is no damage to the radio.

Diagnostic Aids

This DTC may be an indication that an incorrect radio is installed in the vehicle, or that the radio was replaced without reprogramming with the new information.

DTC B0997

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B0997 3A: Auxiliary Electronic Control Unit (ECU) 2 Performance Incorrect Component

DTC B0997 33: Auxiliary Electronic Control Unit (ECU) 2 Performance Special Memory Failure

DTC B0997 36: Auxiliary Electronic Control Unit (ECU) 2 Performance, EEPROM Failure

DTC B0997 42: Auxiliary Electronic Control Unit (ECU) 2 Performance Calibration Data Set Not Programmed

DTC B0997 45: Auxiliary Electronic Control Unit (ECU) 2 Performance Variant Not Programmed

Circuit / System Description

The EEPROM (Electrically Erasable Programmable Read Only Memory) is part of the printed circuit board housed within the radio display. It stores variables required for the operation of the entertainment system.

Conditions for Running DTC

The radio display runs the program to detect an internal fault or compatibility concern when the radio changes from OFF to ON.

Conditions for Setting the DTC

- The radio display internal EEPROM has failed or is corrupt.
- An incompatible radio display is installed to the radio.
- The radio display that is installed is compatible but a different type of radio display from the current learned type.

Action Taken When DTC Sets

The system will set the DTC and not function.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

This DTC may be an indication that the radio display was installed in the vehicle, or that the radio display was replaced without reprogramming with the new information.

DTC B0998 or B0999

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B0998: Screen 1 EEPROM Failure

DTC B0999: Screen 2 EEPROM Failure

Circuit / System Description

The EEPROM (Electrically Erasable Programmable Read Only Memory) is part of the printed circuit board housed within the DVD screen. It stores variables required for the operation of the rear seat entertainment system.

Conditions for Running DTC

The DVD screen runs the program to detect an internal fault or compatibility concern when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

DTCs B0998 and B0999 will set if the EEPROM checksum is incorrect. The testing of the EEPROM checksum occurs every time the ignition is turned on. The DTC is reset when the EEPROM checksum is tested as being correct. The DTC is logged as a History DTC.

DTC B0999 is only applicable to level 5 vehicles with DVD screens mounted within the rear seats and applies to the second of the two screens.

Action Taken When DTC Sets

The system will set the DTC and disable itself.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

Video Display Replacement

DTC B1008 (RHD)

DTC Descriptor

DTC B1008: Calibration Data Not Programmed

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle in Vehicle DTC Information, prior to using this diagnostic procedure.

Circuit/System Description

The telematics module requires initial programming when installed for a valid calibration data set, if no valid calibration set is found the telematics module will set a DTC and commands the red LED ON.

Conditions for Running the DTC

The only requirements are battery positive voltage and ground.

Conditions for Setting the DTC

This code shall set as current when the calibration set does not exist in the telematics module.

Action Taken When the DTC Sets

- The telematics module sets a DTC.
- The telematics module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

DTC B1009 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1009 36: EEPROM Failure

Circuit/System Description

The electrically erasable programmable read-only memory (EEPROM) check sum error detection is handled inside the Audio/Video Interface Module. No external circuits are involved.

Conditions for Running DTC

The Audio/Video Interface Module runs the program to detect an EEPROM checksum error after each wake-up. The only requirements are battery positive voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTCs

The Audio/Video Interface Module retains an inverse copy of the digital value stored in certain blocks of memory in the EEPROM. The Audio/Video Interface Module then reads the information from those certain blocks and adds the stored inverse value to the current value. If they do not equal 0, the module sets the DTC.

Action Taken When the DTC Sets

The Audio/Video Interface Module reverts to base operation values programmed for those blocks of data that have failed the check sum test. The blocks of data that have not failed the check sum test are not affected.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Diagnostic Aids

This DTC may be stored as a history DTC without affecting the operation of the Audio/Video Interface Module. If stored only as a history DTC and not retrieved as a current DTC, do not replace the Audio/Video Interface Module.

DTC B1011 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1011: System Disabled Over Temperature

Circuit/System Description

The internal diagnostics of the navigation module periodically test the DVD drive temperature. If the DVD drive temperature is excessive DTC B1011 will set.

Conditions for Running the DTC

The radio must detect one of the following power modes:

- The navigation module is in the ACCESSORY, RUN, or RAP power mode.
- The system voltage is at least 9 volts and no more than 16 volts.

Conditions for Setting the DTC

Temperature of the DVD drive increases due to continuous operation/abnormal operating circumstances.

Action Taken When the DTC Sets

The navigation system will display either of the following messages: "Temperature High" and/or "DVD drive over temperature".

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC clears after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1015 00: Vehicle Identification Number (VIN) Information Error

DTC B1016 00: VIN Not Programmed (Vehicle Identification Number)

Circuit / System Description

When the telematics module receives Over-The-Air messages, it will compare the information received to the data stored in memory. If the VIN stored in memory does not match the VIN received via Over-The-Air messages, the telematics module will set a DTC and commands the red LED on the electrochromatic mirror ON.

Conditions for Running the DTC

The system voltage is at least 9 volts and no more than 16 volts.

Conditions for Setting the DTC

B1015

- The telematics module stored VIN digits does not match the digits stored in the BCM.
- The VIN stored in memory does not match the VIN received via an Over-The-Air message.

B1016

The telematics module stored VIN digits are not programmed.

Action Taken When the DTC Sets

- The telematics module sets a DTC.
- The telematics module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

DTC Descriptor

DTC B1019 45: System Configuration Error

Circuit / System Description

When the ignition is turned ON, the radio performs a self test to verify proper calibration exists within the system.

Conditions for Running the DTC

This DTC test runs when the radio changes from OFF to ON.

Conditions for Setting the DTC

The radio calibration has failed or is corrupt.

Action Taken When DTC Sets

The system will set the DTC and disable itself.

Conditions for Clearing the DTC

Re-calibration with the correct calibrations for the vehicle and cycling the radio to OFF then to ON will clear the DTC if there is no damage to the radio.

DTC Descriptor

DTC B101D 33: ECU Hardware Performance Special Memory Failure

DTC B101D 34: ECU Hardware Performance RAM Failure

DTC B101D 36: ECU Hardware Performance EEPROM Failure

Circuit/System Description

When the ignition is turned ON, the navigation interface module (NIM) performs a self test to verify if any critical malfunction exists within the system.

Conditions for Running the DTC

This DTC runs continuously

Conditions for Setting the DTC

The module has detected an internal electrical malfunction.

Action Taken When the DTC Sets

This code will set as current when the NIM recognises an internal fault or fails to communicate with the BCM.

Conditions for Clearing the DTC

- A current DTC clears when the conditions for setting the DTC are no longer present.
- A history DTC clears after 50 malfunction-free ignition cycles.

DTC Descriptor

DTC B101D 00: ECU Hardware Performance, Internal Communications Failure

Circuit/System Description

The rear seat entertainment (RSE) interface module is used to communicate between all the infotainment units equipped on the vehicle.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

When the RSE interface module has recognised an internal fault.

Action Taken When the DTC Sets

This code will set as current when the RSE interface module recognises an internal fault or fails to communicate with the BCM. DTC B101D indicates that the RSE interface module has had an internal fault and is not affected by any external circuits.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 fault-free ignition cycles.
- The DTC can be cleared using the scan tool.

Scan Tool Reference

Control Module References for scan tool information

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC clears after 50 fault-free ignition cycles.

Circuit / System Verification

1. Verify DTC B1020 is not set.

   If the DTC is set, replace the navigation module.

Repair Instructions

Perform the Diagnostic Repair Verification.

Control Module References for navigation module replacement, setup, and programming.

DTC B1021 (RHD)

DTC Descriptor

DTC B1021: SIM Mismatch

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle in Vehicle DTC Information, prior to using this diagnostic procedure.

Circuit/System Description

The telematics module is programmed to match a SIM card. SIM cards have each been assigned a unique SIM card number. If the SIM card number programmed into the telematics module does not match the SIM card or if the SIM card has been swapped from another telematics module, the telematics module will set a DTC.

Conditions for Running the DTC

The SIM card number programmed into the telematics module does not match the SIM card.

Conditions for Setting the DTC

This code shall set as current when the SIM card number programmed into the telematics module does not match the SIM card.

Action Taken When the DTC Sets

- The telematics module sets a DTC.
- The telematics module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Scan Tool Reference

Control Module References

Circuit/System Testing

1. Verify that the SIM card present is correct for the original unit and has not been swapped from another telematics module.
2. Ignition ON, use the scan tool to request DTCs. Verify that DTC B1021 is set as current.

   If DTC B1021 is historical, clear the DTC.

   If DTC B1021 is current replace the telematics module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for telematics module replacement, setup and programming.

DTC B1023

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1023 00: Integral Switch Performance

Circuit / System Description

The radio monitors the button presses on the radio display. The radio will ignore any stuck buttons and allow full functionality of the working buttons. The only circuit required is the serial data line between the radio and the radio display.

Conditions for Running DTC

- System voltage is between 9-16 volts.
- Ignition switch is in the ON position.

Conditions for Setting DTC

This DTC is generated by the radio if a button is active for a period greater than 60 seconds.

Action Taken When DTC Sets

- The radio ignores continuous inputs from the button.
- The radio will respond to all other valid button inputs.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

Center Speaker Output Signal (+)	3	3	3	--
Center Speaker Output Signal (-)	3	3	3	--
Amplifier Ground	--	1	--	--

1. Amplifier inoperative/no sound from speakers.

2. No or reduced sound from subwoofer.

3. No sound from center speaker.

* Noticeable audio distortion possible.

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio and audio amplifier have a DC bias voltage that is one half of the battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. This voltage will vary depending on what type of audio is being listened to, talk or music, and type of music, as well as the volume setting of the system. Low volume and talk settings will measure around 1V AC and less, where constant music may measure 3V AC and slightly higher. The amplifier may only supplied an amplified signal to the subwoofers, or on the premium audio systems, the amplifier will amplify all of the audio signals. The amplifier can not set DTCs.

Conditions for Running the DTC

- The radio is ON.
- Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

B1025 01, B1035 01, B1045 01, B1055 01

A short to voltage is detected on the specified (+) or (-) signal circuit.

B1025 02, B1035 02, B1045 02, B1055 02

A short to ground is detected on the specified (+) or (-) signal circuit.

B1025 04, B1035 04, B1045 04, B1055 04

An open/high resistance is detected on the specified (+) or (-) signal circuit.

Action Taken When the DTC Sets

No sound is present from one or more of the speakers.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

Without Amplifier

1. Ignition OFF, disconnect the harness connector at the appropriate speaker.
2. Radio ON, test for 5.0-7.5 volts between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. Test for 5.0-7.5 volts between the signal circuit terminal B and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
4. If all circuits test normal, replace the speaker.

With Amplifier -- Front Speaker Testing UQG

1. Ignition OFF, disconnect the harness connector at the appropriate speaker.
2. Radio ON, test for 5.0-7.5 V between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. Test for 5.0-7.5 V between the signal circuit terminal B and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
4. If all circuits test normal, replace the speaker.

With Amplifier -- Rear Speaker Testing UQG

1. Ignition OFF, disconnect the amplifier and the appropriate speaker harness connectors.
2. Radio ON, test for 5.0-7.5 V between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. Test for 5.0-7.5 V between the signal circuit terminal B and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
4. Ignition OFF, reconnect the harness connector at the audio amplifier.
5. Radio ON, test for 5.0-7.5 V between the signal circuit terminal A and ground at the appropriate speaker.

   If not within the specified range, replace the amplifier.
6. Radio ON, test for 5.0-7.5 V between the signal circuit terminal B and ground at the appropriate speaker.

   If not within the specified range, replace the amplifier.
7. If all circuits test normal, replace the speaker.

With Amplifier -- Speaker Testing RHD -- UQA

1. Ignition OFF, disconnect the X1 harness connector at the amplifier.
2. Radio ON, test for 5.0-7.5 V between the terminals listed below and ground.
   - Left front low level audio signal (+) - terminal 15
   - Left front low level audio signal (-) - terminal 7
   - Right front low level audio signal (+) - terminal 14
   - Right front low level audio signal (-) - terminal 6
   - Left rear low level audio signal (+) - terminal 13
   - Left rear low level audio signal (-) - terminal 5
   - Right rear low level audio signal (+) - terminal 12
   - Right rear low level audio signal (-) - terminal 4

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. If all circuits test normal, replace the amplifier.

With Amplifier -- Speaker Testing LHD -- UQA

1. Ignition OFF, disconnect the X1 harness connector at the amplifier.
2. Radio ON, test for 5.0-7.5 V between the terminals listed below and ground.
   - Left front low level audio signal (+) - terminal 14
   - Left front low level audio signal (-) - terminal 6
   - Right front low level audio signal (+) - terminal 15
   - Right front low level audio signal (-) - terminal 7
   - Left rear low level audio signal (+) - terminal 12
   - Left rear low level audio signal (-) - terminal 4
   - Right rear low level audio signal (+) - terminal 13
   - Right rear low level audio signal (-) - terminal 5

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. If all circuits test normal, replace the amplifier.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC B1240 or B1245

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1240 59: CD-Player Not Responding

DTC B1245 54: CD-Changer High Temperature

DTC B1245 59: CD-Changer Not Responding

Circuit/System Description

When the ignition is turned ON, the radio performs a self test to verify if any critical malfunction exists within the system.

Conditions for Running the DTC

This DTC test runs when the radio changes from OFF to ON.

Conditions for Setting the DTC

DTC B1240 59, DTC B1245 59

The CD player mechanism does not respond when requested and internal communication attempts time out.

DTC B1245 54

The CD player changer reports that the mechanism is overheating.

Action Taken When the DTC Sets

DTC B1240 59, DTC B1245 59

- The radio displays a "CD Error" message temporarily.
- The radio will attempt a communication reset with the CD player mechanism, this will be attempted each time there is an infotainment system source change request.

DTC B1245 54

- The radio displays a "Mechanism Overheat" message temporarily.
- The radio will attempt a communication reset with the CD player mechanism, this will be attempted each time there is an radio source change request.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

Diagnostic Aids

Extended use the CD player, especially in warm weather conditions, may cause this DTC to set in the radio. Under these conditions, it may be normal for this DTC to set to prevent permanent damage to the radio circuitry and no repair should be attempted.

DTC B1277 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1277: Microphone Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cellular Microphone Signal	B1277 02	B1277 04	B1277 01	--
Cellular Microphone Drain	--	B1277 04	1	--
1. Microphone Inoperative - Caller Cannot Be Heard				

Circuit/System Description

The communication interface module provides the cellular microphone with a supplied voltage on the cellular microphone signal circuit. When the microphone is in use, voice data from the user is sent back to the communication interface module on the signal circuit. The communication interface module provides a ground for the microphone via the drain wire.

Conditions for Running the DTC

- The ignition must be in the RUN or ACC position.
- The system voltage is at least 9.5 volts and no more than 15.5 volts.
- All the above conditions are present for greater than 10 seconds.

Conditions for Setting the DTC

- The CIM detects an open, short to ground or short to voltage in the cellular microphone signal circuit for 10 seconds or greater.
- The CIM detects an open/high resistance in the drain wire circuit for 10 seconds or greater.

Action Taken When the DTC Sets

- The communication interface module will not receive a signal from the microphone.
- Calls can be placed but the caller cannot be heard.
- The communication interface module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the inside rearview mirror.
2. Test for less than 10 Ω between the drain circuit terminal 2 and ground.

   If greater than the specified range, test the circuit for an open/high resistance.
3. Ignition ON, test for 9.5-10.5 V between the signal circuit terminal 10 and ground.

   If less than the specified range, test the circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the communication interface module.

   If greater than the specified range, test the circuit for a short to voltage. If the circuit tests normal, replace the communication interface module.
4. If all circuit test normal, replace the cellular microphone.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Communication Interface Module Microphone Replacement
- Control Module References for telematics module replacement, setup and programming.

DTC B1287 (RHD)

DTC Descriptor

DTC B1287: Radio Mute Circuit

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle in Vehicle DTC Information, prior to using this diagnostic procedure.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Radio Mute Circuit	B1277 02	B1277 0B	B1277 01	--

Circuit/System Description

The telematics module is connected to the drivers side radio speaker via an internal relay. When the Emergency, Holden Assist or Information/End Call button is pressed, the telematics module sends a signal to the infotainment unit via the auxiliary Infotainment unit inputs selected with the aid of the radio mute line. The Infotainment unit will then mute the radio and allow only the telematics audio and tones to sound through the speaker.

Conditions for Running the DTC

The radio mute output circuit has a malfunction.

Conditions for Setting the DTC

This code shall set as current when the telematics module detects the radio mute output circuit is short to ground, battery or is over loaded.

Action Taken When the DTC Sets

- The telematics module sets a DTC.
- The telematics module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Scan Tool Reference

Control Module References

Circuit/System Testing

1. Ignition ON, use the scan tool to request DTCs. Verify that DTC B1287 is set as current.
   If DTC B1287 is historical, Clear the DTC.
2. Check the infotainment unit is functioning correctly.
   If the infotainment unit is not functioning correctly, refer to infotainment unit system diagnostics.
3. Ignition OFF, disconnect the harness connector at the telematics module.
4. Test the radio mute circuit for short to ground, short to voltage or an open/high resistance.
   If all circuits do not test normal, repair or replace the affected circuit(s).

   Important: Other infotainment related DTC's will set when the infotainment unit is disconnected.

5. Disconnect the Infotainment unit.
   If the DTC is still current, replace the telematics module.

   If the DTC is not current, replace the infotainment unit.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for the infotainment unit and telematics module replacement, setup and programming.

DTC B1325, B1330, or B1423

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1325 03: DVD Player Power Supply Voltage Below Threshold

DTC B1325 07: DVD Player Power Supply Voltage Above Threshold

DTC B1330 03: RSE Control Panel Supplied Power Below Voltage Threshold

DTC B1330 07: Rear Control Panel Power Supply Voltage Above Threshold

DTC B1423 03: Supply Voltage Below Threshold

DTC B1423 07: Supply Voltage Above Threshold

Circuit/System Description

With the ignition in either the ACC or ON positions, the DVD player, rear seat entertainment (RSE) control panel and rear seat entertainment interface module receives an individual 12V power supply. The DVD player and RSE control panel power supply is distributed via the rear seat entertainment interface module.

Conditions for Running the DTC

- The rear seat entertainment is ON.
- Battery voltage must be between 9-16 volts.

Conditions for Setting the DTCs

B1325 03, B1325 07

- DTC B1325 03 will set to indicate the B+ positive supplied to the DVD Player is below the threshold.
- DTC B1325 07 will set to indicate the B+ positive supplied to the DVD Player is above the threshold.

B1330 03, B1330 07

- DTC B1330 03 will set to indicate the B+ positive supplied to the RSE control panel is below the threshold.
- DTC B1330 07 will set to indicate the B+ positive supplied to the RSE control panel is above the threshold.

B1423 03, B1423 07

- DTC B1423 03 will set to indicate the B+ positive supplied to the rear seat entertainment interface module is below the threshold.
- DTC B1423 07 will set to indicate the B+ positive supplied to the rear seat entertainment interface module is above the threshold.

Action Taken When the DTC Sets

B1325 03, B1325 07

When DTC B1325 03 or DTC B1325 07 are set, the DVD player will not turn ON.

B1330 03, B1330 07

When DTC B1330 03 or DTC B1330 07 are set, the video disc player control will not turn ON.

B1423 03, B1423 07

When DTC B1423 03 or DTC B1423 07 are set, the DVD player and video disc player control will not turn ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

Diagnostic Aids

The DVD player and RSE control panel power supply is distributed via the rear seat entertainment interface module. DTC B1325 03 or DTC B1330 03 could set concurrently with DTC B1423 03 as a result of the B+ positive supplied to the rear seat entertainment interface module being below the threshold. DTC B1325 07 or DTC B1330 07 could set concurrently with DTC B1423 07 as a result of the B+ positive supplied to the rear seat entertainment interface module being above the threshold. In the event of these DTCs setting together either DTC B1423 03 or DTC B1423 07 should be diagnosed first. If either DTC B1423 03 or DTC B1423 07 is not set it would suggest that the fault exists after the rear seat entertainment interface module and is within either of the B+ positive supplies to the DVD player or video disc player control or a fault within one of these components.

Circuit/System Testing

B1423 03, B1423 07

1. Ignition OFF, disconnect the rear seat entertainment interface module harness connector.
2. Ignition OFF, test for less than 3 Ω between the ground circuit at the rear seat entertainment interface module harness connector and a ground.

   If greater than the specified range, test the circuti for an open/high resistance.
3. Ignition ON, test for B+ between the battery positive voltage circuit at the rear seat entertainment interface module harness connector and a ground.

   If not within specified range, test the circuit for a short to ground or an open/high resistance.
4. If all circuits test normal, replace the Audio/Video Interface Module.

B1325 03, B1325 07

1. Ignition OFF, disconnect the DVD player harness connector.
2. Ignition OFF, test for less than 3 Ω between the ground circuit at the DVD player harness connector and a ground.

   If greater than the specified range, test the circuit for a short to ground or an open/high resistance.
3. Ignition ON, test for B+ between the battery positive voltage circuit at the DVD player harness connector and ground.

   If not within specified range, test the battery positive voltage circuit for an open/high resistance. If the circuit tests normal replace the rear seat entertainment interface module.
4. If all circuits test normal, replace the DVD player.

B1330 03, B1330 07

1. Ignition OFF, disconnect the Video Disc Player Control harness connector.
2. Ignition OFF, test for less than 3 Ω between the ground circuit at the rear seat entertainment interface module harness connector and a ground.

   If greater than the specified range, test the circuit for a short to ground or an open/high resistance.
3. Ignition ON, test for B+ between the battery positive voltage circuit at the Video Disc Player Control harness connector and ground.

   If not within specified range, test the battery positive voltage circuit for an open/high resistance. If the circuit tests normal replace the rear seat entertainment interface module.
4. If all circuits test normal, replace the Video Disc Player Control.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Video Disc Player Replacement
- Audio/Video Interface Module Replacement
- Video Disc Player Control Replacement

DTC B1335 or B1340

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1335 03: Screen 1 Power Supply Voltage Below Threshold

DTC B1335 07: Screen 1 Power Supply Voltage Above Threshold

DTC B1340 03: Screen 2 Power Supply Voltage Below Threshold

DTC B1340 07: Screen 2 Power Supply Voltage Above Threshold

Circuit/System Description

With the ignition in either the ACC or ON positions, the DVD screens each receive an individual 12V power supply. The DVD screen power supply is distributed via the Audio/Video Interface Module. DTCs B1335 03 and B1335 07 relate to the headlining DVD screen installed to lower level vehicles and the right front head restraint DVD screen on higher level vehicles. DTCs B1340 03 and B1340 07 relate to the left front head restraint DVD screen on higher level vehicles.

Conditions for Running DTC

B1335 03, B1340 03

DTC B1335 03 or B1340 03 will set to indicate the B+ positive supplied to the DVD screen is below the threshold.

B1335 07, B1340 07

DTC B1335 07 or B1340 07 will set to indicate the B+ positive supplied to the DVD screen is above the threshold.

Conditions for Setting the DTCs

These DTCs run continuously once the following condition is met:

The supplied power to the DVD screen is between 9 - 16V.

Action Taken When the DTC Sets

When DTC B1335 or B1340 is set, the DVD screen will not turn ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

Diagnostic Aids

The DVD screen power supply is distributed via the rear seat entertainment interface module. DTC B1335 03 or DTC B1340 03 could set concurrently with DTC B1423 03 as a result of the B+ positive supplied to the Audio/Video Interface Module being below the threshold. DTC B1335 07 or DTC B1340 07 could set concurrently with DTC B1423 07 as a result of the B+ positive supplied to the Audio/Video Interface Module being above the threshold. In the event of these DTCs setting together either DTC B1423 03 or DTC B1423 07 should be diagnosed first. If either DTC B1423 03 or DTC B1423 07 is not set it would suggest that the fault exists after the Audio/Video Interface Module and is within the B+ positive supply to the DVD screen or a fault within the component.

Circuit/System Testing

1. Ignition OFF, disconnect the DVD screen harness connector.
2. Ignition OFF, test for less than 3 Ω between the ground circuit at the rear seat entertainment interface module harness connector and a ground.

If greater than the specified range, test the circuti for an open/high resistance.

3. Ignition ON, test for B+ between the battery positive voltage circuit at the DVD screen harness connector and ground.

   If not within specified range, test the battery positive voltage circuit for an open/high resistance. If the circuit tests normal replace the Audio/Video Interface Module.

4. If all circuits test normal, replace the DVD screen.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Video Display Replacement
- Audio/Video Interface Module Replacement

DTC B1446 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1446: Backup Battery Timer Expired

Circuit/System Description

The Back-up Battery provides voltage to the communication interface module , to be able to successfully place a call in the event of a main battery disconnect during a collision event.

Conditions for Running the DTC

- Ignition is in the RUN or ACC position.
- System voltage is between 9.5 and 15.5 volts.
- DTC B1447 is not set.

Conditions for Setting the DTC

The communication interface module detects that the back-up battery voltage has dropped below the minimum threshold value.

Action Taken When the DTC Sets

The communication interface module commands the red LED ON.

Conditions for Clearing the DTC

- When the CIM detects the voltage of the back-up battery is above the minimum threshold value.
- The history DTC will clear after 50 fault-free ignition cycles.

Diagnostic Aids

Note: Shorting the back-up battery positive voltage circuit to the back-up battery ground circuit or chassis ground will activate the internal circuit protection of the back-up battery , rendering the back-up battery inoperable.

DTC B1447 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1447 03: Backup Battery Voltage Too Low

DTC B1447 04: Backup Battery Circuit Open

DTC B1447 07: Backup Battery Voltage Too High

Circuit/System Description

The Back-up Battery provides voltage to the communication interface module , to be able to successfully place a call in the event of a main battery disconnect during a collision event.

Conditions for Running the DTC

- Ignition is in the RUN or ACC position.
- System voltage is between 9.5 and 15.5 volts.
- The above conditions are present for greater than 10 seconds.

Conditions for Setting the DTC

The communication interface module detects no voltage from the back-up battery.

Action Taken When the DTC Sets

- The communication interface module module will be unable to place a call in the event of a main battery disconnect during a collision event.
- The communication interface module module commands the red LED ON.

Conditions for Clearing the DTC

- A current DTC B1447 will clear when the CIM detects voltage from the back-up battery.
- The history DTC will clear after 50 fault-free ignition cycles.

Diagnostic Aids

Note: DTC B1447 may set if the communication interface module has been incorrectly disconnected or serviced. When disconnecting the communication interface module, disconnect the harness connector X1 at the communication interface module prior to disconnecting any other harness connectors. This will ensure the back-up battery is preserved when voltage is removed from the communication interface module.

DTC B1517 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1517 00: Battery Voltage Below/Above Threshold

Circuit/System Description

The body control module (BCM) has designated circuits for monitoring vehicle system voltage. The BCM monitors the system voltage to ensure that the voltage stays within a correct range. Damage to components and incorrect data may occur when the voltage is out of range. The BCM monitors the system voltage over an extended length of time. If the BCM detects the system voltage is outside an expected range for the calibrated length of time, or the BCM battery sense circuits differ by 1 volt, DTC B1517 will set. Other modules also monitor system voltage. The system voltage message is sent to the other modules and will default to 12.9 volts.

Conditions for Running the DTC

This DTC shall run only if the telematics module has power, ground, and the ignition is not in START mode. This DTC shall execute regardless of the battery voltage.

Conditions for Setting the DTC

The battery voltage measured by the telematics module is:

- Less than 11.8 V for greater than 30 minutes
- Less than 11.6 V for greater than 20 minutes
- Less than 11 V for greater than 90 seconds

Action Taken When the DTC Sets

- The telematics module contacts the Telematics Call Centre alerting them of a low battery concern.
- The telematics module sets a DTC.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The battery voltage measured by the telematics module is above 11.8 V.

DTC B245A (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B245A: Telematics Indicator 1 (Green) Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Telematics Indicator 1 (Green) Circuit	B245A 02	B245A 04	B245A 01	--

Circuit/System Description

The communication interface module button assembly on the inside rearview mirror assembly consists of 3 buttons, Information/End Call, Holden Assist and Emergency. The button assembly on the inside rearview mirror assembly also has three status Light Emitting Diodes (LED), Green, Red and Orange. The function of each is as follows:

- Flashing Green: Call is in progress.
- Steady Green: System is on and self test has been completed.
- Steady Red: System is on and self test has detected a malfuntion.
- Steady Orange: Vehicle is not in the coverage area. This is emphasised by 5 beeps when the ignition is switched off to inform the driver that the vehicle is about to be left in a "shadow" location that is untraceable by the Telematics Call Center.
- Red and Green Lights Flashing: telematics is in Service mode. Press the Holden Assist button to request this mode be disabled.

Conditions for Running the DTC

- Ignition is in the RUN or ACC position.
- System voltage is between 9 and 16 volts.

Conditions for Setting the DTC

The communication interface module detects a short to voltage, short to ground, or an open/high resistance on the Green LED circuit.

Action Taken When the DTC Sets

- The communication interface module sets a DTC.
- The communication interface module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

DTC B2461 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B2461 00: Navigation Electronic Control Unit (ECU) Synchronous Signal Error

Circuit Description

The navigation interface module (NIM) communicates with the navigation module via serial data. The NIM can request diagnostic information from the navigation module, if the NIM does not receive a response from the navigation module a DTC will set.

Conditions for Running the DTC

The ignition or the infotainment unit is ON.

Conditions for Setting the DTC

When diagnostic information is requested from the navigation module by the navigation interface module (NIM) and a response is not received.

Conditions for Clearing the DTC

A history DTC clears after 50 fault-free ignition cycles.

DTC B2462 (RHD Entertainment)

DTC Descriptor

DTC B2462: GPS Antenna Circuit

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle in Vehicle DTC Information, prior to using this diagnostic procedure.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Telematics Indicator 1 (Green) Circuit	B2462 02	B2462 04	B2462 01	--

Circuit Description

The Global Positioning System (GPS) antenna is connected to the telematics module with a coax cable. The telematics module polls the data from the GPS antenna once every second.

Conditions for Running the DTC

- System voltage is between 9-16 volts.
- Ignition switch is in the ON position.

Conditions for Setting the DTC

- GPS antenna output above threshold.
- General GPS receiver error during test.

Conditions for Clearing the DTC

A history DTC clears after 50 fault-free ignition cycles.

Diagnostic Aids

An intermittent condition may be caused by the following:

- Mis-routed harness
- Rubbed through wire insulation
- Broken wire inside the insulation

Circuit / System Testing

1. Ignition ON, disconnect the GPS coaxial cable from the GPS antenna. Verify there is 4 to 5.5 volts between the centre conductor and the shield of the coaxial cable.

   If 4 to 5.5 volts are present, replace the GPS antenna.
2. Ignition OFF, disconnect the GPS coaxial cable from the telematics module. Test the resistance of the GPS coaxial cable centre conductor from end to end. Verify the resistance is less than 5 ohms.

   If the resistance greater than 5 ohms, replace the GPS coaxial cable
3. Test the resistance of the GPS coaxial cable between the centre conductor and the outer conductor. Verify there is infinite resistance between both conductors.

   If there is less than infinite resistance between the inner conductor and the outer conductor of the GPS coaxial cable, replace the GPS coaxial cable. If the GPS coaxial cable tests normal, replace the telematics module.

DTC Descriptor

DTC B2462 00: Global Positioning System Sensor Receiver Failure

DTC B2462 08: Global Positioning System Sensor Signal Invalid

Circuit Description

The navigation antenna is connected to the navigation module with a coax cable. The navigation module polls the data from the navigation antenna once every second.

Conditions for Running the DTC

- The ignition ON
- The system voltage is at least 9.5 volts and no more than 15.5 volts.

Conditions for Setting the DTC

- GPS antenna output above threshold.
- General GPS receiver error during test.

Conditions for Clearing the DTC

- The navigation module detects a proper signal from the GPS antenna.
- A history DTC clears after 50 fault-free ignition cycles.

DTC B2464

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B2464 00: Navigation Player Decoding Error

Circuit / System Description

The circuitry is internal to the navigation radio. The system does not function when the internal temperature reaches 70°C (158°F) or above. This feature prevents heat damage to internal components.

Conditions for Running the DTC

The radio must detect one of the following power modes:

- The ignition ON.
- Battery voltage must be between 9-16 volts.
- The navigation module detects a power mode transition from OFF to ON.

Conditions for Setting the DTC

- Error found with the inserted DVD disc after 4 attempts at reading.
- The navigation module is unable to read the DVD due to laser focus error, there is a table of contents error or the DVD laser head temperature is above 70°C (158°F).

Action Taken When the DTC Sets

- No map or blue screen appears on the display and index is not usable.
- Navigation buttons do not function.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

Diagnostic Aids

- Cycle the ignition after a successful inspection with a scan tool so initialization will occur.
- Make sure the map DVD is the correct one for this system.
- Occasionally it is possible to overheat the navigation system due to excessive ambient heat inside the vehicle. In this instance it may be necessary to allow time for the navigation system to cool.

Note: Allow the navigation system to cool if the ambient temperature inside the vehicle is excessive and the radio is hot to the touch before proceeding with this diagnostic procedure.

1. Ignition ON, with a scan tool clear all DTCs.
2. Ignition ON, install a known good MAP DVD and operate the system within the Condition for Running the DTC.

   If B2464 resets, replace the radio.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for Navigation Module replacement, setup, and programming

DTC B2469 (RHD)

DTC Descriptor

DTC B2469: SIM Card Invalid

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle in Vehicle DTC Information, prior to using this diagnostic procedure.

Circuit/System Description

The telematics module is programmed to match a SIM card. SIM cards have each been assigned a unique SIM card number. If the SIM card number programmed into the telematics module does not match the SIM card or if the SIM card has been swapped from another telematics module, the telematics module will set a DTC.

Conditions for Running the DTC

The SIM card is no longer valid or is barred from the network.

Conditions for Setting the DTC

This code shall set as current when the SIM card number programmed into the telematics module does not match the SIM card.

Action Taken When the DTC Sets

- The telematics module sets a DTC.
- The telematics module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for telematics module replacement, setup and programming.

DTC B2471 (RHD)

DTC Descriptor

DTC B2471: Telephone Number Error

Diagnostic Fault Information

Perform the Diagnostic System Check - Vehicle in Vehicle DTC Information, prior to using this diagnostic procedure.

Circuit/System Description

The telematics module is programmed with the phone numbers for information services, Holden assist and emergency. If any one of their respective buttons are pushed, the telematics module will attempt to establish a voice call to an information services operator. If an incorrect phone number is programmed into the telematics module, the telematics module will set a DTC.

Conditions for Running the DTC

The phone number automatically dialled is invalid.

Conditions for Setting the DTC

This code shall set as current when an incorrect phone number is programmed into the telematics module.

Action Taken When the DTC Sets

- The telematics module sets a DTC.
- The telematics module commands the red LED ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

DTC B2476 (RHD)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B2476 00: Cellular Phone Select Switch

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keypad Supply Voltage	B2476 00	B2476 00	B2476 00	--

Circuit/System Description

The telematics button assembly on the inside rearview mirror assembly consists of 3 buttons, Information/End Call, Holden Assist and Emergency. Ten volts is supplied to the button assembly on the keypad supply voltage circuit. Each of the buttons, when pressed, completes the circuit across a resistor allowing a specific voltage to be returned to the telematics module on the keypad signal circuit. Depending upon the voltage range returned, the telematics module is able to identify which button has been pressed.

Conditions for Running the DTC

- The radio is ON.
- Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

The communication interface module detects a short to voltage, short to ground, or an open/high resistance on the keypad supply voltage circuit.

Action Taken When the DTC Sets

- No calls can be placed.
- The communication interface module commands the red LED ON.
- The communication interface module will ignore all inputs from the button assembly.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 100 fault-free ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the inside rearview mirror.
2. Test for less than 5 Ω between the mirror ground circuit terminal 8 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for less than 1 V between the keypad signal circuit terminal 11 and ground.

   If greater than the specified range, test the keypad signal circuit for a short to voltage. If the circuit tests normal, replace the communication interface module.
4. Ignition OFF, test for 600 K - 700 K Ω between the keypad signal circuit terminal 11 and ground.

   If less than the specified range, test the keypad signal circuit for a short to ground. If the circuit tests normal, replace the communication interface module.

   If greater than the specified range, test the ground circuit for an open/high resistance. If the circuit tests normal, replace the communication interface module.
5. Ignition ON, test for 9.8-10.2 V between the keypad supply voltage circuit terminal 12 and ground.

   If less than the specified range, test the supply voltage circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the communication interface module.

If greater than the specified range, test the supply voltage circuit for a short to voltage. If the circuit tests normal, replace the communication interface module.

6. If all circuits test normal, test or replace the button assembly.

Component Testing

1. Ignition OFF, disconnect the harness connector at the inside rearview mirror.
2. Test for infinite resistance between the keypad supply voltage terminal 12 and the keypad signal terminal 11.

   If less than the specified range, replace the inside rearview mirror.
3. Test for 1.4 K - 1.6 K Ω between the keypad supply voltage terminal 12 and the keypad signal terminal 11 while pressing the black phone button.

   If not within the specified range, replace the inside rearview mirror.
4. Test for 2.7 K - 3.3 K Ω between the keypad supply voltage terminal 12 and the keypad signal terminal 11 while pressing the blue Holden Assist® button.

   If not within the specified range, replace the inside rearview mirror.
5. Test for 2.7 K - 3.3 K Ω between the keypad supply voltage terminal 12 and the keypad signal terminal 11 while pressing the red emergency button.

   If not within the specified range, replace the inside rearview mirror.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC B2484

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B2484 00: Global Positioning System Sensor Open Circuit

Circuit Description

The GPS antenna is connected to the navigation module with a coaxial cable. The navigation module polls the data from the GPS antenna once every second. The GPS antenna is powerd a 5 volt reference from the radio via the coaxial cable.

Conditions for Running the DTC

- The ignition must be in the RUN or ACC position.
- The system voltage is at least 9.5 volts and no more than 15.5 volts.
- All the above conditions are present for greater than 1 second.

Conditions for Setting the DTC

- The navigation module determines there is an open in the GPS antenna.
- All the above conditions are present for greater than 1 second.

Actions Taken When the DTC Sets

- Unable to get GPS location updated, the radio uses the last reported position and the vehicle speed signal to calculate the vehicle position.
- Route guidance may be inaccurate.
- This failure has no effect outside the navigation system.

Conditions for Clearing the DTC

- The navigation module detects the presence of a GPS antenna.
- A history DTC clears after 50 fault-free ignition cycles.

Circuit/System Testing

Note: The global positioning system (GPS) requires a clear line of sight to the sky to operate properly. In most cases the GPS will not have reception near tall buildings or inside structures.

1. Turn ON the ignition. Disconnect the GPS coaxial cable from the navigation module. Verify there is 4-5.5 volts between the center conductor and the shield of the coaxial cable.
   If 4-5.5 volts is not present, replace the navigation module.
2. If all circuits test normal, replace the GPS antenna.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Electronic Navigation Antenna Replacement

DTC B3924

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3924: DVD Player Theft Locked

Circuit/System Description

This DTC will set when the rear seat entertainment (RSE) system is switched from the OFF to ON position. The DVD player and audio/video interface module communicate with each other to verify that a security code relayed between the two components is valid. The DTC will pass when the both components acknowledge a matching code.

Conditions for Running the DTC

- The radio is ON.
- Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

- The RSE system transitions from OFF to ON.
- This DTCs will set when there is a security code mismatch.

Action Taken When the DTC Sets

The system will enter the Theft Detected Mode and "Security Error" is displayed on the screen.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.

DTC B3926 or B3927

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3926: Screen 1 Theft Locked

DTC B3927: Screen 2 Theft Locked

Circuit/System Description

The DVD screen and rear seat entertainment interface module communicate with each other to verify that a security code relayed between the two components is valid. The DTC will pass when the both components acknowledge a matching code.

Conditions for Setting the DTC

- The RSE system transitions from OFF to ON. This may be in response to the RSE system power switch or an ignition key cycle.
- This DTCs will set when there is a security code mismatch.
- Battery voltage must be between 9-16 volts.

Action Taken When the DTC Sets

The system will enter the Theft Detected Mode.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

DTC U1401

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC U1401: Lost Communications Between AD and ADG

Circuit/System Description

The navigation interface module (NIM) continuously sends a communication signal to the navigation module. Upon receiving the signal, the navigation module sends a reply signal, confirming that it can communicate.

Conditions for Running the DTC

- The ignition ON
- The system voltage is at least 9.5 volts and no more than 15.5 volts.

Conditions for Setting the DTC

The NIM does not receive a response from the navigation module for 5 or more consecutive seconds.

Action Taken When the DTC Sets

The navigation system is disabled.

Conditions for Clearing the DTC

- The current DTC will clear when the NIM receives a communication reply from the navigation module.
- The history DTC will clear after 50 fault-free ignition cycles have occurred.

Control Module References

Circuit/System Testing

1. Disconnect the X1 harness connector at the Navigation Module.
2. Ignition OFF, test for less than 10 Ω between the ground circuit terminal A8 and ground

   If greater than specified range, test the ground circuit for an open/high resistance.
3. Ignition On, test for B+ between the B+ circuit terminal A4 and ground.

   If less than the specified value, test the circuit for a short to ground or an open/high resistance.
4. Ignition ON, Navigation ON, test for B+ between the control circuit terminal A7 and ground.

   If less than the specified value, test the circuit for an open/high resistance or short to ground. If the circuit tests normal, replace the Navigation Interface Module.
5. Ignition OFF, disconnect the harness connector at the Navigation Interface Module and the X3 harness connector at the Navigation Module.
6. Test for less than 1 Ω between the serial data terminals listed below:
   - Terminal 1 at the Navigation Interface Module and terminal C7 X3 at the Navigation Module.
   - Terminal 7 at the Navigation Interface Module and terminal C8 X3 at the Navigation Module.

   If greater than the specified range, test the circuit for an open/high resistance.
7. Test for infinite resistance between the serial data terminals listed below and ground:
   - Terminal 1 at the Navigation Interface Module.
   - Terminal 7 at the Navigation Interface Module.

   If less than the specified value, test the circuit for a short to ground.
8. Test for less than 1 V between the serial data terminals listed below and ground:
   - Terminal 1 at the Navigation Interface Module.
   - Terminal 7 at the Navigation Interface Module.

   If greater than the specified range, test the circuit for a short to voltage.
9. If all circuits test normal, replace the Navigation Module.

Repair Instructions

Perform the Diagnostic Repair Verification.

DTC U2121

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U2121: No Communication with Radio Display

Circuit/System Description

The radio continuously sends a communication signal to the driver information display. Upon receiving the signal, the display sends a reply signal, confirming that it can communicate. The display is directly connects to the radio with no external circuits involved.

Conditions for Running the DTC

The radio is active.

Conditions for Setting the DTC

The radio does not receive a response from the radio display for 10 or more consecutive seconds.

Action Taken When the DTC Sets

The system will set the DTC and disable itself.

Conditions for Clearing the DTC

- The current DTC will clear when the radio receives a communication reply from the driver information display.
- The history DTC will clear after 50 fault-free ignition cycles have occurred.

Diagnostic Aids

Physically check that the driver information display is correctly mounted to the radio.

DTC U2201

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

With the ignition in either the ACC position or the ON position the rear seat entertainment (RSE) interface module continuously sends a communication signal to the DVD player. Upon receiving the signal, the DVD player sends a reply signal, confirming that it can communicate. DTC U2201 will set to indicate the DVD Player has not received a communication signal or replied when the RSE interface module has requested operation.

Conditions for Running the DTC

DTC U2201 runs continuously once a valid DVD player response occurs.

Conditions for Setting the DTC

The RSE interface module does not receive a response from the DVD player after 3 consecutive communication attempts.

Action Taken When the DTC Sets

The rear seat entertainment system fails to operate.

Conditions for Clearing the DTC

- The current DTC will clear when the RSE interface module receives a communication reply from the DVD player.
- The history DTC will clear after 50 fault-free ignition cycles have occurred.

Circuit/System Testing

1. Using the scan tool, select the DTC display function. Verify that DTC U2201 is set.
2. If DTC U2201 is set, turn OFF the RSE system for 30 seconds.
3. Ignition ON, RSE system ON, select the DVD function for the system. Using the scan tool, select the DTC display function and verify that DTC U2201 is set to current.
4. Press the eject button on the DVD player and audibly verify that the DVD player has eject/load capability.

   If the DVD player fails to eject verify that DTC B1325 is not set to current.
5. Ignition OFF, disconnect the RSE interface module and DVD player harness connectors.
6. Using a DMM test the RSE interface module and DVD player; communication, power and ground circuits for short to ground or an open/high resistance.

   If the circuits do not test normal, repair or replace the effected circuit(s).

   If the circuits test normal, replace the DVD player.
7. Using the scan tool, select the DTC display function. If DTC U2201 resets, replace the audio video interface module.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Audio/Video Interface Module Replacement
- Video Disc Player Replacement

DTC U2202

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U2202: No Communication With Rear Control Panel

Circuit/System Description

With the ignition in either the ACC position or the ON position the rear seat entertainment (RSE) interface module continuously sends a communication signal to the rear seat entertainment (RSE) control panel. Upon receiving the signal, the RSE control panel sends a reply signal, confirming that it can communicate. DTC U2202 will set to indicate the RSE control panel has not received a communication signal or replied when the RSE interface module has requested operation.

Conditions for Running the DTC

DTC U2202 runs continuously once a valid RSE control panel response occurs.

Conditions for Setting the DTC

The RSE interface module does not receive a response from the RSE control panel after 3 consecutive communication attempts.

Action Taken When the DTC Sets

The rear seat entertainment system fails to operate.

Conditions for Clearing the DTC

- The current DTC will clear when the RSE interface module receives a communication reply from the RSE control panel.
- The history DTC will clear after 50 fault-free ignition cycles have occurred.

Global Positioning System (GPS) Data Not Current or Inaccurate

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit / System Description

The communication interface module (CIM) receives information from a specific navigation antenna located on the outside of the vehicle. The navigation antenna is connected to the CIM via a shielded coaxial cable. The antenna cable also provides a path for DC current for powering the antenna.

Diagnostic Aids

- The GPS signal title on the scan tool will display a Yes or No dependant upon whether or not the module sees an increment of the seconds transmitted by GPS signals to the vehicle communication interface module. Upon entering this screen, the GPS signal title will automatically display Yes, regardless of the presence of time increment, for at least 2 seconds, while the algorithm in the scan tool determines the status of the clock. If increment is found, Yes is continually displayed. If the clock remains static, No is displayed. The scan tool looks for increment every second, regardless of current display.
- Inaccurate or aged GPS position concerns which are no longer present may have been due to the temporary loss of GPS signal reception by the vehicle. Conditions such as driving through tunnels or parking structures while making an Holden Assist® keypress will restrict the navigation antenna from a clear view of the satellites in the sky and may have caused this temporary data loss.

Circuit/System Verification

Note: It is important to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from the satellites. It is also necessary to inform the Holden Assist® Call Center advisor that this call is for vehicle diagnostic purposes.

1. Ignition ON, observe the GPS signal status indicator for at least 10 seconds with a scan tool. The indicator should display Yes.

   If the indicator does not display Yes, refer to Circuit/System Testing.
2. Call and verify the Holden Assist advisor has received the GPS data.

   If the advisor did not receive the GPS data and the call was a "fail to voice", contact the GM Technical Assistance Center.

   If the advisor did not receive the GPS data and the call was not a "fail to voice", refer to Circuit/System Testing.
3. Verify with the Holden Assit Call Center advisor that your actual position is within a reasonable distance from the actual location of the vehicle.

   If your actual position is not within a reasonable distance from the actual location of the vehicle, replace the CIM.

Circuit/System Testing

1. Disconnect the navigation antenna coax cable from the CIM.
2. Ignition ON, test for 4.5-5.5 V between the CIM coax cable center conductor terminal at the module and ground.

   If not within the specified range, replace the CIM.
3. Reconnect the coax cable to the CIM. Disconnect the coax cable from the navigation antenna.
4. Test for 4.5-5.5 V between the coax cable center conductor and the outer shield.

   If not within the specified range, replace the coax cable.
5. If all circuits test normal, replace the navigation antenna.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cellular Microphone Signal	1	1	1	--
Cellular Microphone Drain	--	1	--	--
1. Microphone Inoperative - Caller Cannot Be Heard				

Circuit/System Description

Bluetooth ® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. Only vehicles with steering wheel controls will have Bluetooth ® functionality. In order to utilize the vehicle's Bluetooth ® system, a Bluetooth ® equipped cellular phone is required. The bluetooth module is not connected to serial data and will not set DTCs. When a Bluetooth button keypress is made, the bluetooth module pulls the celular telephone signal to ground to mute all radio functions and transmit cellular telephone originated audio. After the audio system is muted, the cellular telephone signals are transmitted to the audio system on the cellular telephone voice signal circuit, and returned to the module on the cellular telephone voice low reference circuit.

Radio Poor Reception

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

AM and FM radio reception is dependent on the following components:

- Radio antenna
- Coax cable between the radio antenna and the radio
- Radio

Diagnostic Aids

Poor AM and FM radio reception is dependent on multiple influences, some of which may not be vehicle related. Areas which have high RF traffic or block the signal path may cause a degradation in radio reception. Radio reception may also be influenced by items within the vehicle, but not part of the radio system. Such examples are aftermarket electrical accessories or other items which may generated noise in the vehicle electrical system.

Circuit/System Verification

1. Inspect the antenna for proper mounting or physical damage.
   If damage is found, repair or replace as necessary
2. Radio ON, tune to several known AM and FM stations, and play a known good CD.
   If audio output is poor from all sources, refer to Speaker Malfunction.

Circuit/System Testing

1. Ignition OFF, disconnect the coax cable from the radio and radio antenna.
2. Verify the coax connectors are properly secured and free of any damage.
   If damage is found, repair or replace as necessary.
3. Test for infinite resistance between the antenna coax center terminal and ground.
   If less than the specified value, replace the antenna coax.
4. Test for less than 5 ohms on the antenna coax center terminal from end to end.
   If greater than the specified range, replace the antenna coax.
5. Test for less than 5 ohms on the antenna coax outer shield from end to end.
   If greater than the specified range, replace the antenna coax.
6. Test for infinite resistance between the coax center terminal and the outer shield.
   If less than the specified value, replace the antenna coax.
7. If all circuits test normal, replace the antenna.
8. Ignition ON, radio ON, verify radio reception has improved.
   If there is still poor reception, replace the radio.

Amplifier Ground	--	1	--	--

1. Amplifier inoperative/no sound from speakers.

2. No or reduced sound from subwoofer.

3. No sound from center speaker

* Noticeable audio distortion possible.

Circuit / System Description

Each of the audio output channel circuits (+) and (-), at the radio and audio amplifier have a DC bias voltage that is one half of the battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. This voltage will vary depending on what type of audio is being listened to, talk or music, and type of music, as well as the volume setting of the system. Low volume and talk settings will measure around 1V AC and less, where constant music may measure 3V AC and slightly higher. The amplifier may only supplied an amplified signal to the subwoofers, or on the premium audio systems, the amplifier will amplify all of the audio signals. The amplifier can not set DTCs. The amplifier mute circuit from the radio to the amplifier sends a 4V signal to disable the rear speakers, and is 2V when the mute is OFF.

Diagnostic Aids

- Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting. If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.
- When equipped with an amplifier, it is possible for some individual circuit faults to affect more than one speakers operation. Perform diagnostic tests in the sequence listed to avoid misdiagnosis.
- The front tweeter speakers are connected to the same channel as the front door speakers.

Circuit/System Verification

Radio ON, adjust the fade and balance controls on the radio to test all four channels individually. Each channel should produce clear and even sound.

Without Amplifier

Radio ON, verify clear audio is heard from each audio speaker.

If audio is inoperative from all speakers, replace the radio.

If audio is inoperative from one or more, but not all, speakers or the audio emitted from the speakers is not clear, refer to Speaker Circuit Malfunction - without Amplifier.

With Amplifier -- UQG

Radio ON, verify clear audio is heard from each audio speaker.

If audio is inoperative from one or both subwoofers, refer to Amplifier Circuit Malfunction.

If audio is inoperative from one or more rear speakers or the audio emitted from the speakers is not clear, refer to Speaker Circuit Malfunction - with Amplifier.

With Amplifier -- UQA

Radio ON, verify clear audio is heard from each audio speaker.

If audio is inoperative from all speakers, or just the rear speakers, refer to Amplifier Circuit Malfunction.

If audio is inoperative from one or more, but not all, speakers or the audio emitted from the speakers is not clear, refer to Speaker Circuit Malfunction - with Amplifier.

Circuit/System Testing

Speaker Circuit Malfunction - without Amplifier

1. Ignition OFF, disconnect the harness connector at the appropriate speaker.
2. Radio ON, test for 5.0-7.5 volts between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. Test for 5.0-7.5 V between the signal circuit terminal B and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.

4. If all circuits test normal, replace the speaker.

Amplifier Circuit Malfunction -- UQG

1. Ignition OFF, disconnect the harness connector at the audio amplifier.
2. Ignition OFF, test for less than 10 Ω between the ground circuit terminals listed below and ground.
   - Terminal 5
   - Terminal 12

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, test for B+ on the B+ circuit terminals listed below and ground.
   - Terminal 4
   - Terminal 11

   If less than the specified value, test the B+ circuit for a short to ground or an open/high resistance.
4. Radio ON, test for 5.0-7.5 V between the appropriate signal circuit terminal listed below and ground.
   - Left rear speaker output (+) terminal 1
   - Left rear speaker output (-) terminal 6
   - Right rear speaker output (+) terminal 2
   - Right rear speaker output (-) terminal 7

   If less than the specified range, test the appropriate signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the appropriate signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
5. Ignition OFF, reconnect the amplifier and disconnect the appropriate subwoofer harness connectors.
6. Radio ON, test for 5.0-7.5 V between the signal circuit terminal 1 and ground.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the amplifier.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the amplifier.
7. Test for 5.0-7.5 V between the signal circuit terminal 2 and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the amplifier.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the amplifier.
8. If all circuits test normal, replace the appropriate subwoofer.

Amplifier Circuit Malfunction UQA

1. Ignition OFF, disconnect the X3 harness connector at the audio amplifier.
2. Ignition OFF, test for less than 10 ohms between the ground circuit terminal 8 and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.
3. Reconnect the X3 harness connector and disconnect the X1 harness connector.
4. Ignition ON, test for B+ between the B+ circuit terminal 4 and ground.

   If less then specified value, test the circuit for a short to ground, or an open/high resistance.

5. Test for B+ between the remote enable signal circuit terminal 8

   If less then the specified value, test the circuit for a short to ground, or an open/high resistance. If the circuit tests normal, replace the radio.
6. Radio ON, Mute OFF, test for 1.5 - 2.5 V between the amplifier mute signal circuit terminal 11 and ground.

   If less then the specified range, test the circuit for a short to ground, or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater then the specified range, test the circuit for a short to voltage. If the circuit tests normal, replace the radio.
7. If all circuits test normal, replace the audio amplifier.

Speaker Circuit Malfunction -- With Amplifier UQG -- Front Speaker Testing

1. Ignition OFF, disconnect the harness connector at the appropriate speaker.
2. Radio ON, test for 5.0-7.5 V between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. Test for 5.0-7.5 V between the signal circuit terminal B and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
4. If all circuits test normal, replace the speaker.

Speaker Circuit Malfunction - with Amplifier UQG -- Rear Speaker Testing

1. Ignition OFF, disconnect the amplifier and the appropriate speaker harness connectors.
2. Radio ON, test for 5.0-7.5 V between the signal circuit terminal A and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. Test for 5.0-7.5 V between the signal circuit terminal B and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
4. Ignition OFF, reconnect the harness connector at the audio amplifier.
5. Radio ON, test for 5.0-7.5 V between the signal circuit terminal A and ground at the appropriate speaker.

   If not within the specified range, replace the amplifier.
6. Radio ON, test for 5.0-7.5 V between the signal circuit terminal B and ground at the appropriate speaker.

   If not within the specified range, replace the amplifier.
7. If all circuits test normal, replace the speaker.

Speaker Malfunction Radio Output Testing -- RHD -- UQA

1. Ignition OFF, disconnect the X1 connector at the amplifier.
2. Ignition ON, radio ON, test for 5.0-7.5 volts between the appropriate signal circuit terminal listed below and ground.
   - Left front low level audio signal (+) - terminal 15
   - Left front low level audio signal (-) - terminal 7
   - Right front low level audio signal (+) - terminal 14
   - Right front low level audio signal (-) - terminal 6
   - Left rear low level audio signal (+) - terminal 13
   - Left rear low level audio signal (-) - terminal 5
   - Right rear low level audio signal (+) - terminal 12
   - Right rear low level audio signal (-) - terminal 4

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. If all circuits test normal, replace the amplifier.

Speaker Malfunction Radio Output Testing -- LHD -- UQA

1. Ignition OFF, disconnect the X1 connector at the amplifier.
2. Ignition ON, radio ON, test for 5.0-7.5 volts between the appropriate signal circuit terminal listed below and ground.
   - Left front low level audio signal (+) - terminal 14
   - Left front low level audio signal (-) - terminal 6
   - Right front low level audio signal (+) - terminal 15
   - Right front low level audio signal (-) - terminal 7
   - Left rear low level audio signal (+) - terminal 12
   - Left rear low level audio signal (-) - terminal 4
   - Right rear low level audio signal (+) - terminal 13
   - Right rear low level audio signal (-) - terminal 5

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. If all circuits test normal, replace the amplifier.

Speaker Malfunction Amplifier Output Testing -- RHD --UQA

1. Ignition OFF, disconnect the X2 and X3 connectors at the amplifier.
2. Radio ON, test for less than 1 volt between the appropriate signal circuit terminal listed below and ground:
   - Left front speaker output (+) - terminal 5 X3
   - Left front speaker output (-) - terminal 1 X3
   - Right front speaker output (+) - terminal 8 X2

- Right front low speaker output (-) - terminal 7 X2
- Left rear speaker output (+) - terminal 15 X2
- Left rear speaker output (-) - terminal 16 X2
- Right rear speaker output (+) - terminal 2 X2
- Right rear speaker output (-) - terminal 1 X2
- Left subwoofer speaker output (+) - terminal 7 X3
- Left subwoofer speaker output (-) - terminal 3 X3
- Right subwoofer speaker output (+) - terminal 6 X3
- Right subwoofer speaker output (-) - terminal 2 X3
- Center speaker output (+) - terminal 4 X2
- Center speaker output (-) - terminal 3 X2
- Roof speaker output (+) - terminal 6 X2
- Roof speaker output (-) - terminal 5 X2

  If greater than the specified range, test both circuits of the affected speaker for a short to voltage.

3. Radio OFF, test for infinite resistance between the appropriate signal circuit terminal listed below and ground:
   - Left front speaker output (+) - terminal 5 X3
   - Left front speaker output (-) - terminal 1 X3
   - Right front speaker output (+) - terminal 8 X2
   - Right front low speaker output (-) - terminal 7 X2
   - Left rear speaker output (+) - terminal 15 X2
   - Left rear speaker output (-) - terminal 16 X2
   - Right rear speaker output (+) - terminal 2 X2
   - Right rear speaker output (-) - terminal 1 X2
   - Left subwoofer speaker output (+) - terminal 7 X3
   - Left subwoofer speaker output (-) - terminal 3 X3
   - Right subwoofer speaker output (+) - terminal 6 X3
   - Right subwoofer speaker output (-) - terminal 2 X3
   - Center speaker output (+) - terminal 4 X2
   - Center speaker output (-) - terminal 3 X2
   - Roof speaker output (+) - terminal 6 X2
   - Roof speaker output (-) - terminal 5 X2

   If less than the specified value, test both circuits of the affected speaker for a short to ground.
4. If all circuits test normal, reconnect all harness connectors at the amplifier.
5. Radio ON, disconnect the appropriate speaker.
6. Test for 5.0-7.5 volts between the signal circuit terminals and ground.

   If less then the specified range test the circuit for an open/high resistance. If the circuit tests normal, replace the amplifier.

   If greater then the specified range test the circuit for a short to voltage. If the circuit tests normal, replace the amplifier.
7. If the circuit tests normal, replace the appropriate speaker.

Speaker Malfunction Amplifier Output Testing -- LHD --UQA

1. Ignition OFF, disconnect the X2 and X3 connectors at the amplifier.
2. Radio ON, test for less than 1 volt between the appropriate signal circuit terminal listed below and ground:
   - Left front speaker output (+) - terminal 8 X2
   - Left front speaker output (-) - terminal 7 X2
   - Right front speaker output (+) - terminal 5 X3
   - Right front low speaker output (-) - terminal 1 X3
   - Left rear speaker output (+) - terminal 2 X2
   - Left rear speaker output (-) - terminal 1 X2
   - Right rear speaker output (+) - terminal 15 X2
   - Right rear speaker output (-) - terminal 16 X2
   - Left subwoofer speaker output (+) - terminal 6 X3
   - Left subwoofer speaker output (-) - terminal 2 X3
   - Right subwoofer speaker output (+) - terminal 3 X3
   - Right subwoofer speaker output (-) - terminal 7 X3
   - Center speaker output (+) - terminal 4 X2
   - Center speaker output (-) - terminal 3 X2
   - Roof speaker output (+) - terminal 6 X2
   - Roof speaker output (-) - terminal 5 X2

   If greater than the specified range, test both circuits of the affected speaker for a short to voltage.
3. Radio OFF, test for infinite resistance between the appropriate signal circuit terminal listed below and ground:
   - Left front speaker output (+) - terminal 8 X2
   - Left front speaker output (-) - terminal 7 X2
   - Right front speaker output (+) - terminal 5 X3
   - Right front low speaker output (-) - terminal 1 X3
   - Left rear speaker output (+) - terminal 2 X2
   - Left rear speaker output (-) - terminal 1 X2
   - Right rear speaker output (+) - terminal 15 X2
   - Right rear speaker output (-) - terminal 16 X2
   - Left subwoofer speaker output (+) - terminal 6 X3
   - Left subwoofer speaker output (-) - terminal 2 X3
   - Right subwoofer speaker output (+) - terminal 3 X3
   - Right subwoofer speaker output (-) - terminal 7 X3
   - Center speaker output (+) - terminal 4 X2
   - Center speaker output (-) - terminal 3 X2
   - Roof speaker output (+) - terminal 6 X2
   - Roof speaker output (-) - terminal 5 X2

   If less than the specified value, test both circuits of the affected speaker for a short to ground.

4. If all circuits test normal, reconnect all harness connectors at the amplifier.
5. Radio ON, disconnect the appropriate speaker.
6. Test for 5.0-7.5 volts between the signal circuit terminals and ground.

   If less then the specified range test the circuit for an open/high resistance. If the circuit tests normal, replace the amplifier.

   If greater then the specified range test the circuit for a short to voltage. If the circuit tests normal, replace the amplifier.
7. If the circuit tests normal, replace the appropriate speaker.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Speaker Replacement Reference
- Control Module References for audio amplifier and radio replacement, setup, and programming

Speaker Replacement Reference

Component	Repair Instruction
Front Side Door Speaker Replacement	Refer to Radio Front Side Door Lower Speaker Replacement
Front Speaker (Tweeter)	Refer to Radio Front Speaker Replacement
Rear Side Door Speaker Replacement	Refer to Radio Rear Side Door Speaker Replacement
Rear Shelf Speaker Replacement	Refer to Radio Rear Speaker Replacement

Symptoms - Cellular Communication

Important: The following steps must be completed before using the symptom table.

Important: The Bluetooth Module is not connected to the GMLAN system.

1. Perform the Diagnostic System Check - Vehicle , before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarise yourself with the system functions. Refer to Cellular Telephone Description and Operation in Cellular Communication.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to Checking Aftermarket Accessories .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Microphone Inoperative - Caller Cannot Be Heard
- Cellular Telephone Will Not Pair Up With Bluetooth Car Kit
- Cellular Telephone Will Not Connect To Bluetooth Car Kit
- Voice Recognition Inoperative

Symptoms - Entertainment

Important: The following steps must be completed before using the symptom table.

1. Perform the Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Radio/Audio System Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to Checking Aftermarket Accessories.
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Radio Poor Reception
- Speaker Malfunction

Symptoms - Telematics

Important: The following steps must be completed before using the symptom table.

1. Perform the Diagnostic System Check - Vehicle , before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarise yourself with the system functions. Refer to Telematics Description and Operation .
3. Refer to the following symptom list, this list will enable the user to verify the customer complaint and narrow it to its source.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to Checking Aftermarket Accessories .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Telematics Call Center Remote Function Requests Inoperative
- Unable to Contact Telematics Call Center
- No or Noisy Telematics Audio
- Global Positioning System (GPS) Data Not Current or Inaccurate

Telematics Audio Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Telephone Audio Signal (+)	1	1	1	--
Telephone Audio Signal (-)	--	1	--	--
1. No (or Noisy) Holden Assist® Audio				

Circuit/System Description

When a Holden Assist® keypress is made, a serial data message is sent to the audio system to mute all radio functions and output Holden Assist® originated audio. After the audio system is muted, the telematics module transmits signals to the audio system on the audio signal circuit, and returned to the module on the audio common circuit.

Circuit/System Verification

1. Tune radio to a known good station and verify the audio is heard clearly through all speaker channels.

   If audio is not heard clearly, refer to Speaker Malfunction.
2. Ignition ON, radio ON, set volume to comfortable level and press Holden Assist® Call Center button. Verify Connecting to Holden Assist® message is heard clearly through the audio system.

   If Holden Assist® message is noisy or distorted, refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the telematics module.
2. Test for less than 5 Ω between terminal 2 and ground.

   If greater than the specified range, test the circuit for an open or high resistance. If the circuit tests normal, replace the radio.
3. Disconnect the X4 harness connector at the radio.
4. Ignition OFF, test for less than 5 Ω of resistance between the Telephone Audio Signal (+) terminal 7 at the radio and the Telephone Audio Signal (+) terminal 15 at the telematics module.

   If greater than the specified range, test the circuit for a short to voltage, short to ground, or an open/high resistance.
5. If all circuits test normal, replace the telematics module.
6. Ignition ON, radio ON, verify Holden Assist® audio has improved.

   If the audio is still poor, replace the radio.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for radio or telematics module replacement, setup, and programming.

Telematics Call Center Remote Function Requests Inoperative

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The communication interface module has the capability of commanding the horn, initiating door lock/unlock, or operating the exterior lamps using the serial data circuits. These functions are commanded by the Call Center per a customer request.

Diagnostic Aids

The customer concern may have been due to a lack of cellular service in a given area. A failure in the Cellular Network infrastructure that has since been corrected.

Circuit/System Verification

Important:

- It is necessary to inform the Call Center advisor that this call is for vehicle diagnostic purposes.
- It is necessary to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.

1. Verify that the horn, lights, and the doors locks on the vehicle operate properly.

   If the applicable system does not operate properly, refer to Diagnostic System Check - Vehicle .
2. Contact the Call Center by pressing the blue button. Verify with the call center advisor that all of the remote functions (door locks, lights, or horn) work.

   If unable to connect with the call center, refer to Unable to Contact Telematics Call Center .

   If the remote functions do not operate when requested, replace the communication interface module.

Repair Instructions

Perform the Diagnostic Repair Verification .

Unable to Contact Telematics Call Center

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit / System Description

The communication interface module is a cellular device that allows the user to communicate data and voice signals over the national cellular network. When a blue button keypress is made, the communication interface module activates and connects the system to the cellular carriers communication system by interacting with the national cellular infrastructure. The module sends and receives all cellular communications over the cellular antenna and cellular antenna coax.

Diagnostic Aids

- The customer concern may have been due to a lack of cellular service in a given area. A failure in the National Cellular Network infrastructure at the time of the customers failed connection that has since been repaired may also have been the cause.
- If an emergency call is able to successfully connect the vehicle to the Call Center when a Call Center button press is not, there may be a failure in the ability of the system in the vehicle to be recognized by the local cellular carrier.
- If the prompt "Request Ended" is heard, without pressing the white dot button at the end of the keypress, the system at one time has made a successful cellular connection, but was unable to complete the call.
- It is important to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.

Circuit / System Verification

1. Verify that the cellular antenna and cellular antenna coupling assembly are not damaged.
   If damage is found, repair or replace as necessary.
2. If the system activates but does not connect with the call center, refer to Circuit/System testing.

Circuit / System Testing

1. Ignition OFF, disconnect the cellular antenna coax from the communication interface module and the cellular antenna.
2. Ignition ON, test for less than 1V between the antenna coax center terminal and ground.
   If greater than the specified range, replace the antenna coax.
3. Ignition ON, test for less than 1 V between the antenna coax outer shield and ground.
   If greater than the specified range, replace the antenna coax.
4. Test for infinite resistance between the antenna coax center terminal and ground.
   If less than the specified value, replace the antenna coax.
5. Test for infinite resistance between the antenna coax outer shield and ground.
   If less than the specified value, replace the antenna coax.
6. Test for less than 5 Ω at the cellular antenna coax center terminal from end to end.
   If greater than specified value, replace the cellular antenna coax cable.
7. Test for less than 5 Ω at the cellular antenna coax outer shield from end to end.
   If greater than specified value, replace the cellular antenna coax cable.
8. Test for infinite resistance between the antenna coax center terminal and the outer shield.
   If less than specified value, replace the cellular antenna coax cable.
9. If coax cable tests normal, replace the cellular antenna.
10. Press the Call Center button. Verify the system connects to call center.
    If a connection is not made to the call center, replace the comunication interface module.

Repair Instructions

Perform the Diagnostic Repair Verification .

Circuit/System Description

Bluetooth ® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. Only vehicles with steering wheel controls will have Bluetooth ® functionality. In order to utilize the vehicle's Bluetooth ® system, a Bluetooth ® equipped cellular phone is required. The bluetooth module is not connected to serial data and will not set DTCs. When a Bluetooth button keypress is made, the bluetooth module pulls the celular telephone signal to ground to mute all radio functions and transmit cellular telephone originated audio. After the audio system is muted, the cellular telephone signals are transmitted to the audio system on the cellular telephone voice signal circuit, and returned to the module on the cellular telephone voice low reference circuit.

Circuit / System Verification

1. Ignition ON, press Bluetooth button and make a phone call. Verify that your voice cannot be heard clearly by the person called.

   If your voice can not be heard clearly, refer to Microphone Inoperative - Caller Cannot Be Heard
2. Make sure the background noise is minimal. Press the Bluetooth button. Attempt to operate the bluetooth system using multiple different voice commands. Verify the system responds appropriately to all voice commands.

   If the Bluetooth system does not respond to any voice commands, replace the Bluetooth module.
3. Record voice commands via the Bluetooth car kit. Refer the cellular telephone's owner handbook.

   If voice commands cannot be recorded via the Bluetooth car kit, the cellular telephone may not be fully compatible with the Bluetooth car kit.

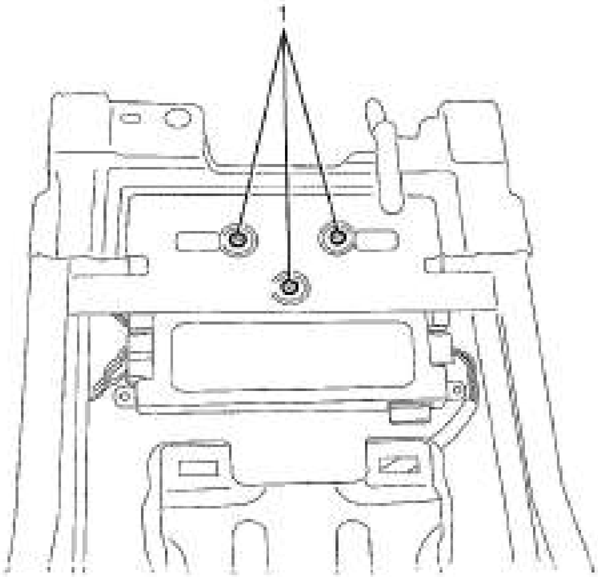
Repair Instructions

Perform the Diagnostic Repair Verification.

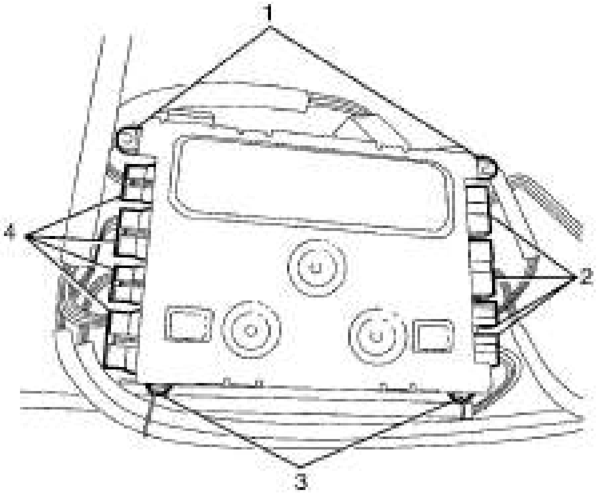
Control Module References for Bluetooth module replacement, setup, and programming.

Audio/Video Interface Module Replacement

Removal Procedure



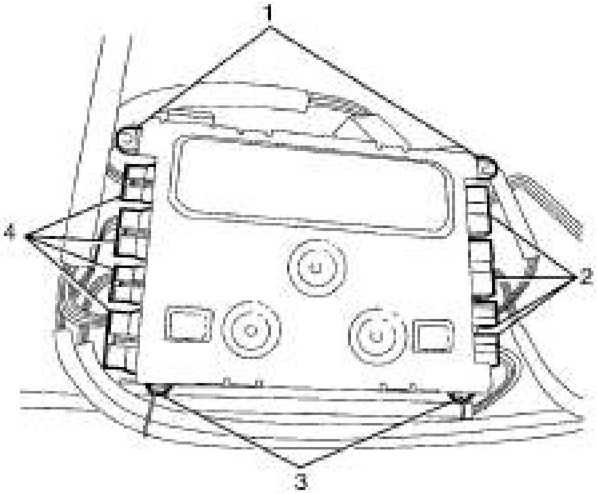
1. Remove the rear seat entertainment (RSE) assembly. Refer to Video Disc Player Bracket Replacement .
2. Remove the RSE interface module to rear seat entertainment assembly bracket screws (1).



Important: Make sure to label the connectors configuration for easy re-assembly.

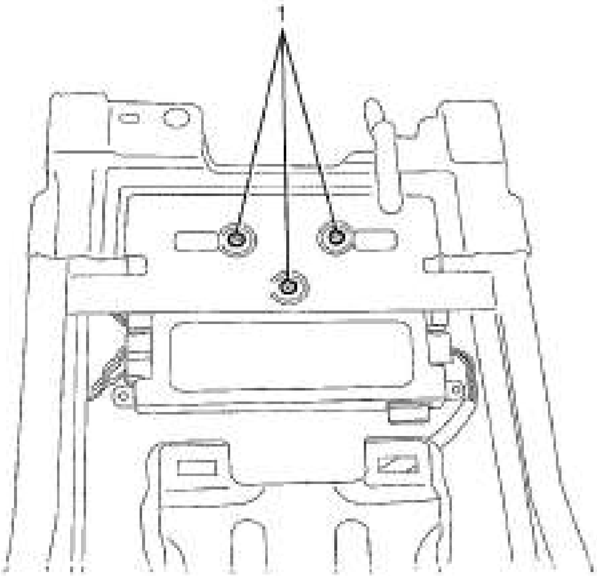
3. Disconnect the RSE interface module connectors (2 and 4, where fitted)
4. Cut the retaining ties (1 and 3) securing the RSE assembly harnesses to the RSE interface module.
5. Remove the RSE interface module from the RSE assembly bracket.

Installation Procedure



1. Install the RSE interface module to the RSE assembly bracket.
2. Connect the RSE interface module electrical connectors (2 and 4, where fitted).
3. Appropriately fasten the RSE harnesses to the RSE interface module assembly (1 and 3) with retaining ties.

Notice: Refer to Fastener Notice in the Preface section.



4. Install the RSE interface module to RSE assembly bracket retaining screws (1).

   Tighten
   Tighten the screws to 1.5 N·m (13 lb in).

5. Install the RSE assembly. Refer to Video Disc Player Bracket Replacement .
6. Refer to Control Module References for RSE interface module programming and setup.

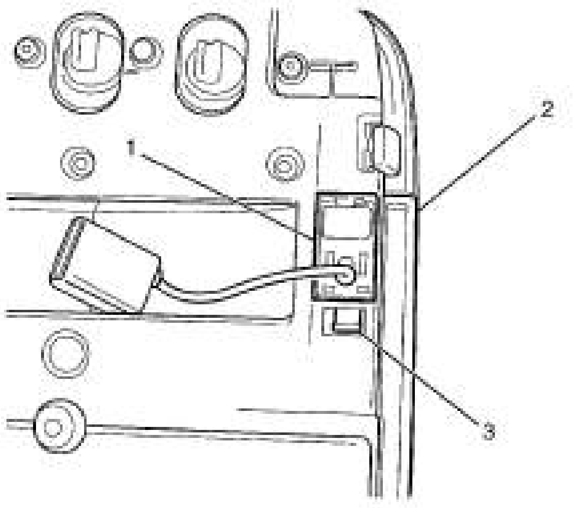
Document ID: 1997153

Bluetooth Microphone Replacement

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

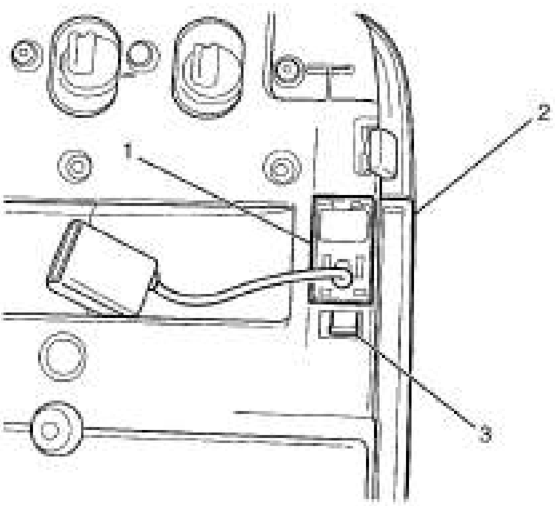
1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the front dome lamp assembly. Refer to Dome Lamp Replacement.



Important: Use a suitable tool to release the bluetooth microphone to dome lamp retaining clip (3) .

3. Remove the bluetooth microphone (1) from the dome lamp (2).

Installation Procedure



Important: Listen for an audible click to make sure the bluetooth microphone to dome lamp retaining clip (3) engages to avoid an induced rattle condition.

1. Install the bluetooth microphone (1) to the dome lamp (2).
2. Install the front dome lamp assembly. Refer to Dome Lamp Replacement in Lighting Systems.
3. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

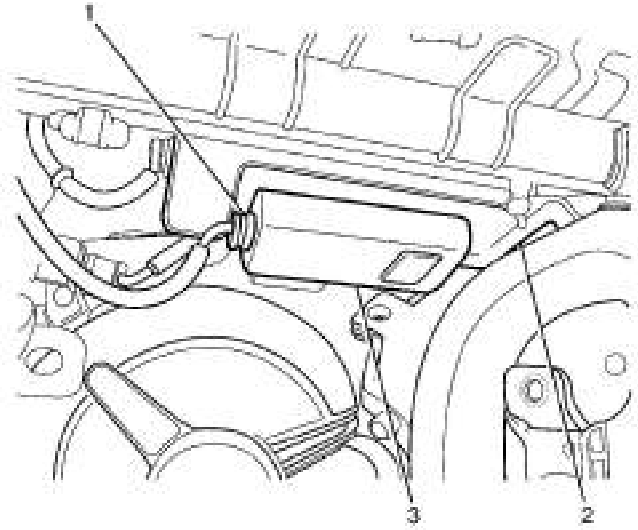
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions |
Document ID: 1997152

Bluetooth Module Replacement

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the insulator panel. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
3. Remove the instrument panel outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement.
4. Remove the instrument panel compartment. Refer to Instrument Panel Compartment Replacement.

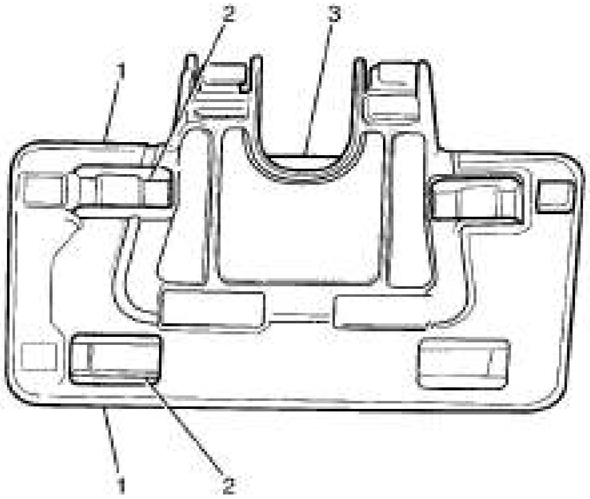


5. Disconnect the bluetooth module electrical connector (1).

Important: Push the bluetooth module assembly (3) towards the front of the vehicle and pull downward to disengage the bluetooth module assembly retaining clips from the I/P carrier (2).

6. Remove the bluetooth module assembly (3) from the I/P carrier (2).

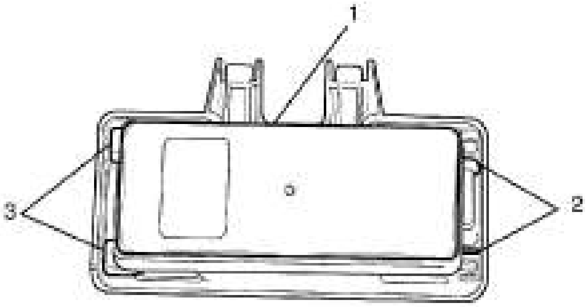
Disassembly Procedure



Important: To remove the bluetooth module bracket (1) from the bluetooth module (3), grasp the outside of the bluetooth module bracket with your fingers and disengage the bluetooth module bracket retaining tangs (2) with your thumbs.

Remove the bluetooth module (3) from the bluetooth module bracket (1).

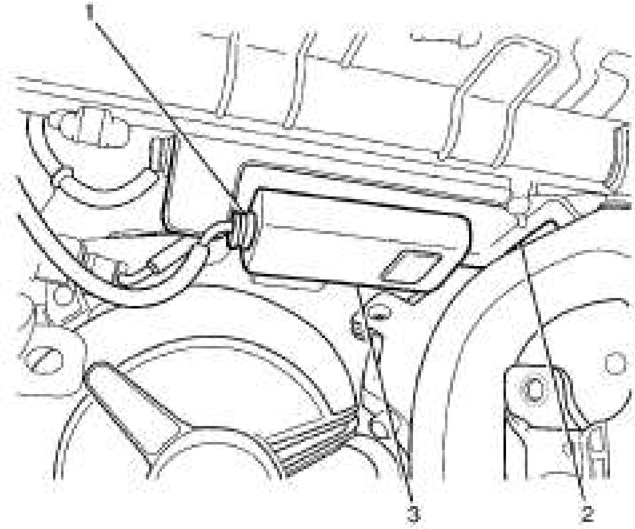
Assembly Procedure



Important: Guide the bluetooth module (1) into the bluetooth module bracket (2), make sure retaining clips (3) engage.

Install the bluetooth module (1) to the bluetooth module bracket (2 and 3).

Installation Procedure



Important: Push the bluetooth module assembly (1) toward the rear of the vehicle, making sure to engage the bluetooth module assembly retaining clips to the I/P carrier (2).

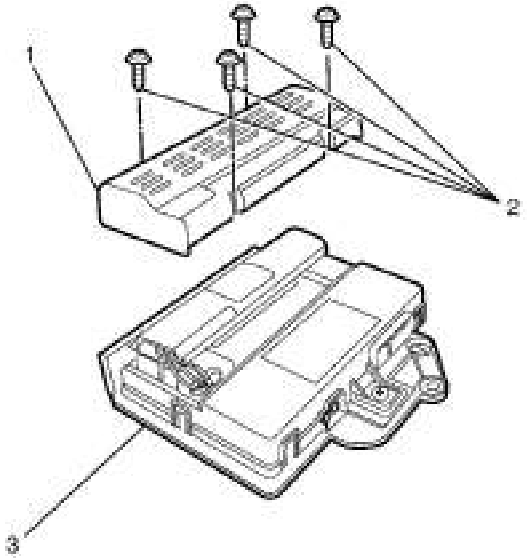
1. Install the bluetooth module assembly (1) to the I/P carrier (2).
2. Connect the bluetooth module electrical connector (1).
3. Install the Instrument Panel Outer Trim Cover. Refer to Instrument Panel Outer Trim Cover Replacement.
4. Install the insulator panel. Refer to Instrument Panel Insulator Panel Replacement - Left Side.
5. Install the instrument panel compartment. Refer to Instrument Panel Compartment Replacement.
6. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
7. If re-programming is required. Refer to Control Module References.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions |
Document ID: 2004980

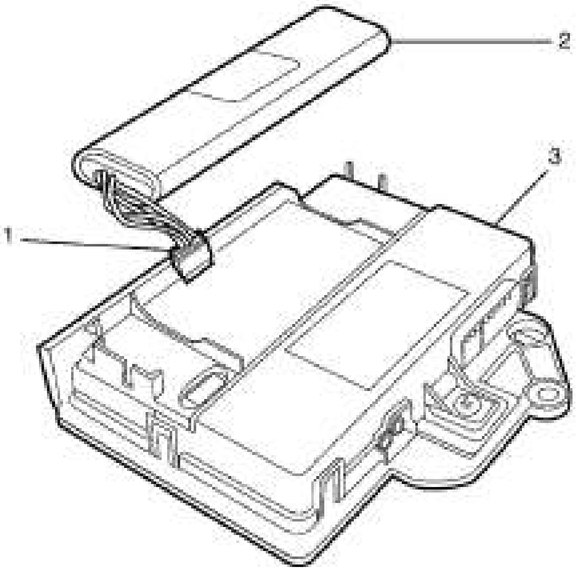
Communication Interface Module Battery Replacement

Removal Procedure

1. Using a scan tool, select service mode to disable the telematics module. Refer to Communication Interface Module Mode Selection.
2. Remove the telematics module. Refer to Communication Interface Module Replacement.



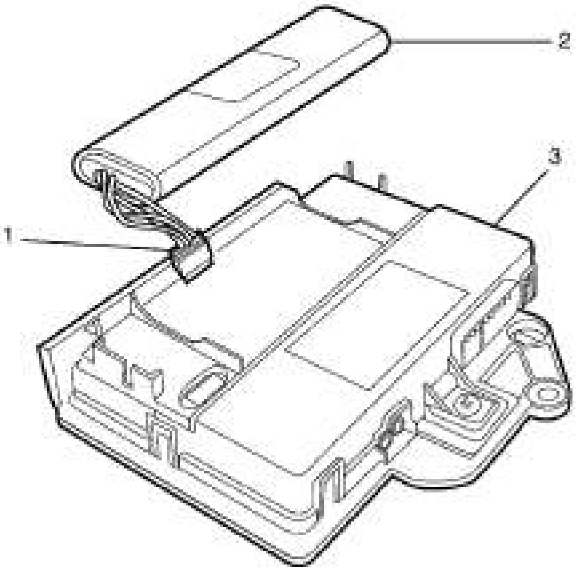
3. Remove the backup battery cover to telematics module retaining torx screws (2).
4. Remove the battery back up cover (1) from the telematics module (3).



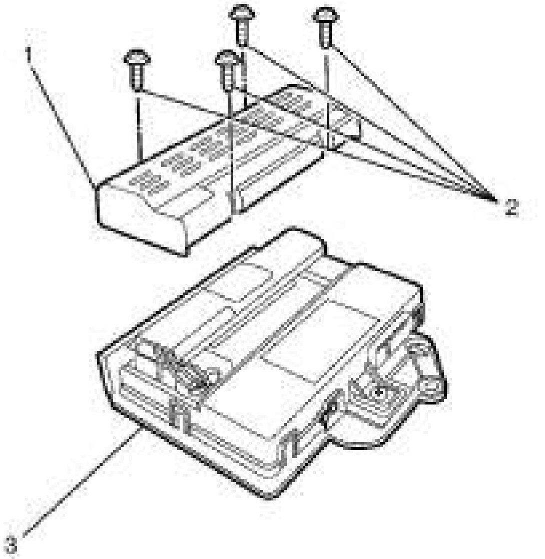
Important: If replacing the battery, dispose of it in an environmentally sound/personally safe manner.

5. Disconnect the backup battery electrical connector (1) from the telematics module (3).
6. Remove the backup battery (2).

Installation Procedure



1. Connect the backup battery electrical connector (1) to the telematics module (3).
2. Install the backup battery (2) into the telematics module (3).



3. Install the backup battery cover (1) to the telematics module (3).

Notice: Refer to Fastener Notice in the Preface section.

4. Install the backup battery cover to telematics module retaining torx screws (2).

   Tighten
   Tighten the screws to 2.0 N·m (18 lb in).

5. Using a scan tool reset the backup battery timer.
6. Install the telematics module. Refer to Communication Interface Module Replacement.

   Important: If the telematics module service mode remains enabled, the telematics system does not have full functionality.

7. Using a scan tool, select active mode to enable the telematics module. Refer to Communication Interface Module Mode Selection.

Communication Interface Module Microphone Replacement

Removal Procedure

1. Using a scan tool, select service mode to disable the telematics module. Refer to Communication Interface Module Mode Selection.

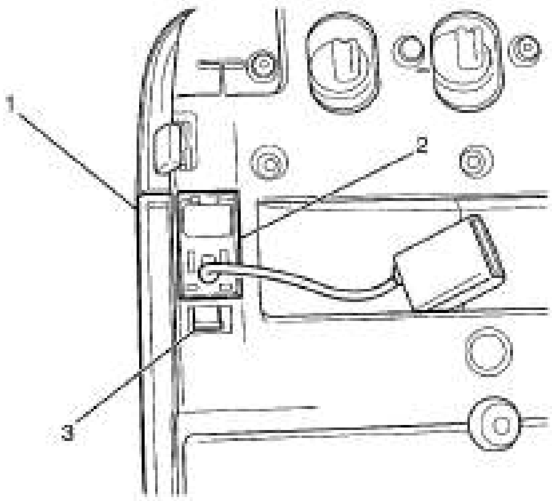
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the front dome lamp assembly. Refer to Dome Lamp Replacement.

   Important: Use a suitable tool to release the telematics (secure) microphone to dome lamp retaining clip (3).

4. Remove the telematics (secure) microphone (1) from the dome lamp (2).

Installation Procedure



Important: Listen for an audible click to make sure the telematics (secure) microphone to dome lamp retaining clips (3) are engaged to avoid an induced rattle condition.

1. Install the telematics (secure) microphone (1) to the dome lamp (2).
2. Install the front dome lamp assembly. Refer to Dome Lamp Replacement.
3. Connect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.

Important: If the telematics module service mode remains enabled, the telematics system does not have full functionality.

4. Using a scan tool, select active mode to enable the telematics module. Refer to Communication Interface Module Mode Selection.

Communication Interface Module Mode Selection

Important: New telematics modules and vehicles that require telematics activation will be delivered in Pre-Delivery mode. Before a system can be activated or once a telematics module has been installed the telematics module must be removed from Pre-Delivery mode.

The telematics module has four operational modes:

- Service - Used to temporarily deactivate the system so as service procedures can be performed.
- Active - When selected will enable the telematics system to function.
- Sleep - Periodic mode of telematics module used to limit battery current draw.
- Pre-Delivery - Initial mode of telematics module when supplied from production.

To select a mode follow the steps below:

1. Install a diagnostic scan tool.
2. Select Infotainment System.
3. Select Telematics.
4. Select Programming.
5. Select the one of the following four options:
    - Service
    - Active
    - Sleep
    - Pre-Delivery

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions |
Document ID: 2004904

Communication Interface Module Registration

Software Selection

If a new telematics module has been installed or a vehicle has had the telematics system activated, the correct system software level must be selected (GM Fleetview, Secure or Assist Ultra). This process is incorporated into the initial programming of the telematics module.

Registration

If a new telematics module has been installed or a vehicle has had the telematics system activated, it must be registered with the Telematics Call Centre:

GM Fleetview

1. After the new telematics module has been installed, turn on the ignition and make a call to the Telematics Call Centre using the following telephone number: 1 300 725 330.
2. When the Telematics Call Centre operator answers, inform the operator who you are and what retail outlet you are from, and that you have just installed a new telematics module into the vehicle. You will also be required to provide the operator with the complete VIN and, if the vehicle is registered, the registration number of the vehicle.
3. The new telematics module is now registered to this vehicle.

Secure

1. After the new telematics module has been installed, turn on the ignition and make a call to the Telematics Call Centre using the following telephone number: 1 300 880 088.
2. When the Telematics Call Centre operator answers, inform the operator who you are and what retail outlet you are from, and that you have just installed a new telematics module into the vehicle. You will also be required to provide the operator with the complete VIN and, if the vehicle is registered, the registration number of the vehicle.
3. The new telematics module is now registered to this vehicle.

Assist Ultra

1. After the new telematics module has been installed, turn on the ignition and press the Holden Assist button to make a call to the Telematics Call Centre.
2. When the Telematics Call Centre operator answers, inform the operator who you are and what retail outlet you are from, and that you have just installed a new telematics module into the vehicle. You will also be required to provide the operator with the complete VIN and, if the vehicle is registered, the registration number of the vehicle.
3. The new telematics module is now registered to this vehicle.

Document ID: 2005001

Communication Interface Module Replacement

Service Operations

Caution: Refer to Service Programming System (SPS) Notice in the Preface section.

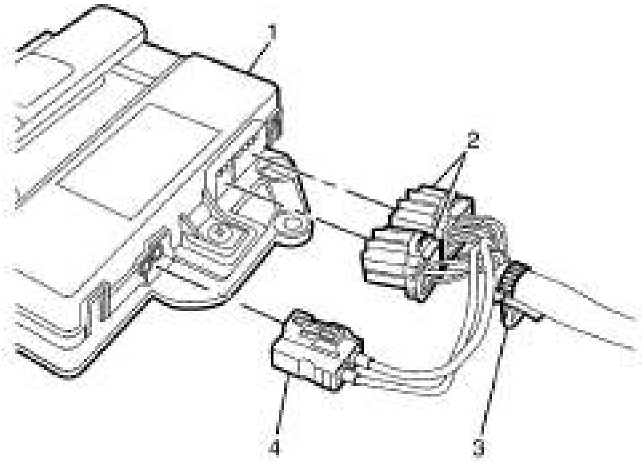
If the telematics module is not enabled:

A low battery voltage alert (when the battery voltage is low) is transmitted to the Telematics Call Centre.

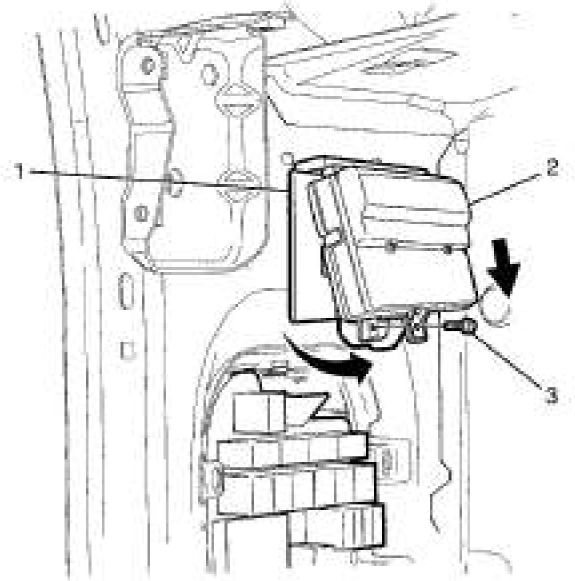
Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Using a scan tool, select service mode to disable the telematics module. Refer to Service Programming System (SPS).
2. Disconnect the battery ground cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the I/P compartment. Refer to Instrument Panel Compartment Replacement.

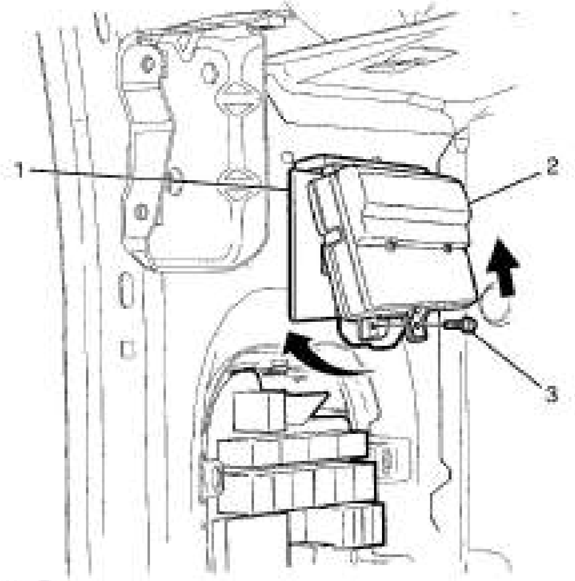


4. Detach the electrical wiring harness cable tie (3) from the telematics module (1).
5. Disconnect the GPS antenna connector (4) and the telematics module connectors (2) from the telematics module (1).



6. Remove the telematics module to retaining bracket retaining screw (3).
7. Remove the telematics module (2), by manoeuvring it forward and sliding it out of the retaining bracket (1).

Installation procedure

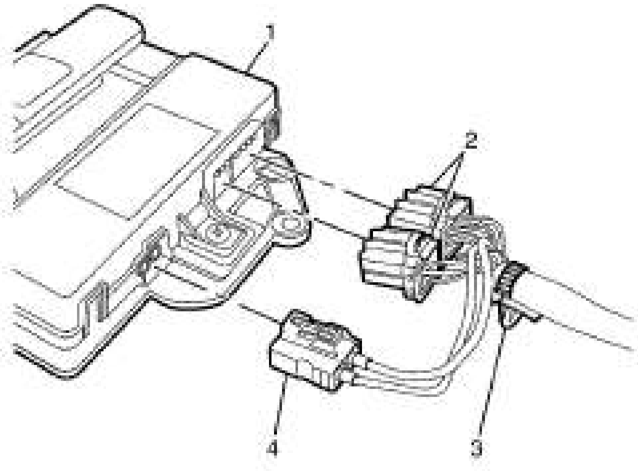


1. Install the top of the telematics module (2) into the retaining bracket (1) and locate the bottom end of the telematics module (2) into the bottom end of the retaining bracket (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the telematics module to retaining bracket retaining screw (3).

Tighten
Tighten the screw to 2.0 N·m (18 lb in).



3. Connect the GPS antenna connector (4) and the telematics module connectors (2) to the telematics module (1).
4. Attach the electrical wiring harness cable tie (3) to the telematics module (1).
5. Install the I/P compartment. Refer to Instrument Panel Compartment Replacement.
6. Install the I/P compartment. Refer to Instrument Panel Compartment Replacement.
7. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Important: If replacing a telematics module, the new module will require the programming of the correct system software level.

8. Reprogram the telematics module and select the system software required (GM Fleetview, Secure or Assist Ultra). Refer to Service Programming System (SPS).

   Important: If replacing a telematics module, the new module will require registration.

9. Register the telematics module. Refer to Communication Interface Module Registration.

   Important: If the telematics module service mode remains enabled, the telematics system does not have full functionality.

10. Using a scan tool, select active mode to enable the telematics module. Refer to Service Programming System (SPS).

Document ID: 2005251

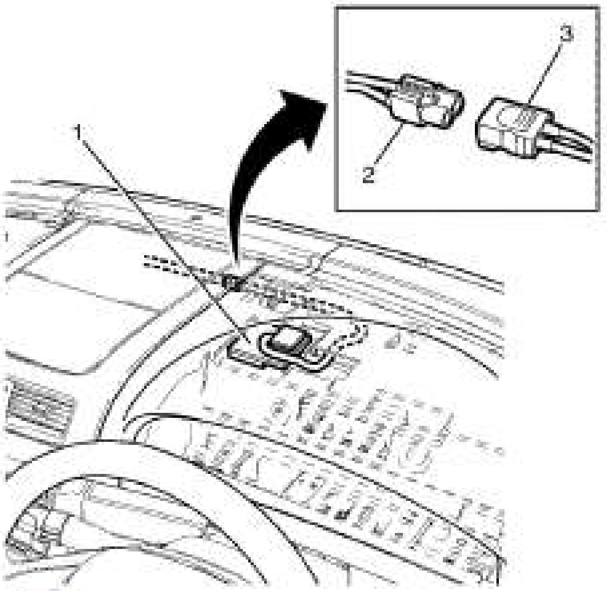
Communication Module Antenna Replacement

Removal Procedure

1. Using a scan tool, select service mode to disable the telematics module. Refer to Communication Interface Module Mode Selection.

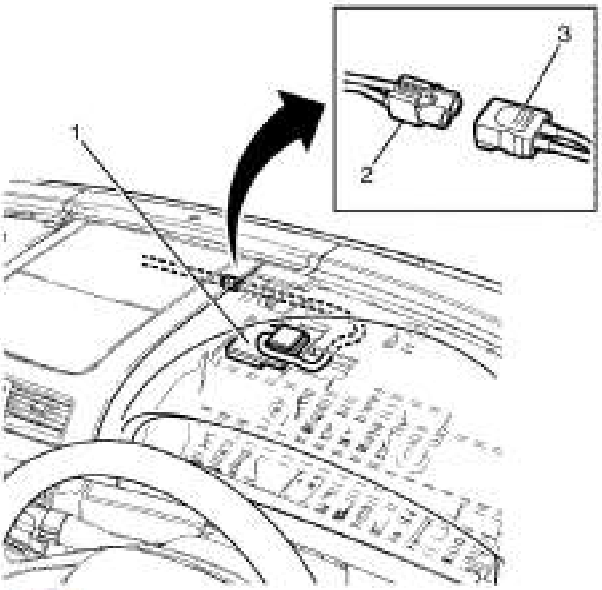
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the I/P cluster. Refer to Instrument Cluster Replacement.

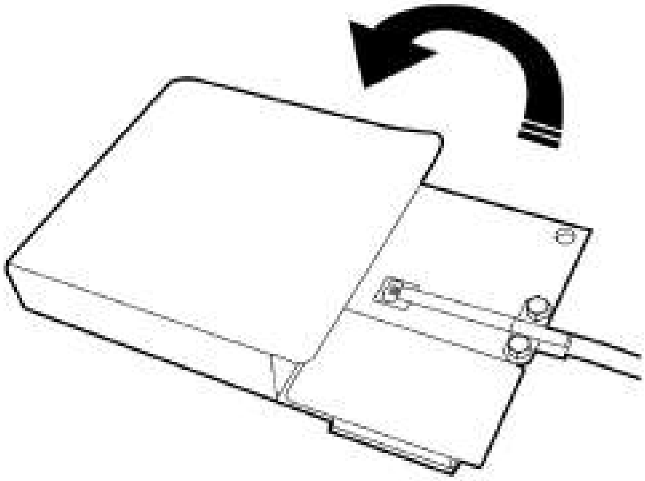


4. Using a flat blade tool, detach the GPS antenna (1) from the I/P pad.
5. Disconnect the GPS antenna electrical connector (2) from the extension wiring harness (3).
6. Remove the GPS antenna (1) from the I/P pad.

Installation Procedure



1. Feed the GPS antenna (1) electrical connector (2) through the hole in the I/P pad.
2. Connect the GPS antenna (1) electrical connector (2) to the extension wiring harness (3).



3. Peel off the paper from the bottom of the GPS antenna.
4. Install the GPS antenna into the I/P pad, by firmly pressing it down into it's location in the I/P pad.
5. Install the I/P cluster. Refer to Instrument Cluster Replacement.
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Important: If the telematics module service mode remains enabled, the telematics system does not have full functionality.

7. Using a scan tool, select active mode to enable the telematics module. Refer to

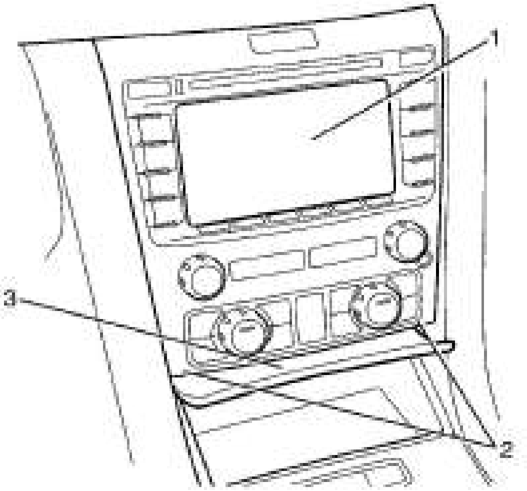
Communication Interface Module Mode Selection.

8. Re-programme the instrument cluster. Refer to Instrument Cluster Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions | Document ID: 2005087

Driver Information Display Replacement

Removal Procedure -- Type A, D and E Infotainment System

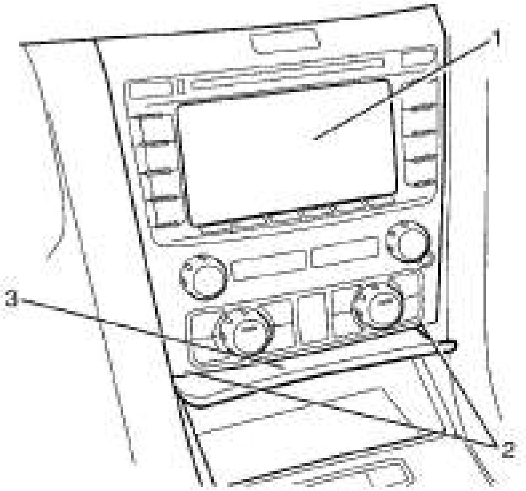


1. Where fitted, open the console storage compartment lid (3) approximately half way.

   Important: Grasp the bottom of the infotainment fascia (1) with two hands at points (2) and pull away from the instrument panel, disconnecting the fascia retainers.

2. Remove the infotainment fascia (1) from the Infotainment Unit.

Installation Procedure -- Type A, D and E Infotainment System

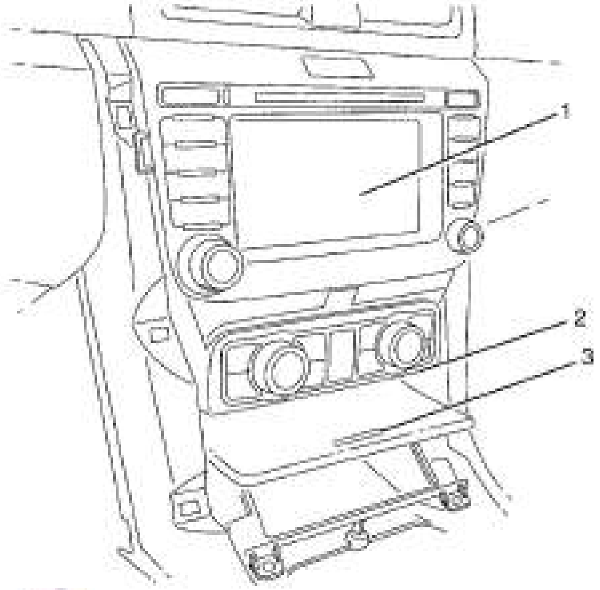


Important: Align the infotainment fascia retainers with the infotainment unit.

1. Install the infotainment fascia (1) to the infotainment unit.
2. Refer to Control Module References.

Removal Procedure -- Type F Infotainment System

1. Remove the console centre trim plate. Refer to Console Trim Plate Replacement.
2. Remove the instrument panel centre trim plate. Refer to Instrument Panel Center Trim Panel Replacement.

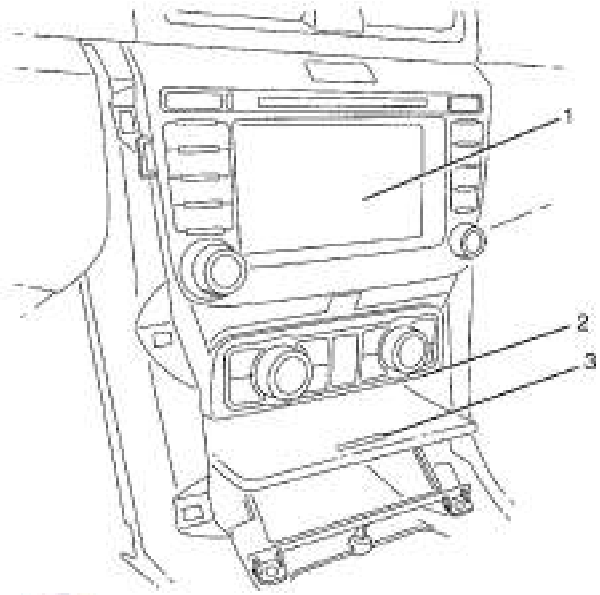


3. Where fitted, open the console storage compartment lid (3) approximately half way.

Important: Grasp the bottom of the infotainment fascia (1) with two hands at points (2) and pull away from the instrument panel, disconnecting the fascia retainers.

4. Remove the infotainment fascia (1) from the Infotainment Unit.

Installation Procedure -- Type F Infotainment System



Important: Align the infotainment fascia retainers with the infotainment unit.

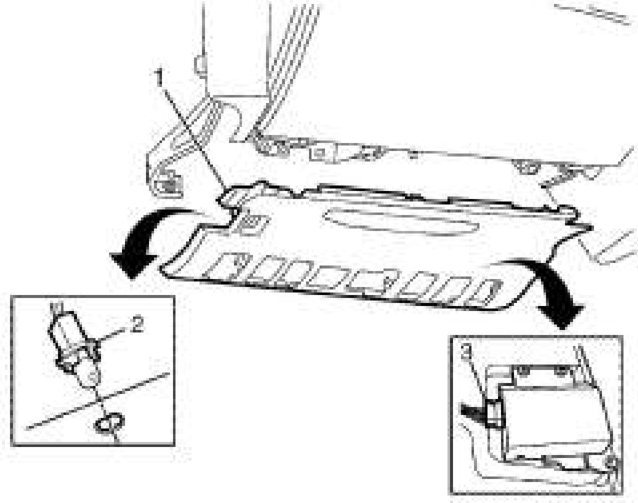
1. Install the infotainment fascia (1) to the infotainment unit.
2. Install the console centre trim plate. Refer to Console Trim Plate Replacement.
3. Install the intrument panel centre trim plate. Refer to Instrument Panel Center Trim Panel Replacement.
4. Refer to Control Module References.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions | Document ID: 1994875

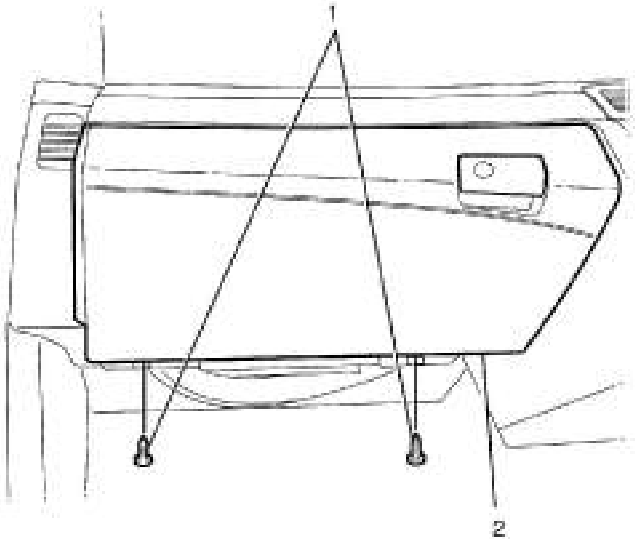
Electronic Navigation Antenna Replacement (RHD)

Removal Procedure

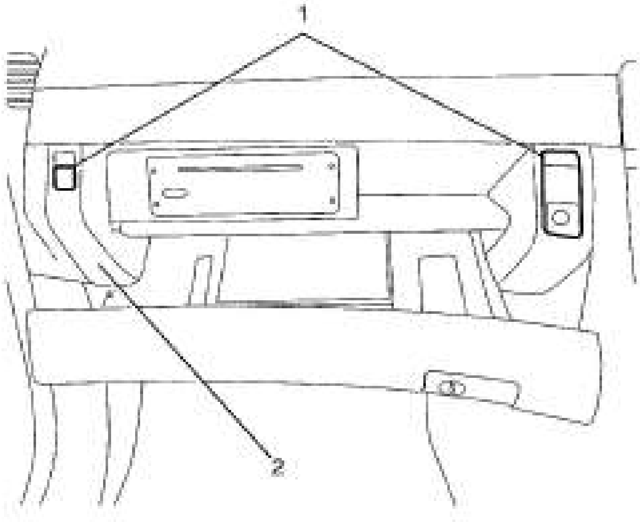
1. Remove the windshield demister grille. Refer to Defroster Grille Replacement in Instrument Panel, Gages, and Console.
2. Remove the instrument panel (I/P) outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement in Instrument Panel, Gages, and Console.



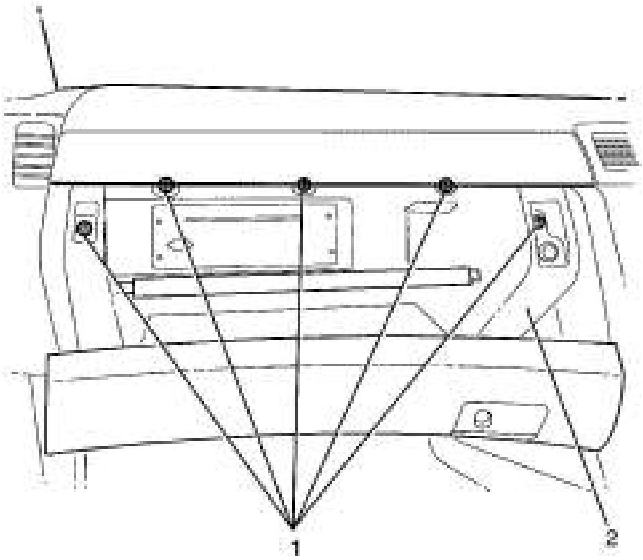
3. Grasp the I/P insulation panel assembly (1) and carefully pull downward to disengage the retaining clips.
4. Remove the courtesy lamp socket (2) from the I/P insulation panel assembly (1) by rotating counter-clockwise.
5. Disconnect the navigation interface module (NIM) electrical connector (3).
6. Remove the I/P insulation panel assembly (1).



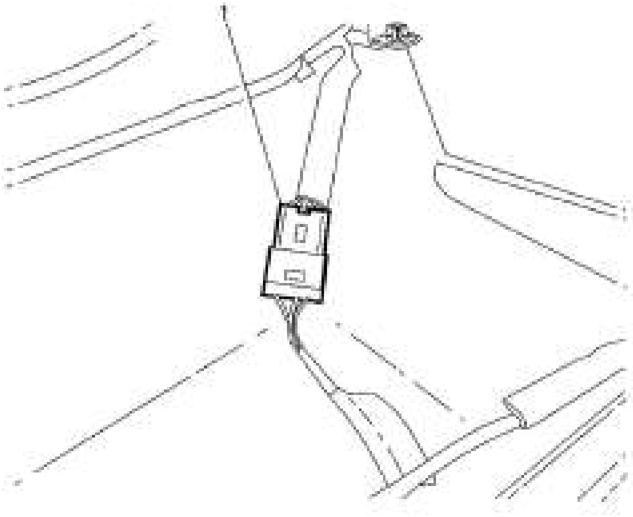
7. Remove the I/P compartment lower retaining screws (1).
8. Open the I/P compartment door (2).



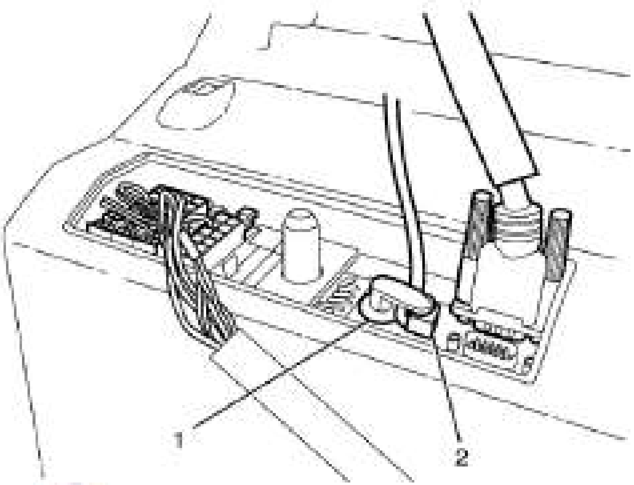
9. Remove the I/P compartment retaining screw covers (1) from the I/P compartment (2)



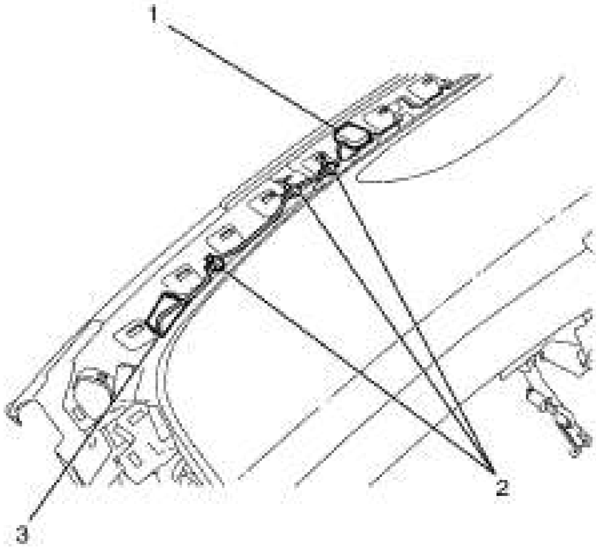
10. Remove the I/P compartment upper retaining screws (1).
11. Detach the I/P compartment (2) from the I/P.



12. Disconnect the I/P compartment electrical connector (1).



13. Rotate the navigation module aerial connector lock (1) clockwise and disconnect the navigation module aerial connector (2).

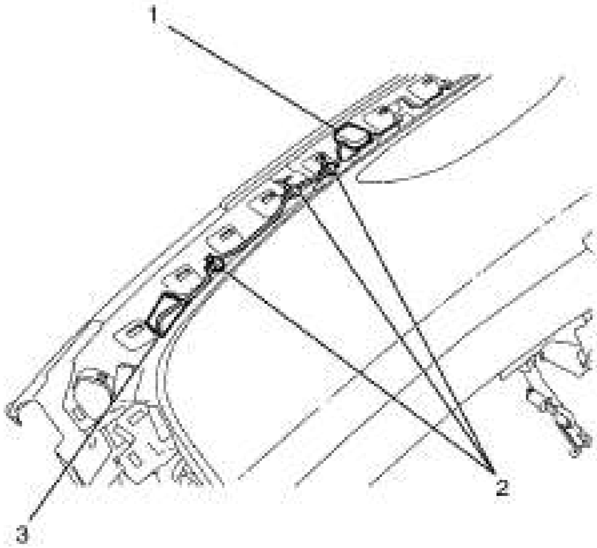


14. Detach the GPS antenna cable retaining clips (2) from the I/P.

Important: The GPS antenna (1) is secured in position with double sided tape.

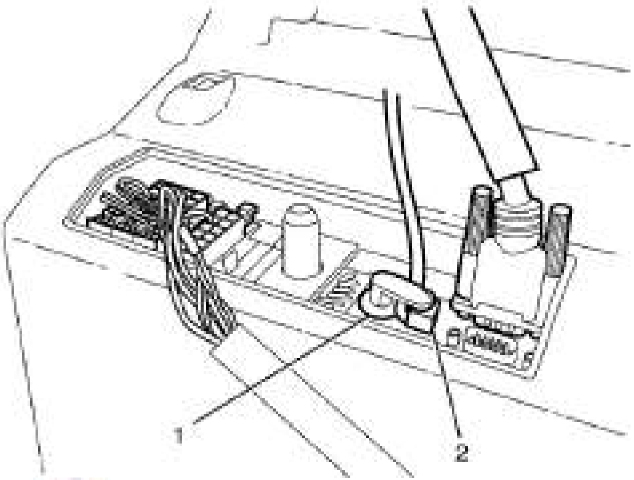
15. Detach the GPS antenna (1) from the I/P.
16. Pull the GPS antenna cable through the hole (3) in the I/P and remove the GPS antenna (1).

Installation Procedure

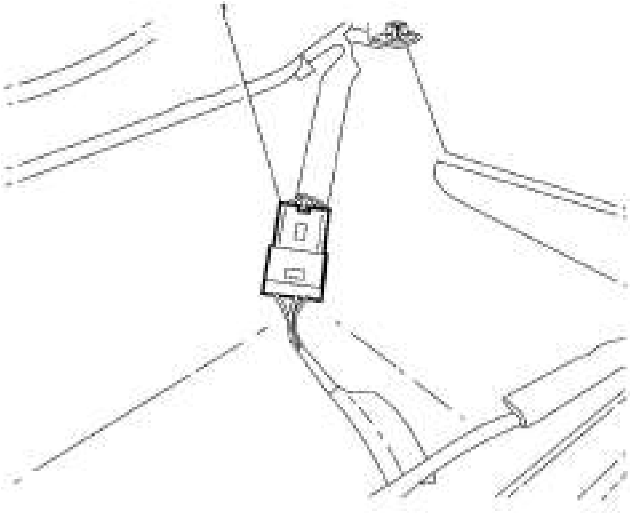


Important: The GPS antenna (1) is secured in position with double sided tape.

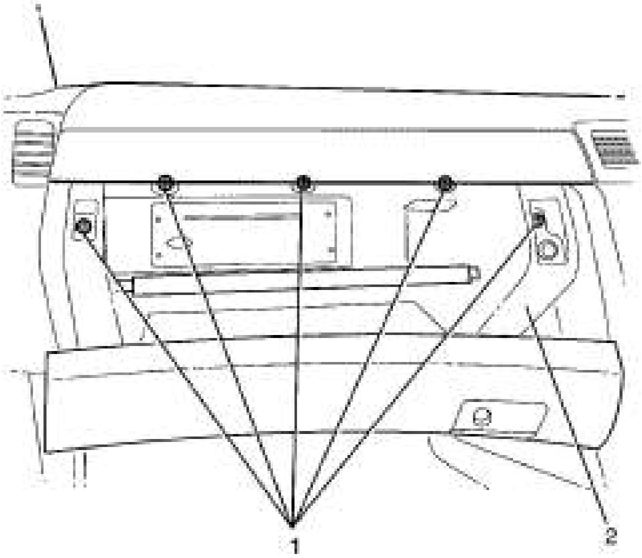
1. Install the GPS antenna (1) to the I/P.
2. Feed the GPS antenna cable through the hole (3) in the I/P.
3. Install the GPS antenna cable retaining clips (2) to the I/P.



4. Connect the navigation module aerial connector (2) and rotate the navigation module aerial connector lock (1) counter-clockwise.



5. Connect the I/P compartment electrical connector (1).

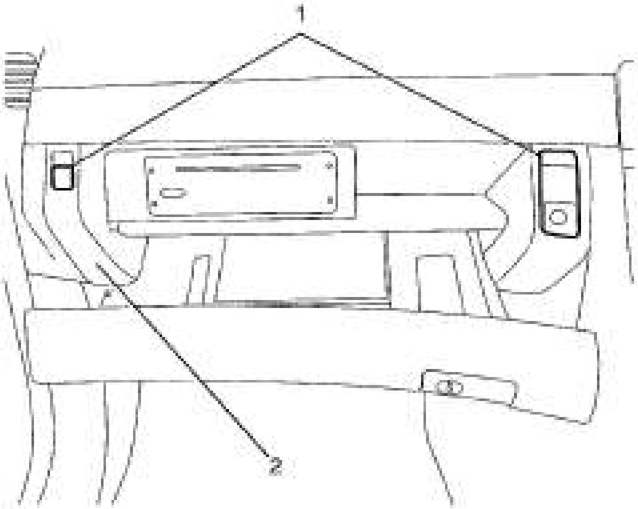


6. Install the I/P compartment (2) to the I/P.

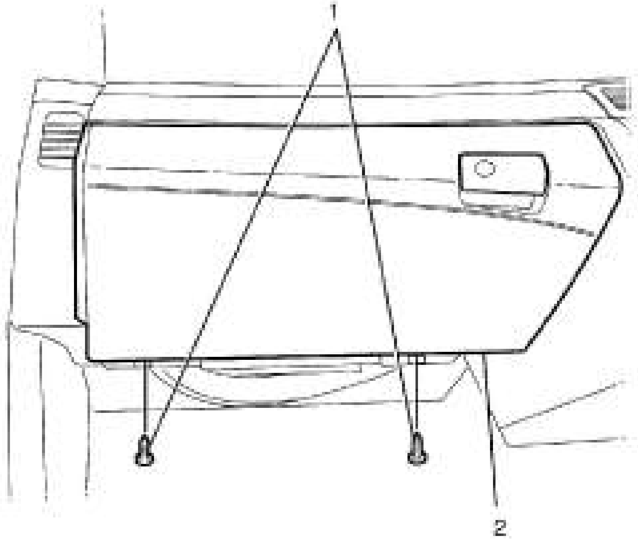
   Notice: Refer to Fastener Notice in the Preface section.

7. Install the I/P compartment upper retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).

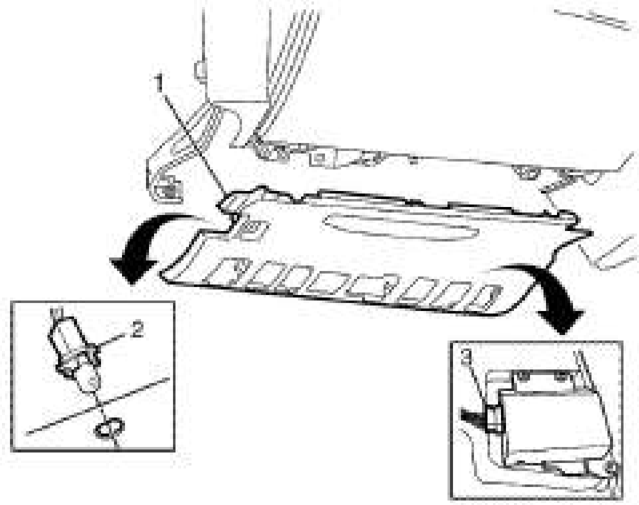


8. Install the I/P compartment retaining screw covers (1) into the I/P compartment (2).



9. Close the I/P compartment door (2).
10. Install the I/P compartment lower retaining screws (1).

Tighten
Tighten the screws to 2 N·m (18 lb in).



11. Install the courtesy lamp socket (2) to the I/P insulation panel assembly (1) by rotating clockwise.
12. Connect the NIM electrical connector (3).
13. Install the I/P insulation panel assembly (1) to the I/P by engaging the retaining clips.
14. Make sure all the clips are located correctly.
15. Install the I/P outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement in Instrument Panel, Gages, and Console.
16. Install the windshield demister grille. Refer to Defroster Grille Replacement in Instrument Panel, Gages, and Console.

Navigation Interface Module Calibration

Important: Before the navigation system can be used, a calibration of the navigation module is required.

The navigation system would require calibration under the following conditions:

- New tyres installed
- New navigation module installed

The navigation module calibration is carried out on vehicle and requires an 8 - 15 Km road test. For further details on the calibration procedure, refer to the Navigation System Handbook.

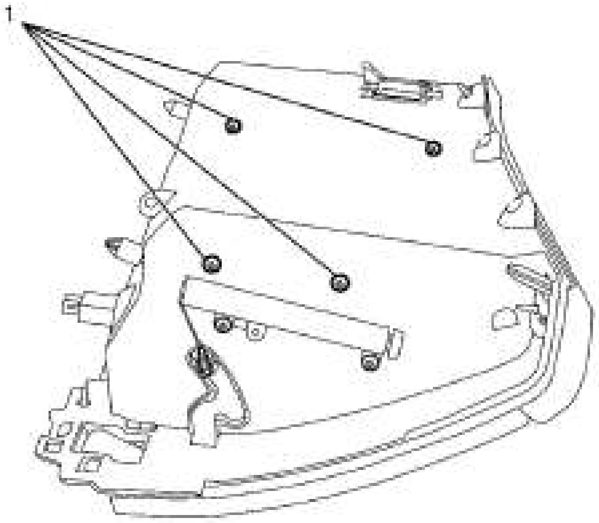
Navigation Interface Module Cradle Replacement

Tools Required

KM6067 Radio Removal Tool

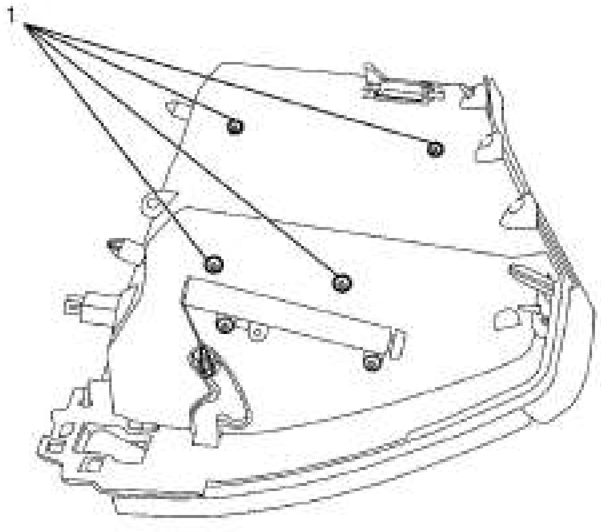
Removal Procedure

1. Remove the navigation module. Refer to Navigation Module Replacement.



2. Remove the navigation module assembly retaining screws (1).
3. Remove the navigation module carrier from the I/P compartment.

Installation Procedure



1. Install the navigation module carrier into the I/P compartment.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the navigation module assembly retaining screws (1).

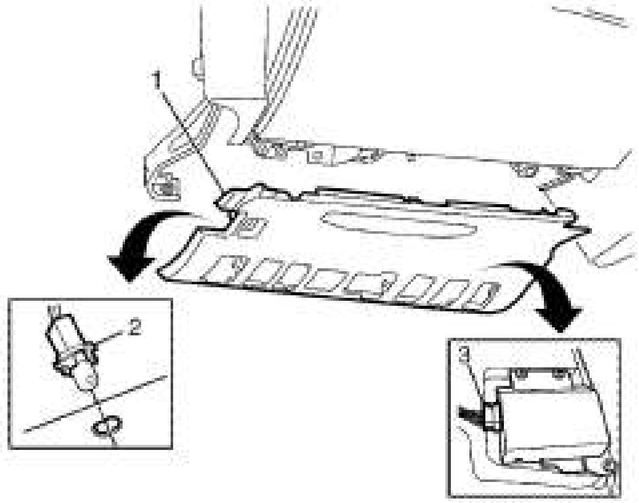
   Tighten
   Tighten the screws to 2 N·m (18 lb in).

3. Install the navigation module. Refer to Navigation Module Replacement.

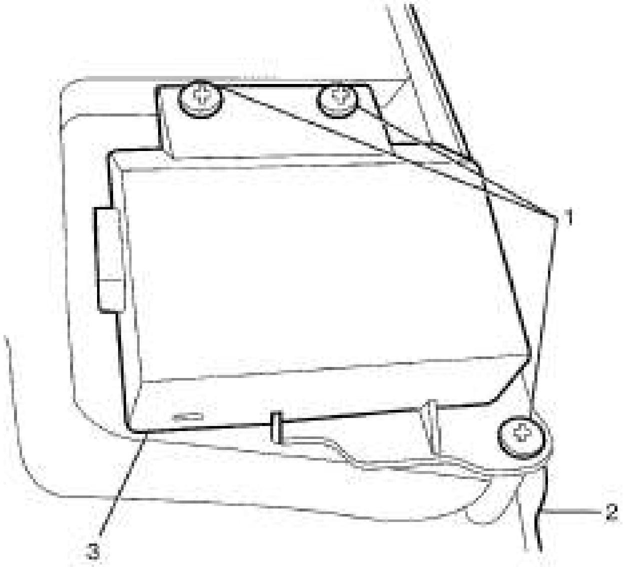
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions | Document ID: 2005230

Navigation Interface Module Replacement

Removal Procedure

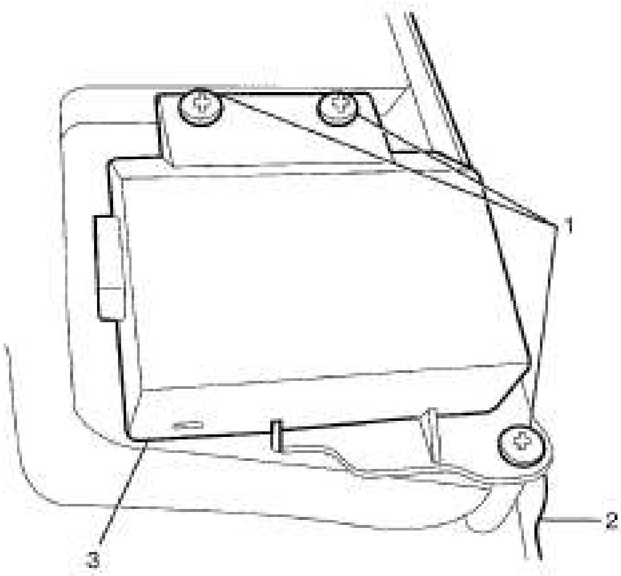


1. Grasp the instrument panel (I/P) insulation panel assembly (1) and carefully pull downward to disengage the retaining clips.
2. Remove the courtesy lamp socket (2) from the I/P insulation panel assembly (1) by rotating counter-clockwise.
3. Disconnect the navigation interface module (NIM) electrical connector (3).
4. Remove the I/P insulation panel assembly (1).



5. Remove the NIM retaining screws (1).
6. Remove the NIM (3) from the I/P insulation panel assembly (2).

Installation Procedure

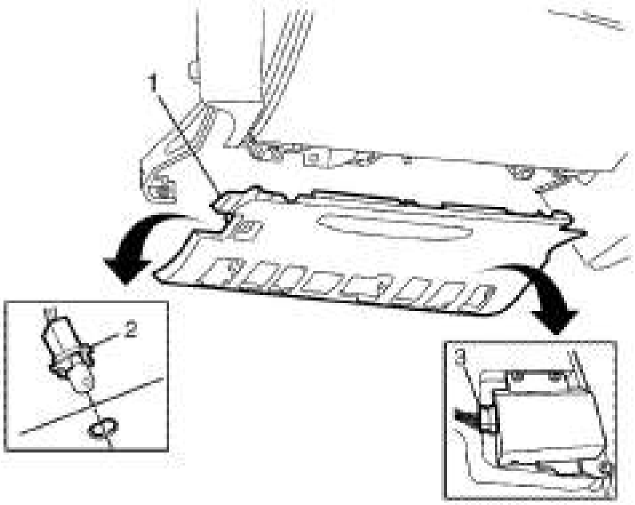


1. Install the NIM (3) to the I/P insulation panel assembly (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the NIM retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).



3. Install the courtesy lamp socket (2) to the I/P insulation panel assembly (1) by rotating clockwise.
4. Connect the NIM electrical connector (3).
5. Install the I/P insulation panel assembly (1) to the I/P by engaging the retaining clips.
6. Make sure all the clips are located correctly.

Document ID: 2009826

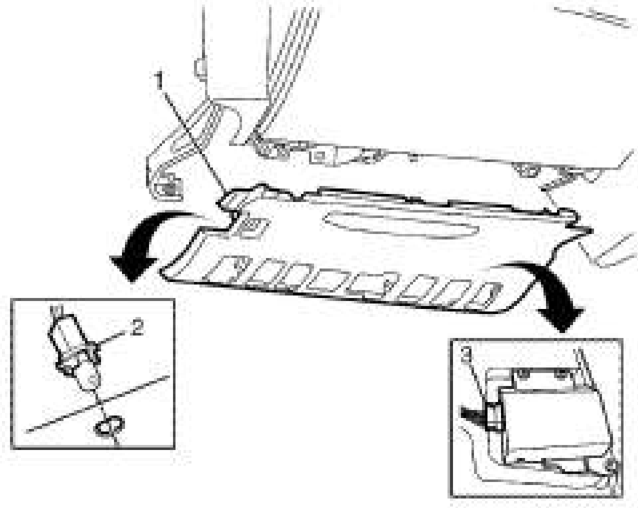
Navigation Map Disc Player Replacement

Tools Required

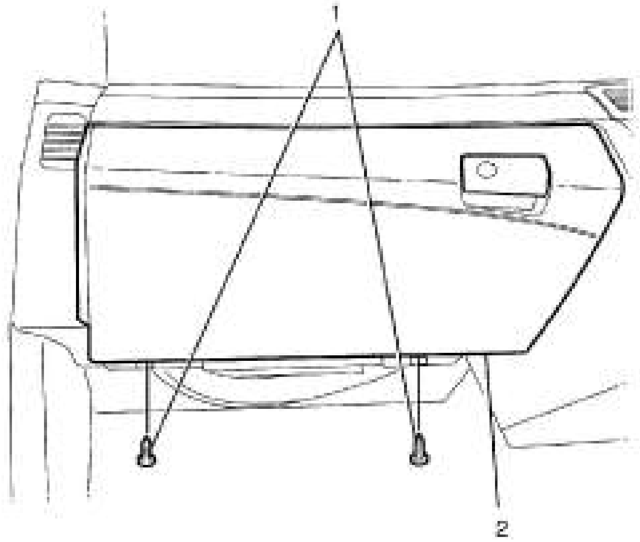
AU-464 Radio Removal Tool

Removal Procedure

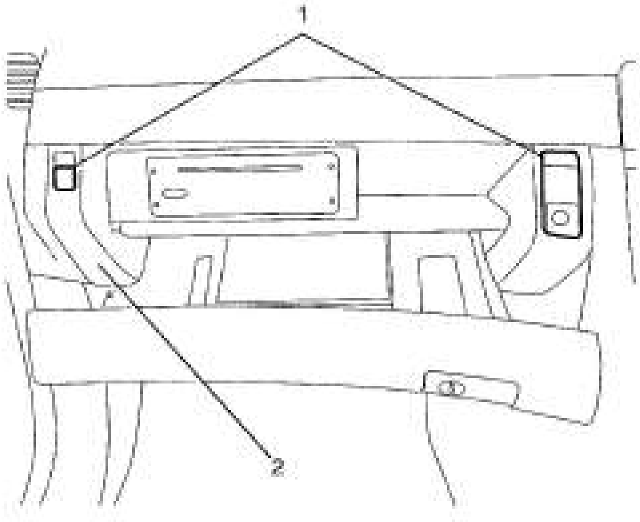
1. Remove the instrument panel (I/P) outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement.



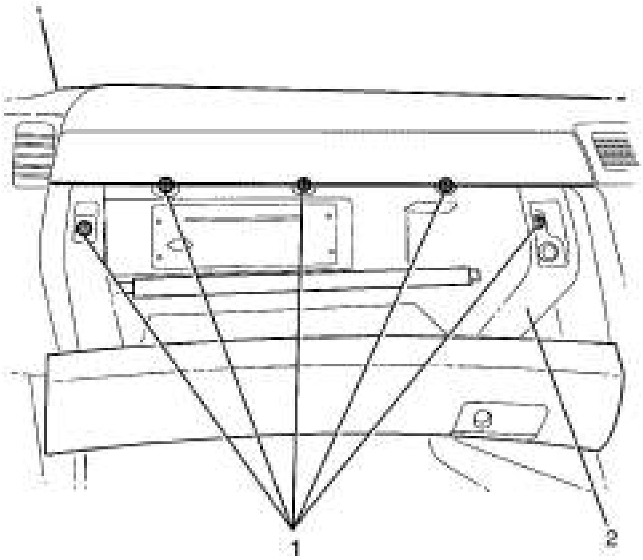
2. Grasp the I/P insulation panel assembly (1) and carefully pull downward to disengage the retaining clips.
3. Remove the courtesy lamp socket (2) from the I/P insulation panel assembly (1) by rotating counter-clockwise.
4. Disconnect the navigation interface module (NIM) electrical connector (3).
5. Remove the I/P insulation panel assembly (1).



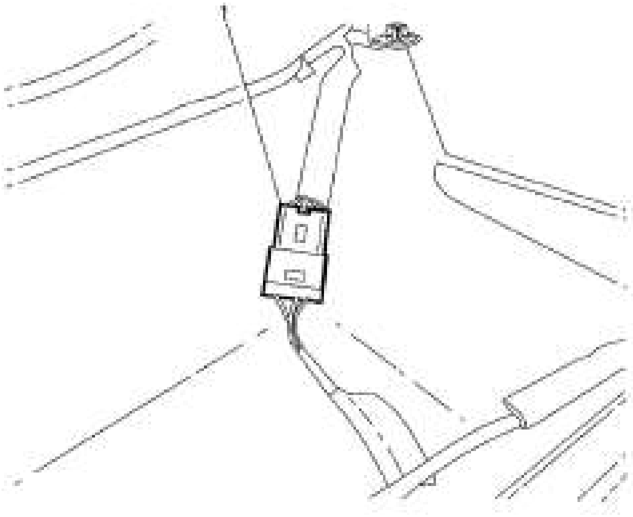
6. Remove the I/P compartment lower retaining screws (1).
7. Open the I/P compartment door (2).



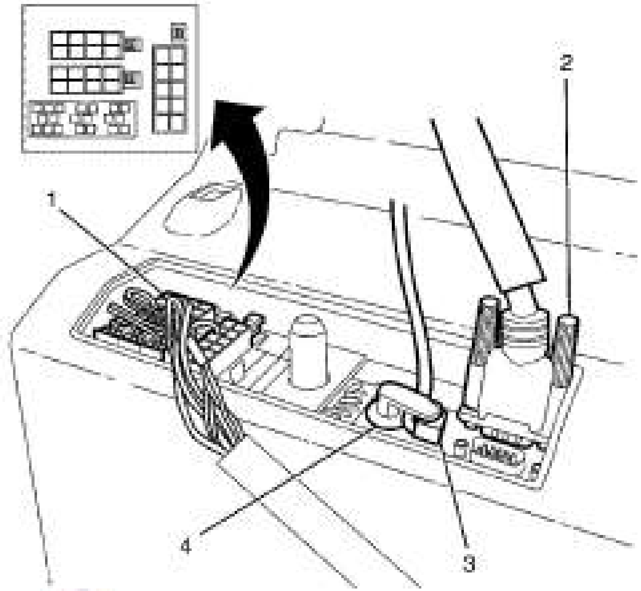
8. Remove the I/P compartment retaining screw covers (1) from the I/P compartment (2).



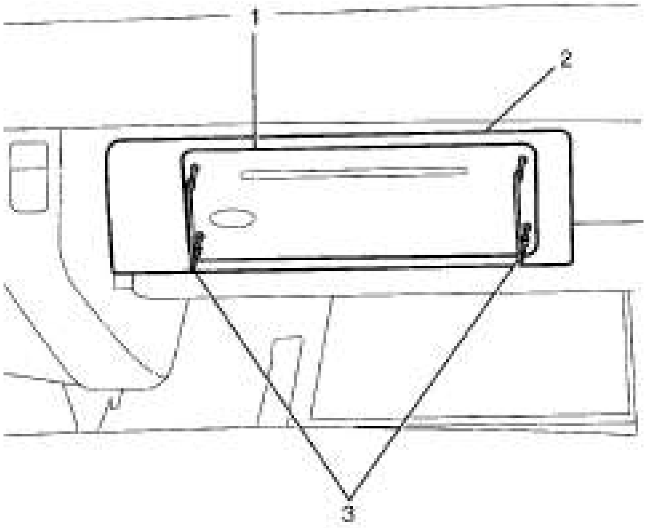
9. Remove the I/P compartment upper retaining screws (1).
10. Detach the I/P compartment (2) from the I/P.



11. Disconnect the I/P compartment electrical connector (1).

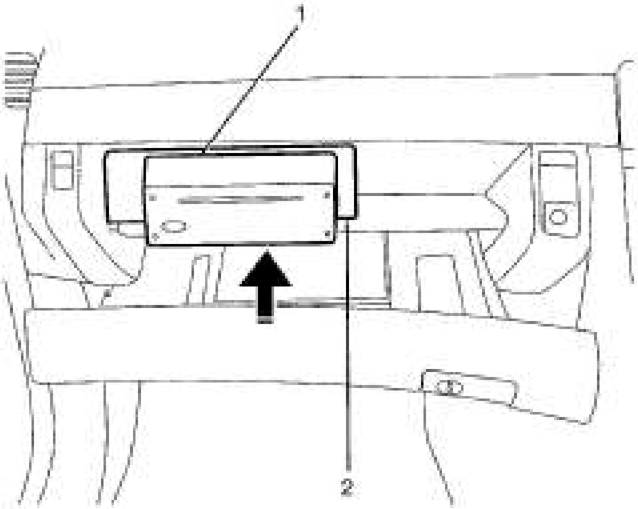


12. Disconnect the navigation module electrical connectors (1).
13. Disconnect the navigation module to audio unit electrical connector (2), where fitted.
14. Rotate the global positioning system (GPS) antenna connector lock (4) clockwise and disconnect the GPS antenna connector (3).
15. Remove the I/P compartment and navigation module assembly.

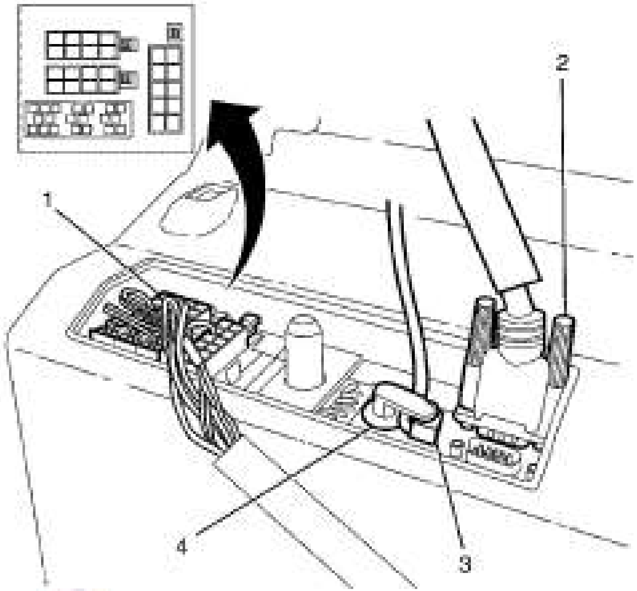


16. Using the tool AU-464 Radio Removal Tool (3), remove the navigation module (1) from the navigation module carrier (2).
17. Remove the navigation module (1) from the navigation module carrier (2).

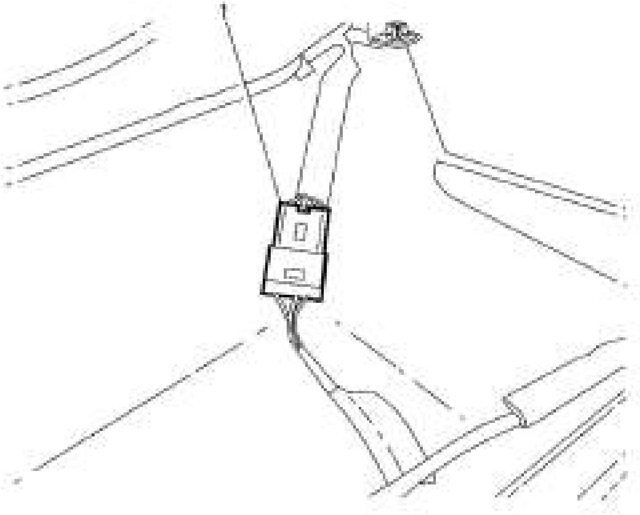
Installation Procedure



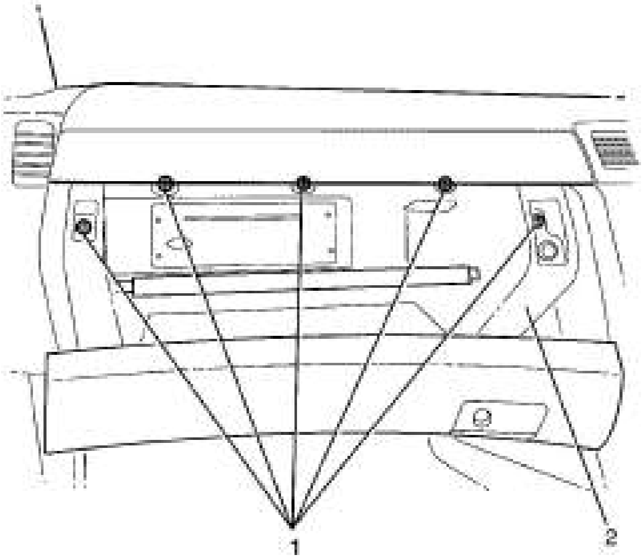
1. Install the navigation module (1) into the navigation module carrier (2).



2. Connect the navigation module electrical connectors (1).
3. Connect the navigation module to audio unit electrical connector (2, where fitted).
4. Connect the GPS antenna connector (3) and rotate the GPS antenna connector lock (4) counter-clockwise.

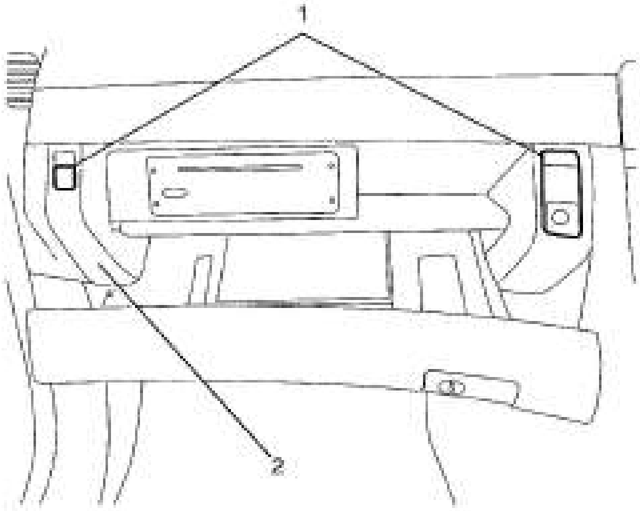


5. Connect the I/P compartment electrical connector (1).

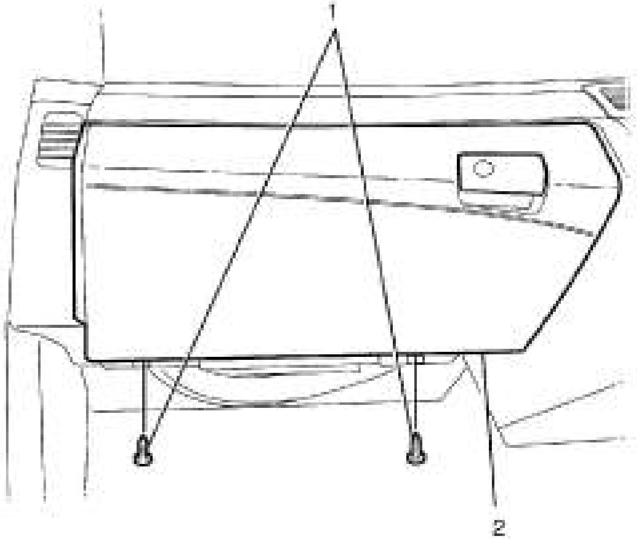


6. Install the I/P compartment (2) to the I/P.
7. Install the I/P compartment upper retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).

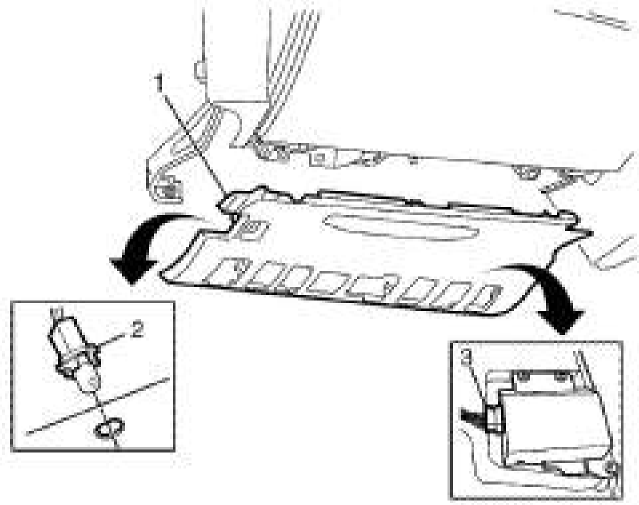


8. Install the I/P compartment retaining screw covers (1) into the I/P compartment (2).



9. Close the I/P compartment door (2).
10. Install the I/P compartment lower retaining screws (1).

    Tighten
    Tighten the screws to 2 N·m (18 lb in).



11. Install the courtesy lamp socket (2) to the I/P insulation panel assembly (1) by rotating clockwise.
12. Connect the navigation interface module (NIM) electrical connector (3).
13. Install the I/P insulation panel assembly (1) to the I/P by engaging the retaining clips.
14. Make sure all the clips are located correctly.
15. Install the I/P outer trim cover. Refer to Instrument Panel Outer Trim Cover Replacement.
16. If a new navigation module is being installed, calibrate the navigation module. Refer to Navigation Interface Module Cradle Replacement.
17. If re-programming is required. Refer to Control Module References.

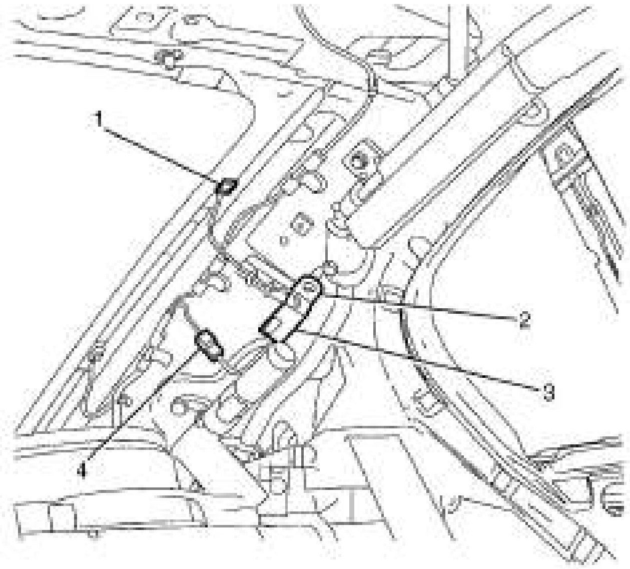
Document ID: 2005257

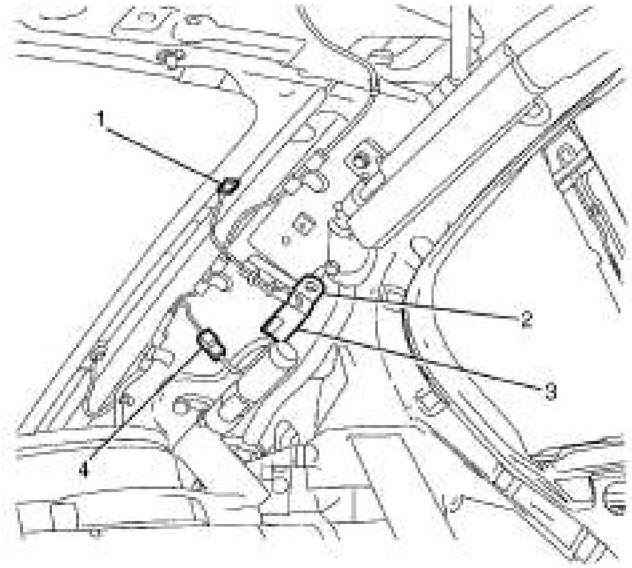
Radio Antenna Diversity Module Replacement

Removal Procedure



1. Turn the infotainment system OFF.
2. Remove the left hand side rear quarter upper trim panel. Refer to Quarter Upper Trim Panel Replacement.
3. Disconnect the rear glass electrical connector (1).
4. Disconnect the diversity antenna amplifier module connector (4).
5. Remove the diversity antenna module to upper body bolt (2).
6. Remove the diversity antenna module (3) from the rear upper quarter panel.

Installation Procedure



1. Install the diversity antenna module (3) to the rear upper quarter.

   Notice: Refer to Fastener Notice in the Preface section.

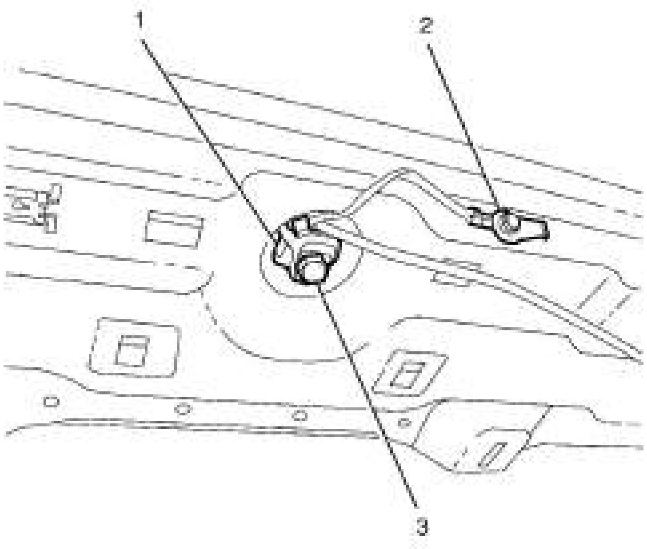
2. Install the diversity antenna module to rear upper quarter panel retaining bolt (2).

   Tighten
   Tighten the bolt to 10 N·m (89 lb in).

3. Connect the diversity antenna amplifier module connector (4).
4. Connect the rear glass electrical connector (1).
5. Install the left hand side rear quarter upper trim panel. Refer to Quarter Upper Trim Panel Replacement.
6. If re-programming is required. Refer to Control Module References.

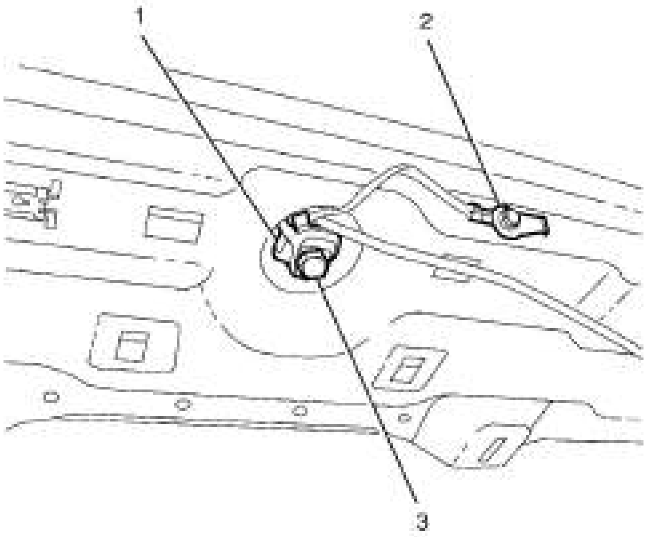
Radio Antenna Replacement (Sedan)

Removal Procedure



1. Remove the headlining trim assembly. Refer to Headlining Trim Panel Replacement.
2. Remove the antenna module ground point to roof panel retaining bolt (2).
3. Remove the antenna module to roof panel retaining bolt (3).
4. Remove the retaining clip (1) securing the antenna module to the roof.
5. Disconnect the electrical connectors.
6. From outside the vehicle, remove the antenna module and harness from the vehicle.

Installation Procedure



1. From outside the vehicle, install the antenna module and harness to the vehicle threading the harness through the cavity.
2. Connect the electrical connector.
3. Install the retaining clip (1) securing the antenna module to the roof.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the antenna module to roof panel retaining bolt (3).

   Tighten
   Tighten the bolt to 4 N·m (35 lb in).

   Notice: Refer to Fastener Notice in the Preface section.

5. Install the antenna module ground point to roof panel retaining bolt (2).

   Tighten
   Tighten the bolt to 2 N·m (18 lb in).

6. Install the headlining trim assembly. Refer to Headlining Trim Panel Replacement

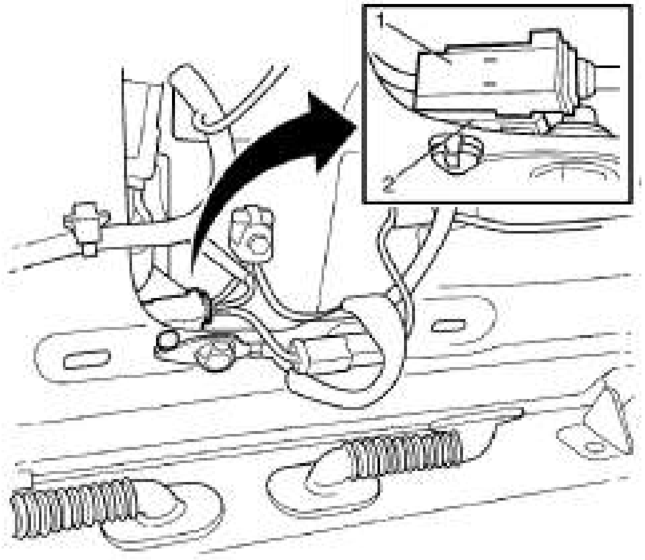
Document ID: 2131736

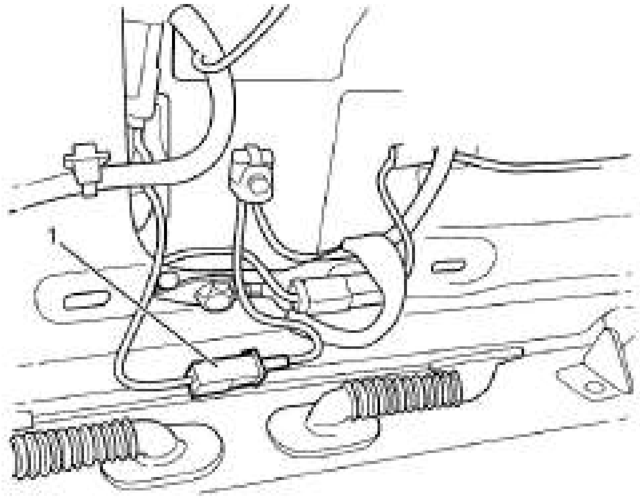
Radio Antenna Replacement (Sportwagon)

Removal Procedure

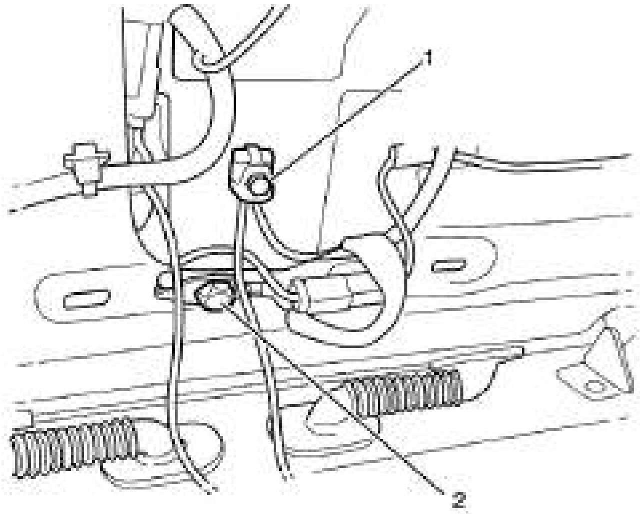
1. Remove the liftgate window upper garnish moulding. Refer to Liftgate Window Upper Garnish Molding Replacement.



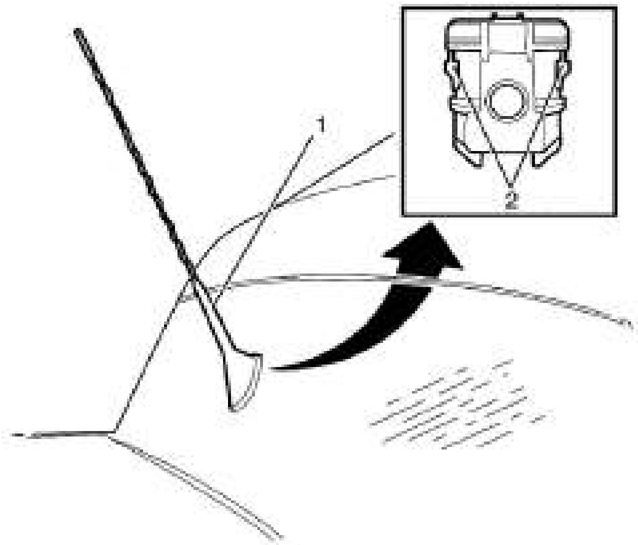
2. Detach the radio antenna module electrical connector (1) by depressing the retaining clip (2).



3. Disconnect the radio antenna module electrical connector (1).

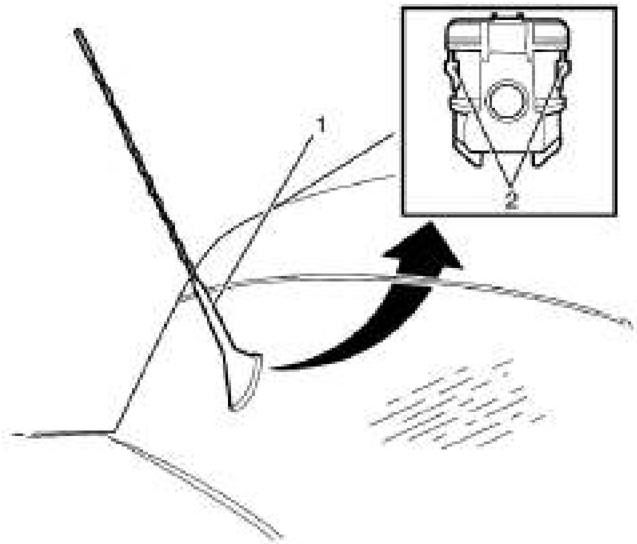


4. Remove the radio antenna module ground point to roof panel retaining bolt (2).
5. Remove the radio antenna module to roof panel retaining bolt (1).



6. From outside the vehicle, hold the radio antenna (1) to prevent from damaging paintwork when released.
7. Release the radio antenna module to liftgate retaining clips (2) .
8. Remove the radio antenna (1) from the vehicle.

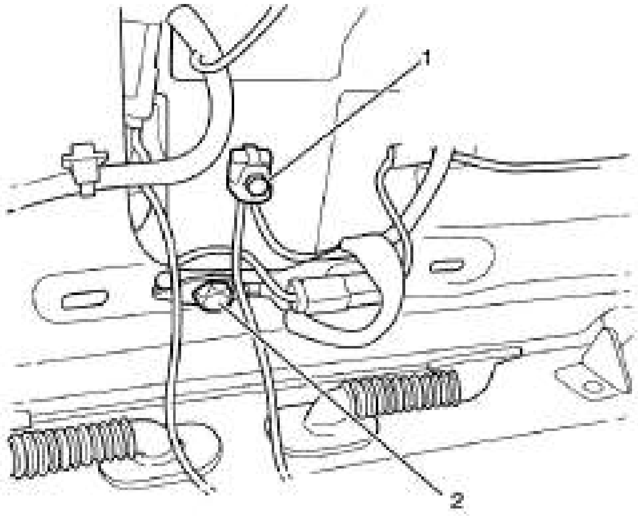
Installation Procedure



1. From outside the vehicle, hold the radio antenna (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the radio antenna module to liftgate retaining clips (2) by threading through the cavity.



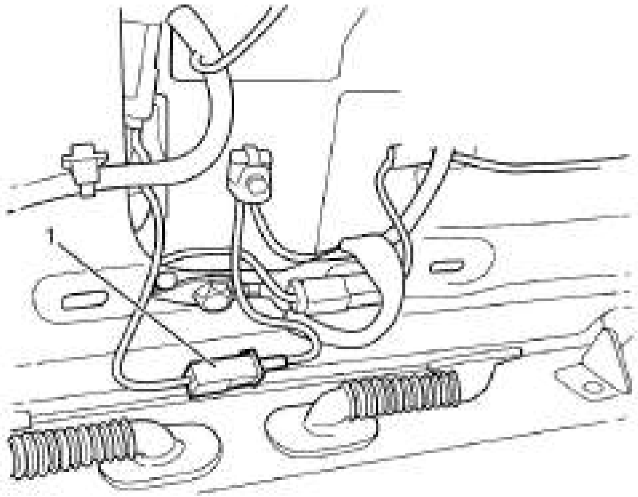
3. Install the radio antenna module to roof panel retaining bolt (1).

   Tighten
   Tighten the bolt to 4 N·m (35 lb in).

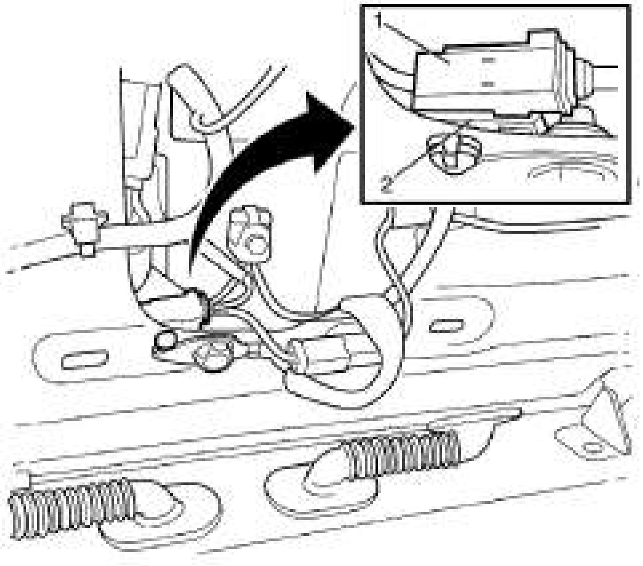
   Notice: Refer to Fastener Notice in the Preface section.

4. Install the radio antenna module ground point to roof panel retaining bolt (2).

   Tighten
   Tighten the bolt to 2 N·m (18 lb in).



5. Connect the radio antenna module electrical connector (1).



6. Install the radio antenna module electrical connector (1) onto the retaining clip (2).
7. Install the liftgate window upper garnish moulding. Refer to Liftgate Window Upper Garnish Molding Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions |

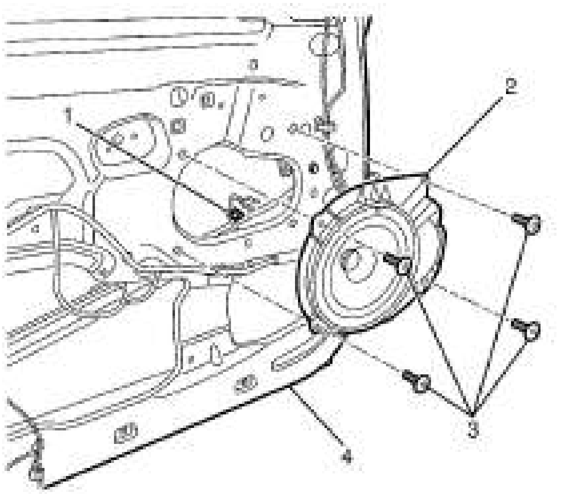
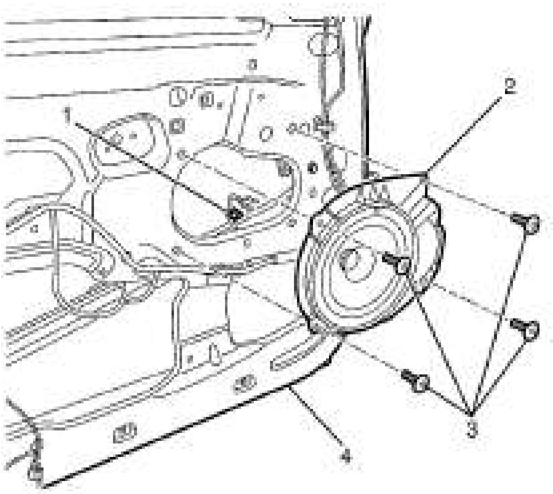
Radio Front Side Door Lower Speaker Replacement

Removal Procedure



1. Remove the front door trim panel. Refer to Front Side Door Trim Panel Replacement.
2. Remove the speaker assembly to door frame retaining screws (3).
3. Disconnect the electrical connector(s) (1).
4. Remove the speaker assembly (2) from the door frame (4).

Installation Procedure



1. Connect the electrical connector(s) (1).

   Notice: Refer to Fastener Notice in the Preface section.

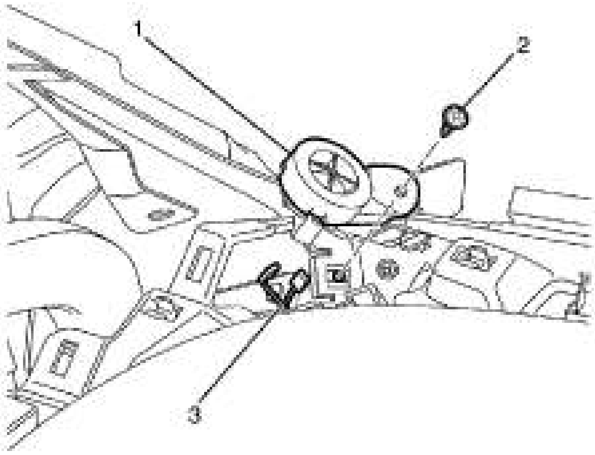
2. Install the speaker assembly (2) to the door frame (4).
3. Install the front speaker assembly to door frame attaching screws (3).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).

4. Install the front door trim panel. Refer to Front Side Door Trim Panel Replacement.

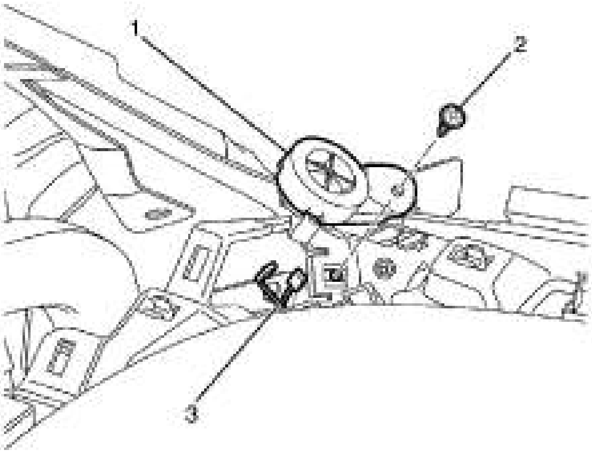
Radio Front Speaker Replacement (RHD)

Removal Procedure - Tweeter



1. Remove the left instrument panel (I/P) defroster grille. Refer to Defroster Grille Replacement .
2. Remove the tweeter speaker to I/P attaching screw (2).
3. Disconnect the electrical connector (3).

Installation Procedure - Tweeter



1. Connect the electrical connector (3).

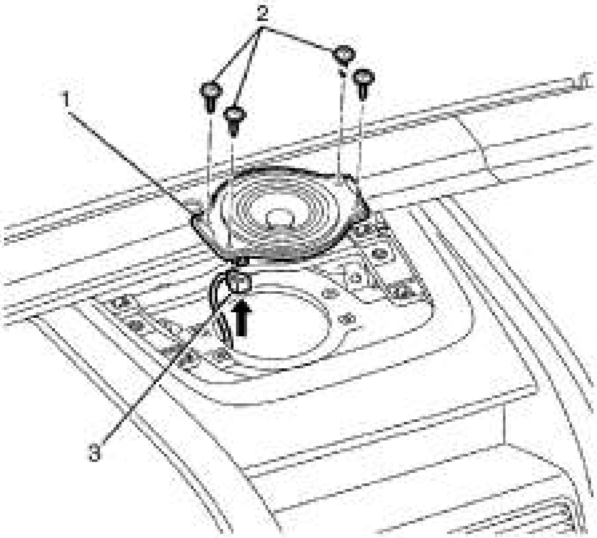
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the tweeter speaker to I/P attaching screw (2).

   Tighten
   Tighten the screw to 2 N·m (18 lb in).

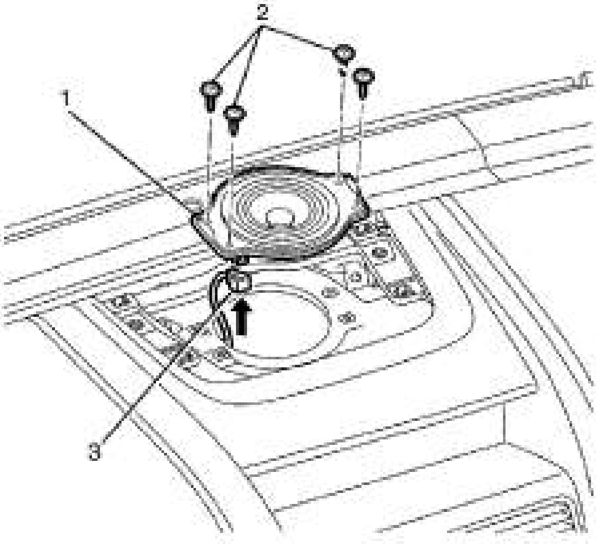
3. Install the left instrument panel defroster grille. Refer to Defroster Grille Replacement .

Removal Procedure - Center



1. Remove the instrument panel (I/P) defroster grilles. Refer to Defroster Grille Replacement .
2. Remove the upper instrument panel (I/P) center trim. Refer to Instrument Panel Upper Trim Panel Replacement
3. Remove the centre speaker to instrument panel attaching screws (2).
4. Disconnect the electrical connector (3).

Installation Procedure - Center



1. Connect the electrical connector (3).

   Notice: Refer to Fastener Notice in the Preface section.

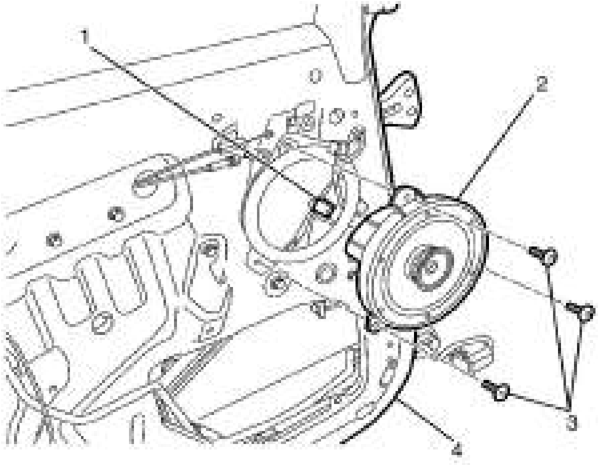
2. Install the centre speaker to instrument panel attaching screws (2).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).

3. Install the upper instrument panel (I/P) centre trim. Refer to Instrument Panel Upper Trim Panel Replacement
4. Install the instrument panel defroster grilles. Refer to Defroster Grille Replacement .

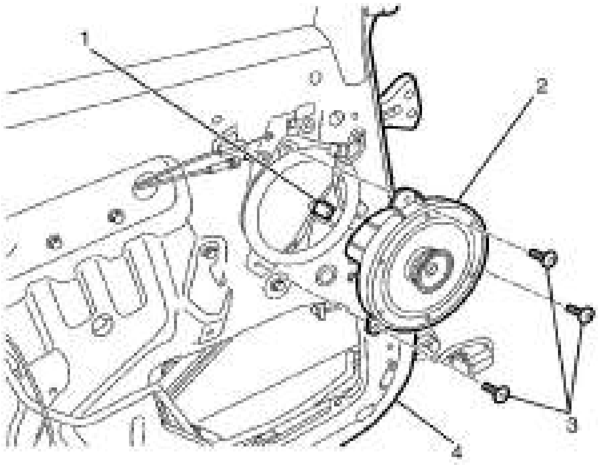
Radio Rear Side Door Speaker Replacement

Removal Procedure



1. Remove the rear door trim panel. Refer to Rear Side Door Trim Panel Replacement.
2. Remove the speaker assembly to door frame attaching screws (3).
3. Disconnect the electrical connector(s) (1).
4. Remove the speaker assembly (2) from the door frame (4).

Installation Procedure



1. Connect the electrical connector(s) (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the speaker assembly (2) to the door frame (4).
3. Install the rear speaker assembly to door frame attaching screws (3).

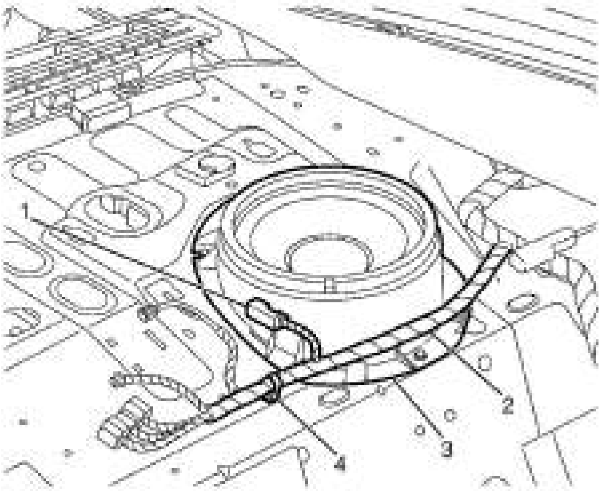
   Tighten
   Tighten the screws to 2 N·m (18 lb in).

4. Install the rear door trim panel. Refer to Rear Side Door Trim Panel Replacement.

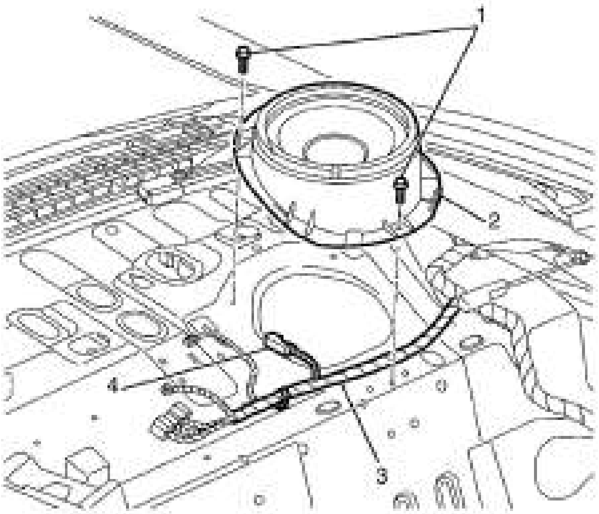
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions | Document ID: 2009831

Radio Rear Speaker Replacement

Removal Procedure



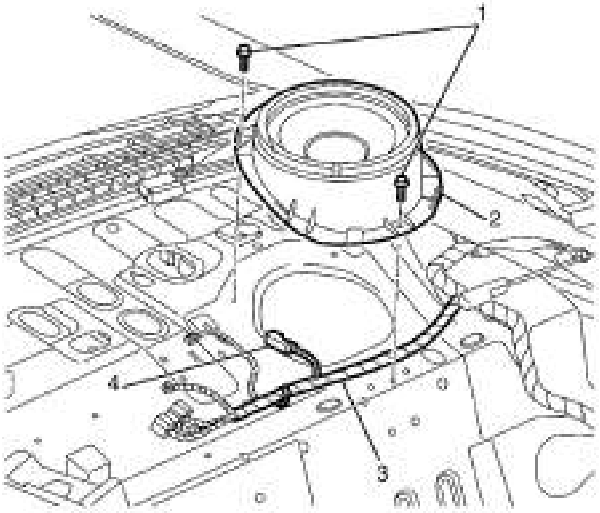
1. Remove the rear shelf trim panel. Refer to Rear Window Shelf Trim Panel Replacement.
2. Disconnect the subwoofer electrical connector (3).
3. Remove the retainer (1) securing the harness (3) to the shelf.



4. Remove the subwoofer assembly to rear shelf attaching screws (1).

5. Slide the harness (3) away from the subwoofer assembly (2).
6. Remove the subwoofer assembly (2) from the rear shelf.

Installation Procedure

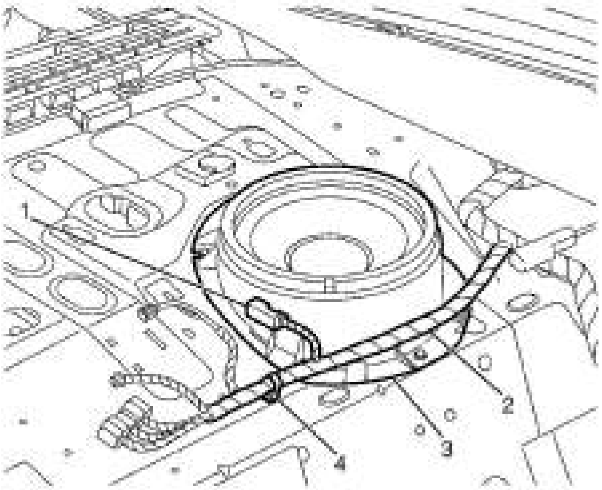


1. Install the subwoofer assembly (2) to the rear shelf.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the subwoofer assembly to rear shelf attaching screws (1).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).



3. Secure the electrical harness retainer (1) to the shelf.
4. Connect the subwoofer electrical connector (2).
5. Install the rear shelf trim panel. Refer to Rear Window Shelf Trim Panel Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions |

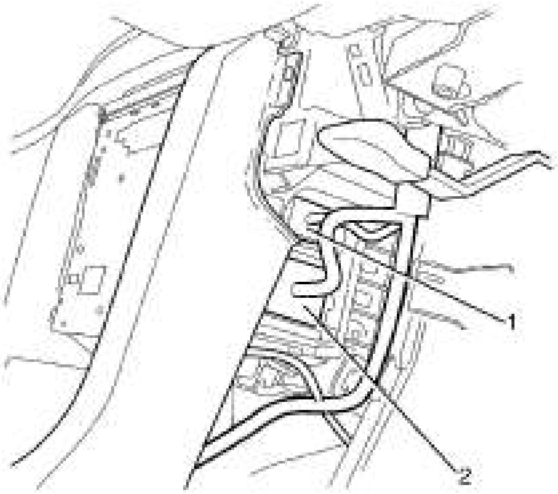
Radio Replacement

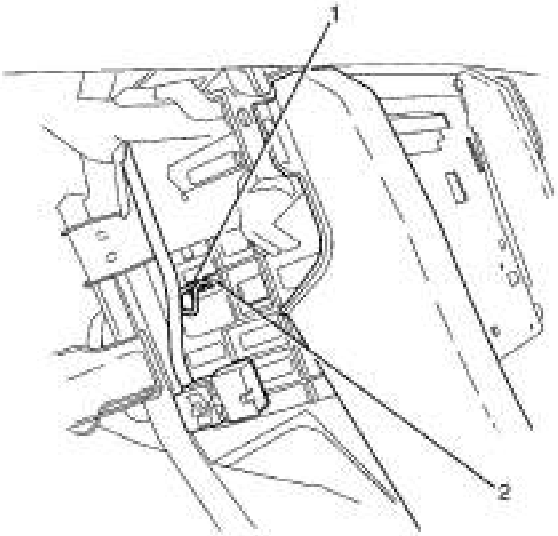
Removal Procedure

1. Remove the infotainment fascia. Refer to Driver Information Display Replacement.
2. Remove the instrument panel compartment assembly. Refer to Instrument Panel Compartment Replacement.
3. Remove the driver side instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement.
4. Remove the left and right side instrument panel lower extension panels. Refer to Instrument Panel Extension Replacement.



Important: Make sure to release the retaining lever on the infotainment electrical connector (2) before disconnecting.

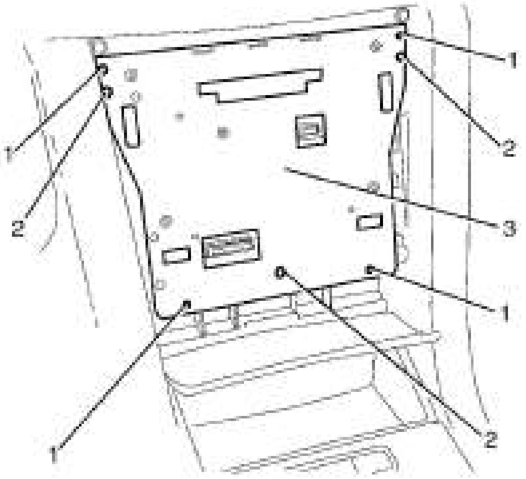
5. Disconnect the connector(s) (1 and 2 where applicable) from the right side of the infotainment unit.



Important: To disconnect coaxial connections, pinch down on the retaining clip near connection side of unit and push connector into the unit and slide connector away from the infotainment unit.

Important: Do not remove by pulling on the coaxial cables as they will be dislodged from the connector.

6. Disconnect the connector(s) (1 and 2 where applicable) from the left side of the infotainment unit.

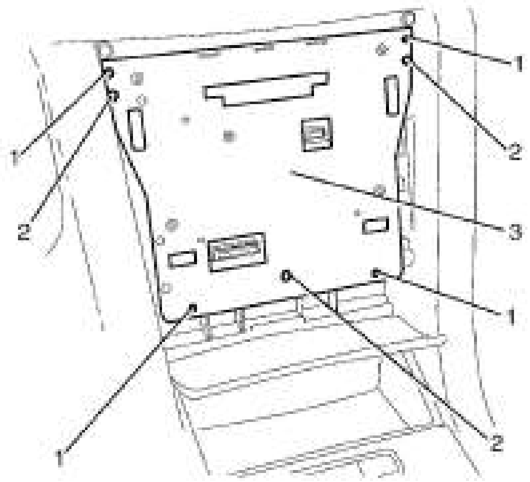


7. Remove the infotainment unit to instrument panel retaining screws (1).

Important: Observe position of aligning lugs (2).

8. Remove the infotainment unit (3) from the instrument panel.

Installation Procedure



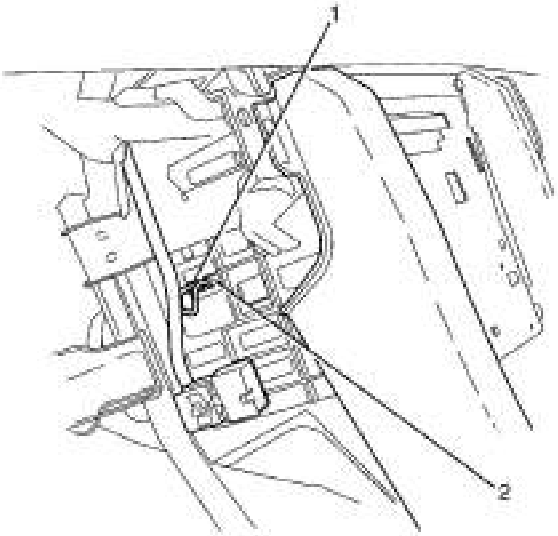
Important: Make sure to guide the infotainment unit (3) over the aligning lugs (2).

1. Install the infotainment unit (3).

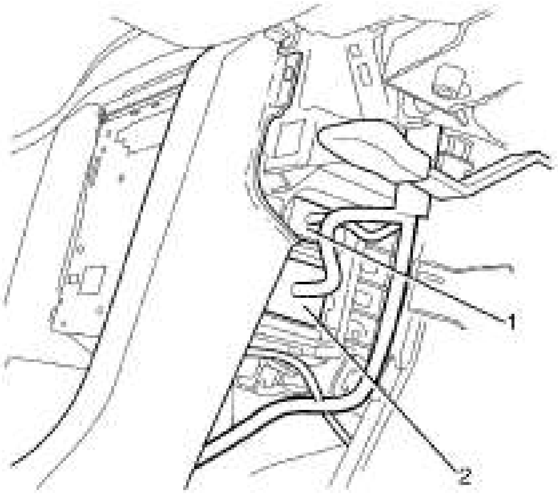
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the infotainment unit to instrument panel retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).



3. Connect the left side infotainment unit electrical connector(s) (1 and 2 where applicable).



Important: Make sure to close the retaining lever on the infotainment electrical connector (2) once connected.

4. Connect the right side infotainment unit electrical connector(s) (1 and 2 where applicable).
5. Install the left and right side instrument panel lower extension panels. Refer to Instrument Panel Extension Replacement.
6. Install the driver side instrument panel lower trim panel assembly. Refer to Knee Bolster Replacement.
7. Install the instrument panel compartment assembly. Refer to Instrument Panel Compartment Replacement.
8. Install the infotainment fascia. Refer to Driver Information Display Replacement.

9. Refer to Control Module References.

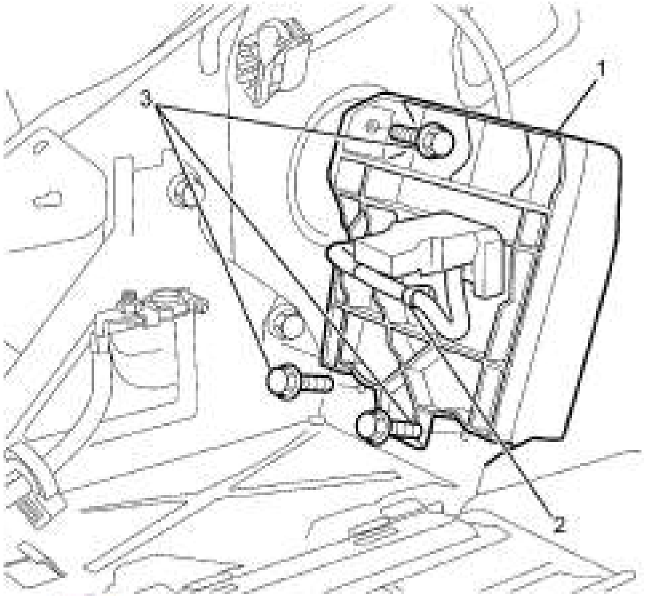
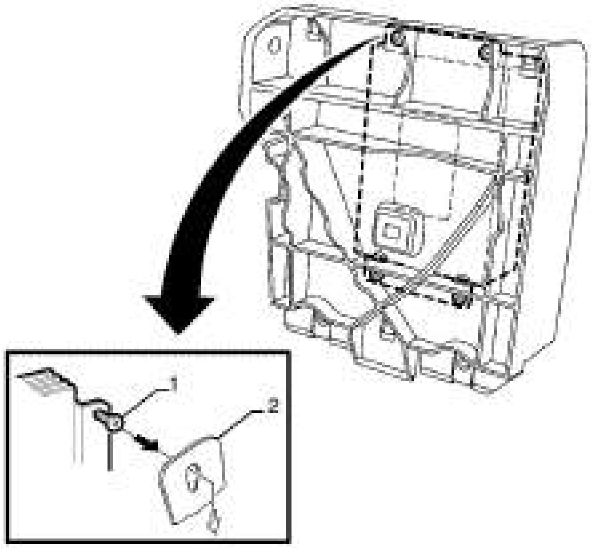
Document ID: 1994833

Radio Speaker Amplifier Replacement (SWB)

Removal Procedure



1. Remove the left-hand side carpet trim. Refer to Rear Corner Trim Panel Carpet Replacement
2. Remove the battery. Refer to Battery Replacement .
3. Disengage the battery harness retainer (2) securing the harness to the amplifier mounting bracket (1).
4. Remove the bolts (3) securing the amplifier mounting bracket to the vehicle.
5. Disconnect the electrical connector from the amplifier.
6. Remove the amplifier and bracket assembly.

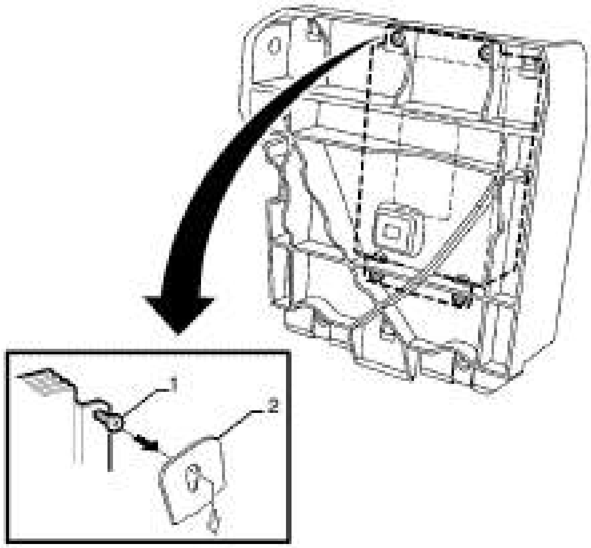


7. Loosen the screws (1) holding the amplifier to the mounting bracket.

   Important: Slide the amplifier upward to release the screw heads from the slots in the mounting bracket.

8. Remove the amplifier from the mounting bracket.

Installation Procedure



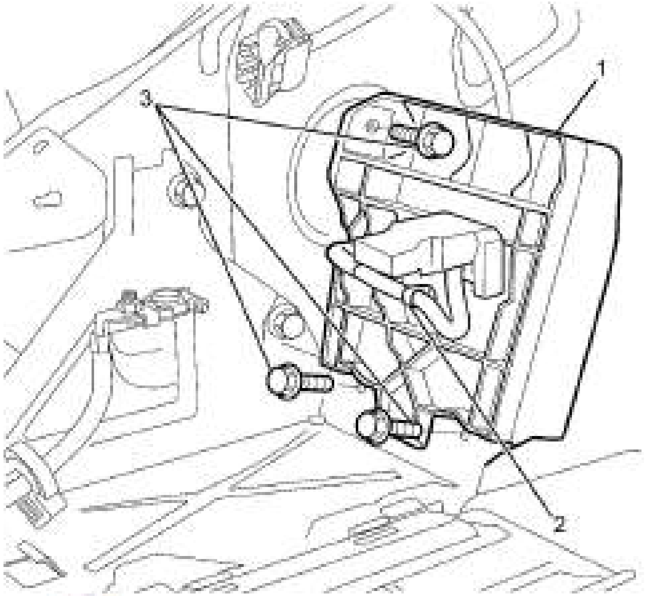
Important: Insert the amplifier screw heads (1) into the mounting bracket slots and slide the amplifier downward to secure the screw heads into the slots in the mounting bracket.

1. Install the amplifier to the mounting bracket.

   Notice: Refer to Fastener Notice in the Preface section.

2. Tighten the amplifier to mounting bracket retaining screws (1).

   Tighten
   Tighten the screws to 2.5 N·m (22 lb in).



3. Install the amplifier and bracket assembly (1).
4. Connect the electrical connector to the amplifier.

Notice: Refer to Fastener Notice in the Preface section.

5. Install the amplifier mounting bracket to vehicle retaining bolts (3).

Tighten
Tighten the bolts to 22 N·m (16 lb ft).

Important: Make sure the retainer (2) securing the harness to the amplifier mounting bracket (1) engages correctly.

6. Connect the battery harness to the amplifier bracket assembly.
7. Install the battery. Refer to Battery Replacement .
8. Install the left-hand side carpet trim. Refer to Rear Corner Trim Panel Carpet Replacement
9. Refer to Control Module References .

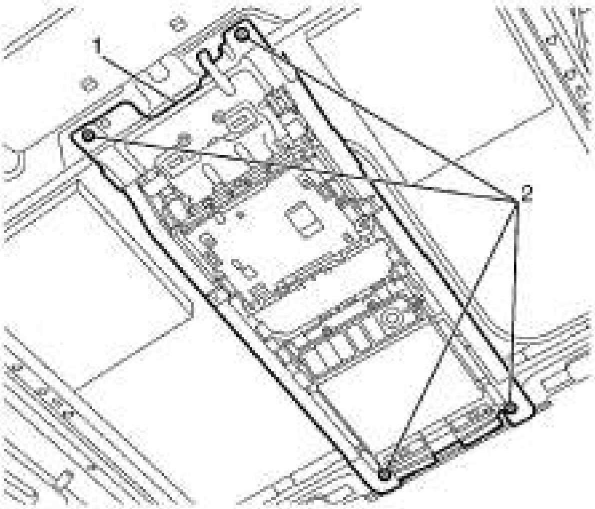
Document ID: 2009829

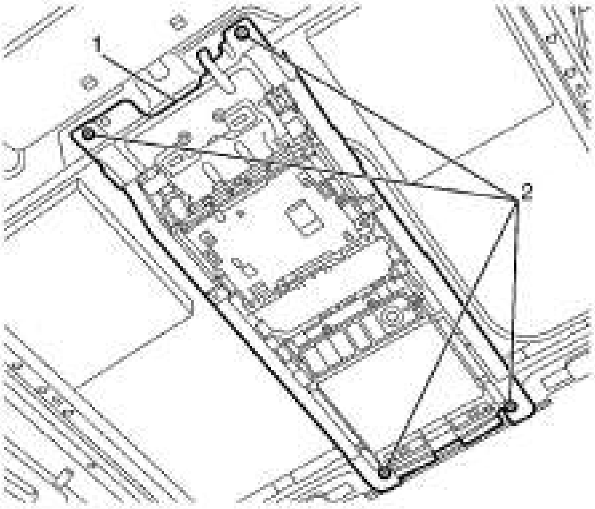
Video Disc Player Bracket Replacement

Removal Procedure



1. Remove the headlining trim assembly. Refer to Headlining Trim Panel Replacement.
2. Remove the rear seat entertainment assembly to roof panel screws (2).
3. Carefully lower the front of the rear seat entertainment assembly (1) from the roof panel followed by the rear.
4. Disconnect the connector from the rear seat entertainment assembly
5. Remove the rear seat entertainment assembly (1) from the roof panel.

Installation Procedure



1. Connect the rear seat entertainment assembly electrical connector.
2. Install the rear seat entertainment assembly (1) to the roof panel.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the rear seat entertainment assembly to roof panel retaining screws (2).

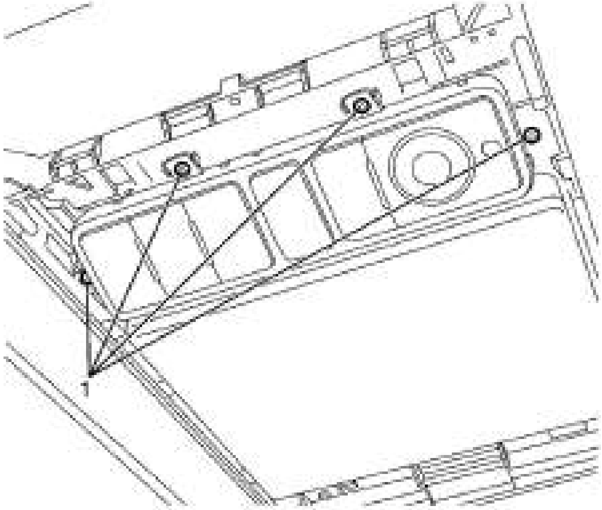
   Tighten
   Tighten the screws to 1 N·m (9 lb in).

4. Install the headlining trim assembly. Refer to Headlining Trim Panel Replacement.

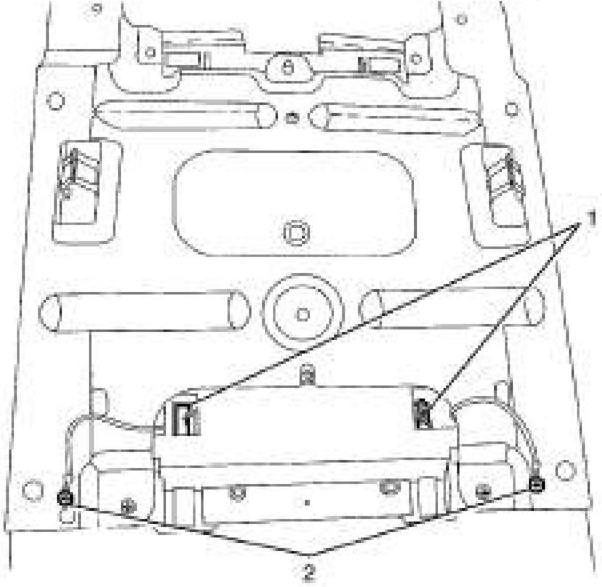
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Cellular, Entertainment, and Navigation | Repair Instructions | Document ID: 2008578

Video Disc Player Control Replacement (SWB)

Removal Procedure



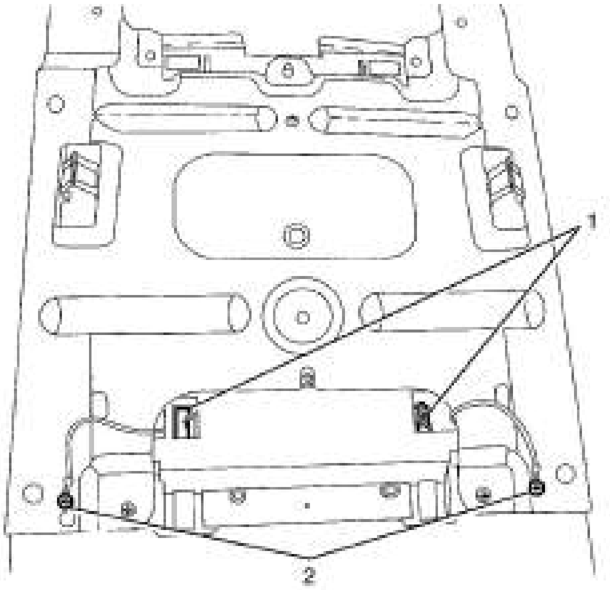
1. Remove the RSE assembly. Refer to Video Disc Player Bracket Replacement .
2. Remove the audio control to RSE assembly bracket screws (1).



3. Disconnect the headliner audio control connectors (1).
4. Remove the grounding point to RSE assembly bracket screws (2).

5. Remove the headliner audio controls from the RSE assembly bracket.

Installation Procedure



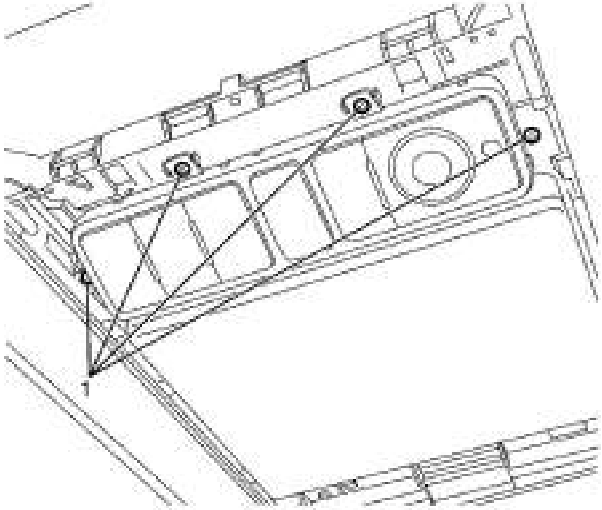
1. Install the headliner audio controls to the headliner.
2. Connect the headliner audio controls electrical connectors (1).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the grounding point to RSE assembly bracket retaining screws (2).

   Tighten
   Tighten the screws to 1 N·m (9 lb in).

   Notice: Refer to Fastener Notice in the Preface section.



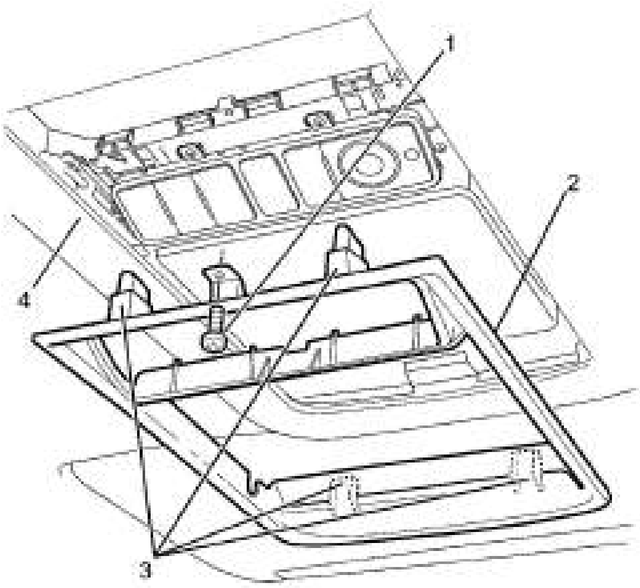
4. Install the headliner audio controls to RSE assembly bracket retaining screws (1).

   Tighten
   Tighten the screws to 1 N·m (9 lb in).

5. Install the rear seat entertainment assembly. Refer to Video Disc Player Bracket Replacement .

Video Disc Player Display Bezel Replacement (Display)

Removal Procedure

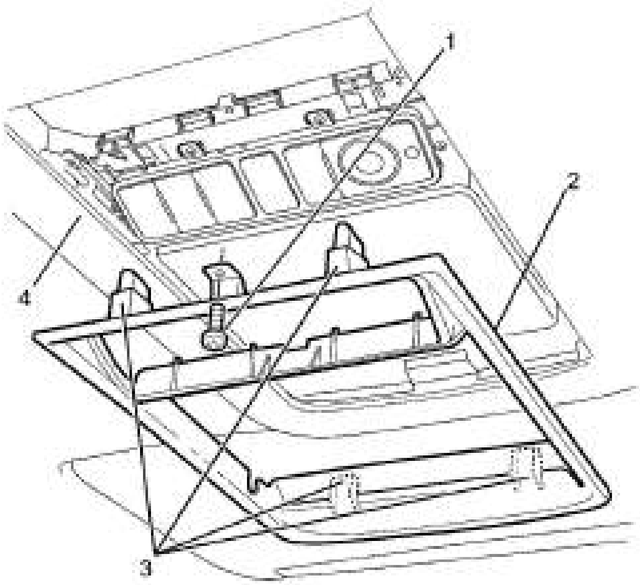


1. Remove the rear dome lamp assembly. Refer to Dome Lamp Replacement.
2. Remove the DVD screen surround to roof panel screw (1).

   Important: Using a suitable tool disengage the retainers (3).

3. Remove the DVD screen surround (2) from the headlining trim (4).

Installation Procedure



Important: Make sure all the retainers (3) engage the headlining trim (3).

1. Install the DVD screen surround (2) to the headlining trim (4).

   Notice: Refer to Fastener Notice in the Preface section.

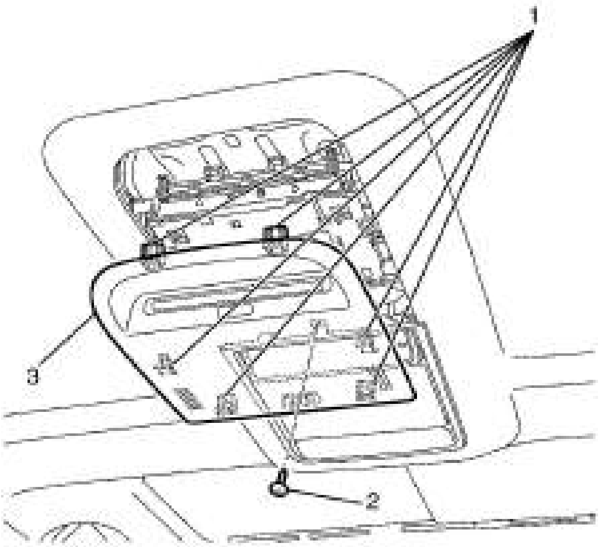
2. Install the DVD screen surround to roof panel retaining screw (1).

   Tighten
   Tighten the screws to 1 N·m (18 lb in).

3. Install the rear dome lamp assembly. Refer to Dome Lamp Replacement.

Video Disc Player Display Bezel Replacement (Player)

Removal Procedure

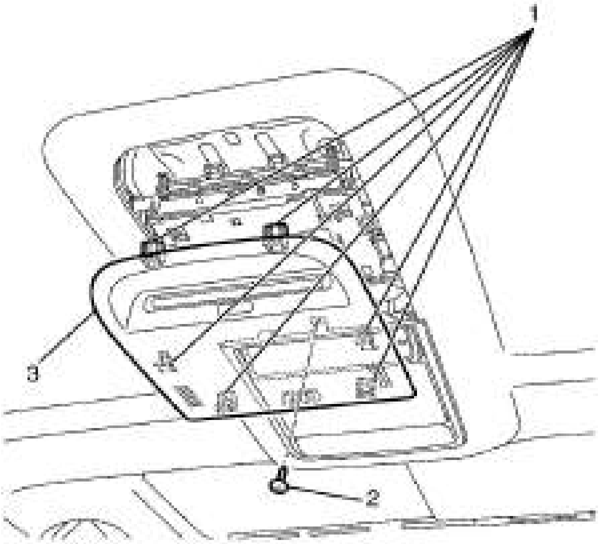


1. Remove the rear dome lamp assembly. Refer to Dome Lamp Replacement.
2. Remove the DVD player surround to roof panel screw (2).

   Important: Using a suitable tool disengage the retainers (1).

3. Remove the DVD player surround (2) from the headlining trim (3).

Installation Procedure



Important: Make sure all the retainers (1) engage through the headlining trim (3).

1. Install the DVD player surround (2) to the headlining trim (3).

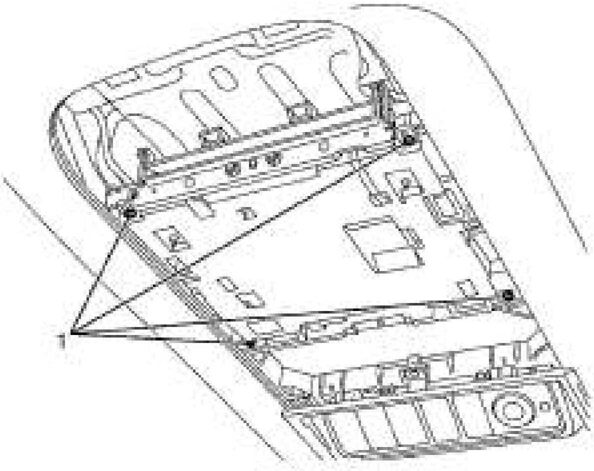
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the DVD player surround to roof panel retaining screw (2).

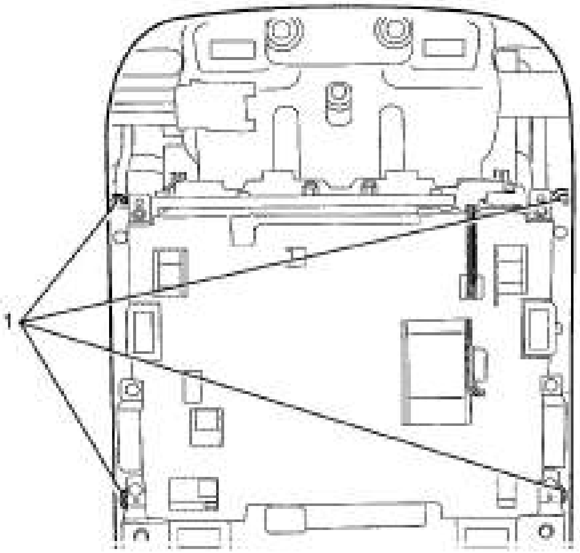
   Tighten
   Tighten the screws to 1 N·m (9 lb in).

3. Install the rear dome lamp assembly. Refer to Dome Lamp Replacement.

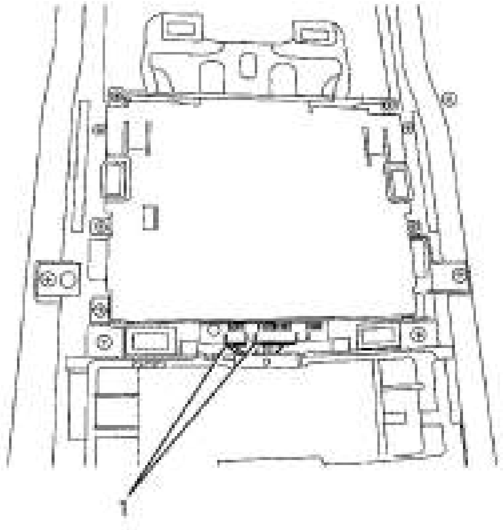
Video Disc Player Replacement



1. Remove the rear dome lamp assembly. Refer to Dome Lamp Replacement.
2. Remove the DVD player surround trim. Refer to Video Disc Player Bezel Replacement.
3. Remove the DVD player to rear seat entertainment (RSE) assembly bracket screws (1).

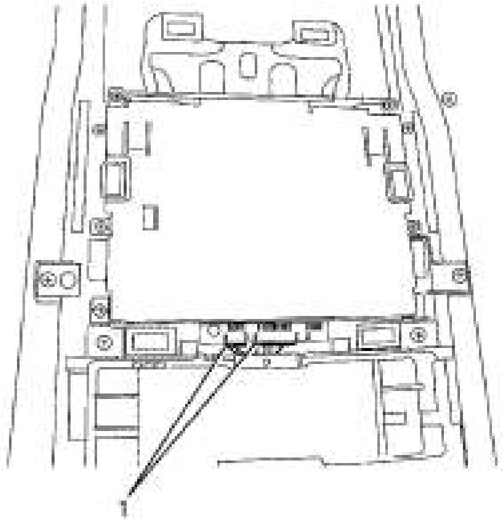


4. Cut the retaining ties (1) securing the RSE assembly harnesses to the DVD player.

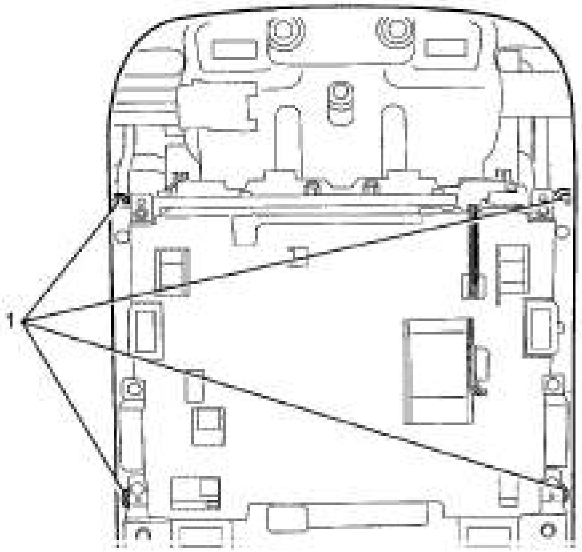


5. Disconnect the DVD player connectors (1).
6. Remove the DVD player from the RSE assembly bracket.

Installation Procedure

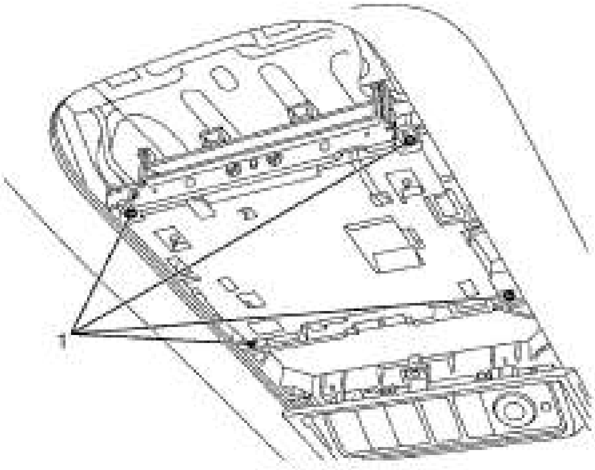


1. Connect the DVD player electrical connector.
2. Install the DVD player to the RSE assembly bracket.



3. Appropriately fasten the RSE harnesses to the DVD player assembly (1) with retaining ties.

   Notice: Refer to Fastener Notice in the Preface section.



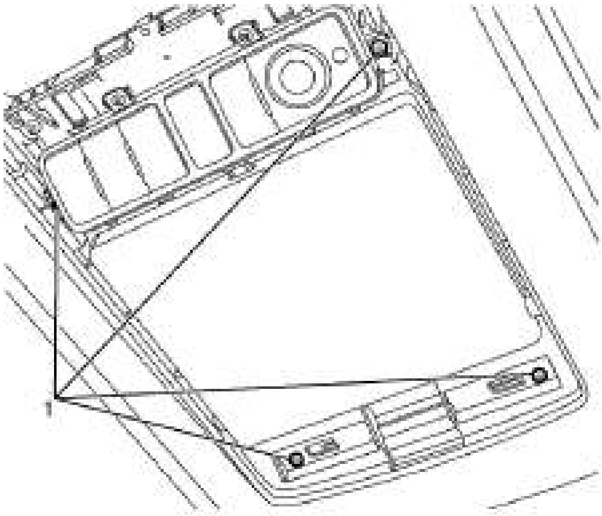
4. Install the DVD player to RSE assembly bracket retaining screws (1).

   Tighten
   Tighten the screws to 2.5 N·m (22 lb in).

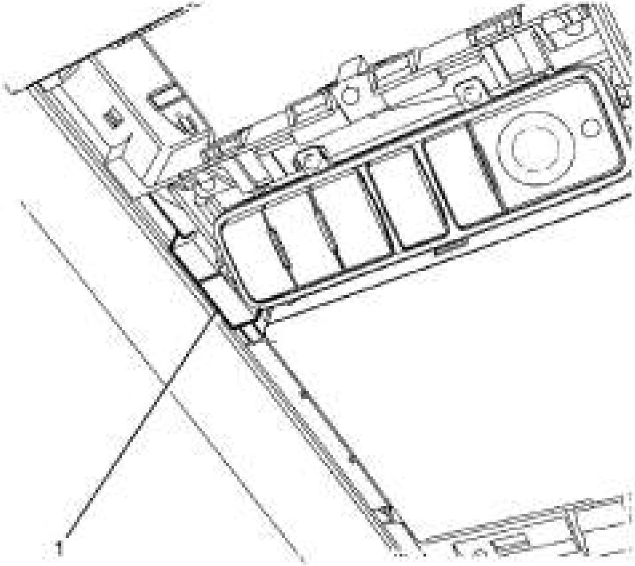
5. Install the DVD player surround trim. Refer to Video Disc Player Bezel Replacement.
6. Install the rear dome lamp assembly. Refer to Dome Lamp Replacement.

Video Display Replacement (Headliner LWB SWB)

Removal Procedure



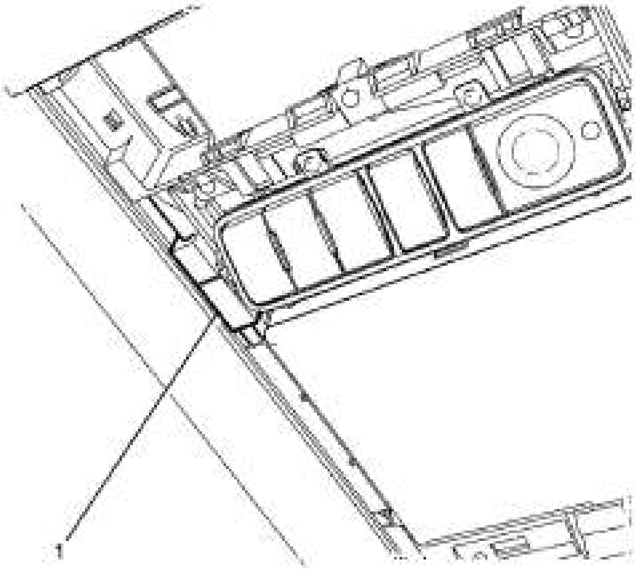
1. Remove the rear dome lamp assembly. Refer to Dome Lamp Replacement .
2. Remove the DVD screen surround trim. Refer to Video Disc Player Display Bezel Replacement
3. Remove the DVD screen to rear seat entertainment (RSE) assembly bracket screws (1).



4. Disconnect the DVD screen connector (1).

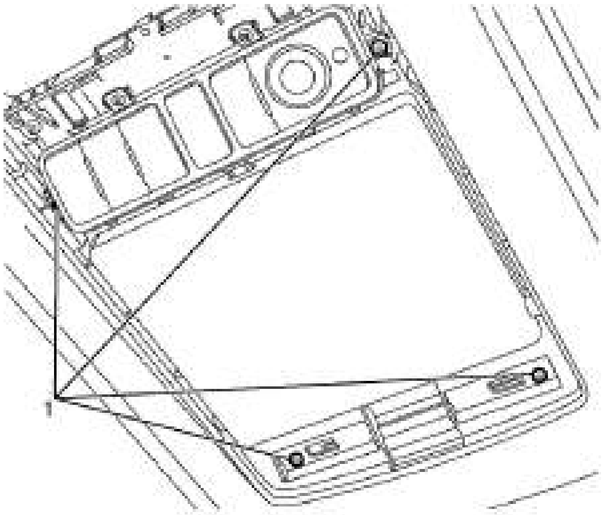
5. Remove the DVD screen from the RSE assembly bracket.

Installation Procedure



1. Install the DVD screen to the RSE assembly bracket.
2. Connect the DVD screen electrical connector (1).

Notice: Refer to Fastener Notice in the Preface section.



3. Install the DVD screen to RSE assembly bracket retaining screws (1).

Tighten
Tighten the screws to 1.5 N·m (13 lb in).

4. Install the DVD screen surround trim.Refer to Video Disc Player Display Bezel Replacement
5. Install the rear dome lamp assembly. Refer to Dome Lamp Replacement .

Cellular Telephone Description and Operation

Bluetooth Wireless Technology

Bluetooth Wireless Technology is a cordless link between two devices, in this case, a cellular telephone and the Bluetooth car kit. Bluetooth devices communicate via low-power radio waves. Bluetooth communicates on a frequency of 2.45 gigahertz which has been reserved by international agreement for the use of industrial, scientific and medical devices (ISM).

Due to the low power of the signal, approximately 1 milliwatt, a cellular telephone must be within 10 meters (32 feet) of the vehicle's Blue Tooth Module to connect and operate. However the cellular telephone and the Bluetooth module do not need to be in a direct line of sight. For example the cellular telephone can be in the centre console or in a bag whilst connected to the Bluetooth car kit.

When a paired cellular telephone and the Bluetooth car kit come within range of one another, an electronic conversation automatically takes place and the devices form a personal-area network (PAN), or piconet, in the vehicle. To avoid interference from other Bluetooth devices, the paired cellular telephone and the Bluetooth car kit, once a piconet is established, randomly hop frequencies in unison so they stay in touch with one another and avoid other piconets that may be operating in the same area.

Bluetooth Definitions

Paired: The Bluetooth module and the cellular telephone have stored each other's ID in memory and are available to be connected when they are within 10 meters (32 feet) of each other.

Connected: The cellular telephone handset is currently linked with the Bluetooth car kit. All functions on the Bluetooth car kit are active.

Pairing a Cellular Telephone

The pairing between a cellular telephone with Bluetooth capability and the Bluetooth car kit can be established using the following procedure.

Important: If a Blackberry/PDA device is being used, the pairing action may take several seconds longer to complete. Do not interrupt during this process or the pairing will not be successful.

1. Switch the cellular telephone ON.
2. Turn the ignition to the ON position.
3. Perform the following steps on the cellular telephone:
   - 3.1. Enter the Bluetooth menu.
   - 3.2. Activate the Bluetooth function.
   - 3.3. Search for Bluetooth devices.
   - 3.4. Select the device labelled 'Vehicle BT'.
   - 3.5. Enter the following PIN: 1234.

This establishes the connection between the cellular telephone and the Bluetooth car kit.

3.6. Set the cellular telephone to accept Bluetooth connection requests automatically without permission (if required).

Pairing multiple cellular telephones

The Bluetooth car kit can be paired with up to six cellular telephones, but can only be connected to one cellular telephone at a time. If a seventh cellular telephone is paired with the Bluetooth car kit, the first or least recent cellular telephone paired with the Bluetooth car kit ID will be over written and will no longer be paired with the Bluetooth car kit.

When the ignition is switched on, the Bluetooth car kit searches for the most recently paired cellular telephone.

Connecting a Cellular Telephone

Important: Make sure the cellular telephone being connected has been paired with the Bluetooth car kit or the connection will not be successful.

Connection between a paired cellular telephone and the Bluetooth car kit can be established using the following procedure.

1. Move the cellular telephone to within 10 meters (32 feet) of the vehicle's Blue Tooth Module, preferably inside the vehicle.
2. Make sure the cellular telephone is switched on and the Bluetooth function has been activated.
3. Turn the ignition to the ON position.
4. Press the Bluetooth button on the steering wheel (if required). A phone symbol will appear in the instrument panel centre display for a few seconds.

Bluetooth Call Options

After connection between a cellular telephone and the Bluetooth car kit has been established, the following call options may be selected. Refer to the owner handbook for specific detail on each call option.

- Dial normally on the cellular telephone handset.
- Make a call by voice dialling.
- Answer a call.
- Automatic answer.
- Reject a call.
- Place call on hold.
- End a call.
- Redial the last number.

Cancelling the Bluetooth Connection

To cancel the Bluetooth connection, perform any of the following:

- Turn the ignition to the OFF position and open the drivers door.
- If no call is in progress, press and hold the Bluetooth button on the steering wheel for three seconds.
- Deactivate the Bluetooth function on the cellular telephone.
- Move the cellular telephone outside of the reception range of the Bluetooth car kit (approximately 10 meters).
- Switch off the cellular telephone

Vehicle Audio System

When making or receiving a call, the vehicle's audio system is automatically set to silent. The voice of the caller is heard through the audio systems speakers and VOICE IN is shown on the audio system display.

Setting Up The Audio System

The volume, bass, treble, fader and balance can be adjusted in the audio system's Bluetooth mode without affecting radio or CD settings.

Set up the audio system for Bluetooth by performing the following procedure:

1. Make a call using the Bluetooth car kit.
2. Adjust the volume, balance and fader settings for Bluetooth.
3. End the call.

Navigation System Description and Operation (SWB)

Navigation System Components

The navigation system contains the following components:

- The navigation module
- The navigation interface module (NIM)
- The global positioning system (GPS) antenna

These components then integrate and communicate with the following components:

- The infotainment module
- The steering wheel controls
- The body control module (BCM)
- The instrument cluster

Navigation Module

The navigation module is available in 2 different variants. Both are single DIN units designed as external components which can be installed as part of the infotainment system. The navigation module is mounted in the instrument panel compartment and contains all the navigation engines and gyroscope used to detect movement of the vehicle.

Type A Navigation Module

This navigation module features 'Turn by Turn' directions. The navigation module is an optional accessory to low level vehicles fitted with Type A or C infotainment systems. The navigation module transmits 'Turn by Turn' direction symbols to the instrument cluster display, via serial data to the navigation interface module (NIM) before being translated and re-transmitted via GMLAN. The navigation module also sends audible verbal direction to the speakers through the infotainment unit via the NIM. Key entries are entered via the steering wheel remote control.

Type B Navigation Module

This navigation module features 'Turn by Turn' directions as well as displaying full map and routing information on the infotainment unit display. The navigation module is an optional accessory to high level vehicles fitted with Type D infotainment systems featuring 6.5" colour LCDs. The navigation module transmits 'Turn by Turn' direction symbols to the instrument cluster display, via serial data to the navigation interface module (NIM) before being translated and re-transmitted via GMLAN. The navigation module also sends audible verbal direction to the speakers through the infotainment unit via the NIM. Map based navigation routing information is also channelled directly to the infotainment unit display from the navigation module. Key entries are entered via the infotainment unit fascia. The INFO button on the steering wheel is used to recall the last audible direction, and also displays the function on the instrument clusters centre multi-function display.

Navigation Interface Module (NIM)

The navigation interface module (NIM) is used to communicate data between the navigation module and the vehicle body control module (BCM), the instrument cluster and the infotainment unit. The illumination signal and ignition signal messages are sent from the BCM to the NIM via GMLAN, the NIM then translates these signals and re-transmits the data to the navigation module. The odometer and reverse signals are also transmitted to the navigation module via the NIM. The NIM also translates and re-transmits the mute signal from the navigation module via serial data to the infotainment unit. The NIM is mounted to the inside edge of the instrument panel insulation panel, directly beneath the I/P compartment.

Global Positioning System (GPS) Antenna

The global positioning system (GPS) locates the current position of the vehicle using signals sent by GPS satellites. The GPS antenna is attached to the instrument panel (I/P) carrier and can be accessed by removing the I/P centre air outlet grille assembly. The GPS antenna is powered through the same coaxial cable used to send the signals to the navigation module. Interference to the system may occur if any of the following exist:

- Signal shadowing, when signals are obstructed by objects such as tall trees or buildings.
- Metallic objects located on the dashboard.
- Aftermarket glass tinting has been applied to the vehicles windshield.
- Ionospheric disturbance (caused by solar activity, which results in greatly increased radio wave absorption).
- Atmospheric disturbances caused by stormy weather.
- Proximity to high power distribution locations, i.e. sub-stations, power stations.

Infotainment Options

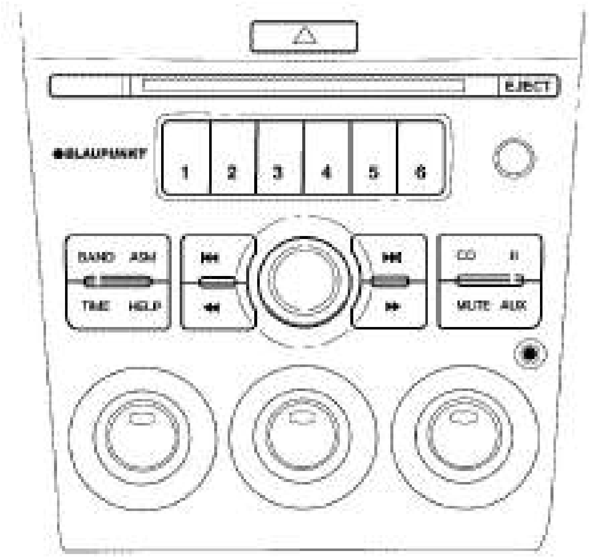
There are 4 Infotainment System options available.

Component(s)	Type A	Type B	Type C	Type D
Single CD (80W) 4 Channel	X	X		
6-Disc CD Changer (80W) 4 Channel with 5.5" Dot Matrix Display		X (SS)	X	
6-Disc CD Changer (150W) 5 Channel with 6.5" Colour LCD				X
4.5" Dot Matrix Remote Display Screen	X			
Wide Red Dot Matrix Remote Display Screen		X		X (SS-V SPORTS GAUGES)
Manual HVAC Controls	X	X		
Automatic Dual Zone HVAC Controls			X	X
Preset Equaliser		X	X	X
Fixed Mast Roof Antenna	X	X	X	X
Diversity Antenna				X (CALAIS & CALAIS-V ONLY)
Steering Wheel Audio Control Assembly	X	X	X	X
Rear Seat Entertainment Controls				X (CALAIS-V ONLY)
Instrument Panel Speakers (Left and Right)	X	X	X	X
Instrument Panel Speaker (Centre)		X	X	X
Front Door Speakers	X	X	X	X
Rear Door Speakers	X	X	X	X
Sub Woofers				X (CALAIS-V & SS-V ONLY)

Sub Woofer Amplifier (80W) 2 Channel				X (CALAIS-V & SS-V ONLY)
DVD Player with Roof Mounted Screen				X (CALAIS-V ONLY)

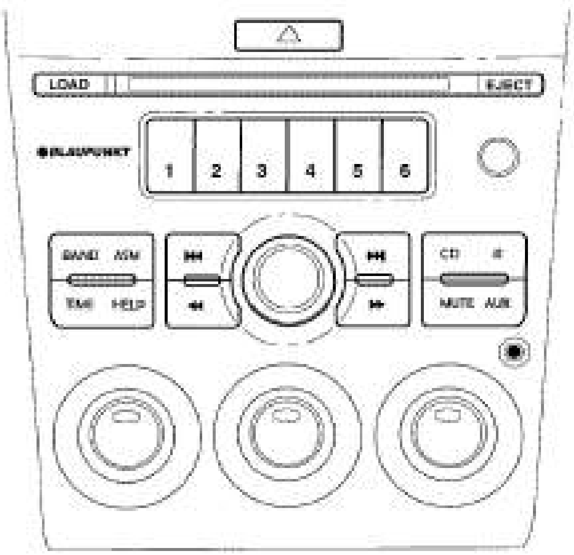
Option Level Recognition

Type A



Type A Infotainment Systems incorporate manual HVAC controls in the fascia and feature a 4.5" remote dot matrix display mounted above the infotainment fascia. This system includes 4 X 20W power output, Dynamic Distortion Limiting (DDL), a single disc CD player with AM/FM radio and 2 X auxiliary audio inputs.

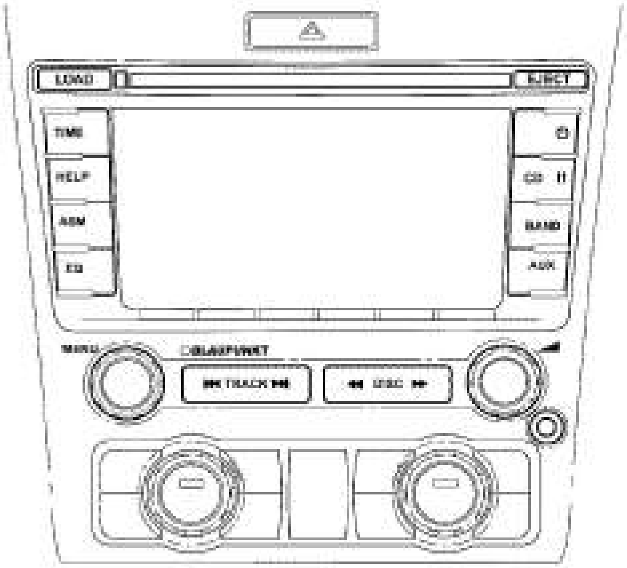
Type B



LOAD
EJECT
BLAUPUNKT
1
2
3
4
5
6
BAND
ASM
TIME
HELP
CD
MUTE
AUX

Type B Infotainment Systems incorporate manual HVAC controls in the fascia and feature a wide red remote dot matrix display mounted above the infotainment fascia. This system includes 4 X 20W power output, Dynamic Distortion Limiting (DDL), preset equaliser, a single disc CD player, or 6 disc CD player for SS vehicles, as well as AM/FM radio and 2 X auxiliary audio inputs.

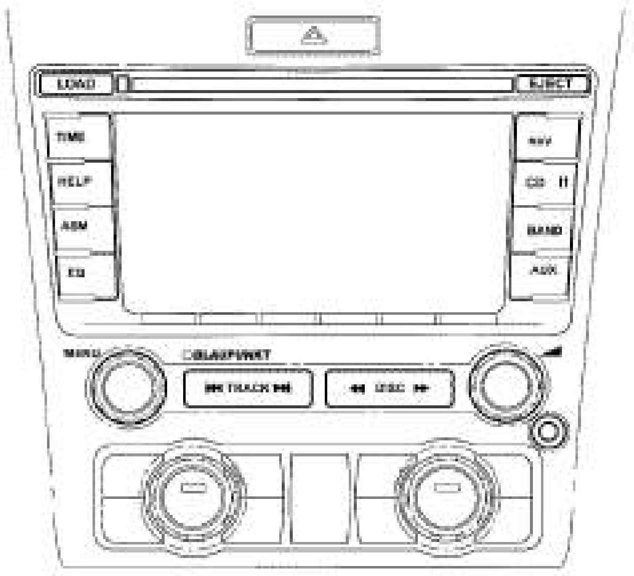
Type C



LOAD
EJECT
TIME
HELP
ASM
EQ
CD
BAND
AUX
MENU
BLAUPUNKT
TRACK
DISC

Type C Infotainment Systems incorporate dual zone automatic HVAC controls and a 5.5" dot matrix reversible display in the fascia. This system includes 4 X 20W power output, Dynamic Distortion Limiting (DDL), preset equaliser, 6 disc CD player with AM/FM radio, MP3 compatible and 2 X auxiliary audio inputs.

Type D



Type D Infotainment Systems incorporate dual zone automatic HVAC controls and a 6.5" colour LCD screen in the fascia. This system includes 5 X 30W power output, Dynamic Distortion Limiting (DDL), pre-programmed 5 band equalisation / effects, 6 disc CD player with AM/FM radio and diversity antenna, MP3 compatible, 2 X auxiliary audio inputs, 1 X auxiliary video input (for optional rear seat entertainment display),1 X auxiliary video and audio inputs (for optional Navigation display and audio), and parking aid display.

Circuit Description

Infotainment Unit Power

The main infotainment unit power is supplied by a 15A fuse located in the rear fuse block. The infotainment system does not require a discrete ignition feed circuit for power moding. The power moding is accomplished using a structure of Virtual Networks (VN). The Power Mode Master (PMM) transmits the GMLAN power mode signals.

The infotainment unit supports the following signals:

- System Power Mode
- Infotainment Operation Allowed

The infotainment unit also supports the following GMLAN Vehicle Power Modes:

- OFF
- ACCESSORY

- RUN
- CRANK REQUEST

Infotainment Unit Ground

A wire in the main radio connector that is connected to battery negative at all times provides the main radio ground. Resistance between the ground pin and the vehicle battery negative terminal must not exceed 0.05 ohms.

Infotainment Speaker Outputs

At low volume, the plus (+) and minus (-) speaker outputs circuits measure approximately 5-6 volts. If a plus or minus circuit for any speaker output is shorted to ground or voltage, the infotainment unit disables the circuit for component protection and sets a diagnostic trouble code (DTC). The radio sets the speaker circuit DTC on non-amplified systems only. As the radio volume increases the voltage on the plus and minus circuits change to create a voltage difference between each other. The difference in voltage is what drives the voice coil of the speaker producing sound.

Infotainment Unit Dimming

GMLAN signal data received by the infotainment unit determines the fascias dimming and backlighting levels. The infotainment unit sets the backlight and VF display dimming to the value indicated by the interior dimming level and interior dimming display level signals in the GMLAN dimming information frame. The infotainment unit provides fascia and control/graphics backlighting in the OFF (RAP inactive) when the exterior lighting virtual network (VN) is activated. The infotainment fascia display is consistent then with the surrounding devices that use PWM dimming to backlight their control/graphics when the power mode is OFF and the park lights are ON.

Sub Woofer Amplifier Speaker Inputs

The low-level audio signals (LR, and RR) from the infotainment unit are the inputs to the amplifier. The amplifier boosts these inputs and outputs them to the rear sub woofer speakers. If one speaker plus or minus low level audio signal circuit is open between the radio and the amplifier, the input to the amplifier is approximately half. The speakers for that channel then operate at approximately half the normal volume or in some cases no volume.

The low level audio signals from the radio to the amplifier typically measure in the 4-5 volts range.

Amplifier Speaker Outputs

At a low volume, the plus (+) and minus (-) speaker outputs circuits measure approximately 2-7 V AC or 7-8 V DC at the speaker connector when testing a normal working system. If a plus (+) or minus (-) for any speaker output is shorted to ground or voltage, the amplifier circuitry will turn OFF the front outputs or rear outputs for component protection.

Repeat speaker malfunction can be caused by a damaged amplifier. Test for a damaged quad bridge output in the amplifier if the wiring between the amplifier and speaker test negative for a short to voltage. Prolonged exposure to DC voltage can cause a speaker coil to short. An early indication of a shorted speaker coil is distortion/noise and eventual malfunction.

Cellular Telephone Mute

The telematics communications module uses the cellular telephone mute signal circuit to over-ride the infotainment unit for telematics communication. When cellular telephone mute is not active, this circuit is held at 1-volt by the radio. When the cellular telephone mute signal is pulled to ground, the radio over-rides any other audio signal and uses the remote audio signals as the source for output to the speakers. If the infotainment unit was OFF when this circuit is pulled low, the infotainment unit will turn ON. Additionally, the radio fades the speakers to full front, adjusts the volume to an initial audible level, and sets an Auto Tone designed for optimal use with telematics. When the mute signal is no longer pulled to ground, the radio returns to the mode it was in previously.

Component Description

Antenna System

The antenna system receives broadcast AM or FM stereo signals from free space and sends the signals to the radio receiver for processing via a coaxial antenna cable. Good antenna grounding is important for good radio reception.

Infotainment Unit

The operator interfaces with the Infotainment unit through the infotainment fascia and steering wheel controls. Through these controls the operator is able to control system power, volume, fade, balance, bass, and treble equalisations. Control on the integrated CD, MP3, or DVD (where fitted). Either a remote display or fascia equipped screen provides system feedback to the operator.

The infotainment unit processes the AM and FM signals from the antenna system or the information from the CD media, amplifies that information and sends the output to the speaker system.

The infotainment unit is located in the instrument panel centre stack area and is fastened to the instrument panel by four screws. The unit features a detachable fascia. Three rear bullet type guide pins are provided to aid in aligning the infotainment fascia to the unit. An electrical connection to the infotainment unit is a 40-way connector that is part of the I/P harness, antenna lead connector, auxiliary audio and video inputs for optional RSE DVD video input, and an additional 8-way harness connector is present on navigation equipped vehicles.

Radio amplifier outputs to the speakers are protected from damage should speaker leads become shorted to ground or shorted to vehicle power. The radio will sense these conditions and shut down the amplifier outputs in a non-destructive manner. After the short condition is removed, the radio will return to normal operation.

Speakers

The Type A speaker system consists of six speakers. Two 6.5" speakers are mounted in each of the front doors. Two 5 1/4" speakers are mounted in each of the rear doors. Two 1" tweeter speakers are mounted in the instrument panel (I/P). Type B and C speaker system adds a 3" speaker mounted in the top centre of the I/P. Type D speaker systems can include two 8" subwoofers mounted to the rear parcel shelf and include a 2 channel 80W amplifier.

Auxiliary Jack Socket

The AM/FM Stereo CD radio shall provide a 3.5 mm Auxiliary stereo jack that will allow playback of audio signals from remote devices (e.g. portable tape player, portable CD player or MP3 playback device, etc.).

Theft Deterrent

The infotainment theft deterrent system is intended to disable infotainment functionality if incorrect vehicle information is received by the infotainment unit. The infotainment unit disables functionality if the VIN information received by the infotainment unit does not match the VIN information that has been learned by the infotainment unit. A VIN sequence is the last 6 digits of the VIN. The infotainment unit receives this information in a GMLAN frame form.

The infotainment unit shall provide the following theft operating modes as part of the infotainment theft deterrent system:

- No VIN Mode - An infotainment unit that has not received or learned a VIN. In this mode the infotainment unit has limited functionality.
- Normal Mode - An infotainment unit has received a VIN sequence. The infotainment unit only learns the VIN sequence if the VIN sequence contained all 6 digits. In this mode the infotainment unit has full functionality.
- Theft Detected Mode - An infotainment unit that had previously learned a VIN sequence and subsequently received a VIN sequence not matching the learned sequence. In this mode the infotainment unit has limited functionality.

AM / FM Reception

Radio Signal

The radio signal is sent from a broadcast station and is then received by an antenna. The strength of the signal received depends on the following:

- The power output, or wattage, of the broadcasting station
- The location of the vehicle, or receiver, relative to the broadcast tower.
- Obstacles between the tower and the receiver
- Atmospheric conditions
- Which band, AM or FM, the station is broadcasting
- Type of antenna and the ground plane

AM Reception

The AM band has a lower frequency range than the FM band. These longer wavelengths:

- Bend around obstacles
- Follow the curvature of the earth
- May reflect, or skip, off of the ionosphere

The AM frequencies have longer range due to the ground wave. The ground wave follows the curvature of the earth and is affected by its conductivity. Greater conductivity equates to less signal loss, thus transmission over water is better than over land. The AM band has a range of 80-320 km (50-200 mi).

FM Reception

The shorter wavelengths of the higher frequency FM band:

- Reflect off obstacles
- Are absorbed by the ground
- Penetrate the ionosphere

Broadcasts in the FM band are limited to "line of sight" reception which is typically 40 km (25 mi). Even when out of a direct line of sight, the signal may be reflected into areas that would be in a "shadow" otherwise. Factors which affect the line of sight include:

- Height of the broadcast antenna
- Height of the receiving antenna
- Terrain and buildings in the broadcast path

Customer Tips

Radio Reception FM

- The Best FM fidelity will be obtained from stations within 16-64 km (10-40 mile) range. Noise or distortion may become apparent when attempting to receive stations at distances greater than this range. *Suggestion:* Reduce treble response when attempting to receive fringe stations.
- Tall buildings or hills may cause a degraded or lost signal. FM signals tend to travel "line of sight". *Suggestion:* Reduce treble response around tall buildings.
- Although receiver circuits are among the most advanced type available, there are instances where one radio station can interfere with another station. *Suggestion:* Select another station or switch to a CD.

Radio Reception AM

AM reception is sensitive to storm disturbances such as lightning. *Suggestion:* Reduce treble response or switch to FM.

Care of Compact Discs

- Handle compact discs (CDs) carefully. Touch only the outer edges of the CD or the edge of the hole in the center of the CD. Never touch the glossy side of the CD. Fingerprints and scratches will interrupt the "reading" of the information on the disc.
- Store CDs in their protective cases. Store CDs away from sunlight, dirt, dust, and debris.
- Do not attach a label or tape to a CD.
- Always check for scratches and signs of wear on both sides of the CD.
- Never place any marks on the CD with a marker.
- If a CD becomes contaminated, clean it with a clean, damp, soft, lint-free cloth and mild detergent. Wipe the CD in a straight line from the center hole outward. Do not use cleaning solutions which may damage the CD, such as chemically treated cleaning cloths, benzene, or paint thinners.

Compact Discs Not Appropriate to Use

These CD players were designed to be compatible with round digital audio CDs with the "Compact Disc Digital Audio" label. Other CDs may be incompatible, causing a no-play condition, skips more than the customer would desire, and "ERR" shown on the radio display or a jam in the loading mechanism. Some incompatible CD types are:

- Special-shaped CDs (any that are not round).
- Re-Writeable CDs (CD-RW type are incompatible).
- Recordable CDs (CD-R type are incompatible, except with Type C or D infotainment units).
- Library CDs (with thick bar code labels).
- CD with User-applied labels.

Technical Information for the MP3/CD Radios (Type B, C or D Infotainment Units)

The Types B, C or D infotainment units will play both standard audio CDs and CD-Rs. The CD-Rs may contain either standard audio (*.cda) or compressed audio (*.mp3). Customers who record their own music CD-Rs should be aware of the following:

- The files can be recorded on a CD-R disc with a maximum capacity of 700 MB.
- The infotainment unit will play only compressed audio files recorded in the *.mp3 format. It also supports playlists that can be made and saved with popular MP3 software (in the *.m3u format). A playlist name must be no more than 32 characters in length. If the name of a playlist is longer than 32 characters, the radio will ignore the playlist.
- The infotainment unit will only play audio from a CD-R, it cannot record audio.
- The infotainment unit will play a mixed mode CD-R/RW (one recorded with both *.cda and *.mp3 files). If a mixed mode CD is inserted in the radio, the radio will assign the standard CD audio to a directory which is listed as ROM audio directory.
- The infotainment unit supports multi-session discs, but only the files from the last session will be played.
- There are a total of 20 directories (folders) allowed on a disc. The file structure can be 0-4 directories deep (a folder within a folder, within a folder, etc). Anything more than 20 directories will be ignored. Each directory may have up to 99 files contained within it. Files not having the *.mp3 extension will not be played, but still count toward the maximum. Anything more than the first 99 files within a directory will be ignored. A single disc may have up to 254 files and directories. Anything beyond the 254 limit will be ignored.
- MP3 files must be written to a CD-R/RW in one of the following industry-standard formats:
  - ISO 9660 Level 1
  - ISO 9660 Level 2
  - Joliet
  - Romeo
- ID3 tag information is displayed by the infotainment unit, if available. The ID3 tag information can either be version 1 or 2. The radio will display the filename, song name, artist name, album name, directory name, and playlist name, etc.

If the customer does not follow these guidelines when recording a CD-R/RW, the disc may not play in the MP3 compatible infotainment units.

Telematics Description and Operation

Available Options

The telematics system is available in three varying option levels, Assist Ultra, Secure and GM Fleetview.

Assist Ultra

Assist Ultra is the highest level of telematics available and has the following functionality/features:

- Air bag deployment notification with Telematics Call Centre assistance.
- Track and recover stolen vehicle.
- Unauthorised entry alert.
- Emergency assistance.
- Remote door unlock.
- Low battery / battery disconnect alert.
- Holden messaging service.
- In vehicle communications, assist rear view mirror.

Secure

Secure is the intermediate level of telematics available and has the following functionality/features:

- Track and recover stolen vehicle.
- Unauthorised entry alert.
- Remote door unlock.
- Low battery alert.

GM Fleetview

GM Fleetview is the basic, fleet customized level of telematics available and has the following functionality/features:

- Track and recover stolen vehicle.
- Remote door unlock.
- Low battery alert.
- Fleet reporting.

These systems consist of the following components:

- Telematics module

- Telematics button assembly (Assist Ultra)
- Microphone (Assist Ultra/Secure)
- Cellular/GPS antenna

This system also interfaces with the factory installed vehicle audio system.

Telematics Module

The telematics module is a 3-watt cellular device that allows the user to communicate data and voice signals over the national cellular network. It is powered by a fused, battery positive, voltage circuit connected through the vehicle wiring to the 3-button assembly (Assist Ultra) and the radio, and attached by means of coax cables to the cellular and navigation antennas. In the event of the battery power not being available, such as after a crash, a flat battery or unauthorised disconnection, an integral Nikel Metal Hydride battery pack provides backup power. Ground for the module is accomplished by means of dedicated circuits that are routed via the body wiring systems to chassis ground points. The module houses 2 modems, one to process global positioning system (GPS) data, and the other for cellular information. Satellites orbiting earth are constantly transmitting signals of their current location, from which the telematics system is able to pinpoint its own location. The navigation antenna receives these GPS signals and provides the data to the telematics module to be processed. The telematics module communicates with the rest of the vehicle through the GMLAN system. The ignition state is determined by the telematics module through GMLAN data system. The telematics module also has the capability of commanding the horn, initiating door lock/unlock and operating the exterior lamps using the GMLAN data system. When a telematics keypress is made, the GMLAN system sends a message, which is sent to the audio system to mute all radio functions and transmit telematics originated audio. After the audio system is muted, the telematics signals are transmitted to the audio system on the cellular telephone voice signal circuit, and returned to the module on the cellular telephone voice low reference circuit. The cellular modem connects the telematics system to the cellular carrier's communication system by interacting with the national cellular infrastructure. The module sends and receives all cellular communications over the cellular antenna and cellular antenna coax.

Telematics Button Assembly (Assist Ultra)

The telematics button assembly is located in the rearview mirror. The button assembly comprises of 3 buttons and a status LED. The buttons are defined as follows:

- The information/end call button, which is black with a white telephone symbol allows the user to answer and end calls.
- The blue Telematics Call Centre button, which displays the Holden Assist logo, allows the user to connect to the Telematics Call Centre.
- The emergency button, which is a white cross on a red background, sends a high priority emergency call to the Telematics Call Centre when pressed.

If any button is pressed for more than 10 seconds the "Button Stuck" DTC will be set. In the event of multiple button presses at the same time, the telematics module will accept the higher ranked button. Button ranking is as follows:

1. Emergency.
2. Holden Assist.
3. Information/end call.

Status Light and Beep

The telematics system also has audible and visual displays to notify the user of system status, they are as follows:

- Flashing green light: call is in progress.
- Steady green light: system is on and self-test has been successfully completed.
- Steady red light: system is ON, however a malfunction has been detected and should be checked by a Holden dealer.
- Steady orange light: car is not within coverage area. This is emphasised by 5 beeps when turning the ignition OFF, to highlight the message to the driver that they are about to leave the car in a 'shadow' location which is untraceable. In an area, such as the basement of a car park, another car park space may be a better option.
- When turning the ignition ON, if the red and green lights flash for 30 seconds accompanied by 5 audible beeps: the telematics system is in service mode. Varying modes can be selected using a scan tool, refer to Communication Interface Module Mode Selection.

Telematics Microphone (Assist Ultra / Secure)

Assist Ultra

The telematics microphone is a cellular device that allows the user to communicate data and voice signals over the national cellular network. It is powered by a fused, battery positive, voltage circuit connected to the telematics button assembly where it is located and interfaces directly with the Infotainment unit. The telematics microphone is not connected to the GMLAN system. When a telematics button keypress is made, a serial data message is sent to the infotainment unit to mute all radio functions and transmit cellular telephone originated audio. After the audio system is muted, the cellular telephone signals are transmitted to the audio system on the cellular telephone voice signal circuit, and returned to the module on the cellular telephone voice low reference circuit.

Secure

The telematics microphone is a cellular device that allows the user to communicate data and voice signals over the national cellular network. It is located in the passenger side of the overhead console, is powered directly by the telematics module which interfaces with the Infotainment unit. The telematics microphone is not connected to the GMLAN system. In the event of the Telematics Call Centre communicating with the user a serial data message is sent to the infotainment to mute all radio functions and transmit cellular telephone originated audio.

Cellular and Navigation Antennas

This vehicle will be equipped with the following types of antenna:

A combination cellular and navigation antenna, which brings the functions of both into a single part.

The cellular antenna is the component that allows the telematics system to send and receive data over airwaves by means of cellular technology. This antenna is connected at the base to a coax cable that plugs directly into the telematics module. The navigation antenna is used to collect the constant signals of the orbiting satellites. A low noise amplifier is housed within the antenna, that allows for a broad and precise reception of this data. The current global positioning system (GPS) location is collected by the module every time a keypress is made. The Telematics Call Centre also has the capability of pinging the vehicle during a telematics call, which commands the module to retrieve the latest GPS location and transmit it to the Telematics Call Centre. A history location of the last recorded position of the vehicle is also stored in the module. In the event the telematics module loses power, or is removed from power, this history location is used by the Telematics Call Centre as a default. Actual GPS location may take up to 10 minutes to register in the event of a loss of power. This antenna requires a clear and unobstructed path to the satellites in the sky. Window tinting on vehicles may interfere with the GPS sensor functions, depending upon the location of the GPS antenna and the amount of darkening and/or metallic particles that are embedded in the film of the tinting material.

Telematics Sleep Cycle

The telematics system uses a digital system to allow the system to receive cellular calls while the ignition is in the OFF position. This cycle enables the telematics module to perform remote functions, such as door unlock, as commanded over the air by the Telematics Call Centre, when requested by the customer, and to continue to maintain an acceptable level of battery electrical drain.

The telematics system uses the following 3 power modes when the vehicle is turned off:

- High Power
- Digital Stand by
- Sleep

The high power state is in effect whenever the ignition is in the ON or RUN position, and enables the telematics system to send and receive cellular calls and perform all remote functions. The digital stand by power state is in effect after the vehicle has been shut off and the retained accessory power (RAP) has timed out. When in digital stand by mode, the telematics module is able to perform all remote functions as commanded by a telematics advisor at any time, for a continuous 8 hours. After 8 hours, the telematics module will follow the standard sleep state of 9 minutes off, 1 minute of digital stand by, based on the time of the GPS signals.

In the event the telematics system loses, or is temporarily removed from battery power, the system will remain in the sleep state while the key is in the OFF position. It will not begin to cycle until the vehicle passes into an open outside area with the ignition ON, where a global positioning system (GPS) signal can be acquired, providing a reference for time. The Telematics Call Centre is able to maintain a record of exactly what time each vehicle will enter the one minute low power state by synchronizing their clocks with those of the vehicle, based on GPS signals.

Deactivated Telematics Accounts

In the event a customer has not renewed their telematics account after expiration or the account was never activated, telematics will make a discrete cellular call to the vehicle to deactivate the telematics system. Before taking this action, customers are notified that the telematics system in their vehicle will be deactivated unless they elect to renew the account. After the vehicle has been successfully deactivated, customers will experience the following when attempting to contact telematics from their vehicle:

- During a Telematics Call Centre button press, the customer will be connected to a dedicated sales team who can sell a telematics subscription and reactivate the vehicle. Depending on the type of telematics hardware in the vehicle, the customer may first hear a demonstration message stating there is no current telematics subscription for the vehicle, and directing the customer what to do to activate services.

- During an emergency button press, a demo message will be played indicating the service has been deactivated.

It is of particular note, that when a telematics system is successfully deactivated, it will NOT attempt to connect to the Telematics Call Centre in the event of a collision or if the vehicles front air bags deploy for any other reason.

Certain vehicles that have never had an active telematics account, that have been deactivated, may be unable to establish a connection with the Telematics Call Centre. When normal published diagnostic procedures do not indicate a possible cause for the no connect concern, the vehicle may have been deactivated. For deactivated vehicles, a no connect response should be considered normal operation. Further diagnosis and subsequent repair is only necessary should the customer elect to become an active telematics subscriber.

Video Entertainment System Description and Operation (SWBRHD)

Display Screen

The rear display screen shows video from either DVD movies, or an AUX input device, such as a video game console or camera. The display screen will turn on when pulled down, and automatically turn off when pushed up and closed. Each video screen has a dedicated video signal circuit to the radio.

AUX Inputs

The auxiliary input jack, located in the DVD control panel in the roof pod, contains the socket for the 3.5 mm type AV auxiliary input plug. A number of devices may be plugged into the AUX jacks, including, but not limited to video game consoles, digital cameras, camcorders, or other devices. Audio only devices can also be played through the 3.5 mm auxiliary jack.

3.5 mm type AV cables are needed to connect the auxiliary device to the Auxiliary Input jacks. Refer to the manufacturers instructions for proper connection of your auxiliary device.

To use the auxiliary inputs on the DVD player, connect an external auxiliary device to the 3.5 mm auxiliary input jack and turn both the auxiliary input jack and DVD player power on. If the DVD player was previously in the DVD player mode, you will need to press the MODE button on the DVD player or the DVD remote control. The display will appear on the Video Screen. Pressing the MODE button will toggle the Rear Entertainment between the auxiliary device and the DVD player.

The auxiliary input video format is preset to NTSC. In some cases, the video format may be in PAL system. The DVD player will detect the video format and set the Video Screen automatically.

Rear Seat Entertainment (RSE) (Type D Infotainment System)

The rear seat entertainment (RSE) is integrated into the rear HVAC control module. Audio, video source and speaker control are controlled by the amplifier and infotainment unit through serial data communication. The rear seat entertainment (RSE) system includes an RSE interface module, a DVD player, a video display screen, a DVD control panel, 2 wireless headphones, and a remote control.

Wireless Headphones (Type D Infotainment System)

Wireless headphones are optional and allow for rear seat passengers to use the rear seat entertainment (RSE) functions without disturbing the listening of front seat passengers. The wireless headphones receive audio signals from the infrared (IR) transmitters on the overhead console. This transmission is line of sight only, so audio quality will be degraded if anything blocks the transmitter signal from reaching the headphones.

To use wireless headphones, turn them on using the power button on the headphone earpiece. Adjust volume using the rotary dial.

DTC B1024

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1024 00: Printed Circuit Board (PCB) Temperature Sensor Fault

Circuit/System Description

When the "Service Error/Contact Dealer" indicator illuminates in the DIC, it indicates a fault in the instrument panel cluster (IPC). The "Service Error/Contact Dealer" indicator is displayed until you press the TRIP/RESET switch. The indicator symbol then reverts to the original trip computer display.

"X Service" appears at the bottom of the DIC and remains illuminated until the problem has been rectified.

Conditions for Running DTC

- System voltage is between 9-16 volts.
- Ignition switch is in the ON position.

Conditions for Setting the DTC

- The instrument panel cluster (IPC) operating temperature is below 40 °C or above 85°C
- The IPC has a shorted or open circuit.
- The IPC internal temperature has exceeded the specified operating range.

Action Taken When the DTC Sets

The IPC shuts down or fails to display the correct information.

Conditions for Clearing the DTC

- The DTC becomes history when the condition for setting the DTC is no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Circuit/System Testing

1. Ignition ON, with the scan tool, verify that DTC B1024 is not set.
   If DTC B1024 is set as current, attempt to re-calibrate the IPC.
2. Clear all DTCs using the scan tool, verify that DTC B1024 does not reset.
   If the DTC B1024 is set as current, replace the IPC.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P0461

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0461: Fuel Level Sensor 1 Performance

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Fuel Level Sensor 1 Signal	P0462	1	P0463	P0463	P0461
Fuel Level Sensor 2 Signal	P2067	1	P2068	P2068	P2066
Fuel Level Sensor Low Reference	--	1	P0463, P2068	P0463, P2068	P0461, P2066
1. Fuel Gage Inaccurate or Inoperative					

Circuit/System Description

The primary fuel level sender and the secondary fuel level sender changes resistance based on fuel level. The engine control module (ECM) monitors the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to determine the fuel level. When the fuel tank is full, the resistances of both fuel level senders are low and the ECM senses a low signal voltage on both the signal circuits of the primary fuel level sender and the secondary fuel level sender. When the fuel tanks are empty, the resistances of the fuel level senders are high and the ECM senses a high signal voltage. The ECM uses the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gage.

Conditions for Running the DTC

- The engine is running.
- No fuel level sensor signal failure present.
- The system voltage is between 10-18 volts.

Conditions for Setting the DTC

- The ECM does not detect a change in fuel level in the primary fuel tank of at least 45 percent over a distance of 120 km (75 miles).
- The above condition is present for about 30 seconds.

Action Taken When the DTC Sets

- The fuel gage defaults to empty.
- The low fuel indicator illuminates.
- The ECM records the operating conditions at the time that the diagnostic test fails. The ECM displays the failure information in the Failure Records on the scan tool.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Description and Operation

Instrument Cluster Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Component Testing

1. Ignition OFF, remove the primary fuel level sender and verify there are no obstructions interfering with the fuel level sender.

   If any interference is present, repair the fuel sender interference.

2. Ignition OFF, disconnect the harness connector at the fuel level sensor.
3. While sweeping the primary fuel level sensor through its full range of motion, test for a minimum value less than 41 ohms and a maximum value greater than 119 ohms between signal terminal 2 and the low reference terminal 4.

   If not within the specified range, replace the fuel level sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Primary Fuel Level Sensor Replacement
- Control Module References for ECM replacement, setup, and programming

Fuel Level Sensor Low Reference	--	1	P0463 P2068	P0463 P2068	P0461 P2066
1. Fuel Gage Inaccurate or Inoperative					

Circuit/System Description

The primary fuel level sender and the secondary fuel level sender changes resistance based on fuel level. The engine control module (ECM) monitors the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to determine the fuel level. When the fuel tank is full, the resistances of both fuel level senders are low and the ECM senses a low signal voltage on both the signal circuits of the primary fuel level sender and the secondary fuel level sender. When the fuel tanks are empty, the resistances of the fuel level senders are high and the ECM senses a high signal voltage. The ECM uses the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gage.

Conditions for Running the DTC

- The ignition is ON, with the engine running.
- The system voltage is between 10-18 volts.

Conditions for Setting the DTC

- The primary fuel level signal is about 0.25 volt.
- The above condition is present for about 60 seconds.

Action Taken When the DTC Sets

- The fuel gage defaults to empty.
- The low fuel indicator displays in the IPC.
- The ECM records the operating conditions at the time that the diagnostic test fails. The ECM displays the failure information in the Failure Records on the scan tool.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool Fuel Level Sensor parameter. The reading should be between 0.9 - 2.5 volts.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the primary fuel level sensor.
2. Ignition ON, verify that the scan tool Fuel Level Sensor Right Tank parameter is greater than 4.5 volts.

   If less than the specified range, test the primary signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the ECM.
3. If all circuits test normal, perform the fuel level sensor component test before replacing the primary fuel level sensor.

Component Testing

1. Ignition OFF, remove the primary fuel level sender.
2. While sweeping the primary fuel level sensor through its full range of motion, test for a minimum value less than 41 ohms and a maximum value greater than 119 ohms between signal terminal 2 and the low reference terminal 4.

   If not within the specified range, replace the primary fuel level sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Primary Fuel Level Sensor Replacement
- Control Module References for the ECM replacement, setup, and programming

Circuit/System Verification

Ignition ON, observe the scan tool Fuel Level Sensor parameter. The reading should be between 0.9 - 2.5 volts.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the primary fuel level sensor.
2. Ignition OFF, test for less than 1 ohm between the low reference circuit terminal 4 and ground.

   If greater than the specified range, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, install a 3A fused jumper between the primary signal circuit terminal 2 and the low reference circuit terminal 4. Verify the scan tool Fuel Level Sensor Right Tank parameter is less than 0.4 volts.

   If greater than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
4. If all circuits test normal, perform the fuel level sensor component test before replacing the primary fuel level sensor.

Component Testing

1. Ignition OFF, remove the primary fuel level sensor.
2. While sweeping the primary fuel level sensor through its full range of motion, test for a minimum value less than 41 ohms and a maximum value greater than 119 ohms between signal terminal 2 and the low reference terminal 4.

   If not within the specified range, replace the primary fuel level sensor.

DTC P0521: Engine Oil Pressure (EOP) Sensor Performance

DTC P0522: Engine Oil Pressure (EOP) Sensor Circuit Low Voltage.

DTC P0523: Engine Oil Pressure (EOP) Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Engine Oil Pressure 5-Volt Reference	P0522	1	P0522	P0523	P0521
Engine Oil Pressure Sensor Signal	P0522	1	P0522	P0523	P0521
Low Reference	--	1	P0523	--	P0521
1. Engine Oil Pressure Gage Inaccurate or Inoperative.					

Circuit/System Description

The engine oil pressure (EOP) sensor changes voltage based on the engine oil pressure. The EOP sensor is a 3-wire sensor comprising of the signal circuit, the low reference circuit and the 5-volt reference circuit. The engine control module (ECM) supplies 5 volts to the EOP sensor via the 5-volt reference circuit and provides ground via the EOP low reference circuit. The ECM monitors the signal circuit of the EOP sensor to determine the engine oil pressure sensor voltage is within the normal operating range of approximately 1-4 volts. When the engine oil pressure is high, the EOP sensor voltage is high and the ECM senses a high signal voltage. When the engine oil pressure is low, the EOP sensor voltage is low and the ECM senses a low signal voltage. The ECM sends the EOP information to the instrument panel cluster (IPC) via the serial data circuit.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

P0521

- The engine oil pressure is greater than 880 kPa (127.6 psi) and the engine speed is less than 640 RPM.
- The engine oil pressure is less than 8 kPa (1.16 psi) with the engine speed greater than 1520 RPM, engine oil temperature is between 80°C (176°F) and 110°C (230°F).
- The above condition is present is present for greater than 4 seconds.

P0522

- The ECM detects that the EOP sensor signal circuit is less than 0.2 volt with the engine oil temperature range is between 80°C (176°F) and 110°C (230°F).
- The above condition is present for greater than 10 seconds.

P0523

- The ECM detects that the EOP sensor signal circuit is greater than 4.8 volts with the engine oil temperature range is between 80°C (176°F) and 110°C (230°F).
- The above condition is present for greater than 10 seconds.

Action Taken When the DTC Sets

- The ECM records the operating conditions at the time the diagnostics test fails. The ECM displays this information in the Failure Records on the scan tool.
- The IPC illuminates the EOP indicator.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine running, observe the scan tool Engine Oil Pressure Sensor parameter. The reading should be between 0.2-4.8 volts.
2. Verify the engine oil pressure, refer to Oil Pressure Diagnosis and Testing for the 3.6L engine or Oil Pressure Diagnosis and Testing for the 4.8L, 5.3L, and 6.0L engines.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the engine oil pressure (EOP) sensor.
2. Ignition OFF, test for less than 1 ohm between the low reference circuit terminal 1 and ground.

   If greater than the specified range, test the circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal 2 and ground.

   If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Verify the scan tool Engine Oil Pressure Sensor parameter is less than 0.2 volt.

   If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit tests normal, replace the ECM.
5. Install a 3A fused jumper wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 2. Verify the scan tool Engine Oil Pressure Sensor parameter is greater than 4.8 volts.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
6. If all circuits test normal, test or replace the EOP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Oil Pressure Sensor and/or Switch Replacement for 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engines

Circuit / System Description

The primary fuel level sender and the secondary fuel level sender changes resistance based on fuel level. The engine control module (ECM) monitors the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to determine the fuel level. When the fuel tank is full, the resistances of both fuel level senders are low and the ECM senses a low signal voltage on both the signal circuits of the primary fuel level sender and the secondary fuel level sender. When the fuel tanks are empty, the resistances of the fuel level senders are high and the ECM senses a high signal voltage. The ECM uses the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gage.

Conditions for Running the DTC

- The engine is running.
- No fuel level sensor signal failure present.
- The system voltage is between 10-18 volts.

Conditions for Setting the DTC

- The ECM does not detect a change in fuel level in the secondary fuel tank of at least 45 percent over a distance of 120 km (75 miles).
- The above condition is present for about 30 seconds.

Action Taken When the DTC Sets

- The fuel gage defaults to empty.
- The low fuel indicator illuminates.
- The ECM records the operating conditions at the time that the diagnostic test fails. The ECM displays the failure information in the Failure Records on the scan tool.

Conditions for Clearing the DTC

- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Charge Indicator Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit / System Description

The engine control module (ECM) uses the generator turn ON signal circuit to control the load of the generator on the engine. A high side driver in the ECM applies voltage to the voltage regulator. This signals the voltage regulator to turn the field circuit ON and OFF. The ECM monitors the state of the generator turn ON signal circuit. The ECM should detect low voltage on the generator turn on signal circuit when the ignition is ON and the engine is OFF, or when the charging system malfunctions. With the engine running, the ECM should detect high voltage on the generator turn on signal circuit. The ECM performs key ON and RUN tests to determine the status of the generator turn on signal circuit. If a malfunction is detected the ECM will illuminate the charge indicator in the instrument panel cluster (IPC).

Circuit/System Verification

Important: Before performing this diagnostics, make sure no indicators are illuminated after the IPC performs a lamp test. If any indicators are illuminated after the bulb test, perform the indicator diagnostics before this diagnostics.

1. Ignition ON, headlamp switch OFF, verify the scan tool Headlamp Switch parameter is Inactive.
   If not Inactive, refer to Headlamps Malfunction.
2. Ignition ON, doors closed, verify the scan tool Door Ajar Switch parameter is Door Closed.
   If not Door Closed, refer to Courtesy Lamps Malfunction.
3. Verify that the Key In Ignition Cylinder Switch parameter is Key In when the key is in the ignition and Key Out when the key is out of the ignition.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the key in ignition switch.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition switch fuse is open, test the signal circuit terminal 4 for a short to ground.
3. Verify the BCM scan tool Key In Ignition Cylinder Switch parameter is Key Out.
   If not the specified value, test the signal circuit terminal 4 for a short to voltage. If the circuit tests normal, replace the BCM.
4. Install a 3A fused jumper wire between the signal circuit terminal 4 and the B+ circuit terminal 2. Verify the BCM scan tool Key In Ignition Cylinder Switch parameter is Key In.
   If not the specified value, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the ignition switch.

Low Reference	--	1	P0523	--	P0521
1. Engine Oil Pressure Gage Inaccurate or Inoperative.					

Circuit/System Description

The engine oil pressure (EOP) sensor changes voltage based on the engine oil pressure. The EOP sensor is a 3-wire sensor comprising of the signal circuit, the low reference circuit and the 5-volt reference circuit. The engine control module (ECM) supplies 5 volts to the EOP sensor via the 5-volt reference circuit and provides ground via the EOP low reference circuit. The ECM monitors the signal circuit of the EOP sensor to determine the engine oil pressure sensor voltage is within the normal operating range of approximately 1-4 volts. When the engine oil pressure is high, the EOP sensor voltage is high and the ECM senses a high signal voltage. When the engine oil pressure is low, the EOP sensor voltage is low and the ECM senses a low signal voltage. The ECM sends the EOP information to the instrument panel cluster (IPC) via the serial data circuit.

Control Module References for scan tool information

Circuit/System Verification

1. Engine running, observe the scan tool Engine Oil Pressure Sensor parameter. The reading should be between 0.2-4.8 volts.
2. Verify the engine oil pressure, refer to:
   - Oil Pressure Diagnosis and Testing for the 2.8L, 3.0L, 3.2L or 3.6L engine
   - Oil Pressure Diagnosis and Testing for the 4.8L, 5.3L, and 6.0L engines.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the engine oil pressure (EOP) sensor.
2. Ignition OFF, test for less than 1 ohm between the low reference circuit terminal 1 and ground.

   If greater than the specified range, test the circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal 2 and ground.

   If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Verify the scan tool Engine Oil Pressure Sensor parameter is less than 0.2 volt.

   If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit tests normal, replace the ECM.
5. Install a 3A fused jumper wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 2. Verify the scan tool Engine Oil Pressure Sensor parameter is greater than 4.8 volts.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

6. Ignition ON, perform the IPC displays test with the scan tool and verify the EOP indicator turns OFF when commanded.

   If the EOP indicator does not turn OFF, replace the IPC.
7. If all circuits test normal, test or replace the EOP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Oil Pressure Sensor and/or Switch Replacement for 4.8L, 5.3L, 6.0L, 6.2L, or 7.0L engines
- Engine Oil Pressure Sensor and/or Switch Replacement for 3.6L engine
- Control Module References for ECM replacement, setup and programming

Fuel Gage Inaccurate or Inoperative

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Fuel Level Sensor 1 Signal	P0462	1	P0463	P0463	P0461
Fuel Level Sensor 2 Signal	P2067	1	P2068	P2068	P2066
Fuel Level Sensor Low Reference	--	1	P0463 P2068	P0463 P2068	P0461 P2066
1. Fuel Gage Inaccurate or Inoperative					

Circuit/System Description

The primary fuel level sender and the secondary fuel level sender changes resistance based on fuel level. The engine control module (ECM) monitors the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to determine the fuel level. When the fuel tank is full, the resistances of both fuel level senders are low and the ECM senses a low signal voltage on both the signal circuits of the primary fuel level sender and the secondary fuel level sender. When the fuel tanks are empty, the resistances of the fuel level senders are high and the ECM senses a high signal voltage. The ECM uses the signal circuits of the primary fuel level sender and the secondary fuel level sender in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data circuit to the instrument cluster in order to control the fuel gage.

Special Tools

J 33431-C Instrument Panel Tester

Circuit/System Verification

Ignition ON, observe the scan tool Fuel Level Sensor parameter. The reading should be between 0.9 - 2.5 volts.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the primary and secondary fuel level sensors.
2. Ignition OFF, test for less than 1 ohm between the primary low reference circuit terminal 4 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuits tests normal, replace the ECM.
3. Ignition OFF, test for less than 1 ohm between the secondary low reference circuit terminal 1 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuits tests normal, replace the ECM.
4. Jumper the primary signal circuit terminal 2 to the secondary signal circuit terminal 2. Install a Signal Generator and Instrument Panel Tester between the jumped signal circuits and the low reference circuit terminal.
5. Ignition ON, vary the signal generator resistance between 40 and 250 ohms. Verify that the scan tool Fuel Tank Level Remaining parameter displays a range that varies between 5 and 95 percent as the signal generator resistance changes.

   If not displaying the specified range, test both signal circuits for an open/high resistance. If the circuits test normal, replace the ECM.
6. Vary the signal generator resistance between 40 and 250 ohms. Verify that the fuel gage displays a range that varies between empty and full as the signal generator resistance changes.

   If the fuel gage is incorrect, replace the IPC.
7. If all circuits test normal, perform the fuel level sensor component test before replacing

either the primary or secondary fuel level sensor.

Component Testing

1. Ignition OFF, remove primary and secondary fuel level senders.
2. While sweeping the primary fuel level sensor through its full range of motion, test for a minimum value less than 41 ohms and a maximum value greater than 119 ohms between signal terminal 2 and the low reference terminal 4.

   If not within the specified range, replace the primary fuel level sensor.
3. While sweeping the secondary fuel level sensor through its full range of motion, test for a minimum value less than 41 ohms and a maximum value greater than 119 ohms between signal terminal 2 and the low reference terminal 1.

   If not within the specified range, replace the secondary fuel level sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Primary Fuel Level Sensor Replacement
- Secondary Fuel Tank Module Replacement
- Control Module References for ECM and IPC replacement, setup, and programming

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Important: If the suspect gage is the speedometer, the drive wheels of the vehicle must be raised and the transmission must be placed in drive or first gear. Refer to Lifting and Jacking the Vehicle.

1. Ignition ON and the scan tool installed, perform the IPC Gage Sweep Test in the IPC Output

Controls. Verify that all gage dials move from minimum to the maximum value and back to the gage minimum value.

If the gages do not perform the IPC Gage Sweep Test, replace the IPC.

2. Start the engine with the vehicle drive wheels raised and place the transmission in drive or first gear. Verify that the speedometer value matches the scan tool Vehicle Speed parameter in the ECM Engine Data List.

   If the speedometer is incorrect, test or replace the IPC.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for the IPC replacement, setup and programming

Symptoms - Displays and Gages

Important: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle , before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data circuit.
2. Review the system operation in order to familiarise yourself with the system functions. Refer to the following procedures:
   - Instrument Cluster Description and Operation.
   - Indicator/Warning Message Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the instrument panel cluster (IPC). Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for the correct fluid levels.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following lists in order to diagnose the symptom:

Gauges and Odometer

- Fuel Gage Inaccurate or Inoperative
- Instrument Cluster Gages Inoperative

Indicators

- ABS Indicator Malfunction
- Air Bag Indicator Circuit Malfunction
- Brake Warning Indicator Malfunction
- Charge Indicator Malfunction
- Courtesy Lamps Malfunction

- Cruise Control Indicator Inoperative
- Door Ajar Indicator Malfunction
- Daytime Running Lamps Malfunction
- Engine Oil Pressure Indicator Malfunction
- Front Fog Lamps Malfunction
- Headlamps Malfunction
- Malfunction Indicator Lamp (MIL) Diagnosis for the 4.8L, 5.3L, 6.0L, 6.2L or 7.0L engine
- Park, License, and/or Tail Lamps Malfunction
- Rear Fog Lamps Malfunction
- Seat Belt Indicator Circuit Malfunction
- Security Indicator Malfunction
- StabiliTrak Indicator Malfunction
- Trailer Lamps Malfunction
- Turn Signal Lamps and/or Indicators Malfunction

Audible Warnings

Chime Malfunction

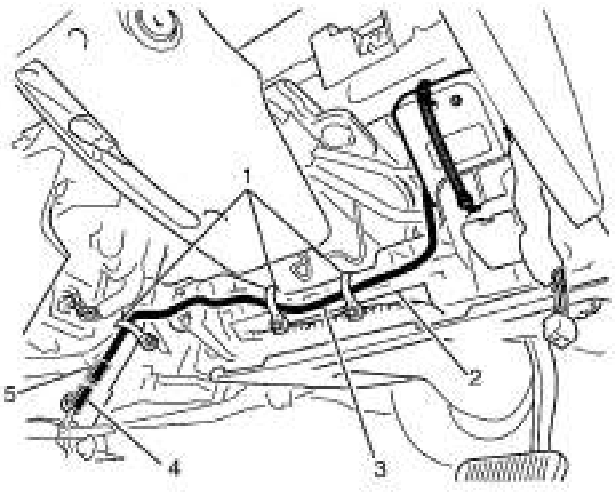
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Displays and Gages | Repair Instructions | **Document ID: 2026359**

Speedometer Adapter Replacement

Removal Procedure

Caution: Refer to Battery Disconnect Caution in the Preface section.

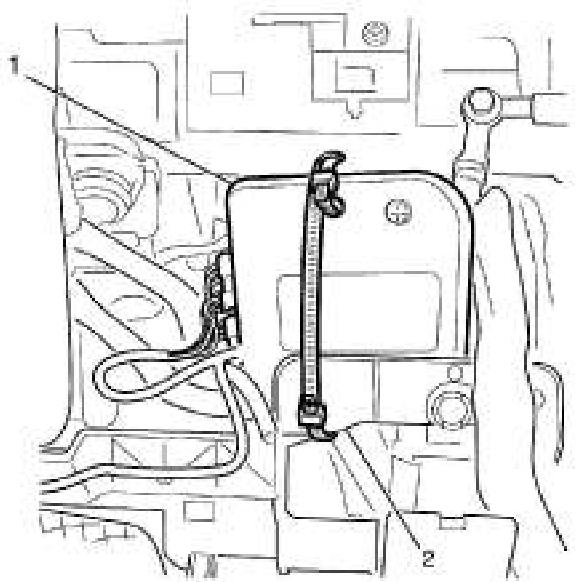
1. Disconnect the battery negative cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove the instrument panel (I/P) outer trim cover Refer to Instrument Panel Outer Trim Cover Replacement.
3. Remove the knee bolster. Refer to Knee Bolster Replacement.
4. Remove the instrument panel extension. Refer to Instrument Panel Extension Replacement.



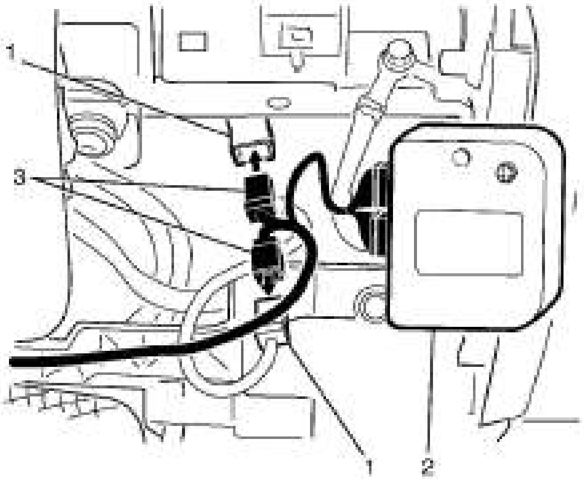
Important: Using a suitable tool, remove the cable ties (1) from the from the I/P lower support brace (2).

Important: Cable ties are a single use item.

5. Detach the vehicle speed interface module (VSIM) wiring harness (3).
6. Disconnect the vehicle speed interface module (VSIM) electrical connector (5) from the main wiring harness connector (4).

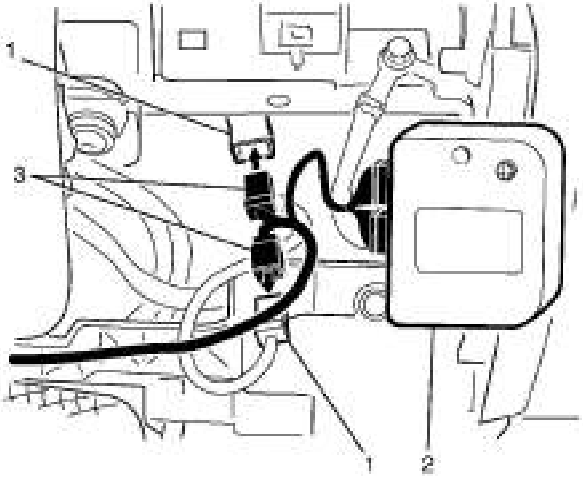


7. Remove the vehicle speed interface module (VSIM) (1) from the I/P beam and the lower fascia support (2).

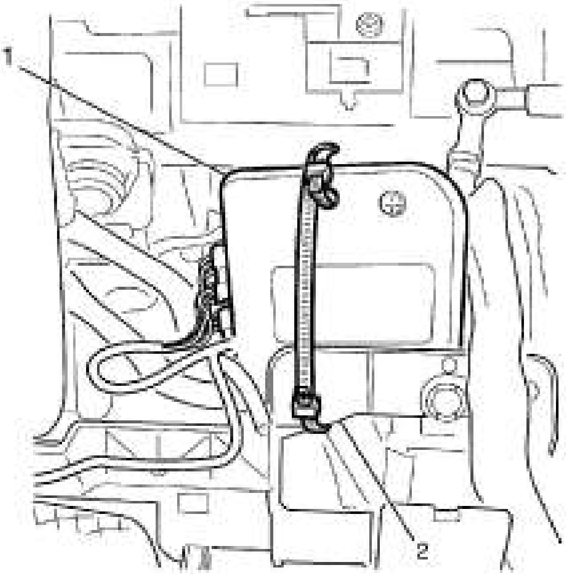


8. Disconnect the vehicle speed interface module (VSIM) (2) electrical connectors (3) from the steering wheel angle sensor (1).
9. Remove the vehicle speed interface module (VSIM) (2) from the vehicle.

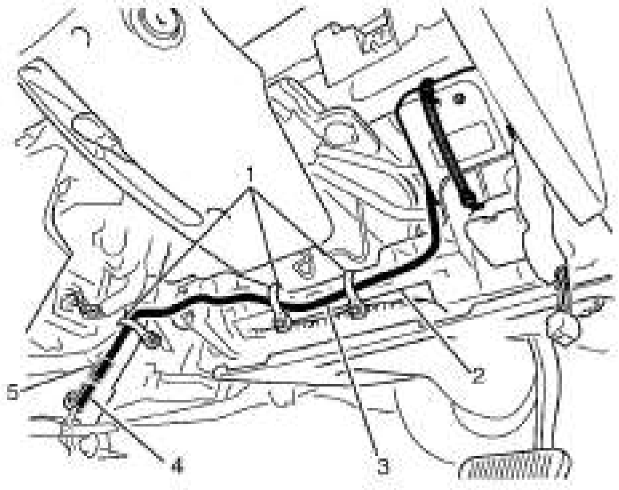
Installation Procedure



1. Connect the vehicle speed interface module (VSIM) (2) electrical connectors (3) to the steering wheel angle sensor (1).



2. Install and secure the vehicle speed interface module (VSIM) (1) to the I/P beam and the lower fascia support (2), using NEW cable ties.



3. Connect the vehicle speed interface module (VSIM) electrical connector (5) to the main wiring harness connector (4).

   Important: Cable ties are a single use item.

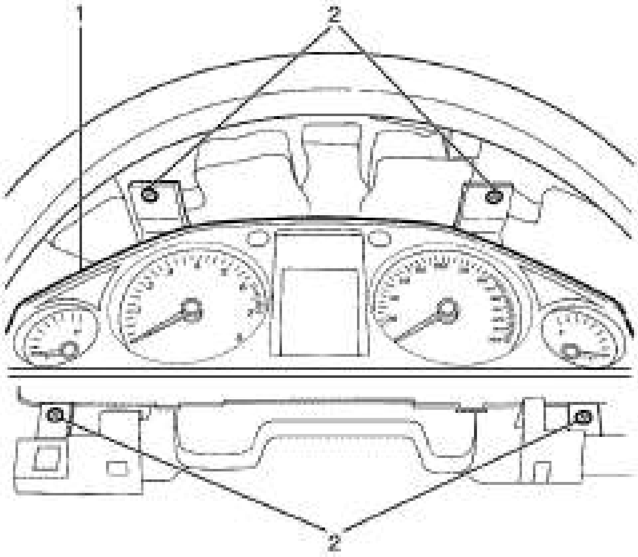
4. Attach the vehicle speed interface module (VSIM) wiring harness (3) to the I/P lower support brace (2), using NEW cable ties (1).
5. Install the instrument panel extension. Refer to Instrument Panel Extension Replacement.
6. Install the knee bolster. Refer to Knee Bolster Replacement.
7. Install the instrument panel (I/P) outer trim cover Refer to Instrument Panel Outer Trim Cover Replacement.
8. Connect the battery negative cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.

Instrument Cluster Replacement (SWB)

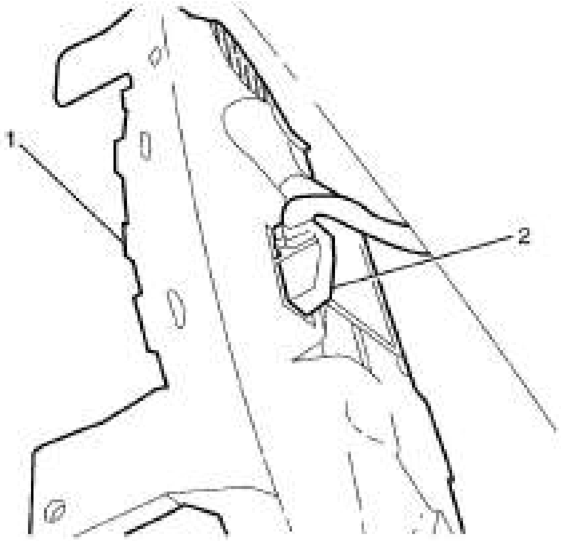
Removal Procedure

Important: If the IPC is being replaced due to mechanical damage only, store the data on Tech 2 so the new IPC can be relearned using the stored info on the Tech 2.

1. Remove the knee Bolster. Refer to Knee Bolster Replacement.
2. Remove the upper steering wheel cover. Refer to Steering Column Trim Covers Replacement.
3. Remove the instrument cluster trim panel. Refer to Instrument Cluster Trim Panel Replacement.
4. Lower the steering column.



5. Remove the instrument cluster (1) to I/P trim pad retaining screws (2).
6. Carefully remove the instrument cluster (1) from the instrument panel trim pad.

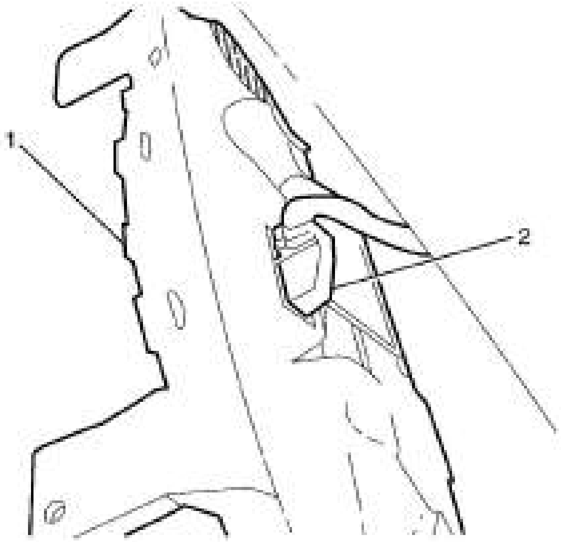


7. Disconnect the instrument cluster (1) electrical connector (2).

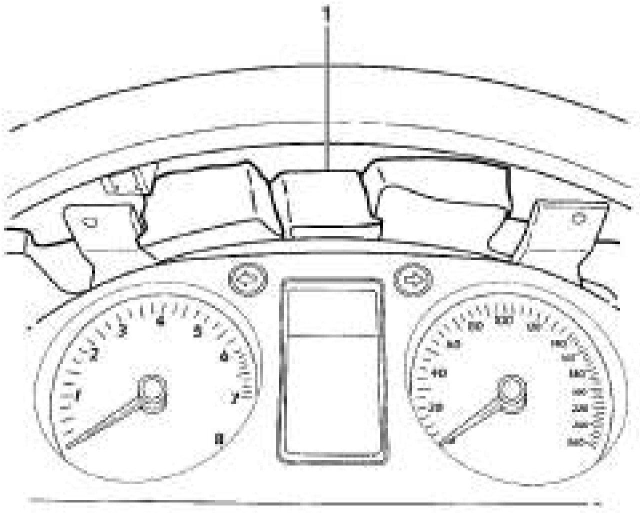
   Important: When removing the instrument cluster, take care not scratch or damage the instrument cluster screen.

8. Remove the instrument cluster (1).

Installation Procedure



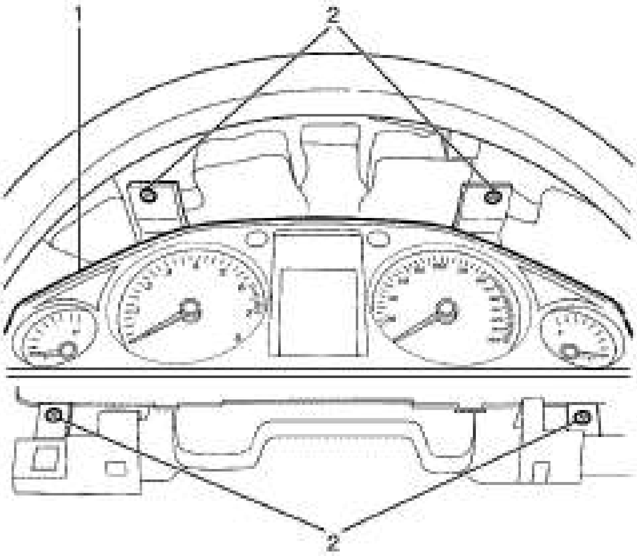
1. Connect the electrical connector (2) to the Instrument cluster (1).



Important: When installing the instrument cluster, make sure the anti-rattle foam (1) is between the I/P trim pad and instrument cluster.

2. Install the instrument cluster.

Notice: Refer to Fastener Notice in the Preface section.



3. Install the instrument cluster (1) retaining screws (2).

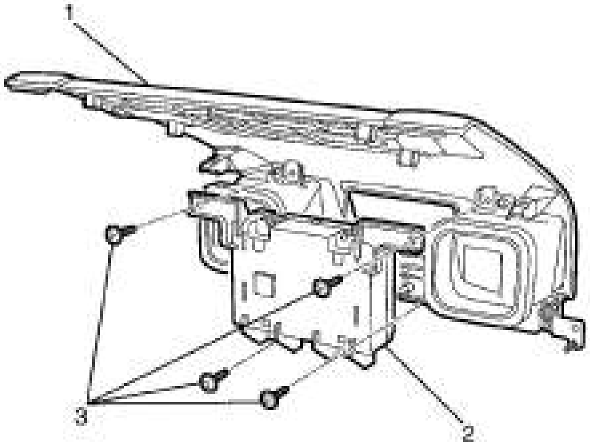
Tighten
Tighten the screws (2) to 2 N·m (18 lb in).

4. Install the instrument panel (I/P) trim panel. Refer to Instrument Cluster Trim Panel Replacement.
5. Install the steering wheel upper trim cover. Refer to Steering Column Trim Covers Replacement.
6. Install the knee bolster. Refer to Knee Bolster Replacement.
7. Re-programme the instrument cluster. Refer to Instrument Cluster Programming and Setup.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Displays and Gages | Repair Instructions | **Document ID: 2007293**

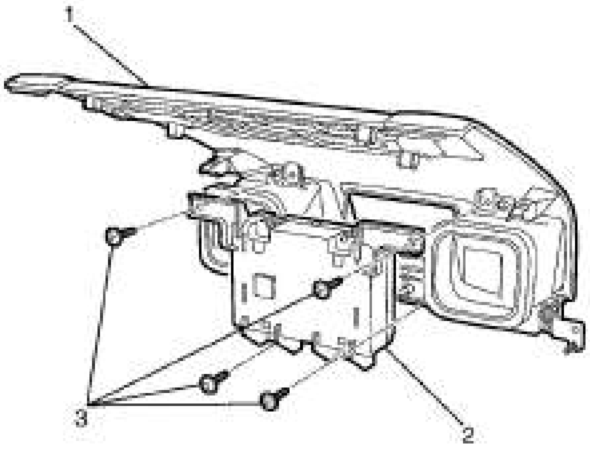
Secondary Driver Information Display Replacement (Base)

Removal Procedure



1. Remove the instrument panel (I/P) upper trim panel assembly. Refer to Instrument Panel Center Trim Panel Replacement.
2. Remove the secondary information centre (SIC) display to I/P upper trim panel assembly retaining screws (3).
3. Remove the SIC display (2) from the I/P upper trim panel assembly (1).

Installation Procedure



1. Install the SIC display (2) to the I/P upper trim panel assembly (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the SIC display to I/P upper trim panel assembly retaining screws (3).

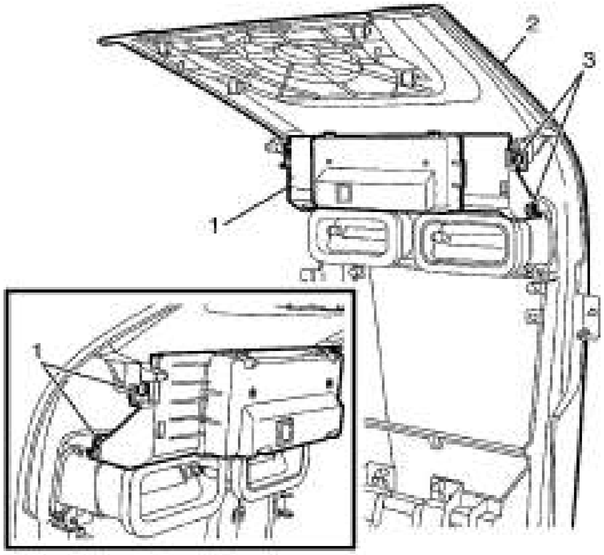
   Tighten
   Tighten the screws to 2 N·m (18 lb in).

3. Install the I/P upper trim panel assembly. Refer to Instrument Panel Center Trim Panel Replacement.
4. For programming and setup, refer to Control Module References.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Displays and Gages | Repair Instructions | **Document ID: 2133651**

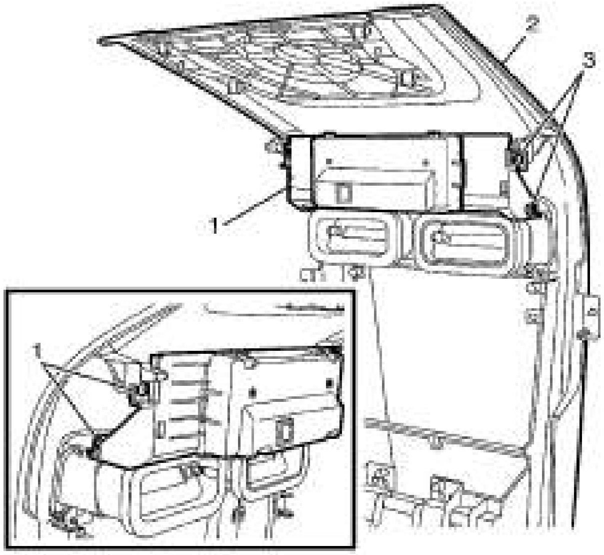
Secondary Driver Information Display Replacement (Sport)

Removal Procedure



1. Remove the instrument panel (I/P) centre trim panel assembly. Refer to Instrument Panel Center Trim Panel Replacement.
2. Remove the secondary information centre (SIC) display to I/P centre trim panel assembly retaining screws (1).
3. Remove the SIC display (2) from the I/P centre trim panel assembly (3).

Installation Procedure



1. Install the SIC display (2) to the I/P centre trim panel assembly (3).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the SIC display to I/P upper trim panel assembly retaining screws (1).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).

3. Install the I/P centre trim panel assembly. Refer to Instrument Panel Center Trim Panel Replacement.
4. For programming and setup, refer to Control Module References.

Audible Warnings Description and Operation

Audible warnings alert the driver of a vehicle to a fault or failure in the vehicle operating systems. Audible warnings are also used to reinforce functions performed and information displayed in the multi function display (MFD) of the Instrument Panel Cluster (IPC). The audible warnings are generated by the (IPC) and sound via an internal speaker. The IPC receives requests for audible warnings from various control systems in the vehicle over the GMLAN network. If the IPC receives multiple audible warning requests, the audible warning with the highest priority will sound. The IPC issues audible warnings to reinforce the following conditions:

- A warning indicator or multi function display (MFD) animation is present on the IPC
- A MFD menu selection is made
- Reminder or programmed threshold is confirmed
- A system function check is performed

Each audible warning has a defined frequency, duration, decay and cycle repeat. The following lists the types of audible warnings:

- Overspeed Chime
- Underspeed Chime
- Reminder Chime
- General Warning Chime
- Confirmation Beep Chime

There are two types of audible warning chimes:

- Internal audible warnings which the IPC generates in order to reinforce a certain vehicle condition associated with an IPC indicator or MFD display.
- External Chimes which the IPC generates in response to a requests received via the GMLAN network from other control systems in the vehicle.

The following IPC indicators and MFD displays will generate an audible warning:

- Low fuel
- Very low fuel
- Low oil level
- Low oil pressure
- Low coolant
- Brake fail (low fluid)
- Park brake reminder
- ABS fault
- MIL (malfunction indicator lamp)
- Alternator fault

- Battery saver mode ON
- Reset service reminder
- Airbag fault
- Seat belt reminder (Driver)
- Safety mode active
- Turn Indicator (click-clack sound)
- Hazard (click-clack sound)
- Reduced engine power
- Overspeed warning
- Service vehicle soon
- Engine temperature hot
- Engine immobilised
- Transmission hot - idle engine
- Contact dealer
- Replace battery in remote
- Check engine
- Service reminder
- Front park assist
- Tyre pressure system fault
- Check tyre pressure
- Automatic headlight levelling failed
- Low washer fluid (Caprice only)

Driver Information Center (DIC) Description and Operation

The driver information center (DIC) displays the DIC Welcome message for 5 seconds when it first powers up. The DIC then returns to the last display status before no power condition.

There are 3 button functions for the DIC.

- Customisation
- Set/Reset
- Trip/Fuel

Trip / Fuel

Cycle through the following vehicle parameters by pressing the TRIP button.

- Average Fuel Economy (AFE)
- Average Vehicle Speed (AVS)
- Fuel Range
- Fuel Used
- Instantaneous Fuel Economy (IFE)
- Odometer
- Trip A
- Trip B
- Trip Time

Customisation

The Customisation Menu is used to set features for both the vehicle and the driver. Many of the parameters in the Trip/Fuel menu can be programmed.

- Security
- Lighting
- Trip Computer
- Radio Display
- TPMS
- Language
- Park Assist
- Navigation

Average Fuel Economy

Average fuel economy is calculated using the equation: AFE = Distance/Fuel

- Distance = The accumulated distance travelled since the last reset of this value
- Fuel = The accumulated fuel consumption since the last reset of this value

The engine control module (ECM) sends the average fuel economy GMLAN message to the instrument panel cluster (IPC). The value of this mode is retained during ignition OFF.

Average Speed

Average speed is calculated using the equation: Average Speed = AVS Distance/AVS Time

- Distance = The accumulated distance travelled since the last reset of this value
- Ignition On = The accumulated ignition on time since the last reset of this value

Fuel Range

This message indicates the estimated distance that the vehicle can travel under the current fuel economy and fuel level conditions since the last battery connection to the IPC. Fuel Range is calculated using the equation: Fuel Range = Range Distance/Range Fuel Used.

- Range Distance = The accumulated distance travelled since the last reset of this value.
- Fuel Used = The accumulated fuel delivered since the last reset of this value

The ECM sends the fuel range value to the IPC. The IPC receives a GMLAN message with fuel information. The fuel range value is retained during ignition OFF. The Fuel Range display cannot be reset. LOW is displayed when fuel range is below a predetermined value.

Fuel Used

The DIC calculates and displays the total amount of fuel used since the last reset operation. You can reset the fuel used mode by depressing and holding the ENTER button for more than 3 seconds. The value of this mode is retained during ignition OFF.

Instantaneous Fuel Economy (IFE)

Instantaneous fuel economy (IFE) is calculated using the equation: IFE = Distance/Fuel Used.

- Distance = The accumulated distance travelled for the last 2 seconds
- Fuel = The accumulated fuel delivered for the last 2 seconds

The IPC receives a GMLAN message from the ECM. The distance information is calculated by the IPC using the vehicle speed information from the ECM. These values are retained during ignition OFF. The IFE display cannot be reset.

Tire Pressure Monitoring System

The IPC receives a GMLAN message from the tire pressure monitoring system (TPMS) for front and rear tire pressure data. The DIC will display the pressure for each of the front and rear tires. When a tire with low air pressure is present, the DIC displays XXXX XXXX TIRE PRESSURE LOW.

Trip Time

The timer records elapsed time starting from activation. When the DIC displays the timer, pressing the ENTER button for 1 second on the DIC resets the timer. Pressing the ENTER button on the DIC switch for approximately 1 second starts and stops the timer. The DIC displays the timer in one of the following formats:

The DIC displays the timer in the following format: HH: MM:SS

The (HH) represents hours elapsed, (MM) represents minutes elapsed, and (SS) represents seconds elapsed. The maximum range of the timer is 99 hours, 59 minutes, and 59 seconds. After the maximum range is reached, the timer displays all zeros (00:00:00).

Fuel Display

Parameter	Update Rate	Range	Reset Value	Units
Average Fuel Economy	1 second	0.0-99.9	99.9	L/100 KM
Instant Fuel Economy	2 seconds	0-70	N/A	L/100 KM
Fuel Range	1 second	0-999	N/A	KM
Fuel Used	1 second	0-999.9	0.0	L

Language

The driver information centre (DIC) is capable of displaying in 2 languages

- English
- Portuguese

Driver Information Display Description and Operation

Driver Information Display Description and Operation

The driver information display processes various input signals and displays the relative information on the driver information display screen.

Vehicles equipped with UT3 Audio System

The driver information display provides several on-screen menus, which may be used to select preferences or to make adjustments. Under normal operating conditions the driver information display will display:

- A digital clock displaying the time.
- The current radio station frequency selected.
- Whether or not a CD is inserted in the audio system.

The following audio system messages may be displayed on the driver information display screen:

- Security Lockout Active: This message is displayed when the coded security system has been activated.
- ERR: This message is displayed when the audio system is unable to play the inserted cassette or CD.
- LOC: This message is displayed when the audio system has entered theft mode.
- CAL/CAL ERR: This message is displayed when the audio system has detected an invalid calibration.
- CHECK CD: This message is displayed when the audio system encounters a tracking error.
- NO DISC: This message is displayed when there is no CD discs inserted in the audio system.
- NONE: This message is displayed when the audio system cannot detect the vehicle speed data from GMLAN.

Perform the appropriate diagnostic procedures when an error message is displayed.

Vehicles equipped with UWP Audio System

The driver information display, displays a digital voltage gauge and a digital oil pressure gauge on the display screen.

Voltage Gauge Display

The driver information display processes input signals and displays the current vehicle's electrical system voltage value in the form of a bar graph on the driver information display screen. Under normal operating conditions, the voltage gauge should display between 13.8 - 15.4 volts.

Oil Pressure Gauge Display

The driver information display processes input signals and displays the current vehicle's engine oil pressure value in the form of a bar graph on the driver information display screen. Under normal operating conditions, the oil pressure gauge should display a minimum oil pressure of 74 kPa/10 psi at idle speed and a maximum oil pressure of 377 kPa/54 psi at 2,000 RPM.

Engineering Mode Description and Operation

Engineering Mode enables some instrument identification and current status information to be displayed on the Mutli-function Display (MFD). It also provides an Instrument Self Test function. Engineering mode is entered, by switching the ignition on while pressing the ENTER button.

Engineering Mode is exited by switching off the ignition or pressing the TRIP button.

While in Engineering Mode, if one or more warnings occur they will interrupt the current display.

After all warnings have been acknowledged with the ENTER button, the previous Diagnostic Display screen is restored. Minimised Warning icons will not be shown whilst Engineering Mode is active.

Navigation through the Engineering Mode menu items is via the Up/Down scroll wheel on the steering wheel.

The sequence of displays is as follows:

- Software Version
- GM Part Number
- Battery Voltage
- Remaining Fuel (Lts)
- Instantaneous Fuel (Lts)
- Coolant Temperature
- Speed (km/h)
- Tacho (rpm)
- Tyre Pressure
- Engine Oil Life (%)
- Park Lamps (on/off)
- Steering Wheel Switch Voltage
- Display of Gears (commanded)
- Throttle Position Requested (pedal %)
- Transmission Sump Temperature (°C)
- Self Test

Driver Information Centre Warning Messages

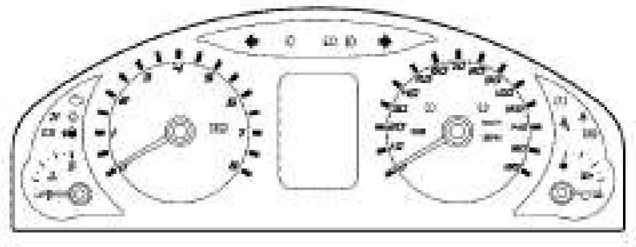
Symbol	Description
ABS FAULT	ABS Description and Operation
BRAKE	Brake Warning System Description and Operation
PARK BRAKE	Brake Warning System Description and Operation
ALTERNATOR/CHARGING SYSTEM	Charging System Description and Operation
CHECK OIL PRESSURE/OIL LEVEL	The low oil pressure/oil level warning occurs when a low engine oil pressure and/or a low engine oil level concern is detected by the ECM.
ENGINE TEMP (Temperature) HOT	Cooling System Description and Operation
AIR BAG FAULT	SIR System Description and Operation
OVER SPEED	The overspeed warning displays when the BCM detects that the vehicle speed has exceeded the selected value the driver had preset. The IPC then displays the overspeed warning on the DIC. The general warning chime sounds when active.
STABILITY CONTROL ASSISTANCE/STABILITY CONTROL OFF	ABS Description and Operation
LOW FUEL	The low fuel message displays when the IPC determines that the fuel level is less than 12 percent.
VERY LOW FUEL	The very low fuel message displays when the IPC determines that the fuel level is less than 0 percent. This occurs when the fuel level in the tank is lower than the minimum level the sender can read. The IPC receives a message indicating the fuel level from the ECM and displays the very low fuel message on the DIC.
SPORT SHIFT	The sport shift message displays when the BCM detects that the shifter assembly has been moved to enable sport shift mode. The BCM sends this information to the IPC via a serial

	data message.
NORMAL SHIFT	The normal shift message displays when the BCM detects that the shifter assembly has been returned to D. The BCM sends this information to the IPC via a serial data message.
SERVICE	The service error message displays when an IPC concern usually relating to a loss of communications is present.
SERVICE CHARGING SYSTEM	Charging System Description and Operation
REPLACE BATTERY IN REMOTE KEY	Keyless Entry System Description and Operation
CHECK ENGINE	• Engine Control Module Description for the 2.8L, 3.0L, 3.2L or 3.6L engine • Engine Control Module Description for the 4.8L, 5.3L, 6.0L, 6.2L or 7.0L engine
SAFETY MODE ACTIVE AND POWER REDUCED	• Transmission Indicators and Messages • Transmission Indicators and Messages
SERVICE VEHICLE SOON	The service vehicle soon message displays when a non emissions related concern is detected by the BCM. The IPC displays the service vehicle soon message on the DIC. The general warning chime sounds when the warning is active.
SERVICE ENGINE OIL	This message displays when the ECM determines that the engine oil life is below 5 percent. The ECM sends the information to the IPC via a serial data message. After the oil is changed, reset the engine oil monitor. Refer to GM Oil Life System Resetting
CRUISE CONTROL ON/ACTIVE/INACTIVE/OFF	Cruise Control Description and Operation
ENGINE IMMOBILISED	Refer to the Owner's Manual
BATTERY SAVER MODE ON	Charging System Description and Operation
REST REMINDER	The rest reminder message displays after two hours of continuous driving. When the ignition is switched to the ON position, a timer in the IPC starts counting. After two hours of continuous driving, the IPC displays the rest reminder message on the DIC.
TIRE PRESSURE SYSTEM FAULT	Tire Pressure Monitor Description and Operation

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Driver Information and Entertainment | Displays and Gages | Description and Operation | **Document ID: 2187253**

Instrument Cluster Description and Operation

System Overview



The Instrument Panel Cluster (IPC) contains one driver information center (DIC) and provides visual information to the driver for a number of vehicle functions such as trip computer, audio functions, warnings and reminders.

When the ignition is switched to the ON position, a vehicle system check is performed and the status is shown on the DIC.

A number of IPC features will be tested in order to verify the features are working correctly. The following occurs at key ON.

- The supplementary restraint system warning lamp illuminates briefly (not IPC controlled).
- The anti-lock brake system (ABS) warning lamp illuminates briefly.
- The charging system warning lamp illuminates briefly.
- The brake warning lamp illuminates briefly.
- The malfunction indicator lamp (MIL) illuminates until the engine is running (not IPC controlled).
- The seat belt warning lamp will stay illuminated until the driver seat belt is latched (not IPC controlled).

If there are no warnings or service reminders the DIC shows a series of welcome screens. If the system check detects a problem, the DIC displays the appropriate warning immediately. If a warning is displayed, press the TRIP button to acknowledge it (once for each warning). The DIC then reverts to the original trip computer display.

- Pressing the TRIP button any time during the system check causes the DIC to jump ahead to the last trip computer screen displayed before the ignition was last switched off. The system check continues to run in the background
- To display the odometer screen, if not already displayed on the DIC, press the TRIP button until the screen appears

When the ignition is in the OFF position, the odometer appears on the DIC, unless a service reminder is active. Active service reminders will be displayed on the DIC for 10 seconds before reverting back to the odometer for a short period of time and then turning off completely. The odometer will be displayed on the DIC again when the drivers door is opened.

Engine Coolant Temperature Gauge

The IPC displays the engine coolant temperature as determined by the engine control module (ECM). The IPC receives a GMLAN message from the ECM indicating the engine coolant temperature. The IPC engine coolant temperature gauge only displays coolant temperatures greater than 60°C. The engine coolant temperature gauge defaults to 60°C or below if:

- The ECM detects a malfunction in the engine coolant temperature sensor circuit.
- The IPC detects a loss of GMLAN communications with the ECM.
- The body control module (BCM) detects a loss of GMLAN communications with the ECM.

Fuel Gauge

The IPC displays the fuel level as determined by the ECM. The IPC receives a GMLAN message from the ECM indicating the fuel level percent. The fuel gauge defaults to empty if:

- The ECM detects a malfunction in the fuel level sensor circuit.
- The IPC detects a loss of GMLAN communications with the ECM.
- When there is little or no fuel in the tank.

When the fuel level is less than a pre-determined value, the low fuel or very low fuel indicators illuminate on the DIC.

Odometer

The IPC contains an odometer and trip odometer. Momentarily press the TRIP button on the steering wheel in order to toggle between the odometer and the trip odometer. Press the ENTER button for approximately 4 seconds, while the trip odometer is displayed on the DIC, in order to reset the trip odometer. If the ENTER button is pressed for less than 4 seconds, all trip information is cleared. The IPC calculates the distance travelled based on the GMLAN vehicle speed information from the ECM. The DIC will display 'error' if an internal IPC memory failure is detected.

PRNDL Display

The IPC displays the selected gear position as determined by the ECM.The IPC receives a GMLAN message from the BCM indicating the gear position. If the BCM detects a malfunction in the transmission range switch where vehicle speed is continually greater than the indicated gear position's capability, the PRNDL display on the DIC will display the letter P. The PRNDL display on the DIC can also blank if:

- The IPC detects a loss of GMLAN communications with the BCM or ECM.
- The ECM detects a malfunction in the transmission range switch circuit.

Speedometer

The IPC displays the vehicle speed as determined by the ECM. The IPC calculates the kilometres based on the GMLAN vehicle speed information from the BCM. The speedometer defaults to 0 km/h if the IPC detects a loss of GMLAN communications with both the ECM.

- The ECM detects a mulfunction in the vehicle speed sensor.
- The IPC detects a loss of GMLAN communications from the BCM or ECM.

Tachometer

The IPC displays the engine speed as determined by the ECM. The IPC receives a GMLAN message from the BCM indicating the engine speed. The tachometer will default to 0 RPM if:

- The ECM detects a malfunction in the engine speed sensor.
- The IPC detects a loss of GMLAN communications from the BCM or ECM.

Diagnostic Starting Point - Secondary and Configurable Customer Controls

Begin the system diagnosis with the Diagnostic System Check - Vehicle . The Diagnostic System Check - Vehicle will provide the following information:

- The identification of the control modules which command the system
- The ability of the control modules to communicate through the serial data circuit
- The identification of any stored DTCs and their status

The use of the Diagnostic System Check - Vehicle will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B1529

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B1529 00: Control Module Voltage Reference Output 5 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
BCM B+ Terminal 3	B1529 00, B3794 08, B3922 00	B1529 00, B3794 08, B3922 00	--	--
BCM B+ Terminal 17	B1529 00, B3794 08, B3922 00	B1529 00, B3794 08, B3922 00	--	--

Circuit/System Description

The body control module (BCM) provides battery voltage to the cruise control switch and the automatic transmission shift lever.

Conditions for Running the DTC

- The ignition is ON.
- The battery voltage is between 9 - 16 volts.

Conditions for Setting the DTC

- The BCM detects a short to ground or an open on the B+ circuit.
- The above condition is met for 5 seconds.

Action Taken When the DTC Sets

The BCM stores the DTC information into memory when the diagnostic runs and fails.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC clears after 40 fault-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the X3 harness connector at the BCM.
2. Verify that a test lamp illuminates between the BCM F9 fuse B+ circuit terminal 3 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Ignition OFF, connect the X3 harness connector at the BCM.
4. Disconnect the harness connector at the turn signal/multifunction switch.
5. Ignition ON, test for B+ between the B+ circuit terminal 6 and ground.

   If less than the specified value, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
6. If all circuits test normal, test or replace the turn signal/multifunction switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the steering wheel switch assembly.

2. Test for 0.5-O.L. ohms between the scroll wheel terminals listed below, while rotating each steering wheel scroll wheel several times through its full range of motion.
   - right steering wheel scroll wheel terminal 1 and terminal 2.
   - left steering wheel scroll wheel terminal 3 and terminal 4.

   If not within the specified range or is erratic, replace the steering wheel switch.
3. Test the resistance between the signal terminal 6 and the low reference terminal 5 while depressing the appropriate steering wheel controls switch button listed below.

   If not the specified value, replace the steering wheel switch.

Function Switch	**Minimum Resistance Value**	**Maximum Resistance Value**
Mute	98 Ohm	104 Ohm
Phone/Talk	247 Ohm	253 Ohm
Disc Change	426 Ohm	434 Ohm
Audio	646 Ohm	653 Ohm
Trip	975 Ohm	983 Ohm
Call End	3.73k Ohm	3.79k Ohm
No Switch Pressed	7.01k Ohm.	7.30k Ohm.

Repair Instructions

Perform the Diagnostic Repair Verification.

DTC B2815

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B2815 04: Steering Wheel Switch Open Circuit

DTC B2815 59: Steering Wheel Switch Stuck

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Steering Wheel Controls Signal	1	1	--	--
Right Steering Wheel Scroll 1 Signal	1	B2815 04	--	--
Right Steering Wheel Scroll 2 Signal	1	B2815 04	--	--
Left Steering Wheel Scroll 1 Signal	1	B2815 04	--	--
Left Steering Wheel Scroll 2 Signal	1	B2815 04	--	--
Steering Wheel Controls Low Reference	1	B2815 04	--	--
1. Steering wheel controls inoperative.				

Circuit/System Description

The instrument panel cluster (IPC) supplies a regulated voltage supply to the steering wheel control switches and monitors the return signal. Each switch state is associated with a specific resistance value. When a switch is depressed a specific voltage drop occurs across the resistor unique to that switch. The IPC is able to identify which switch was depressed by recognising the voltage drop associated with that switch and responds to the selected request.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.

- The ignition is ON.

Conditions for Setting the DTC

DTC B2815 04

The IPC detects an open in the steering wheel circuits for more than 5 seconds.

DTC B2815 59

The IPC detects a stuck steering wheel switch for more than 3 minutes.

Action Taken When the DTC Sets

- The IPC will not acknowledge driver requested inputs from the steering wheel switch.
- A stuck steering wheel switch will be unable to send driver requests to the IPC.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC can be cleared using a scan tool.

Circuit/System Verification

Ignition ON, while depressing the individual push button steering wheel control switches, observe the scan tool and verify the status of the individual steering wheel control switches. The following values should display depending on which switch is depressed.

Depressed	Displayed	
Right Scroll Wheel	Mute	
Phone/Talk	Phone A	
Call End	Phone B	
Source	Mode	
Trip	Trip time	

- While rotating the individual scroll wheel control switches UP multiple times, the value of the Left Source Button or the Right Source Button parameter starts counting until a maximum value of 127 counts are shown. When the switch is released, the Left Source Button or the Right Source Button parameter restarts from 0.
- While rotating the individual scroll wheel control switches DOWN multiple times, the value of the Left Source Button or the Right Source Button parameter starts counting until a minimum value of -127 counts are shown. When the switch is released, the Left Source Button or the Right Source Button parameter restarts from 0.

Circuit/System Testing

Note: If DTC B2815 59 is set the steering wheel switch component test should be performed prior to continuing with component testing below.

1. Ignition OFF, disconnect the harness connector at the steering wheel switch assembly.
2. Test for less than 5 ohms between the low reference circuit terminal 5 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the IPC.
3. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal 6 and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the IPC.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the IPC.
4. Test for 4.8-5.2 volts between the signal circuit terminals listed below and ground.
   - Right Steering Wheel Scroll 2 terminal 1.
   - Right Steering Wheel Scroll 1 terminal 2.
   - Left Steering Wheel Scroll 1 terminal 3.
   - Left Steering Wheel Scroll 2 terminal 4.

   If less than the specified range, test the appropriate signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the IPC.

   If greater than the specified range, test the appropriate signal circuit for a short to voltage. If the circuit tests normal, replace the IPC.
5. If all circuits test normal, replace the steering wheel control switch assembly.

Component Testing

1. Ignition OFF, disconnect the harness connector at the steering wheel switch assembly.
2. Test for 0.5-O.L. ohms between the scroll wheel terminals listed below, while rotating each steering wheel scroll wheel several times through its full range of motion.
   - right steering wheel scroll wheel terminal 1 and terminal 2.
   - left steering wheel scroll wheel terminal 3 and terminal 4.

   If not within the specified range or is erratic, replace the steering wheel switch.
3. Test the resistance between the signal terminal 6 and the low reference terminal 5 while depressing the appropriate steering wheel controls switch button listed below.

   If not the specified value, replace the steering wheel switch.

Function Switch	Minimum Resistance Value	Maximum Resistance Value
Mute	98 Ohm	104 Ohm
Phone/Talk	247 Ohm	253 Ohm
Disc Change	426 Ohm	434 Ohm
Audio	646 Ohm	653 Ohm
Trip	975 Ohm	983 Ohm
Call End	3.73k Ohm	3.79k Ohm
No Switch Pressed	7.01k Ohm.	7.30k Ohm.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Steering Wheel Control Switch Assembly Replacement
- Control Module References for BCM replacement, setup, and programming

Symptoms - Secondary and Configurable Customer Controls

Important:

- Perform the Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following conditions are true:
  - There are no DTCs set.
  - The control modules can communicate via the serial data link.
- Review the system operation in order to familiarize yourself with the system functions. Refer to Steering Wheel Controls Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the Steering Wheel Controls System. Refer to Checking Aftermarket Accessories.
- Inspect for easily accessible or visible system components for obvious damage or conditions which may cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to Steering Wheel Controls Malfunction in order to diagnose the symptom.

Trip	Trip time

- While rotating the individual scroll wheel control switches UP multiple times, the value of the Left Source Button or the Right Source Button parameter starts counting until a maximum value of 127 counts are shown. When the switch is released, the Left Source Button or the Right Source Button parameter restarts from 0.
- While rotating the individual scroll wheel control switches DOWN multiple times, the value of the Left Source Button or the Right Source Button parameter starts counting until a minimum value of -127 counts are shown. When the switch is released, the Left Source Button or the Right Source Button parameter restarts from 0.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the steering wheel switch assembly.
2. Test for less than 5 ohms between the low reference circuit terminal 5 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the IPC.
3. Ignition ON, test for 4.8-5.2 volts between the signal circuit terminal 6 and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the IPC.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the IPC.

4. Test for 4.8-5.2 volts between the signal circuit terminals listed below and ground.
   - Right Steering Wheel Scroll 2 terminal 1.
   - Right Steering Wheel Scroll 1 terminal 2.
   - Left Steering Wheel Scroll 1 terminal 3.
   - Left Steering Wheel Scroll 2 terminal 4.

   If less than the specified range, test the appropriate signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the IPC.

   If greater than the specified range, test the appropriate signal circuit for a short to voltage. If the circuit tests normal, replace the IPC.
5. If all circuits test normal, replace the steering wheel control switch assembly.

Component Testing

1. Ignition OFF, disconnect the harness connector at the steering wheel switch assembly.
2. Test for 0.5-O.L. ohms between the scroll wheel terminals listed below, while rotating each steering wheel scroll wheel several times through its full range of motion.
   - right steering wheel scroll wheel terminal 1 and terminal 2.
   - left steering wheel scroll wheel terminal 3 and terminal 4.

   If not within the specified range or is erratic, replace the steering wheel switch.
3. Test the resistance between the signal terminal 6 and the low reference terminal 5 while depressing the appropriate steering wheel controls switch button listed below.

   If not the specified value, replace the steering wheel switch.

Function Switch	Minimum Resistance Value	Maximum Resistance Value
Mute	98 Ohm	104 Ohm
Phone/Talk	247 Ohm	253 Ohm
Disc Change	426 Ohm	434 Ohm
Audio	646 Ohm	653 Ohm
Trip	975 Ohm	983 Ohm
Call End	3.73k Ohm	3.79k Ohm
No Switch Pressed	7.01k Ohm.	7.30k Ohm.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Steering Wheel Control Switch Assembly Replacement
- Control Module References for BCM replacement, setup, and programming

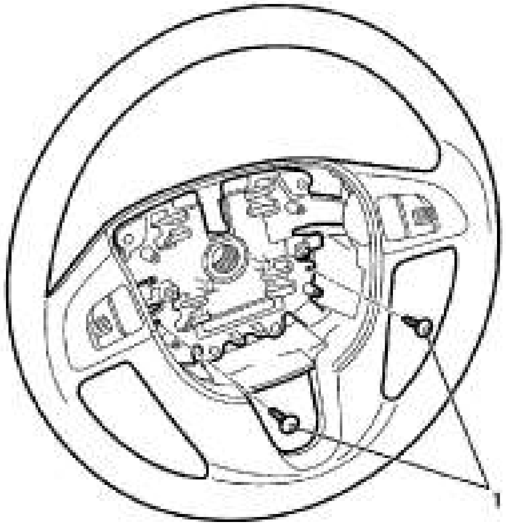
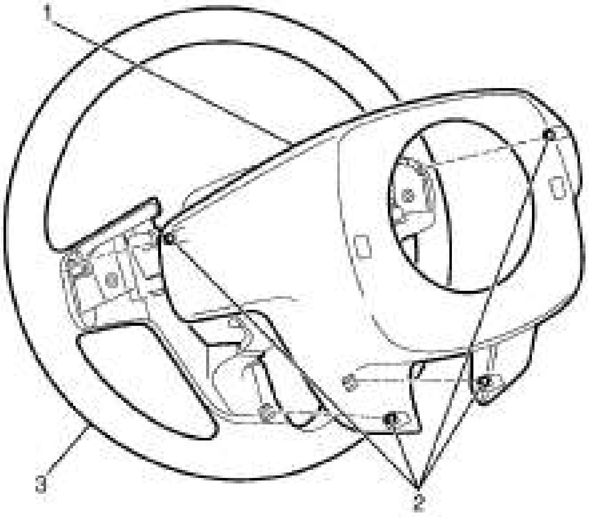
Steering Wheel Control Switch Assembly Replacement

Removal Procedure

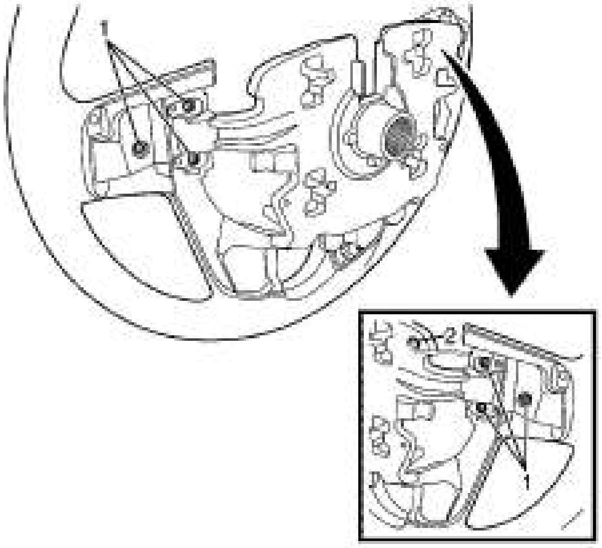


1. Disable the occupant protection system. Refer to SIR Disabling and Enabling.
2. Remove the steering wheel inflatable restraint. Refer to Inflatable Restraint Steering Wheel Module Replacement.
3. Remove the steering wheel. Refer to Steering Wheel Replacement.
4. Remove the steering wheel hub to rear cover screws (1).

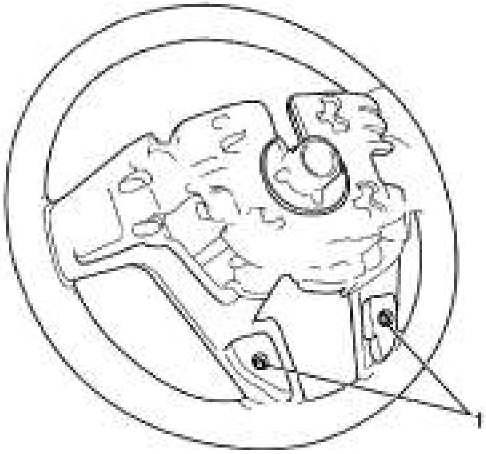


Important: Make sure to disengage the retaining lugs (2).

5. Remove the rear cover (1) from the steering wheel hub (3).

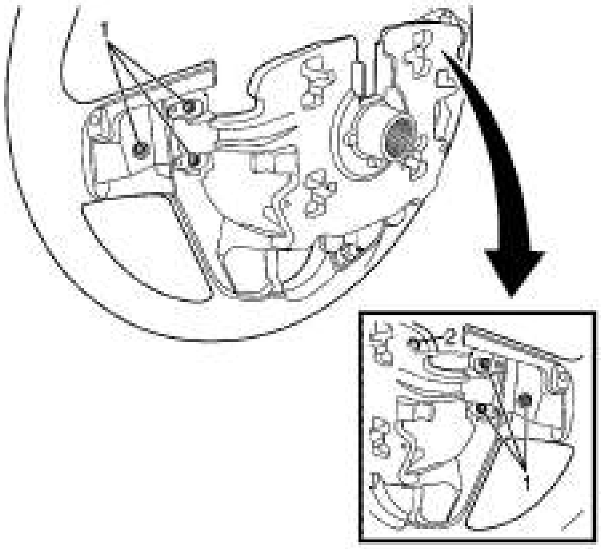


6. Remove the steering wheel hub to steering wheel audio control switch assembly screws (1).
7. Remove the steering wheel audio control switch assembly harness grounding screw (2).



8. Remove the steering wheel hub to steering wheel spoke trim retaining screws (1).
9. Remove the steering wheel audio control switches from the steering wheel hub assembly.

Installation Procedure



1. Install the steering wheel audio control switches from the steering wheel hub assembly.

   Notice: Refer to Fastener Notice in the Preface section.

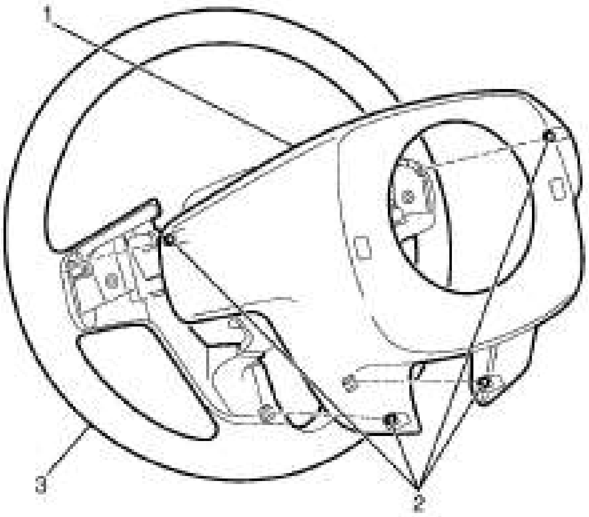
2. Install the steering wheel audio control switch assembly harness grounding screw (2).

   Tighten
   Tighten the screws to 1 N·m (9 lb in).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the steering wheel hub to steering wheel audio control switch assembly retaining screws (1).

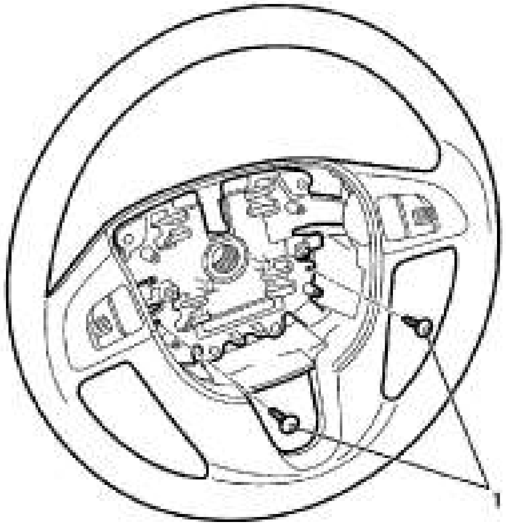
   Tighten
   Tighten the screws to 1 N·m (9 lb in).



Important: Make sure that all the retainers (2) engage.

4. Install the rear cover (1) to the steering wheel hub (3).

   Notice: Refer to Fastener Notice in the Preface section.



5. Install the steering wheel hub to rear cover retaining screws (1).

   Tighten
   Tighten the screws to 1 N·m (9 lb in).

6. Install the steering wheel. Refer to Steering Wheel Replacement.
7. Install the steering wheel inflatable restraint. Refer to Inflatable Restraint Steering Wheel Module Replacement.
8. Enable the occupant protection system. Refer to SIR Disabling and Enabling.

Steering Wheel Controls Description and Operation

The steering wheel control switches duplicate the function of the primary controls of the associated component through a network of multiple momentary contact switches and a series of resistors. The instrument panel cluster (IPC) supplies voltage to the switches and monitors the return signal. When a switch is pressed, a specific voltage drop across the resistors. The IPC identifies the switch selected, sends a serial data message to the component controlled by the switch and activates the feature.

This section is intended to diagnosis the circuits between the IPC and the steering wheel control switches. If the primary control for the device is inoperative, refer to the appropriate section for the component the steering wheel control switch is used for.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Preliminary Information | **Document ID: 2182574**

#PIP4462: SES Light and DTC P0230 - (Aug 26, 2008)

Subject: SES Light and DTC P0230

Models: 2004 - 2009 Passenger Cars and Light Duty Trucks
Equipped with gasoline engines

The following diagnosis might be helpful if the vehicle exhibits the symptom(s) described in this PI.

Condition/Concern:

Some owners may comment that the Service Engine Soon (SES) light has illuminated. Upon closer inspection using a Tech 2, DTC P0230 (Fuel Pump Relay Control Circuit) may have been found stored in the PCM

Recommendation/Instructions:

Follow the appropriate diagnostic information in SI. If no cause for the DTC can be found, inspect the vehicle for installation of an aftermarket anti-theft system. Some aftermarket anti-theft systems may have features that take control of or override the fuel pump relay circuit. Anti-theft systems that have such features may cause the diagnostic code to set if an attempt is made to start the vehicle without first disabling (turning off) the aftermarket system.

If such an aftermarket system is found on the vehicle and the condition (setting the DTC) can be duplicated by not disabling the system prior to starting the vehicle, advise the vehicle owner that the cause of the SES light being illuminated is the aftermarket anti-theft system.

Please follow this diagnostic or repair process thoroughly and complete each step. If the condition exhibited is resolved without completing every step, the remaining steps do not need to be performed.

GM bulletins are intended for use by professional technicians, NOT a ""do-it-yourselfer"". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, DO NOT assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. See your GM dealer for information on whether your vehicle may benefit from the information.

Diagnostic Starting Point - Cruise Control

Begin the system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTC's) and their status.

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B3794

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC B3794 08: Cruise Control Function Request Circuit Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
BCM B+ Terminal 3	B3794 08, B1529 00, B3922 00	B3794 08, B1529 00, B3922 00	--	--
BCM B+ Terminal 17	B3794 08 B1529 00, B3922 00	B3794 08 B1529 00, B3922 00	--	--
Cruise Control Switch Signal	B3794 08	B3794 08	B3794 08	--

Circuit/System Description

The cruise control switch is an input to the body control module (BCM). The BCM monitors the cruise control on/off, set/coast, resume/accelerate and cancel switches via the cruise control switch signal circuit in order to detect when the driver has requested to perform a cruise control function. The BCM detects a specific voltage signal on the cruise control switch signal circuit when a switch is applied. The BCM sends a serial data message to the ECM indicating the status of the cruise control switches.

Conditions for Running the DTC

- Ignition ON.
- Battery Voltage Must be Between 9 - 16 volts.

Conditions for Setting the DTC

- The BCM detects a short to ground or open on the BCM B+ circuit.
- The BCM detects a short to ground or short to voltage on the cruise control switch signal circuit.

- The BCM detects an invalid voltage signal on the cruise control switch signal circuit.

Actions Taken When the DTC Sets

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

Engine ON, observe the scan tool Cruise Control Switch parameter while pressing each of the cruise control switches. The parameter should toggle between On, Off, Resume and Set as the applicable switch is pressed.

Circuit / System Testing

1. Ignition OFF, disconnect the X3 harness connector at the BCM.

2. Verify that a test lamp illuminates between the BCM F9 fuse B+ circuit terminal 3 and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Ignition OFF, connect the X3 harness connector at the BCM.
4. Disconnect the harness connector at the turn signal/multifunction switch.
5. Ignition ON, test for B+ between the B+ circuit terminal 6 and ground.

   If less than the specified value, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
6. Ignition ON, test for B+ between the B+ circuit terminal 6 and the signal circuit terminal 5.

   If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
7. Ignition ON, verify that a test lamp does not illuminate between B+ and the signal circuit terminal 5.

   If the test lamp illuminates, test the signal circuit for a short to ground. If the circuit test normal, replace the BCM.
8. If all circuits test normal, test or replace the turn signal/multifunction switch.

Component Testing

1. Disconnect the harness connector at the turn signal/multifunction switch.
2. Cruise control switch ON, measure the resistance between terminal 5 and terminal 6 while individually activating and holding each cruise control function switch and compare the resistance reading to the values in the table below.

   If not within the specified resistance range, replace the turn signal/multifunction switch.

Function Switch	Minimum Resistance Value	Maximum Resistance Value
Off	6.7k Ohms	6.9k Ohms
On	1.4k Ohms	1.6k Ohms
- SET	2.2k Ohms	2.4k Ohms
+ RES	3.6k Ohms	3.9k Ohms

- Control Module References for BCM replacement, setup, and programming.

DTC P0571

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0571: Cruise Control Brake Switch Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open or High Resistance	Short to Voltage	Signal Performance
Stop Lamp Switch Signal	P0571	P0571	P0571	--

Circuit/System Description

The brake applied signal circuit is a high voltage input from the body control module (BCM) to the engine control module (ECM) and transmission control module (TCM). The ECM monitors the stop lamp switch circuit to detect when the brake pedal has been applied. The BCM monitors the brake pedal position sensor to determine when the brake pedal is applied. When the brake pedal is applied, the BCM supplies a high voltage signal on the brake applied signal circuit and also sends a serial data message to the ECM indicating that the brake pedal has been applied. The ECM senses a high voltage signal on the brake applied signal circuit when the brake pedal has been applied.

Conditions for Running the DTC

- The vehicle has cycled from 0-60 km/h (0-37 mph) 3 times in 1 ignition cycle.
- Continuous once the previous criteria have been met.

Conditions for Setting the DTC

The ECM detects either a low voltage signal on the stop lamp switch signal circuit when the serial data message from the BCM indicates the brakes are applied, or a high voltage signal on the stop lamp switch signal circuit when the serial data message from the BCM indicates the brakes are not applied.

Actions Taken When the DTC Sets

- The malfunction indicator lamp (MIL) will not illuminate.

- The cruise control system becomes disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

Ignition ON, observe the Stoplamp Pedal Switch parameter while applying and releasing the brake pedal. The reading should change between Applied/Released, and all brake lights should turn ON and OFF accordingly. Refer to Exterior Lighting Systems Description and Operation

Circuit/System Testing

1. Ignition OFF, disconnect the harness connectors at the appropriate control modules listed below.
   - ECM X1 (L76)
   - ECM X2 (LY7)
   - TCM
2. Connect a test lamp between the appropriate signal circuit terminal listed below and ground.

  - ECM terminal 9 (L76)
  - ECM terminal 52 (LY7)
  - TCM terminal 6 (L76)
  - TCM terminal 38 (LY7)
3. Ignition ON, press and release the brake pedal. Verify the test lamp turns ON and OFF when pressing and releasing the brake pedal.

   If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.

   If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Ignition OFF, connect the harness connector at the TCM.
5. Connect a test lamp between the appropriate signal circuit terminal listed below and ground.
   - ECM X1 terminal 9 (L76)
   - ECM X2 terminal 52 (LY7)
6. Ignition ON, press and release the brake pedal. Verify the test lamp turns ON and OFF when pressing and releasing the brake pedal.

   If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal, replace the TCM.

   If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the TCM.
7. If all circuits test normal, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Stop Lamp Switch Replacement

DTC P0575

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0575 : Cruise Control Enable Circuit Malfunction

Circuit/System Description

When a cruise control function switch is activated the body control module (BCM) detects a predetermined voltage signal. The BCM sends a GMLAN serial data message to the engine control module (ECM) indicating the function that has been requested.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

- The ECM receives an invalid cruise control switch status GMLAN serial data message from the BCM.
- This diagnostic runs continuously.

Action Taken when the DTC Sets

DTC P0575 is a type A DTC.

Conditions for Clearing the MIL/DTC

DTC P0575 is a type A DTC.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

DTC P0703

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0703: Torque Converter / Brake Switch Circuit Malfunction

Circuit/System Description

The body control module (BCM) monitors the stop lamp switch mounted on the brake pedal. The BCM sends a GMLAN serial data message to the engine control module (ECM) indicating the status of the stop lamp switch.

Conditions for Running the DTC

The engine is ON.

Conditions for Setting the DTC

- The ECM receives an invalid brake pedal status GMLAN serial data message from the BCM.
- This diagnostic runs continuously.

Action Taken when the DTC Sets

DTC P0703 is a type C Store Only DTC.

Conditions for Clearing the MIL/DTC

DTC P0703 is a type C Store Only DTC.

Circuit/System Testing

Important: Fix any Brake System related DTCs before using this diagnostic.

Note: This DTC may be stored as a history DTC without affecting the operation of the BCM. Do not replace the BCM if this DTC is stored only as a history DTC and is not retrieved as a current DTC.

Using a scan tool is DTC P0703 current in the ECM?

If DTC P0703 is current in the ECM, replace the BCM.

If DTC P0703 is not current in the ECM, the system is OK.

Repair Instructions

Perform the Diagnostic Repair Verification .

Control Module References

Symptoms - Cruise Control

Important: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Cruise Control Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Cruise Control System. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to Cruise Control Inoperative/Malfunctioning.

Cruise Control Indicator Inoperative

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

The body control module (BCM) monitors the cruise control indicator switch. When the cruise on/off switch is pressed ON, the cruise control switch is closed and the signal circuit is low. The BCM sends a serial data message to the instrument panel cluster (IPC) indicating the status of the cruise control switch.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
BCM B+ Terminal 3	B3794 08, B1529 00, B3922 00	B3794 08, B1529 00, B3922 00	--	--
BCM B+ Terminal 17	B3794 08, B1529 00, B3922 00	B3794 08, 1529 00, B3922 00	--	--
Cruise Control Switch Signal	B3794 08	B3794 08	B3794 08	--

Circuit/System Description

The cruise control switch is an input to the body control module (BCM). The BCM monitors the cruise control on/off, set/coast, resume/accelerate and cancel switches via the cruise control switch signal circuit in order to detect when the driver has requested to perform a cruise control function. The BCM detects a specific voltage signal on the cruise control switch signal circuit when a switch is applied. The BCM sends a serial data message to the ECM indicating the status of the cruise control switches.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Engine ON, observe the scan tool Cruise Control Switch parameter while pressing each of the cruise control switches. The parameter should toggle between On, Off, Resume and Set as the applicable switch is pressed.

Circuit/System Testing

1. Ignition OFF, disconnect the X3 harness connector at the BCM.
2. Verify that a test lamp illuminates between the BCM F9 fuse B+ circuit terminal 3 and ground.
   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Ignition OFF, connect the X3 harness connector at the BCM.
4. Disconnect the harness connector at the turn signal/multifunction switch.
5. Ignition ON, test for B+ between the B+ circuit terminal 6 and ground.
   If less than the specified value, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
6. Ignition ON, test for B+ between the B+ circuit terminal 6 and the signal circuit terminal 5.
   If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
7. Ignition ON, verify that a test lamp does not illuminate between B+ and the signal circuit terminal 5.
   If the test lamp illuminates, test the signal circuit for a short to ground. If the circuit test normal, replace the BCM.
8. If all circuits test normal, test or replace the turn signal/multifunction switch.

Component Testing

1. Disconnect the harness connector at the turn signal/multifunction switch.
2. Cruise control switch ON, measure the resistance between terminal 5 and terminal 6 while individually activating and holding each cruise control function switch and compare the resistance reading to the values in the table below.
   If not within the specified resistance range, replace the turn signal/multifunction switch.

Function Switch	Minimum Resistance Value	Maximum Resistance Value
Off	6.7k Ohms	6.9k Ohms
On	1.4k Ohms	1.6k Ohms
- SET	2.2k Ohms	2.4k Ohms

+ RES	3.6k Ohms	3.9k Ohms

Repair Instructions

Perform the Diagnostic Repair Verification.

- Turn Signal Switch Replacement
- Control Module References for BCM replacement, setup, and programming.

Cruise Control Description and Operation

Cruise control is a speed control system that maintains a desired vehicle speed under normal driving conditions at speeds above 33 km/h for V6 and 38 km/h for V8. Steep grades may cause variations in the selected vehicle speeds.

The following are the main components of the Cruise Control System:

- The accelerator pedal.
- The stop lamp switch.
- The body control module (BCM).
- The cruise control switches.
- The engine control module (ECM).
- The throttle actuator control (TAC) motor.
- The vehicle speed sensor (VSS).

Cruise Control Engaged

The Cruise Control System will engage and adjust vehicle speeds, based on the activation of the following cruise control switches, which are located in the cruise control stalk.

- On/Off cancel switch
- RES/ACCEL switch.
- SET/DECEL switch.

The body control module (BCM) monitors the signal circuit of the cruise control switches. The BCM relays the cruise control switch status to the engine control module (ECM) via the serial data circuit. The ECM uses the status of the cruise control switch to determine when to capture and maintain the vehicle speed. The ECM monitors the vehicle speed signal circuit in order to determine the desired vehicle speed. The ECM uses the throttle actuator control (TAC) motor in order to maintain the vehicle speed. For further information on the TAC System, refer to Throttle Actuator Control (TAC) System Description.

Voltage is supplied to the cruise control switch via reference voltage circuit supplied by the BCM. The cruise control function switches are arranged in a resistive ladder design, with each cruise control function switch having a different resistance value. The BCM detects a specific voltage value that is associated with the cruise control function switch being activated. When the normally open cruise control on/off switch is turned ON, the switch closes and the BCM supplies a ground to the cruise control switch.

The BCM sends a serial data message to the ECM indicating that the on/off switch is active. Similarly, when the normally open + RES switch or the normally open - SET switch are pressed, the switch closes and the BCM detects the predetermined voltage signal on the cruise control set/coast and resume/accel switch signal circuit. The BCM sends a serial data message to the ECM indicating that the + RES switch or the - SET switch is active. To engage the Cruise Control System, make sure that the vehicle speed is above 33 km/h for a V6 and 38 km/h for a V8, turn the cruise On/Off switch ON and momentarily press the - SET switch. The Cruise Control System has a maximum engaging speed of 110 km/h.

The ECM will engage the Cruise Control System and record the vehicle speed. The ECM sends a serial data message to the driver information center (DIC) in order to illuminate the CRUISE SET TO ### message. The ECM sends a serial data message to the instrument panel cluster (IPC) in order to illuminate the Cruise Engaged indicator in the IPC. The - SET switch and the + RES switch will remain inactive when the BCM has not received the predetermined voltage signal from the on/off switch.

Pressing the accelerator pedal, while the Cruise Control System is engaged, will allow the driver to override the Cruise Control System in order to accelerate the vehicle beyond the current set vehicle speed. When the accelerator pedal is released, the vehicle will decelerate and resume the current set vehicle speed. The driver can also override the current set vehicle speed via the - SET switch and the + RES switch. When the Cruise Control System is engaged, pressing and holding the - SET switch will allow the vehicle to decelerate from the current set vehicle speed without deactivating the Cruise Control System. When the - SET switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed.

When the Cruise Control System is engaged, momentarily pressing the - SET switch will allow the vehicle to decelerate at 1 km/h increments for each time that the - SET is momentarily pressed, with a minimum vehicle speed of 38 km/h. Pressing and holding the + RES switch, when the Cruise Control System is engaged, will allow the vehicle to accelerate to a greater vehicle speed than the current set vehicle speed. When the + RES switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed.

When the Cruise Control System is engaged, momentarily pressing the + RES switch will allow the vehicle to accelerate at 1 km/h increments for each time that the + RES switch is momentarily pressed, with the maximum acceleration total of 16 km/h over the current set vehicle speed. Momentarily activating the + RES switch will recall the previous vehicle speed, after the cruise control system is disengaged by pressing the brake pedal or by activating the CANCEL switch.

Cruise Control Disengaged

The engine control module (ECM) disengages the cruise control operation based on the signals from the following switches:

- The stop lamp switch.
- The cruise control On/Off switch.

The body control module (BCM) determines when the cruise control cancel switch is activated. When the normally open cancel switch is closed, the BCM detects the predetermined voltage signal on the cruise control function switch circuit. The BCM sends a serial data message to the ECM in order to disengage the cruise control system.

The stop lamp switch is mounted on the brake pedal bracket. When the brake pedal is applied, the normally open stop lamp switch closes. The ECM monitors the stop lamp signal circuit through a discrete input and a serial data message signal from the BCM indicating the brake status. When both signals indicate the brake pedal is applied, the ECM will disengage the cruise control system.

The Cruise Control System will disengage when the cruise control On/Off switch is switched OFF. The vehicle speed stored in the memory of the engine control module will be erased when the cruise control On/Off switch is turned OFF, or the ignition switch is turned OFF.

The Cruise Control System will disengage when the ECM detects that a driver override function has been active for approximately 60 seconds. When the Cruise Control System has been disengaged, the ECM sends a serial message to the instrument panel cluster (IPC) in order to turn OFF the Cruise Engaged indicator, and to the driver information center (DIC) in order to turn OFF the CRUISE SET TO ### message.

Cruise Control Inhibited

The engine control module (ECM) inhibits the cruise control operation when any of the following conditions exist:

- The ECM has not detected a brake pedal activation from the body control module (BCM).
- A Cruise Control System DTC has been set.
- The vehicle speed is less than 38 km/h.
- The vehicle speed is too high.
- The vehicle is in PARK, REVERSE, NEUTRAL, or 1st gear.
- The engine RPM is too low.
- The engine RPM is too high.
- The system voltage is not between 9-16 volts.
- The Antilock Brake System (ABS)/Traction Control System (TCS) is active for more than 2 seconds.

Fuel Controls - Fuel Pump and Injector Controls

Diagnostic Starting Point - Engine Controls (Petrol)

Begin the system diagnosis with Diagnostic System Check - Vehicle. The Diagnostic System Check - Vehicle will provide the following information:

- The identification of the Control Modules which command the system.
- The ability of the Control Modules to communicate through the serial data circuit.
- The identification of any stored DTCs and the codes status.

The use of the Diagnostic System Check - Vehicle will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC P0008 or P0009

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0008: Engine Position System Performance Bank 1

DTC P0009: Engine Position System Performance Bank 2

Circuit/System Description

The engine control module (ECM) tests for a misalignment between both camshafts on one bank of the engine and the crankshaft. The misalignment would be at an idler sprocket for either bank or at the crankshaft. Once the ECM learns the position of both camshafts on one bank of the engine, the ECM compares the learned values to a reference value. The ECM will set a DTC if both learned values for one bank of the engine are exceeding a calibrated threshold in the same direction.

Conditions for Running the DTC

- DTCs P0010, P0011, P0013, P0014, P0020, P0021, P0023, P0024, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P2088, P2089, P2090, P2091, P2092, P2093, P2094 and P2095 are not set.
- The engine is operating.
- The ECM has learned the camshaft positions.
- DTC P0008 and P0009 runs continuously once the above conditions are met.

Conditions for Setting the DTC

The ECM detects that both camshafts on either bank of the engine are mis-aligned with the crankshaft for greater than 4 seconds.

Action Taken When the DTC Sets

DTC P0008 and P0009 are type B DTCs.

Conditions for Clearing the DTC

DTC P0008 and P0009 are type B DTCs.

Diagnostic Aids

- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed secondary timing chain can cause this DTC to set.
- A single failed camshaft actuator or actuator solenoid will not cause this DTC to set. This diagnostic algorithm is designed to detect an alignment condition between a primary intermediate sprocket and the secondary timing chain or the alignment between a primary intermediate sprocket and the crankshaft. Either condition would cause the camshaft timing for both cams on one bank to be off an equal number of degrees.
- The presence of DTCs P0008 and P0009 along with P0016, P0017, P0018 and P0019 indicates a possible condition with the primary timing chain and the alignment between both intermediate sprockets and the crankshaft or the crankshaft reluctor wheel has moved and is no longer referenced to top dead centre (TDC).
- Observing the desired and actual camshaft angle parameters with a scan tool before a DTC sets, may help to isolate whether a condition is specific to one camshaft, one bank or caused by a condition with the primary crankshaft timing.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Clear the DTCs with a scan tool.
2. Allow the engine to reach the normal operating temperature.
3. Idle the engine for 10 minutes or until a DTC sets. Observe the DTC information with a scan tool, DTCs P0008 and P0009 should not set.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Inspect the timing chains and tensioners for excessive wear or misalignment.
   If you find a condition with the timing chains or tensioners, repair as necessary.
2. Inspect the crankshaft reluctor wheel for being mis-positioned on the crankshaft.
   If you find a condition with the crankshaft, repair as necessary.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Dieseling, Run-On (Petrol)

Checks	Action
DEFINITION: The engine continues to run when the ignition is turned OFF, but usually runs very roughly.	
Preliminary Checks	Refer to Important Preliminary Checks in Symptoms - Engine Controls .
Fuel System Checks	• Test for correct EVAP Purge system operation. • Test the fuel injectors for leakage. • Inspect for correct throttle blade adjustment, if applicable. • Perform the fuel system diagnostic procedure. Refer to Fuel System Diagnosis .
Additional Checks	If the engine continues to run smoothly when the ignition is turned OFF inspect for the following: • Correct ignition switch adjustment • A short to voltage in the LPG ECM ignition feed circuit.

DTC P2095: Exhaust Camshaft Position Control Solenoid Circuit High Voltage Bank 2

Circuit / System Description

The camshaft position (CMP) actuator system enables the engine control module (ECM) to change the timing of the camshafts while the engine is operating. The CMP actuator solenoid signal from the ECM is pulse width modulated (PWM). The ECM controls the CMP actuator solenoid duty cycle by controlling the amount of solenoid ON time. The CMP actuator solenoid controls the advance or the retard of each camshaft. The CMP actuator solenoid controls the oil flow that applies the pressure to advance or retard the camshafts.

Ignition voltage is supplied directly to the CMP actuator solenoid. The ECM controls the solenoid by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

- The engine speed is greater than 80 RPM.
- The ignition voltage is between 10-18 volts.
- The ECM has commanded the CMP actuator solenoid ON and OFF at least once during the ignition cycle.
- DTCs P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094 and P2095 run continuously once the above conditions are met for greater than 1 second.

Conditions for Setting the DTC

P0010, P0013, P0020, P0023

The ECM detects an open in the CMP actuator solenoid circuits for greater than 4 seconds, when the solenoid is commanded OFF.

P2088, P2090, P2092, P2094

The ECM detects a short to ground in the CMP actuator solenoid circuits for greater than 4 seconds, when the solenoid is commanded OFF.

P2089, P2091, P2093, P2095

The ECM detects a short to voltage in the CMP actuator solenoid circuits for greater than 4 seconds, when the solenoid is commanded ON.

Action Taken When the DTC Sets

DTCs P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094 and P2095 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094 and P2095 are type B DTCs.

Circuit / System Verification

1. With the engine at normal operating temperature, raise the engine speed to 2,000 RPM for 10 seconds. DTCs P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094 or P2095 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate camshaft position (CMP) actuator solenoid.
2. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition circuit and replace as necessary.
3. Connect a DMM, set on the diode setting, between the control circuit terminal 2 and ground. The voltage should be greater than 2.0 V.

   If the DMM displays OL, test the control circuit for a short to voltage or an open/high resistance. If the circuit/connections test normal, replace the ECM.

   If less than the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Command the CMP actuator solenoid ON and OFF with a scan tool. The DMM should transition from greater than 2 V when commanded OFF to less than 1 V when commanded ON.

   If the circuit voltage does not correspond to the specified values, replace the ECM.
5. If all circuits/connections test normal, test or replace the CMP actuator solenoid.

Component Testing

1. Ignition OFF, disconnect the harness connector at the appropriate camshaft position (CMP) actuator solenoid.
2. Test for 7-12 Ω between the control terminal 2 and the ignition terminal 1 of the camshaft position (CMP) actuator solenoid.

   If not within the specified range, replace the CMP actuator solenoid.

3. Test for infinite resistance between each terminal and the CMP actuator solenoid housing.
   If not the specified value, replace the CMP actuator solenoid valve.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake .
- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Exhaust .
- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake .
- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust .
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P0011, P0014, P0021, or P0024

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0011: Intake Camshaft Position Range/Performance Bank 1

DTC P0014: Exhaust Camshaft Position Range/Performance Bank 1

DTC P0021: Intake Camshaft Position Range/Performance Bank 2

DTC P0024: Exhaust Camshaft Position Range/Performance Bank 2

Circuit/System Description

The camshaft position (CMP) actuator system enables the engine control module (ECM) to change the timing of the camshafts while the engine is operating. The CMP actuator solenoid signal from the ECM is pulse width modulated (PWM). The ECM controls the CMP actuator solenoid duty cycle by controlling the amount of solenoid ON time. The CMP actuator solenoid controls the advance or the retard of each camshaft. The CMP actuator solenoid controls the oil flow that applies the pressure to advance or retard the camshafts.

Conditions for Running the DTC

- Before the ECM can report DTC P0011, P0014, P0021, or P0024 failed DTCs P0010, P0013, P0020, P0023, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P2088, P2089, P2090, P2091, P2092, P2093, P2094 and P2095 must run and pass.
- DTCs P0016, P0017, P0018, P0019, P0335, P0336 and P0338 are not set.
- The engine speed is greater than 500 RPM.
- The engine must accelerate such that the CMP actuator system is commanded from the park position to the phased position. This is considered a cam control cycle. There must be a total of 4-10 cam control cycles for at least 2.5 seconds each in the phased position.
- The engine is operating for approximately 1.8 seconds.
- DTCs P0011, P0014, P0021 and P0024 run continuously once the above conditions are met for greater than 1 second.

Conditions for Setting the DTC

- The ECM detects the difference between the desired camshaft position and the actual camshaft position angle is greater than 5 degrees.

OR

- The ECM detects the difference between the actual camshaft angle and the locked position angle is greater than 1 degree.
- The condition exists for greater than 4 seconds.

Action Taken When the DTC Sets

DTCs P0011, P0014, P0021 and P0024 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0011, P0014, P0021 and P0024 are type B DTCs.

Diagnostic Aids

- The engine oil condition has a major impact on the camshaft actuator system.
- A low oil level condition may set this DTC. The engine may require an oil change. You may also monitor the Engine Oil Life parameter with a scan tool.
- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed camshaft, camshaft actuator, or timing chain can cause this DTC to set.

Circuit / System Verification

Note: The engine oil level and the oil pressure are critical to the correct operation of the camshaft position (CMP) actuator system. Verify that the engine has the correct oil level and the correct oil pressure before continuing with this diagnostic.

1. Ignition ON, observe the scan tool DTC information. Verify that none of the following DTCs are set. DTC P0016, P0017, P0018, P0019, P0335, P0336, P0338, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P0521, P0522, P0523, P0638, P2100, P2101, P2102, P2103, or P2119.

   If any of the DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.
2. Engine idling, command the suspected camshaft actuator from 0 degrees to 40 degrees and back to zero while observing the appropriate scan tool CMP Angle Variance parameters. The CMP Angle Variance should be less than 2 degrees in each of the commanded states.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate camshaft position (CMP) actuator solenoid.
2. Ignition ON, load test for B+ between the ignition circuit terminal 1 and ground.

   If less than the specified range, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition circuit and replace as necessary.

   Note: Use the *j 35616-200* Test Lamp Kit for this test. If the *j 35616-200* Test Lamp Kit is not available, use a test lamp that measures greater than 20 Ω.
3. Connect a test lamp between the control circuit terminal 2 and B+.

   Note: The voltage must be measured at the control side of the circuit.
4. Command the appropriate CMP actuator solenoid ON with a scan tool. Load test for less than 1 V between the control circuit terminal 2 and ground.

   If greater than the specified range, test the control circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.
5. Remove the CMP actuator solenoid. Inspect the CMP actuator solenoid and mounting area for the following conditions:
   - For a torn, restricted, mis-positioned, or missing screens at the CMP actuator solenoid

- For engine oil leaks between the oil sealing lands of the CMP actuator solenoid--Inspect the lands of the CMP actuator solenoid for nicks.
- For oil seepage at the CMP actuator solenoid connector

  If a condition is found, replace CMP actuator solenoid.

6. Ignition OFF, swap the suspected CMP actuator solenoid with a CMP actuator solenoid that is operating correctly.
7. Engine idling. Command the suspected camshaft actuator from 0 degrees to 40 degrees and back to zero while observing the appropriate scan tool CMP Angle Variance parameters. The CMP Angle Variance should be less than 2 degrees in each of the commanded states.

   If the CMP Angle Variance is greater than 2 degrees, replace the mechanical camshaft position (CMP) actuator.
8. If all circuits/connections test normal, test or replace the CMP actuator solenoid.

Component Testing

1. Ignition OFF, disconnect the harness connector at the appropriate camshaft position (CMP) actuator solenoid.
2. Test for 7-12 Ω between the control terminal 2 and the ignition terminal 1 of the camshaft position (CMP) actuator solenoid.

   If not within the specified range, replace the CMP actuator solenoid.
3. Test for infinite resistance between each terminal and the CMP actuator solenoid housing.

   If not the specified value, replace the CMP actuator solenoid valve.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake
- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Exhaust
- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake
- Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust
- Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake
- Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust
- Camshaft Position Actuator Replacement - Bank 2 (Left Side) Intake
- Camshaft Position Actuator Replacement - Bank 2 (Left Side) Exhaust
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P0016, P0017, P0018, or P0019

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0016: Crankshaft/Intake Camshaft Position not Plausible Bank 1

DTC P0017: Crankshaft/Exhaust Camshaft Position not Plausible Bank 1

DTC P0018: Crankshaft/Intake Camshaft Position not Plausible Bank 2

DTC P0019: Crankshaft/Exhaust Camshaft Position not Plausible Bank 2

Circuit/System Description

The camshaft position (CMP) actuator system enables the engine control module (ECM) to change the timing of the camshafts while the engine is operating. The CMP actuator solenoid signal from the ECM is pulse width modulated (PWM). The ECM controls the CMP actuator solenoid duty cycle by controlling the amount of solenoid ON time. The CMP actuator solenoid controls the advance or the retard of each camshaft. The CMP actuator solenoid controls the oil flow that applies the pressure to advance or retard the camshafts.

Ignition voltage is supplied directly to the CMP actuator solenoid. The ECM controls the solenoid by grounding the control circuit with a solid state device called a driver. The ECM compares the camshaft position or the camshaft angle to the position of the crankshaft.

Conditions for Running the DTC

- Before the ECM can report DTC P0016, P0017, P0018, or P0019 failed, DTCs P0010, P0011, P0013, P0014, P0020, P0021, P0023, P0024, P0335, P0336, P0338, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P2088, P2089, P2090, P2091, P2092, P2093, P2094 and P2095 must run and pass.
- The engine is operating for greater than 5 seconds.
- The engine coolant temperature is between 0-95°C (32-203°F).
- The calculated engine oil temperature is less than 120°C (248°F).
- DTC P0016, P0017, P0018 and P0019 run continuously once the above conditions are met for approximately 10 minutes.

Conditions for Setting the DTC

- The ECM detects one of the following conditions:
  - The ECM detects a deviation in the relationship between a camshaft and the crankshaft.
  - A camshaft is greater than 10 degrees advanced in relationship to the crankshaft.
  - A camshaft is greater than 10 degrees retarded in relationship to the crankshaft.
- The ECM detects the difference between an actual intake camshaft angle and the locked position angle is greater than 15 degrees.
- The ECM detects the difference between an actual exhaust camshaft angle and the locked position angle is greater than 21 degrees.
- The condition exists for greater than 4 seconds or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0016, P0017, P0018 and P0019 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0016, P0017, P0018 and P0019 are type B DTCs.

Diagnostic Aids

- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed camshaft, camshaft actuator, camshaft sensor, crankshaft sensor or timing chain can cause this DTC to set.
- An actuator that is in the full advance or retard position can cause this DTC to set.
- The presence of DTCs P0008 and P0009 along with P0016, P0017, P0018 and P0019 indicates a possible condition with the primary timing chain and the alignment between both intermediate sprockets and the crankshaft. Or the crankshaft reluctor wheel has moved and is no longer referenced to top dead centre (TDC).
- Observing the desired and actual camshaft angle parameters with a scan tool before a DTC sets, may help to isolate whether a condition is specific to one camshaft, one bank or caused by a condition with the primary crankshaft timing.

Circuit / System Testing

1. Ignition ON, observe the DTC information with a scan tool. Verify that none of the following DTCs are set. DTC P0010, P0013, P0020, P0023, P0335, P0336, P0338, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095.

   If any of the DTCs listed are set refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.
2. Idle the engine at normal operating temperature for 10 minutes. DTCs P0016, P0017, P0018, or P0019 should not set.

   If a DTC sets, inspect for the following:
   - The correct installation of the camshaft sensors
   - The correct installation of the crankshaft sensor
   - A timing chain tensioner condition
   - An incorrectly installed timing chain
   - Excessive play in the timing chain
   - A timing chain that jumped teeth
   - A crankshaft reluctor wheel that has moved in relationship to top dead center (TDC) on the crankshaft
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

DTC P0058: O2 Sensor Heater Circuit High Voltage (Bank 2 Sensor 2)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0030, P0036, P0050, P0056	P0030, P0036, P0050, P0056	--	P0135, P0141, P0155, P0161
HO2S Heater Control Sensor 1 Bank 1 or 2	P0031, P0051	P0030, P0050	P0032, P0052	P0135, P0141, P0155, P0161
HO2S Heater Control Sensor 2 Bank 1 or 2	P0037, P0057	P0036, P0056	P0038, P0058	P0135, P0141, P0155, P0161

Circuit Description

The heated oxygen sensor (HO2S) heater reduces the time required for the oxygen sensor to reach operating temperature and maintains the operating temperature during extended idle periods. When the ignition is turned to the Run position, ignition voltage is supplied directly to the sensor heater. The engine control module (ECM) controls the heater operation by first modulating the control circuit to ground when the sensors are cold. This prevents the possibility of thermal shock to the sensor from condensation build-up on the sensor, by controlling the sensors rate of heating. After a predetermined amount of time the ECM commands the heaters ON continuously. Once the sensor reaches operating temperature the ECM may modulate the heater control circuit to ground, to maintain a desired temperature.

The ECM controls the heater by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to voltage. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

P0030, P0031, P0032, P0050, P0051, P0052

- The ignition voltage is between 10-18 volts.
- The engine speed is greater than 80 RPM.
- The HO2S heater is commanded ON and OFF at least once during the ignition cycle.
- The DTCs run continuously once the above conditions are met for 1 second.

P0036, P0037, P0038, P0056, P0057, P0058

- The ignition voltage is between 10-18 volts.
- The engine speed is greater than 80 RPM.
- The HO2S heater is commanded ON and OFF at least once during the ignition cycle.
- The secondary HO2S is at operating temperature.
- The DTCs run continuously once the above conditions are met for 1 second.

Conditions for Setting the DTC

P0030, P0036, P0050, P0056

The ECM detects an open circuit in the heater circuits of the HO2S when the heater is commanded OFF. The condition exists for greater than 4 seconds or a cumulative of 30 seconds.

P0031, P0037, P0051, P0057

The ECM detects a ground in the heater circuits of the HO2S when the heater is commanded OFF. The condition exists for greater than 4 seconds or a cumulative of 30 seconds.

P0032, P0038, P0052, P0058

The ECM detects a short to voltage in the heater circuits of the HO2S when the heater is commanded ON. The condition exists for greater than 4 seconds or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 and P0058 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 and P0058 are type B DTCs.

Diagnostic Aids

- If the condition is intermittent, move the related harnesses and connectors with the engine operating, while monitoring the circuit status for the component with a scan tool. If the circuit status parameter changes from OK or Indeterminate to Fault there is a condition with the circuit or a connection.
- An open fuse in the HO2S heater circuit may be caused by the heater element in one of the sensors. The condition may not be present until the sensor operates for a period of time. If no fault is present in the heater circuit, monitor the amperage of each heater using the DMM to determine if one of the heater elements is the cause of the open fuse. Inspect the sensor pigtail or the harness for contacting the exhaust system.

Circuit/System Verification

1. Engine idling at operating temperature for at least 30 seconds. Observe the DTC information, DTCs P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 and P0058 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate heated oxygen sensor (HO2S).
2. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.

   Note: The ignition circuit supplies voltage to other components. Make sure you test all circuits for a short to ground or test all components for being shorted that share the ignition circuit.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition circuit and replace as necessary.
3. Connect a test lamp between the heater control circuit terminal 2 and B+. The test lamp should not illuminate.

   If the test lamp is always ON, test the control circuit for a short to ground. If the circuit/connections test normal, replace the ECM.

   Note: The control circuit for the HO2S heater is pulled-up to voltage within the ECM, 2.0-3.0 V on the control circuit is normal.
4. Idle the engine, and verify the test lamp illuminates or flashes.

   If the test lamp is always OFF, test the control circuit terminal 2 for an open/high resistance. If the circuit/connections test normal, replace the ECM.
5. Ignition ON, test for 2.0-3.0 V between the control circuit terminal 2 and ground.

   If not within the specified range, test the control circuit for a short to voltage. If the circuit/connections test normal, replace the ECM.
6. If all circuits/connections test normal, test or replace the HO2S sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector at the heated oxygen sensor (HO2S) sensor.
2. Test for 5-25 Ω between the control terminal 2 and the ignition terminal 1 of the heated oxygen sensor (HO2S) sensor.

   If not within the specified range, replace the HO2S sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Heated Oxygen Sensor Replacement - Bank 1 Sensor 1
- Heated Oxygen Sensor Replacement - Bank 1 Sensor 2

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0053: O2 Sensor Heater Resistance Range/Performance (Bank 1 Sensor 1)

DTC P0059: O2 Sensor Heater Resistance Range/Performance (Bank 2 Sensor 1)

Circuit/System Description

Heated oxygen sensors (HO2S) are used for fuel control and post catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. The HO2S must reach operating temperature to provide an accurate voltage signal. A heating element inside the HO2S minimizes the time required for the sensor to reach operating temperature. Voltage is provided to the heater by an ignition voltage circuit through a fuse. With the engine running a ground is provided to the heater by the HO2S heater low control circuit, through a low side driver within the engine control module (ECM). The ECM commands the heater ON or OFF to maintain a specific HO2S operating temperature range.

The ECM determines the temperature by measuring the current flow through the heater and calculating the resistance. Based on the resistance the ECM can predict the sensor temperature. The sensors use pulse width modulation (PWM) to control the heater operation. The ECM calculates the heater resistance on a cold start. This diagnostic will only run once per ignition cycle. If the ECM detects that the heater calculated resistance is not within the expected range these DTC will be set.

Conditions for Running the DTC

- DTCs P0112, P0113, P0117, P0118 are not set.
- The engine is running.
- The ignition is OFF for greater than 10 hours.
- The Engine Coolant Temperature (ECT) Sensor parameter is between -30°C and +45°C (-22°F and +113°F) at engine start-up.
- The ECT Sensor parameter minus the Intake Air Temperature (IAT) Sensor parameter is less than 8°C (14°F) at engine start-up.
- DTCs P0053 and P0059 run once per drive cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the affected HO2S heater low control circuit is not within a specified range at engine start-up.

Action Taken when the DTC Sets

DTCs P0053 and P0059 are type A DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0053 and P0059 are type A DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

- With the engine running at operating temperature, observe the HO2S Heater parameter with a scan tool and manipulate the related wiring and connectors.

  If manipulation does affect the parameter then repair the harness or connector.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal a known ground.

If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the HO2S.

3. Ignition OFF, verify that the test lamp is OFF between the heater low control circuit terminal of the appropriate HO2S and B+.

   If the test lamp illuminates, test the low control circuit for a short to ground.
4. Connect a test lamp between the heater low control circuit terminal of the appropriate HO2S and the B+ circuit terminal.
5. With the engine running, the test lamp should be ON steady or flashing.

   If the test lamp is not ON steady or flashing, test the low control circuit for a short to voltage and for open/high resistance. If the circuit tests normal, replace the ECM.
6. If all circuits test normal, replace the appropriate HO2S.

DTC Descriptors

DTC P0100: Mass Air Flow Sensor Circuit Malfunction

DTC P0102: Mass Air Flow Sensor Voltage Low

DTC P0103: Mass Air Flow Sensor Voltage High

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Ignition Voltage	P0100	P0100	P0100	--	P0101
MAF Sensor Signal	P0100	P0102	P0100	P0102	P0101
Low Reference	--	P0102	P0100	--	P0101

Circuit/System Description

The mass air flow (MAF) sensor is located in the air intake duct. The MAF sensor is an airflow meter that measures the amount of air that enters the engine. The MAF sensor uses a hot film that is cooled by air flowing past the sensing film as air enters the engine. The amount of cooling is proportional to the amount of the air flow. As the air flow increases greater current is required in order to maintain the hot film at a constant temperature. The engine control module (ECM) uses the MAF sensor in order to provide the correct fuel delivery for all operating conditions.

Conditions for Running the DTC

- The engine is operating.
- The ignition voltage is greater than 10 volts.
- DTC P0100, P0102 and P0103 run continuously once the above conditions are met for 6 seconds.

Conditions for Setting the DTC

P0100

- The ECM detects that the MAF sensor signal is 0.0 Hz.
- The condition exists for 4 seconds or for a cumulative of 30 seconds.

P0102

- The ECM detects that the MAF sensor signal is less than 1135 Hz.
- The condition exists for 4 seconds or for a cumulative of 30 seconds.

P0103

- The ECM detects that the MAF sensor signal is greater than 15,152 Hz.
- The condition exists for 4 seconds or for a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0100, P0102 and P0103 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0100, P0102 and P0103 are type B DTCs.

Diagnostic Aids

- Inspect the harness of the MAF sensor to verify that it is not routed too close to the following components:
  - The secondary ignition wires or coils
  - Any solenoids
  - Any relays
  - Any motors
- Inspect for any of the following conditions.
  - A dirty or deteriorating air filter element
  - Water intrusion in the induction system
  - Vacuum leaks
  - Brake booster leaks
  - Faulty crank case ventilation system
  - Restricted or collapsed air duct.
  - An engine mechanical condition
- Inspect for any contamination, water intrusion, or debris on the sensing elements of the MAF sensor. If debris is present, clean the sensor. If the sensor cannot be cleaned, replace the sensor.
- A high resistance may cause a driveability concern before this DTC sets.

J 38522 Variable Signal Generator

Circuit/System Verification

1. Engine idling for 1 minute, observe the DTC information with a scan tool. DTCs P0100, P0102 and P0103 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the MAF sensor.
2. Ignition OFF, test for less than 5 Ω between the ground circuit terminal C and ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.

   Caution: Do NOT use the low reference circuit in the component harness connector for this test. Damage to the control module may occur due to excessive current draw.

3. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal B and

ground.

If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition circuit and replace as necessary.

4. Test for 4.8-5.2 V between the signal circuit terminal A and the ground circuit terminal C.

   If less than the specified range, test the signal circuit for an open/high resistance or a short to ground. If the circuit/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit/connections test normal, replace the ECM.
5. Ignition OFF, connect the red lead of the *J 38522* Variable Signal Generator to the signal circuit terminal A at the MAF sensor harness connector. Connect the battery voltage supply to B+, and ground the black lead.
6. Set the *J 38522* Variable Signal Generator Signal switch to 5 V, the Frequency switch to 5 K, and the Duty Cycle switch to Normal.
7. Ignition ON, observe the scan tool MAF Sensor frequency parameter. The parameter should be between 4,950-5,025 Hz.

   If the parameter is not within the specified range, replace the ECM.
8. If all circuits/connections test normal, replace the MAF sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Mass Airflow Sensor with Intake Air Temperature Sensor Replacement
- Engine Control Module Replacement for engine control module replacement, setup, and programming

---

DTC P0101

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit/System Description

The mass air flow (MAF) sensor is located in the air intake duct. The MAF sensor is an airflow meter that measures the amount of air that enters the engine. The MAF sensor uses a hot film that is cooled by air flowing past the sensing film as air enters the engine. The amount of cooling is proportional to the amount of the air flow. As the air flow increases greater current is required in order to maintain the hot film at a constant temperature. The engine control module (ECM) uses the MAF sensor in order to provide the correct fuel delivery for all operating conditions.

Conditions for Running the DTC

- Before the ECM can report DTC P0101 failed, DTCs P0100, P0102, P0103, P0121, P0122, P0123, P0221, P0222, P0223, P0335, P0336 and P0338 must run and pass.
- DTC P2176 is not set.
- The engine speed is greater than 320 RPM.
- The MAF sensor signal is greater than 11 grams per second.
- The ignition voltage is greater than 10.5 volts.
- The ECM detects greater than 150 revolutions of the crankshaft.
- DTC P0101 runs continuously once the above conditions are met for greater than 2 seconds.

Conditions for Setting the DTC

- The ECM detects that the MAF sensor signal is greater or less than the calculated air flow based on engine load and engine speed.

  OR
- The ECM detects that the MAF sensor signal is greater or less than the calculated air flow, and the ECM detects a significant error in the long term fuel trim at cruising speed.

Action Taken When the DTC Sets

DTC P0101 is a type B DTC.

Conditions for Clearing the DTC

DTC P0101 is a type B DTC.

Diagnostic Aids

- Inspect the harness of the MAF sensor to verify that it is not routed too close to the following components:
  - The secondary ignition wires or coils
  - Any solenoids
  - Any relays
  - Any motors
- Inspect for any contamination, water intrusion, or debris on the sensing elements of the MAF sensor. If debris is present, clean the sensor. If the sensor cannot be cleaned, replace the sensor.
- A high resistance may cause a driveability concern before this DTC sets.

Circuit / System Verification

1. Engine idling for 1 minute, observe the DTC information with a scan tool. DTC P0101 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Inspect for the following conditions:
   - An engine vacuum leak
   - An air leak in the intake air duct between the mass air flow (MAF) sensor and the throttle body
   - A plugged or collapsed intake air duct
   - Objects that block the MAF sensor air inlet
   - An air filter element that is restricted
   - The hydro-carbon absorber, if equipped, in the air cleaner assembly for ruptures or deterioration.
   - A restricted throttle plate or for carbon build-up around the throttle plate
   - An unseated engine oil dip stick
   - A loose or missing engine oil fill cap
   - An over filled crankcase
   - An engine mechanical condition

   If you find any of the above conditions, repair as necessary.
2. Ignition OFF, disconnect the harness connector at the MAF sensor.
3. Ignition OFF, test for less than 5 Ω between the ground circuit terminal C and the battery ground.

   If greater than the specified range, test the ground circuit for an open/high resistance.

   Notice: Do NOT use the low reference circuit in the component harness connector for this test. Damage to the control module may occur due to excessive current draw.

4. Ignition ON, load test the ignition circuit for B+ between terminal B and ground.
   If less than the specified value, test the ignition circuit for an open/high resistance.
5. Test for 4.8-5.2 V between the signal circuit terminal A and the ground circuit terminal C .
   If less than the specified range, test the signal circuit for an open/high resistance or a short to ground. If the circuit/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuit/connections test normal, replace the ECM.
6. Ignition OFF, connect the red lead of the *J 38522* Variable Signal Generator to the signal circuit terminal A at the MAF/IAT sensor harness connector. Connect the battery voltage supply to B+, and ground the black lead.
7. Set the *J 38522* Variable Signal Generator Signal switch to 5 V, the Frequency switch to 5K, and the Duty Cycle switch to Normal.
8. Ignition ON, observe the scan tool MAF Sensor frequency parameter. The parameter should be between 4,950-5,025 Hz.
   If the parameter is not within the specified range, replace the ECM.
9. If all circuits/connections test normal, replace the MAF sensor.

Circuit Description

The intake air temperature (IAT) sensor is an integral part of the mass air flow (MAF) sensor. The IAT sensor is a variable resistor that measures the temperature of the intake air. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and supplies a ground to the low reference circuit.

The following table illustrates the difference between temperature, resistance, and voltage:

IAT	IAT Resistance	IAT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

P0111 Idle Test

- Before the ECM can report DTC P0111 failed, DTC P0101 must run and pass.
- DTCs P0112, P0113, P0116, P0117, P0118, P0119, P0125, and P0128 are not set.
- The engine coolant temperature (ECT) at engine start is less than 65°C (149°F).
- The ECT is greater than 75°C (167°F).
- The vehicle speed is less than 10 km/h (6.3 mph).
- DTC P0111 runs continuously once the above conditions are met for greater than 2 seconds.

P0111 Cruise Test

- Before the ECM can report DTC P0111 failed, DTC P0101 must run and pass.
- DTCs P0112, P0113, P0116, P0117, P0118, P0119, P0125 and P0128 are not set.
- The ECT at engine start is less than 65°C (149°F)
- The vehicle speed is greater than 60 km/h (37.4 mph).
- The MAF is between 11-42 g/s.
- Decel fuel cut-off (DFCO) is not active.
- DTC P0111 runs continuously once the above conditions are met for greater than 2 seconds.

P0112 and P0113

- The engine run time is greater than 3 minutes.
- The engine is idling for greater than 10 seconds.
- The DTCs runs continuously once the above conditions are met.

Conditions for Setting the DTC

P0111

The ECM detects that the IAT increased less than 4°C (7°F) during the idle test. The condition exists for a total of 16 seconds or 4 events of greater than 4 seconds each. Or the ECM detects that the IAT decreased less than 4°C (7°F) during the cruise test. The condition exists for a total of 28 seconds or 7 events of greater than 4 seconds each.

P0112

The ECM detects that the intake air temperature is greater than 132°C (270°F) for greater than 4 seconds or a cumulative of 30 seconds.

P0113

The ECM detects that the intake air temperature is less than -42°C (-43°F) and remains steady within 3°C (5°F) during a cumulative air flow of greater than 999 grams. The scan tool is limited to -40°C (-40°F), so the diagnostic procedure uses -39°C (-38°F) to determine if there is an IAT condition. The condition exists for greater than 4 seconds or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0111, P0112 and P0113 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0111, P0112 and P0113 are type B DTCs.

Diagnostic Aids

- If the vehicle has sat overnight, the IAT sensor and the ECT sensor values should display within 3°C (5°F).
- High resistance on either the IAT sensor signal circuit or the IAT sensor low reference circuit may set a DTC.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine idling, DTC P0111, P0112 or P0113 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Observe the scan tool Intake Air Temperature (IAT) sensor parameter, while moving the MAF/IAT sensor connector and the engine control module (ECM) connector. The IAT sensor parameter should not fluctuate while moving the related harnesses and connectors.

   If the IAT parameter fluctuates greater than 3°C (5°F) while moving the related harnesses and connectors, repair the condition as necessary.
2. Ignition OFF, disconnect the harness connector at the MAF/IAT sensor.
3. Ignition OFF, remove the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.

   Caution: Do NOT use a test lamp to test the continuity of the circuit. Damage to the control module may occur due to excessive current draw.

4. Test for less than 5 Ω between the low reference circuit terminal E and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance, or for a short to voltage. If the circuit/connections test normal, replace the ECM.
5. Install the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
6. Ignition ON, verify that the scan tool IAT sensor parameter is at -40°C (-40°F).

   If warmer than the specified value, test the signal circuit terminal D for a short to ground. If the circuit/connections test normal, replace the ECM.

   Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.

7. Ignition ON, install a 3 A fused jumper wire between the signal circuit terminal D and ground circuit terminal C. Verify the IAT sensor parameter is greater than 134°C (274°F).

   If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit/connections test normal, replace the ECM.
8. If all circuits/connections test normal, test or replace the MAF/IAT sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector of the MAF/IAT sensor.

   Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the IAT sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the Temperature Versus Resistance - Intake Air Temperature Sensor and verify that the resistance is within 5 percent of the specification.

   If the Resistance vs Temperature is not within 5 percent, replace the MAF/IAT sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Mass Airflow Sensor with Intake Air Temperature Sensor Replacement
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P0116

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.

Low Reference	--	-40°C (-40°F)	-40°C (-40°F)*
* Internal ECM or ECT sensor damage may occur if the circuit is shorted to B+			

Circuit Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and supplies a ground to the low reference circuit. The ECM monitors the mutual performance of the ECT and the intake air temperature (IAT) signals. The ECM monitors the warm up and cool down behavior of the sensors, after a vehicle has been driven at operating temperature and then is shut down . If the ECM detects that the ECT is not with in a predetermined range of IAT after a long soak (over night) or the ECT and IAT are not within a range of each other as compared to a previous cold start, this DTC sets.

The following table illustrates the difference between temperature, resistance and voltage:

ECT	ECT Resistance	ECT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

Condition 1

- Before the ECM can report DTC P0116 failed, DTC P0101 must run and pass.
- DTC P0112, P0113, P0117, P0118, P0119, or P2610 is not set.
- The engine run time of the previous ignition cycle was greater than 10 minutes.
- The calculated engine cool down of the previous test was greater than 50°C (120°F).
- The ignition was OFF for greater than 330 minutes after the previous engine shut down.
- The accumulated air mass of the previous ignition cycle was greater than 6,000 grams.
- The DTC runs once an ignition cycle when the above conditions are met for greater than 35 seconds.

Condition 2

- Before the ECM can report DTC P0116 failed, DTC P0101 must run and pass.
- DTCs P0112, P0113, P0117, P0118, and P0119 are not set.
- The ECT at the previous engine shut down is greater than 82°C (180°F).
- The block heater is not detected.
- The ignition was OFF for greater than 330 minutes after the previous engine shut down.
- DTC runs once an ignition cycle when the above conditions are met.

Conditions for Setting the DTC

- The ECM determines the difference between the ECT and IAT at ignition ON is not within 14°C (25°F) of the difference recorded during a previous ignition cycle, when the enable conditions were met.

  OR
- The ECM determines the IAT at ignition ON is within a calibrated range of the ECT and IAT recorded during a previous ignition cycle, but the ECT is not within 14°C (25°F) of the calibrated range.

Action Taken When the DTC Sets

DTC P0116 is a type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0116 is a type B DTC.

Diagnostic Aids

- Test the ECT and the IAT sensor at various temperature levels in order to evaluate the possibility of a skewed sensor. A skewed sensor can result in a DTC or a driveability condition. Refer to Temperature Versus Resistance - Engine Coolant Temperature Sensor and Temperature Versus Resistance - Intake Air Temperature Sensor .
- If the vehicle has sat overnight, the IAT sensor and the ECT sensor values should display within 3°C (5°F).
- After starting a cold engine, the ECT sensor temperature should rise steadily, then stabilize after the thermostat opens.
- High resistance in the circuits of either the ECT or IAT sensor may set a DTC.
- A short to ground or voltage through a conductive material or fluid may set this DTC. Inspect the ECT sensor for evidence of coolant leaking into the connector body.

Control Module References for scan tool information

Circuit/System Verification

1. Engine idling for 1 minute, observe the DTC information with a scan tool. DTC P0117, P0118, or P0119 should not set.

   If a DTC sets, refer to Diagnostic Trouble Code (DTC) List - Vehicle
2. Ignition OFF, inspect the cooling system surge tank for the proper coolant level. Refer to Cooling System Leak Testing and Cooling System Draining and Filling .

Inspect the engine coolant level. Verify that the cooling system is operating correctly.

If you suspect a condition with engine cooling system, refer to Symptoms - Engine Cooling

3. Inspect the thermostatically-controlled coolant heater, if equipped , for damage or modifications. Test for proper operation of the Coolant Heater. Refer to Coolant Heater Inoperative .
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the ECT sensor.
2. Ignition OFF, remove the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.

Note: The control module or the sensor may be damaged if the circuit is shorted to battery positive voltage.

3. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance, or for a short to voltage. If the circuit tests normal, replace the ECM.
4. Install the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
5. Ignition ON, verify that the scan tool ECT sensor parameter is at -40°C (-40°F).

   If warmer than the specified value, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the ECM.

Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.

6. Ignition ON, install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the ECT sensor parameter is greater than 142°C (288°F).

   If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all circuits test normal, test or replace the ECT sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector at the engine coolant temperature (ECT) sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the ECT sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the Temperature Versus Resistance - Engine Coolant Temperature Sensor table and verify that the resistance is within 5 percent of the specification.

   If not within the specified range, replace the ECT sensor.

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT sensor signal circuit and supplies a ground for the low reference circuit.

The following table illustrates the difference between temperature, resistance, and voltage:

ECT	ECT Resistance	ECT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

P0117

- The start up intake air temperature (IAT) is greater than 72°C (161°F).
- The engine run time is greater than 59 seconds.
- The DTC runs continuously once the above conditions are met.

P0118

- The engine run time is greater than 10 seconds.
- The ignition is ON and the IAT parameter is warmer than 0°C (32°F).
- The DTC runs continuously when one of the above conditions is met.

Conditions for Setting the DTC

P0117

The ECM detects that the ECT is greater than 140°C (284°F) for greater than 1 second or a cumulative of 10 seconds.

P0118

The ECM detects that the ECT is less than -39°C (-38°F) for greater than 1 seconds or a cumulative of 10 seconds.

Action Taken When the DTC Sets

DTCs P0117 and P0118 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0117 and P0118 are Type B DTCs.

Diagnostic Aids

- Test the ECT sensor at various temperature levels in order to evaluate the possibility of a skewed sensor. A skewed sensor can result in a DTC or a driveability condition. Refer to Temperature Versus Resistance - Engine Coolant Temperature Sensor .
- If the vehicle has sat overnight, the IAT sensor and the ECT sensor values should display within 3°C (5°F).
- After starting a cold engine, the ECT sensor temperature should rise steadily, then stabilize

after the thermostat opens.

- High resistance in the circuits of either the ECT or IAT sensor could set a DTC.

Circuit Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and supplies a ground to the low reference circuit. The ECM monitors the performance of the ECT sensor. If the ECM detects incorrect or rapid fluctuations in the ECT signal, this DTC sets.

The following table illustrates the difference between temperature, resistance and voltage:

ECT	ECT Resistance	ECT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

- DTC P0117, P0118, or P0128 are not set.
- The ignition is ON or the engine is operating.
- DTC P0119 runs continuously once the above conditions are met.

Conditions for Setting the DTC

- The ECM detects that the ECT changed greater than an expected value during a calibrated amount of time.
- The condition exists for greater than 5 minutes.

Action Taken When the DTC Sets

DTC P0119 is a type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0119 is a type B DTC.

Diagnostic Aids

- Test the ECT sensor at various temperature levels in order to evaluate the possibility of a skewed sensor. A skewed sensor can result in a DTC or a driveability condition. Refer to Temperature Versus Resistance - Engine Coolant Temperature Sensor .
- If the vehicle has sat overnight, the IAT sensor and the ECT sensor values should display within 3°C (5°F).
- After starting a cold engine, the ECT sensor temperature should rise steadily, then stabilize after the thermostat opens.
- High resistance on either the ECT sensor signal circuit or the ECT sensor low reference circuit may set a DTC.

Circuit/System Verification

1. Observe the ECT sensor parameter with a scan tool while moving the ECT sensor connector and the ECM connector. The ECT sensor parameter should not fluctuate while moving the related harnesses and connectors.

   Repair the suspected harness or connection if the ECT parameter fluctuates greater than 3°C (5°F) while moving the related harnesses and connectors.
2. Inspect the engine coolant level. Verify that the cooling system is operating correctly.

   If you suspect a condition with engine cooling system, refer to Symptoms - Engine Cooling .
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the ECT sensor.
2. Ignition OFF, remove the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.

   Caution: Do NOT use a test lamp to test the continuity of the circuit. Damage to the control module may occur due to excessive current draw.

   Note: The control module or the sensor may be damaged if the circuit is shorted to battery positive voltage.

3. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance, or for a short to voltage. If the circuit tests normal, replace the ECM.
4. Install the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
5. Ignition ON, verify that the scan tool ECT sensor parameter is at -40°C (-40°F).

   If greater than the specified value, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the ECM.

   Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.

6. Ignition ON, install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the ECT sensor parameter is greater than 142°C (288°F).
   If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all circuits test normal, test or replace the ECT sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector at the engine coolant temperature (ECT) sensor.

   Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the ECT sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the Temperature Versus Resistance - Engine Coolant Temperature Sensor table and verify that the resistance is within 5 percent of the specification.
   If not within the specified range, replace the ECT sensor.

Repair Instructions

Perform the Diagnostic Repair Verification .

TP Sensor Signal 2	4%/0.00 V	4%/4.98 V	27%/4.98 V
Low Reference	--	0%/4.98 V	--

Circuit/System Description

The throttle body assembly contains 2 throttle position (TP) sensors. The TP sensors are mounted to the throttle body assembly and are not serviceable. The TP sensors provide a signal voltage that changes relative to throttle blade angle. The engine control module (ECM) supplies the TP sensors with a common 5-volt reference circuit , a common low reference circuit, and two independent signal circuits. The TP sensors have opposite functionality . TP sensor 1 signal voltage decreases from greater than 4 volts at idle to less than 1 volt at wide open throttle (WOT). TP sensor 2 signal voltage increases from less than 1 volt at idle to greater than 4 volts at WOT.

Conditions for Running the DTC

P0121

- The ignition voltage is greater than 7 volts.
- The TP sensor 1 voltage is between 0.18-4.6 volts.
- DTC P0121 runs continuously once the above conditions are met.

P0122, P0123, P0222, and P0223

- The ignition is ON, with the engine OFF, or the engine is operating.
- The ignition voltage is greater than 7 volts.
- DTC P0122 runs continuously once the above conditions are met.

P0221

- The ignition voltage is greater than 7 volts.
- The TP sensor 2 voltage is between 0.16-4.9 volts.
- DTC P0221 runs continuously once the above conditions are met.

Conditions for Setting the DTC

P0121

The TP sensor 1 disagrees greater than 9 percent from TP sensor 2, or TP sensor 1 disagrees greater than 9 percent from the predicted value for greater than 1 second or a cumulative of 10 seconds.

P0122

The ECM detects the TP sensor 1 signal voltage is less than 0.18 volt for greater than 1 second or a cumulative of 10 seconds.

P0123

The ECM detects the TP sensor 1 signal voltage is greater than 4.6 volts for greater than 1 second or a cumulative of 10 seconds.

P0221

The TP sensor 2 disagrees greater than 9 percent from TP sensor 1, or TP sensor 2 disagrees greater than 9 percent from the predicted value for greater than 1 second or a cumulative of 10 seconds.

P0222

The ECM detects the TP sensor 2 signal voltage is less than 0.16 volt for greater than 1 second or a cumulative of 10 seconds.

P0223

The ECM detects the TP sensor 2 signal voltage is greater than 4.9 volts for greater than 1 second or a cumulative of 10 seconds.

Action Taken When the DTC Sets

- DTCs P0121, P0122, P0123, P0221, P0222 and P0223 are type B DTCs.
- The ECM commands the TAC system to operate in the Reduced Engine Power mode.
- Under certain conditions the ECM commands the engine OFF.

Conditions for Clearing the MIL/DTC

DTCs P0121, P0122, P0123, P0221, P0222 and P0223 are type B DTCs.

Diagnostic Aids

If there is a condition with the TP sensors the ECM defaults to reduced power mode for the entire ignition cycle, even if the condition is corrected.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, verify that DTC P0697, P0698, or P0699 is not set.

   If a DTC is set, refer to DTC P0641-P0643, P0651-P0653, or P0697-P0699 .
2. Clear the DTC Info with a scan tool.
3. Start the engine, observe the scan tool TP Sensor 1 and 2 voltage parameters. TP sensor 1 should be between 0.17-4.6 V and TP sensor 2 should be between 0.15-4.8 V.
4. Observe the scan tool TP sensor 1 and 2 parameters while performing the tests listed below. The TP sensor 1 and 2 parameter should display Agree.
   - Rapidly depress the accelerator pedal from the rest position to the wide open throttle position (WOT) and release pedal. Repeat the procedure several times.
   - Slowly depress the accelerator pedal to WOT and then slowly return the pedal to closed throttle. Repeat the procedure several times.
5. Observe the DTC Information with a scan tool. DTCs P0121, P0122, P0123, P0221, P0222, and P0223 should not set.
6. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at throttle body.
2. Ignition OFF, remove the fuse that supplies B+ to terminal 56 X2 of the ECM.

   Note: The control module or the sensor may be damaged if the circuit is shorted to battery positive voltage.
3. Test for less than 5 Ω between the low reference circuit terminal C and ground.

   If greater than the specified range, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
4. Install fuse that supplies B+ to terminal 56 X2 of the ECM.

5. Ignition ON, test for 4.8-5.2 V between the 5-volt reference circuit terminal E and ground.

   If less than the specified range, test the circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the circuit for a short to voltage. If the circuit tests normal, replace the ECM.
6. Ignition ON, verify that the scan tool TP sensor 1 voltage parameter is less than 0.3 V.

   If greater than the specified value, test the signal circuit terminal D for a short to voltage. If the circuit tests normal, replace the ECM.
7. Connect a 3 A fused jumper wire between the 5-volt reference circuit terminal E and the TP sensor 1 signal circuit terminal D. Verify the scan tool TP sensor 1 voltage parameter is greater than 4.89 V.

   If less than the specified value, test the signal circuit for an open/high resistance or for a short to ground. If the circuit tests normal, replace the ECM.
8. Verify the scan tool TP sensor 2 voltage parameter is greater than 4.97 V.

   If less than the specified value, test the signal circuit terminal F for a short to ground. If the circuit tests normal, replace the ECM.

   Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage.

9. Connect a 3 A fused jumper wire between the TP sensor 2 signal circuit terminal F and the low reference circuit terminal C. Verify the scan tool TP sensor 2 voltage parameter is less than 0.10 V.

   If greater than the specified value, test the signal circuit for an open/high resistance or for a short to voltage. If the circuit tests normal, replace the ECM.
10. If all circuits test normal, replace the throttle body assembly.

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0128: Engine Coolant Temperature (ECT) Below Thermostat Regulating Temperature

Circuit Description

The engine control module (ECM) monitors the temperature of the engine coolant for engine control and as an enabling criteria for some diagnostics. The amount of air flow into an engine is proportional to the amount of heat an engine generates. The ECM monitors the amount of air flow into the engine to calculate engine coolant temperature (ECT). The ECM uses the calculated temperature to determine if the engine has warmed up to the closed loop temperature or to the thermostat regulating temperature. If the coolant temperature does not increase normally or does not reach the closed loop temperature, diagnostics that use the ECT as enabling criteria, may not run when expected.

Conditions for Running the DTC

- Before the ECM can report DTC P0128 failed, DTC P0117 must run and pass.
- DTCs P0100, P0101, P0102, P0103, P0111, P0112, P0113, P0116, P0117, P0118, P0119, or P0700 is not set.
- The calculated ambient air temperature is warmer than -39°C (-38°F) and colder than 100°C (212°F).
- The vehicle speed is greater than 5 km/h (8 mph).
- The engine speed is greater than 760 RPM.
- The ECT is colder than 70°C (158°F) at start up.
- The air flow coming into the engine has accumulated to greater than 1,000 grams.
- DTC P0128 runs continuously once the above conditions have been met for approximately 15 minutes.

OR

- DTCs P0100, P0101, P0102, P0103, P0111, P0112, P0113, P0116, P0117, P0118, P0119, or P0700 is not set.
- The engine speed is greater than 25 RPM.
- The block heater is not detected.
- DTC P0128 runs continuously once the above conditions have been met for approximately 8 minutes.

Conditions for Setting the DTC

- The ECM detects that the actual engine coolant temperature is 11°C (20°F) colder than the calculated thermostat regulating temperature of 89°C (192°F), for greater than 4 seconds or for a cumulative of 30 seconds.

  OR
- The ECM detects that the actual engine coolant temperature is 10°C (18°F) colder than the calculated ECT for greater than 1 second or for a cumulative time of 10 seconds.

Action Taken When the DTC Sets

DTC P0128 is a Type B DTCs.

Conditions for Clearing the MIL/DTC

DTC P0128 is a Type B DTCs.

Diagnostic Aids

An engine that soaks for about 8 hours will help diagnosis the condition. After the cold soak, operate the vehicle at highway speeds for 20 minutes while monitoring the scan tool Calculated ECT - Thermostat parameter. If there is a condition, the calculated temperature will be 10°C (18°F) warmer than the actual engine coolant temperature.

Circuit / System Verification

1. Verify that the engine coolant level is correct.

   If the engine coolant is not at the correct level, refer to Loss of Coolant .
2. Verify that the engine coolant temperature is at the normal operating temperature.

   If the engine coolant temperature is colder than the normal operating temperature, refer to Thermostat Diagnosis .
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the ECT sensor.
2. Ignition OFF, remove the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.

   Caution: Do NOT use a test lamp to test the continuity of the circuit. Damage to the control module may occur due to excessive current draw.

   Note: The control module or the sensor may be damaged if the circuit is shorted to battery positive voltage.

3. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.

   If greater than specified value, test the circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
4. Install the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
5. Ignition ON, observe the scan tool the ECT sensor parameter. Verify that the ECT sensor parameter is at -40°C (-40°F).

   If warmer than the specified value, test the signal circuit for a short to ground. If the circuit/connections test normal, replace the ECM.

   Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the ECT sensor may be damaged.

6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool ECT sensor parameter is warmer than 142°C (288°F).

   If colder than the specified value, test the signal circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
7. If all circuits test normal, test or replace the ECT sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector at the ECT sensor.

   Note: A thermometer can be used to the used to test the sensor off the vehicle.

2. Test the ECT sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the Temperature Versus Resistance - Engine Coolant Temperature Sensor table and verify that the resistance is within 5 percent of the

specification.

If the resistance vs. temperature is not within specified value, replace the ECT sensor.

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine operating in Closed Loop *Parameter Normal Range:* Fluctuates above and below 350-500 mV			
Sensor Signal	0-60 mV	400-415 mV	5000 mV
Low Reference	--	400-415 mV	5000 mV

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. Or, to detect if the HO2S signal voltage switches at the same rate at which the ECM is commanding the heater ON and OFF.

Conditions for Running the DTC

Condition 1 and 2

- DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 is not set.
- The engine is operating.
- The ignition voltage is greater than 10 volts.
- The HO2S 1 heater duty cycle is greater than 70 percent for greater than 8 seconds.
- The DTCs run continuously once the conditions above exist for greater than 20 seconds.

Condition 3

- Before the ECM can report that DTC P0130 or P0150 failed, DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0133, P0135, P0153, and P0155 must run and pass.
- DTC P0030, P0031, P0032, P0050, P0051, P0052, P0133, P0135, P0153, P0155, P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 is not set.
- The engine is operating.
- The ignition voltage is greater than 10 volts.
- The air flow into the engine has exceeded 10 grams.
- The calculated exhaust gas temperature is greater than 600°C (1,112°F).
- The HO2S 1 heater duty cycle is less than 70 percent.
- The HO2S 2 is operating in closed loop.
- The DTCs run continuously once the conditions above exist for greater than 60 seconds.

Conditions for Setting the DTCs

Condition 1

The ECM detects that the HO2S 1 signal voltage increases greater than 2 volts in 4 out of 6 HO2S heater switch OFF samples.

Condition 2

The HO2S 1 voltage is between 600-1,150 mV and the corresponding HO2S 2 voltage is less than 100 mV for greater than 1 second.

Condition 3

The HO2S 1 voltage is between 60-400 mV and the corresponding HO2S 2 voltage is less than

500 mV for greater than 1 second.

Action Taken when the DTCs Set

DTCs P0130 and P0150 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0130 and P0150 are type B DTCs.

Diagnostic Aids

- The HO2S 1 voltage should be between 350-550 mV with the ignition ON. If the voltage is greater than the specified value, there is a condition with the HO2S 1 circuits. If the voltage does not change after disconnecting the HO2S, the condition is between the sensor and the ECM. If the voltage is between 350-550 mV after disconnecting the sensor, the condition is with the HO2S 1.
- Inspect the HO2S 1 harness connector for water intrusion. Moisture in a connector may cause voltage to bleed to other circuits within the connector.

DTC Descriptors

DTC P0130: HO2S Signal Circuit Shorted to Heater Circuit Bank 1 Sensor 1

DTC P0150: HO2S Signal Circuit Shorted to Heater Circuit Bank 2 Sensor 1

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. Or, to detect if the HO2S signal voltage switches at the same rate at which the ECM is commanding the heater ON and OFF.

Conditions for Running the DTC

Condition 1 and 2

- Before the ECM can report that DTC P0130 or P0150 failed, DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0133, P0135, P0153, and P0155 must run and pass.
- DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P2146, P2149, P2152, P2155, P216A, or P216D is not set.
- The engine is greater than 240 RPM.
- The ignition voltage is greater than 10 volts.
- The HO2S 1 heater duty cycle is greater than 90 percent for greater than 5 seconds.
- The DTCs run continuously once the conditions above exist for greater than 60 seconds.

Condition 3

- Before the ECM can report that DTC P0130 or P0150 failed, DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0133, P0135, P0153, and P0155 must run and pass.
- The engine is operating.
- The ignition voltage is greater than 10 volts.

- The air flow into the engine has exceeded 10 grams.
- The HO2S 1 heater duty cycle is greater than 70 percent or, the calculated exhaust gas temperature is warmer than 600°C (1,112°F).
- Closed loop fuel control is enabled.
- The evaporative emissions system (EVAP) is not performing an intrusive test.
- The DTCs run continuously once the conditions above exist for greater than 30 seconds.

Conditions for Setting the DTC

Condition 1

The ECM detects that the HO2S 1 signal voltage increases to greater than 2 volts within 4 ms of 4 out of 6 HO2S heater switch OFF samples.

Condition 2

The HO2S 1 voltage is between 520-1,150 mV and the corresponding HO2S 2 voltage is less than 100 mV.

Condition 3

The HO2S 1 voltage is between 60-400 mV and the corresponding HO2S 2 voltage is less than 500 mV.

Action Taken when the DTC Sets

DTCs P0130 and P0150 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0130 and P0150 are Type B DTCs.

Diagnostic Aids

- The HO2S 1 voltage should be between 350-550 mV with the ignition ON. If the voltage is greater than the specified value, there is a condition with the HO2S 1 circuits. If the voltage does not change after disconnecting the HO2S, the condition is between the sensor and the ECM. If the voltage is between 350-550 mV after disconnecting the sensor, the condition is with the HO2S 1.
- Inspect the HO2S 1 harness connector for water intrusion. Moisture in a connector may cause voltage to bleed to other circuits within the connector.

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine operating in Closed Loop *Parameter Normal Range:* Fluctuates above and below 350-500 mV			
Sensor Signal	0-60 mV	445-450 mV	1275 mV
Low Reference	--	445-480 mV	1275 mV

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust

stream. When the engine is started the engine control module (ECM) operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air/fuel ratio. The ECM supplies the HO2S with a reference or bias voltage of about 450 mV. While the engine runs the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the ECM, Closed Loop is entered. The ECM uses the HO2S voltage to determine the air/fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the ECM to calculate the air/fuel ratio sooner.

Conditions for Running the DTC

Condition 1

- DTC P0201, P0202, P0203, P0204, P0205, P0206 P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 is not set.
- The ignition voltage is greater than 11 volts.
- The engine is operating.
- The air flow into the engine is greater than 10 grams.
- The HO2S 1 heater duty cycle is greater than 70 percent for greater than 8 seconds.
- DTC P0131 and P0151 run continuously once the conditions above exist for greater than 30 seconds.

Condition 2

- DTC P0116, P0117, P0118, P0119, P0201, P0202, P0203, P0204, P0205, P0206 P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 is not set.
- The ignition voltage is greater than 11 volts.
- The engine is operating for greater than 1 second.
- The engine coolant temperature (ECT) during the previous ignition cycle was greater than 60°C (140°F).
- The ECT at startup is less than 40°C (104°F).
- The HO2S 1 heater duty cycle is greater than 70 percent for greater than 8 seconds.
- DTC P0131 and P0151 run continuously once the conditions above exist.

Conditions for Setting the DTCs

Condition 1

The ECM detects that the HO2S 1 signal voltage is less than 60 mV while the corresponding HO2S 2 voltage is greater than 500 mV.

Condition 2

The ECM detects that the HO2S 1 signal voltage is less than 60 mV after a cold start with the engine coolant temperature (ECT) less than 40°C (104°F).

Action Taken when the DTC Sets

DTCs P0131 and P0151 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0131 and P0151 are type B DTCs.

Circuit/System Verification

1. Engine idling, observe the appropriate HO2S 1 voltage parameter. The voltage should fluctuate above and below the range of 350-550 mV.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S sensor.
2. Ignition ON, verify that the HO2S voltage parameter is between 350-500 mV.

If less than the specified range, test the signal circuit for a short to ground. If the circuit/connections test normal, replace the ECM.

If greater than the specified range, test the signal circuit for a short to voltage. If the circuit/connections test normal, replace the ECM.

3. Connect a 3 A fused jumper wire between the signal circuit terminal 4 and ground. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.

4. Connect a 3 A fused jumper wire between the signal circuit terminal 4 and the low reference circuit terminal 3. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.

5. Verify that the following conditions do not exist:
   - The HO2S is loose
   - Lean fuel injectors--Refer to Fuel Injector Balance Test with Special Tool or Fuel Injector Balance Test with Tech 2
   - Low fuel system pressure--Refer to Fuel System Diagnosis .
   - Exhaust leaks near the HO2S.
   - Engine vacuum leaks.

   If you find any of the above conditions, repair as necessary.

6. If all circuits/connections test normal, replace the HO2S sensor.

Low Reference	--	445-480 mV	1275 mV

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring

the HO2S signal voltage while calculating the air-to-fuel ratio. The control module supplies the HO2S with a reference, or bias voltage of about 450 mV. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTC

Condition 1

- DTC P0201, P0202, P0203, P0204, P0205, P0206 P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P2146, P2149, P2152, P2155, P216A, or P216D is not set.
- The ignition voltage is greater than 10 volts.
- The engine speed is greater than 240 RPM.
- The air flow into the engine is greater than 220 grams.
- The HO2S 1 heater duty cycle is greater than 90 percent for greater than 5 seconds.
- The evaporative emissions system (EVAP) is not performing an intrusive test.
- The ECM is not commanding the air/fuel mixture lean.
- DTC P0131 and P0151 run continuously once the conditions above exist for greater than 5 seconds.

Condition 2

- DTC P0116, P0117, P0118, P0119, P0201, P0202, P0203, P0204, P0205, P0206 P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P2146, P2149, P2152, P2155, P216A, or P216D is not set.
- The ignition voltage is greater than 10 volts.
- The engine speed is greater than 240 RPM.
- The conditions for a cold start are present.
- The HO2S 1 heater duty cycle is greater than 90 percent.
- DTC P0131 and P0151 run continuously once the conditions above exist for greater than 5 seconds.

Conditions for Setting the DTC

Condition 1

The ECM detects that an HO2S 1 signal voltage is less than 60 mV while the corresponding HO2S 2 voltage is greater than 500 mV.

Condition 2

The ECM detects that an HO2S 1 signal voltage is less than 60 mV after a cold start.

Action Taken when the DTC Sets

DTCs P0131 and P0151 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0131 and P0151 are Type B DTCs.

Circuit/System Verification

1. Engine idling, observe the appropriate scan tool HO2S 1 voltage parameter. The voltage should fluctuate above and below the range of 350-550 mV.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S 1.

2. Ignition ON, verify that the scan tool HO2S 1 voltage parameter is between 350-500 mV.

   If less than the specified range, test the signal circuit terminal B for a short to ground. If the circuit/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit terminal B for a short to voltage. If the circuit/connections test normal, replace the ECM.
3. Install a 3 A fused jumper wire between the signal circuit terminal B and ground. Verify the HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.
4. Connect a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
5. Verify that the following conditions do not exist:
   - Lean condition.
   - Low fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Exhaust leaks near the HO2S.
   - Engine vacuum leaks.

     If you find any of the above conditions, repair as necessary.
6. If all circuits/connections test normal, replace the appropriate HO2S 1.

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air-to-fuel ratio. The control module supplies the HO2S with a reference, or bias voltage of about 450 mV. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTCs

- Before the ECM can report that DTC P0133 or P0153 failed, DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0135, and P0155 must run and pass.
- DTC P0036, P0037, P0038, P0057, P0058, P0130, P0137, P0138, P0140, P0141, P0150, P0157, P0158, P0160, P0161, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0442, P0443, P0455, P0458, P0459, P2096, P2097, P2098, P2099, P2177, P2178, P2179, P2088, P2089, P2090, P2232, P2235, P2270, P2271, P2272, or P2273 is not set.
- The engine speed is 1,200-2,520 RPM.
- The closed loop fuel control is enabled.
- The engine load is 13-55 percent.
- The exhaust gas temperature is warmer than 350°C (662°F).
- The evaporative purge (EVAP) solenoid is commanded OFF, or is ON for greater than 10 seconds.
- DTC P0133 and P0153 run continuously once the conditions above exist.

Conditions for Setting the DTCs

The ECM determines that the length of time for a primary HO2S to switch from lean to rich and back to lean, which is called a switching cycle, has exceeded a predetermined threshold. The condition exists for 2.5 cycles out of a 20 cycle test sample.

Action Taken when the DTCs Set

DTCs P0133 and P0153 are Type B DTCs.

Conditions for Clearing the MIL/DTCs

DTCs P0133 and P0153 are Type B DTCs.

Circuit / System Verification

1. Ignition ON, observe the scan tool DTC information. Verify no other DTC is not set.
   If any other DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Engine idling, observe the appropriate scan tool HO2S voltage parameter. The voltage should fluctuate above and below the range of 350-550 mV.
3. Observe the DTC information with a scan tool. DTCs P0133 and P0153 should not set.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Verify that none of the following conditions exist:
   - Lean or rich condition.
   - Water intrusion in the HO2S harness connector
   - HO2S wiring harness damage
   - Incorrect RTV sealant
   - Low or high fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Fuel saturation of the evaporative emission (EVAP) canister
   - Exhaust leaks near the HO2S
   - Engine vacuum leaks
   - Engine oil consumption
   - Engine coolant consumption

   If you find any of the above conditions, repair as necessary.
2. If all conditions test normal, replace the appropriate HO2S.

Low Reference	--	P0134, P0135, P0154, P0155	--	--

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started the engine control module (ECM) operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air/fuel ratio. The ECM supplies the HO2S with a reference or bias voltage of about 450 mV. While the engine runs the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the ECM, Closed Loop is entered. The ECM uses the HO2S voltage to determine the air/fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the ECM to calculate the air/fuel ratio sooner.

Conditions for Running the DTCs

- Before the ECM can report that DTC P0133 or P0153 failed, DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0135, and P0155 must run and pass.
- DTC P0036, P0037, P0038, P0057, P0058, P0130, P0137, P0138, P0140, P0141, P0150, P0157, P0158, P0160, P0161, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0442, P0443, P0455, P0458, P0459, P2096, P2097, P2098, P2099, P2177, P2178, P2179, P2088, P2089, P2090, P2232, P2235, P2270, P2271, P2272, or P2273 is not set.
- The engine speed is 1,240-2,400 RPM.
- The closed loop fuel control is enabled.
- The engine load is 18-50 percent.
- The exhaust gas temperature is warmer than 350°C (662°F).
- The evaporative purge (EVAP) solenoid is commanded OFF, or is ON for greater than 10 seconds.
- The ignition voltage is between 10-16 volts.
- The engine is operating.

Conditions for Setting the DTCs

The ECM determines that the length of time for a HO2S 1 to switch from lean to rich and back to lean, which is called a switching cycle, has exceeded a predetermined threshold. The condition exists for 12 cycles out of a 20 cycle test sample.

Action Taken when the DTCs Set

DTCs P0133 or P0153 are type B DTCs.

Conditions for Clearing the MIL/DTCs

DTCs P0133 or P0153 are type B DTCs.

Circuit / System Verification

1. Verify that no other DTCs are not set.

   If any other DTCs are set, refer to Powertrain Diagnostic Trouble Code (DTC) Type Definitions .
2. Engine idling, observe the HO2S voltage parameter. The voltage should fluctuate above and below the range of 350-550 mV.
3. Operate the vehicle within the conditions for running the DTC. DTC P0133 or P0153 should not set.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Verify that none of the following conditions exist:
   - Lean or rich fuel injectors - Refer to Fuel Injector Balance Test with Special Tool or Fuel Injector Balance Test with Tech 2 .
   - Water intrusion in the HO2S harness connector.
   - HO2S wiring harness damage.
   - Incorrect RTV sealant.
   - Low or high fuel system pressure - Refer to Fuel System Diagnosis .
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis .
   - Fuel saturation of the evaporative emission (EVAP) canister.
   - Exhaust leaks near the HO2S.
   - Engine vacuum leaks.
   - Engine oil consumption.
   - Engine coolant consumption.

   If you find any of the above conditions, repair as necessary.
2. If all conditions test normal, replace the appropriate HO2S.

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring

the HO2S signal voltage while calculating the air-to-fuel ratio. The control module supplies the HO2S with a reference, or bias voltage of about 450 mV. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTCs

Condition 1

- DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P2146, P2149, P2152, P2155, P216A, or P216D is not set.
- The ignition voltage is greater than 10 volts.
- The engine speed is greater than 240 RPM.
- The HO2S 1 heater duty cycle is greater than 90 percent for more than 5 seconds.
- DTCs P0134 and P0154 run continuously once the conditions above exist for greater than 10 seconds.

Condition 2

- DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P2146, P2149, P2152, P2155, P216A, or P216D is not set.
- The ignition voltage is greater than 10 volts.
- The engine speed is greater than 240 RPM.
- The HO2S 1 is warmed up for greater than 30 seconds.
- The HO2S 1 heater duty cycle is greater than 68 percent.
- DTCs P0134 and P0154 run continuously once the conditions above exist.

Condition 3

- DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P2146, P2149, P2152, P2155, P216A, or P216D is not set.
- The ignition voltage is greater than 10 volts.
- The engine speed is greater than 240 RPM.
- The HO2S 1 is warmed up for greater than 30 seconds.
- The calculated exhaust temperature is warmer than 600°C (1,112°F).
- DTCs P0134 and P0154 run continuously once the conditions above exist.

Conditions for Setting the DTCs

Condition 1

The HO2S 1 signal voltage is between 400-520 mV, or 400-550 mV when the calculated exhaust temperature is warmer than 800°C (1,472°F).

Condition 2

The calculated internal resistance of the HO2S 1 is greater than 40,000 ohms when the calculated exhaust temperature is warmer than 600°C (1,112°F).

Condition 3

A corresponding HO2S 1 and HO2S 2 are greater than 200 mV during a decel fuel cut-off greater 3 seconds.

Action Taken when the DTC Sets

DTCs P0134 and P0154 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0134 and P0154 are Type B DTCs.

Circuit/System Verification

1. Engine idling, observe the appropriate scan tool HO2S voltage parameter. The voltage should fluctuate above and below the range of 350-550 mV.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal C and ground.

   If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition circuit and replace as necessary.
3. Ignition OFF, connect a test lamp between the heater control circuit terminal D and B+.
4. Idle the engine, and verify the test lamp illuminates or flashes.

   If the test lamp is always OFF, test the control circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.
5. Ignition ON, verify that the appropriate scan tool HO2S voltage parameter is between 350-500 mV.

   If less than the specified range, test the signal circuit terminal B for a short to ground. If the circuit/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit terminal B for a short to voltage. If the circuit/connections test normal, replace the ECM.
6. Connect a 3 A fused jumper wire between the signal circuit terminal B and ground. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.
7. Connect a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
8. Verify that none of the following conditions exist:
   - The HO2S is loose
   - Lean or rich condition.
   - Water intrusion in the HO2S harness connector
   - Low or high fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Fuel saturation of the evaporative emission (EVAP) canister
   - Exhaust leaks near the HO2S
   - Engine vacuum leaks

   If you find any of the above conditions, repair as necessary.
9. If all circuits/connections test normal, replace the appropriate HO2S.

Circuit Description

The heated oxygen sensor (HO2S) heater reduces the time required for the oxygen sensor to reach operating temperature and maintains the operating temperature during extended idle periods. When the ignition is turned to the ON position, ignition voltage is supplied directly to the sensor heater. The engine control module (ECM) controls the heater operation by first modulating the control circuit to ground when the sensors are cold. This prevents the possibility of thermal shock to the sensor from condensation build-up on the sensor by controlling the sensor's rate of heating.

After a predetermined amount of time the ECM commands the heaters ON continuously. Once the sensor reaches operating temperature the ECM may modulate the heater control circuit to ground to maintain a desired temperature.

Conditions for Running the DTCs

P0135 or P0155

- Before the ECM can report DTC P0135 or P0155 failed, P0030, P0031, P0032, P0050, P0051, and P0052 must run and pass.
- DTC P0130, P0131, P0132, P0134, P0150, P0151, P0152, or P0154 is not set.
- The engine is operating.
- The ignition voltage is 10-18 volts.
- The intake air temperature (IAT) is greater than -30°C (-22°F).
- After the previous ignition cycle the engine OFF time was greater than 2 minutes.
- The calculated exhaust temperature is less than 524°C (975°F).
- The engine is not in decel fuel cut-off (DFCO).
- The HO2S 1 is at operating temperature for greater than 10 seconds.
- The internal HO2S 1 resistance is less than 10,000 Ω.
- The DTCs run continuously once the above conditions are met for approximately 100 seconds.

P0141 or P0161

- Before the ECM can report DTC P0141 or P0161 failed, DTCs P0030, P0031, P0032, P0050, P0051, and P0052 must run and pass.
- DTCs P0130, P0131, P0132, P0134, P0150, P0151, P0152, or P0154 are not set.
- The engine is operating.
- The ignition voltage is 10-18 volts.
- The intake air temperature (IAT) is greater than -30°C (-22°F).
- After the previous ignition cycle the engine OFF time was greater than 0 seconds.
- The calculated exhaust temperature is 360-500°C (680-932°F).
- The engine is not in decel fuel cut-off (DFCO).
- The internal HO2S 2 resistance is less than 10,000 Ω.
- The HO2S 2 heater is enabled for greater than 120 seconds.
- The DTCs run continuously once the above conditions are met for approximately 100 seconds.

Conditions for Setting the DTCs

The ECM detects that the internal resistance of an HO2S 1 or HO2S 2 heater is not within the expected range.

Action Taken When the DTC Sets

DTCs P0135, P0141, P0155 and P0161 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0135, P0141, P0155 and P0161 are type B DTCs.

Circuit/System Verification

Note: It may take up to 8 minutes for the DTC to set.

1. With the engine at normal operating temperature, operate the engine above 1,200 RPM for 2 minutes and then allow the engine to idle. DTCs P0135, P0141, P0155 or P0161 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, test for B+ on the HO2S ignition circuit terminal 1 of the HO2S harness connector.

   If less than the specified value, repair the ignition voltage circuit of the HO2S heater for a short to ground or an open/high resistance.

3. Ignition OFF, connect a test lamp between the heater control circuit terminal 2 and B+.

   If test lamp illuminates, test the heater control circuit for a short to ground. If the circuit/connections test normal, replace the ECM.
4. Idle the engine, and verify the test lamp illuminates or flashes.

   If the test lamp is always OFF, test the control circuit terminal 2 for an open/high resistance. If the circuit/connections test normal, replace the ECM.

   Note: The control circuit for the HO2S heater is pulled-up to voltage within the ECM, 2.0-3.0 V on the control circuit is normal.

5. Ignition ON, test for 2.0-3.0 V between the control circuit terminal 2 and ground.

   If not within the specified range, test the control circuit for a short to voltage. If the circuit/connections test normal, replace the ECM.
6. If all circuits/connections test normal, test or replace the HO2S.

Component Testing

1. Ignition OFF, disconnect the harness connector at the heated oxygen sensor (HO2S) sensor.
2. Test for 5-25 Ω between the control terminal 2 and the ignition terminal 1 of the heated oxygen sensor (HO2S) sensor.

   If not within the specified range, replace the HO2S sensor.

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air-to-fuel ratio. The control module supplies the HO2S with a reference, or bias voltage of about 450 mV. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTCs

P0137 and P0157

- DTC P0036, P0037, P0038, P0056, P0057, P0058, P0116, P0117, P0118, P0119, or P0128 is not set.
- The engine speed is greater than 240 RPM.
- The ignition voltage is greater than 10 volts.
- The engine coolant temperature is colder than 40°C (104°F) at start-up and the engine coolant temperature was warmer than 60°C (140°F) when the ignition was turned OFF last ignition cycle.
- The calculated exhaust temperature at the HO2S 2 is warmer than 700°C (1,292°F) and the HO2S 2 is warmed up for greater than 90 seconds.
- The calculated exhaust temperature is colder than 800°C (1472°F) 5 seconds after engine start.
- DTCs P0137 and P0157 run continuously once the above conditions are met.

P0138, P0140, P0158, and P0160

- The engine speed is greater than 240 RPM.
- The ignition voltage is greater than 10 volts.
- The HO2S 2 heater duty cycle is stable and the HO2S 2 is warmed up for greater than 90 seconds.
- The calculated exhaust temperature is colder than 800°C (1472°F).
- DTCs P0138 and P0158 run continuously once the above conditions are met for greater than 5 seconds.

- DTCs P0140 and P0160 run continuously once the above conditions are met for greater than 60 seconds.

Conditions for Setting the DTC

P0137 or P0157

The ECM detects that a secondary HO2S signal voltage is less than 60 mV for greater than 1 seconds of for a cumulative of 10 seconds.

P0138 or P0158

The ECM detects that the HO2S signal voltage is greater than 1,150 mV for greater than 1 seconds or for a cumulative of 10 seconds.

P0140 or P0160

- The ECM detects that the HO2S 2 signal voltage is between 401-519 mV.
- The ECM detects that the measured internal resistance of the HO2S 2 is greater than 40,000 ohms, when the calculated exhaust temperature is warmer than 500°C (932°F).
- Either condition exists for greater than 1 second or for a cumulative of 10 seconds.

Action Taken when the DTC Sets

DTCs P0137, P0138, P0140, P0157, P0158, and P0160 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0137, P0138, P0140, P0157, P0158, and P0160 are Type B DTCs.

Control Module References for scan tool information

Circuit / System Verification

1. Engine idling, observe the appropriate scan tool HO2S 2 voltage parameter. The reading should fluctuate above and below the range of 401-519 mV.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that the scan tool HO2S 2 voltage parameter is between 400-520 mV.

   If less than the specified range, test the signal circuit terminal B for a short to ground. If the circuit/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit terminal B for a short to voltage. If the circuit/connections test normal, replace the ECM.
3. Connect a 3 A fused jumper wire between the signal circuit terminal B and ground. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.
4. Connect a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
5. Verify that the following conditions do not exist:
   - Lean, rich, or leaking fuel injectors.
   - A fuel pressure that is too low or too high--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Evidence of water intrusion into the electrical connector of the HO2S
   - The HO2S is loose
   - Exhaust leaks near the HO2S
   - Engine vacuum leaks

   If you find any of the above conditions, repair as necessary.
6. If all circuits/connections test normal, replace the appropriate HO2S sensor.

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started the engine control module (ECM) operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air/fuel ratio. The ECM supplies the HO2S with a reference or bias voltage of about 450 mV. While the engine runs the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the ECM, Closed Loop is entered. The ECM uses the HO2S voltage to determine the air/fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the ECM to calculate the air/fuel ratio sooner.

Conditions for Running the DTCs

P0137 or P0157

- DTC P0117, P0118, or P0128 is not set.
- The HO2S 2 is at operating temperature for greater than 90 seconds.
- The engine is operating for greater than 5 seconds.
- The ignition voltage is greater than 10 volts.
- The engine coolant temperature is less than 40°C (104°F) at start-up and the engine coolant temperature was greater than 60°C (140°F) when the ignition was turned OFF last ignition cycle.
- The DTCs run continuously once the above conditions are met.

P0138, P0140, P0158, and P0160

- The HO2S 2 is at operating temperature for greater than 30 seconds.
- The engine is operating for greater than 1 second.
- The ignition voltage is greater than 10 volts.
- DTCs P0138 and P0158 runs continuously once the above conditions are met for greater than 5 seconds.
- DTCs P0140 and P0160 runs continuously once the above conditions are met for greater than 60 seconds.

Conditions for Setting the DTCs

P0137 or P0157

The ECM detects that a secondary HO2S signal voltage is less than 60 mV for greater than 1 seconds of for a cumulative of 10 seconds.

P0138 or P0158

The ECM detects that the HO2S signal voltage is greater than 1,150 mV for greater than 1 seconds or for a cumulative of 10 seconds.

P0140 or P0160

- The ECM detects that the HO2S 2 signal voltage is between 401-519 mV, when the calculated exhaust temperature is less than 800°C (1,472°F).
- The ECM detects that the HO2S 2 signal voltage is between 401-548 mV, when the calculated exhaust temperature is greater than 800°C (1,472°F).
- The ECM detects that the measured internal resistance of the HO2S is greater than 40,000 Ω, when the calculated exhaust temperature is greater than 450°C (802°F).
- The ECM detects any one of the above conditions for greater than 1 second or for a cumulative of 10 seconds.

Action Taken when the DTC Sets

DTCs P0137, P0138, P0140, P0157, P0158 and P0160 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0137, P0138, P0140, P0157, P0158 and P0160 are type B DTCs.

Circuit/System Verification

1. Engine idling, observe the appropriate scan tool HO2S 2 voltage parameter. The reading should fluctuate above and below the range of 350-550 mV.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S 2.
2. Ignition ON, verify that the scan tool HO2S 2 voltage parameter is between 350-500 mV.

   If less than the specified range, test the signal circuit terminal 4 for a short to ground. If the circuit/connections test normal, replace theECM.

   If greater than the specified range, test the signal circuit terminal 4 for a short to voltage. If the circuit/connections test normal, replace the ECM.
3. Connect a 3 A fused jumper wire between the signal circuit terminal 4 and ground. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.
4. Connect a 3 A fused jumper wire between the signal circuit terminal 4 and the low reference circuit terminal 3. Verify the scan tool HO2S 2 voltage parameter is less than 60 mV.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
5. Verify that the following conditions do not exist:
   - Lean, rich, or leaking fuel injectors--Refer to Fuel Injector Solenoid Coil Test.
   - A fuel pressure that is too low or too high--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Evidence of water intrusion into the electrical connector of the HO2S
   - The HO2S is loose
   - Exhaust leaks near the HO2S
   - Engine vacuum leaks

   If you find any of the above conditions, repair as necessary.
6. If all circuits/connections test normal, replace the appropriate HO2S 2 sensor.

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air-to-fuel ratio. The control module supplies the HO2S with a reference, or bias voltage of about 450 mV. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTCs

- Before the ECM can reports that DTC P013A, P013C, P013E, or P014A failed, DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0135, and P0155 must run and pass.
- DTC P0036, P0037, P0038, P0057, P0058, P0137, P0138, P0140, P0141, P0157, P0158, P0160, P0161, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0442, P0443, P0455, P0458, P0459, P2096, P2097, P2098, P2099, P2177, P2178, P2179, P2088, P2089, P2090, P2232, P2235, P2270, P2271, P2272, or P2273 is not set.
- The HO2S 2 signal voltage is greater than 590 mV at the beginning of decel fuel cut-off.
- The ignition voltage is greater than 10 volts.
- The internal controller HO2S 2 resistance is less than 500 Ω.
- The HO2S 1 and 2 are in closed loop.
- The calculated exhaust temperature for HO2S 2 is greater than 450°C (842°F).
- The HO2S 1 signal voltage is less than 141 mV
- The DTCs run continuously once the conditions above exist.

Conditions for Setting the DTCs

P013A or P013C

The ECM determines that the response time for the HO2S 2 to switch from greater than 400 mV to less than 200 mV is greater than 1 second. The condition exists for greater than 4 seconds or for a cumulative time of 30 seconds.

P013E or P014A

- The ECM determines the time for the HO2S 2 to transition from greater than 140 mV to less than 140 mV during decel fuel cut-off is greater than 4 seconds. The condition exists for greater than 4 seconds or for a cumulative time of 30 seconds.

  OR
- The ECM determines that the airflow into the engine exceeds 15 grams before the HO2S 2 voltage drops below 140 mV during decel fuel cut-off. The condition exists for greater than 4 seconds or for a cumulative time of 30 seconds.

Action Taken when the DTCs Set

DTCs P013A, P013C, P013E, and P014A are Type B DTCs.

Conditions for Clearing the MIL/DTCs

DTCs P013A, P013C, P013E, and P014A are Type B DTCs.

Circuit / System Verification

1. Verify that other DTCs are not set.

   If any other DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Engine idling, observe the appropriate scan tool HO2S voltage parameter. The voltage should fluctuate above and below the range of 350-550 mV.
3. Observe the DTC information with a scan tool. DTC P013A, P013C, P013E, and P014A should not set.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that the scan tool HO2S voltage parameter is between 350-500 mV.

   If less than the specified range, test the signal circuit terminal 4 for a short to ground. If the circuit/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit terminal 4 for a short to voltage. If the circuit/connections test normal, replace the ECM.
3. Connect a 3 A fused jumper wire between the signal circuit terminal 4 and ground. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.

4. Connect a 3 A fused jumper wire between the signal circuit terminal 4 and the low reference circuit terminal 3. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.

5. Verify that none of the following conditions exist:
   - Lean or rich fuel injectors--Refer to Fuel Injector Solenoid Coil Test
   - Water intrusion in the HO2S harness connector
   - HO2S wiring harness damage
   - Incorrect RTV sealant
   - Low or high fuel system pressure--Refer to Fuel System Diagnosis
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis
   - Fuel saturation of the evaporative emission (EVAP) canister
   - Exhaust leaks near the HO2S
   - Engine vacuum leaks
   - Engine oil consumption
   - Engine coolant consumption

     If you find any of the above conditions, repair as necessary.

6. If all conditions test normal, replace the appropriate HO2S.

Circuit Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air-to-fuel ratio. The control module supplies the HO2S with a reference, or bias voltage of about 450 mV. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. This voltage will fluctuate above and below the bias voltage. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases above bias voltage toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases below bias voltage toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTCs

- Before the ECM can reports that DTC P013A, P013C, P013E, or P014A failed, DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0135, and P0155 must run and pass.
- DTC P0036, P0037, P0038, P056, P0057, P0058, P0137, P0138, P0140, P0141, P0157, P0158, P0160, P0161, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0442, P0443, P0455, P0458, P0459, P2096, P2097, P2098, P2099, P2177, P2178, P2179, P2088, P2089, P2090, P2232, P2235, P2270, P2271, P2272, or P2273 is not set.
- The ignition voltage is greater than 10 volts.
- The HO2S 1 and 2 are in closed loop.
- The HO2S 2 resistance is less than 900 ohms.
- The HO2S 2 has switched from lean to rich during the ignition cycle.
- The calculated exhaust gas mass flow rate is greater than 2.22 g/s.
- The calculated exhaust gas temperature for HO2S 2 is warmer than 450°C (842°F).
- The HO2S 1 signal voltage is less than 141 mV
- The HO2S 2 signal voltage is greater than 590 mV at the beginning of decel fuel cut-off - DTC P013E and P014A only.
- The DTCs run continuously once the conditions above exist for greater than 4 seconds.

Conditions for Setting the DTCs

P013A or P013C

The ECM determines that the response time for the HO2S 2 to switch from greater than 400 mV to less than 200 mV is greater than 800 mS. The condition exists for greater than 4 seconds or for a cumulative time of 30 seconds.

P013E or P014A

- The ECM determines the time for the HO2S 2 to transition from greater than 590 mV to less than 140 mV, during decel fuel cut-off is greater than 4 seconds. The condition exists for greater than 4 seconds or for a cumulative time of 30 seconds.

  OR
- The ECM determines that the air flow into the engine exceeded 15 grams before the HO2S 2 transitions to less than 140 mV, during decel fuel cut-off. The condition exists for greater than 4 seconds or for a cumulative time of 30 seconds.

Action Taken when the DTCs Set

DTCs P013A, P013C, P013E, and P014A are Type B DTCs.

Conditions for Clearing the MIL/DTCs

DTCs P013A, P013C, P013E, and P014A are Type B DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool DTC information. Verify no other DTC is set.

   If any other DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Engine idling, observe the appropriate scan tool HO2S voltage parameter. The voltage should fluctuate above and below the range of 401-519 mV.
3. Observe the DTC information with a scan tool. DTC P013A, P013C, P013E, and P014A should not set.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that the scan tool HO2S voltage parameter is between 400-520 mV.

   If less than the specified range, test the signal circuit terminal B for a short to ground. If the circuit/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit terminal B for a short to voltage. If the circuit/connections test normal, replace the ECM.
3. Connect a 3 A fused jumper wire between the signal circuit terminal B and ground. Verify the scan tool HO2S voltage parameter is less than 60 mV.

If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit/connections test normal, replace the ECM.

4. Connect a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the scan tool HO2S voltage parameter is less than 60 mV.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
5. Verify that none of the following conditions exist:
   - Lean or rich condition.
   - Water intrusion in the HO2S harness connector
   - HO2S wiring harness damage
   - Incorrect RTV sealant
   - Low or high fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Fuel saturation of the evaporative emission (EVAP) canister
   - Exhaust leaks near the HO2S
   - Engine vacuum leaks
   - Engine oil consumption
   - Engine coolant consumption

   If you find any of the above conditions, repair as necessary.
6. If all conditions test normal, replace the appropriate HO2S.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Heated Oxygen Sensor Replacement - Bank 1 Sensor 2
- Heated Oxygen Sensor Replacement - Bank 2 Sensor 2
- Control Module References for engine control module replacement, setup, and programming

DTC P0196, P0197, or P0198

Diagnostic Instructions

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0196: Engine Oil Temperature Sensor Range/Performance

DTC P0197: Engine Oil Temperature Voltage Low

DTC P0198: Engine Oil Temperature Voltage High

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
EOT Sensor Signal	P0198	P0196, P0197	P0197	P0197	P0196
EOT Low Reference	--	P0196, P0197	P0197	--	P0196

Circuit/System Description

The Engine Oil Temperature (EOT) Sensor is a variable resistor that measures the temperature of the engine oil. The engine control module (ECM) supplies a 5 voltage to the EOT signal circuit and supplies a ground for the reference circuit.

Conditions for Running the DTC

P0196

- The engine speed is greater than 25 RPM.
- The engine oil temperature EOT is between -35 to +170°C (-31 to +338°F).
- The DTC runs continuously when the above enable conditions are met for greater than 10 seconds.

P0197 and P0198

- The ignition is ON, or the engine is operating.

- The DTCs runs continuously when the above enable condition is met for greater than 2 seconds.

Conditions for Setting the DTC

P0196

The ECM detects the actual EOT is 40°C (104°F) colder than the calculated EOT of the controller, for greater than 4 seconds or a cumulative time of 30 seconds.

P0197

The ECM detects the EOT is colder than -35°C (-31°F) for greater than 4 seconds or a cumulative time of 30 seconds.

P0198

The ECM detects the EOT is warmer than 170°C (331°F) for greater than 4 seconds or a cumulative time of 30 seconds.

Action Taken when the DTC Sets

DTCs P0196, P0197 and P0198 are type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0196, P0197 and P0198 are type B DTCs.

Circuit/System Verification

1. Engine operating, observe DTC information with a scan tool. DTCs P0196, P0197, or P0198 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the EOT sensor.
2. Ignition OFF, remove the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
3. Test for less than 5 Ω between the low reference circuit terminal C and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
4. Install the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
5. Ignition ON, verify the scan tool Engine Oil temperature Sensor parameter is colder than -35° C (-31°F).

   If greater than the specified range, test the signal circuit terminal B for a short to ground. If the circuit tests normal, replace the ECM.

   Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.
6. Connect a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal C. Verify the scan tool EOT Sensor parameter is warmer than 171°C (340°F).

   If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance, if the circuit tests normal, replace the ECM.
7. If all circuits test normal, replace the EOT/oil level sensor assembly.

Repair Instructions

Always perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Circuit/System Description

The engine control module (ECM) enables the appropriate fuel injector on the intake stroke for each cylinder. Ignition voltage is supplied directly to the fuel injectors. The ECM controls each fuel injector by grounding the control circuit with a solid state device called a driver. The ECM monitors the status of each driver. Each driver has a feedback voltage circuit which the ECM monitors. The injector control circuits are pulled-up to voltage within the ECM . The ECM can determine if a control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

- The engine speed is greater than 80 RPM.
- The ignition voltage is between 10-18 volts.
- The fuel injector has been commanded ON and OFF at least once.
- The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

DTC P0201, P0202, P0203, P0204, P0205 or P0206

The ECM detects the injector control circuit is open for greater than 4 seconds or for a cumulative of 50 seconds.

DTC P0261, P0264, P0267, P0270, P0273 or P0276

The ECM detects the injector control circuit is shorted to ground for greater than 4 seconds or for a cumulative of 50 seconds.

DTC P0262, P0265, P0268, P0271, P0274 or P0277

The ECM detects the injector control circuit is shorted to voltage for greater than 4 seconds or for a cumulative of 50 seconds.

Action Taken When the DTC Sets

DTCs P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 and P0277 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 and P0277 are type B DTCs.

Diagnostic Aids

- Performing the fuel injector coil test may help isolate an intermittent condition. Refer to Fuel Injector Solenoid Coil Test .
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the circuit status for the component with a scan tool. The circuit status parameter changes from OK or Not Run to Fault if there is a condition with the circuit or a connection.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

1. Observe the scan tool Misfire Current Counters. The Misfire Current Counters should not increment.
2. Engine operating, observe the scan tool DTC information. DTCs P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, and P0277 should not set.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records Data List.

Circuit / System Testing

1. Ignition OFF, disconnect the fuel injector multi-way harness connector.

   Note: Testing for steps 2 through 4 is performed on the ECM side of the multi-way harness connector.

2. Ignition ON, probe both ignition circuits terminal 1/2 to ground with a test lamp. The test lamp should illuminate at each ignition circuit.

   If the test lamp does not illuminate, test the ignition circuits for a short to ground, or an open/high resistance. If the circuits test normal and the ignition circuit fuse is open, test or replace the fuel injector.

3. Test for 2.6-4.6 V between the appropriate fuel injector control circuit listed below and ground.
   - Injector 1 terminal 3
   - Injector 2 terminal 6
   - Injector 3 terminal 4
   - Injector 4 terminal 7
   - Injector 5 terminal 5
   - Injector 6 terminal 8

   If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.

4. Probe the appropriate fuel injector control circuit listed below with a test lamp connected to B+. Engine cranking, verify the test lamp flashes.
   - Injector 1 terminal 3
   - Injector 2 terminal 6
   - Injector 3 terminal 4
   - Injector 4 terminal 7
   - Injector 5 terminal 5
   - Injector 6 terminal 8

   If the test lamp remains OFF, test the control circuit for a high resistance. If the circuit/connections test normal, replace the ECM.

   Note: Testing for steps 5 and 6 is performed on the fuel injector side of the multi-way harness connector. It may be necessary to remove the intake manifold to isolate the condition.

5. Ignition OFF, measure the resistance between the ignition voltage circuit terminal listed below and ground. The DMM should display O.L.
   - Injector 1 terminal 3
   - Injector 2 terminal 6
   - Injector 3 terminal 4
   - Injector 4 terminal 7
   - Injector 5 terminal 5
   - Injector 6 terminal 8

   If not the specified value, repair the ignition voltage, or control circuit, for a short to ground. If the circuits/connections test normal, test or replace the appropriate fuel injector.
6. Test for 12-16 Ω between the appropriate ignition voltage circuit terminal 1 or 2 and each fuel injector control circuit listed below.
   - Injector 1 terminal 3
   - Injector 2 terminal 6
   - Injector 3 terminal 4
   - Injector 4 terminal 7
   - Injector 5 terminal 5
   - Injector 6 terminal 8

   If less than the specified range, test for a short between the control circuit and the ignition voltage circuit. If the circuits/connections test normal, test or replace the appropriate fuel injector.

   If greater than the specified range, test the ignition voltage, and fuel injector control circuit, for an open/high resistance. If the circuits/connections test normal, test or replace the appropriate fuel injector.

Repair Instructions

Perform the Diagnostic Repair Verification .

- Fuel Injector and Fuel Rail Replacement
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P0219

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0219: Engine Over speed Condition

Circuit/System Description

This DTC is used to indicate that the engine speed exceeded the fuel cutoff limit in gear. This DTC may set if the transmission is placed in a low gear while driving down a steep grade or traveling at a high speed.

Conditions for Running the DTC

- The DTC is valid for manual transmissions only.
- The engine is running.
- Ignition voltage is between 10-18 volts.

Conditions for Setting the DTC

The ECM detects the engine speed is greater than 7,200 RPM for greater than 1 second.

Action Taken When the DTC Sets

DTC P0219 is a type A DTC.

Conditions for Clearing the DTC

DTC P0219 is a type A DTC.

Diagnostic Aids

An over speed condition can only exist when a low gear on a manual transmission is selected and the vehicle is travelling at high road speed. This DTC cannot be set by free revving the engine.

Circuit/System Verification

Note: This DTC is used for information only. This DTC does NOT indicate there is a condition with the crank sensor or the engine control module (ECM).

DTC P0219 is an informational DTC.

Repair Instructions

Perform the Diagnostic Repair Verification

DTC P0300-P0306 (with LLT)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0300: Engine Misfire Detected

DTC P0301: Cylinder 1 Misfire Detected

DTC P0302: Cylinder 2 Misfire Detected

DTC P0303: Cylinder 3 Misfire Detected

DTC P0304: Cylinder 4 Misfire Detected

DTC P0305: Cylinder 5 Misfire Detected

DTC P0306: Cylinder 6 Misfire Detected

Circuit/System Description

The engine control module (ECM) uses information from the crankshaft position (CKP) sensor and the camshaft position (CMP) sensors in order to determine when an engine misfire is occurring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM is able to detect individual misfire events. A misfire rate that is high enough can cause 3-way catalytic converter damage. The malfunction indicator lamp (MIL) will flash ON and OFF when the conditions for catalytic converter damage are present. DTCs P0301 through P0306 correspond to cylinders 1 through 6. If the ECM is able to determine that a specific cylinder is misfiring, the DTC for that cylinder will set, and the corresponding fuel injector is disabled. The ECM will re-enable the fuel injector after 4 crankshaft revolutions when the misfire is not current. The ECM will re-enable the fuel injector after 8 crankshaft revolutions when the misfire is not current, if the vehicle is equipped with a manual transmission.

Conditions for Running the DTC

- DTC P0121, P0122, P0123, P0221, P0222, P0223, P0335, P0336, or P0338 is not set.
- The engine speed is between 420-7,000 RPM and steady.
- The evaporative emissions (EVAP) leak detection is not active.
- The delivered torque signal is greater than 5 percent at idle.
- The delivered torque signal is between 6-29 percent with the transmission in drive.
- The intake air temperature (IAT) is greater than -30°C (-22°F).

- The A/C compressor clutch is not changing states.
- The ECM is not receiving a rough road signal.
- The fuel level is greater than 11 percent.

  OR
- The fuel level is less than 11 percent and the MIL is illuminated for a misfire DTC, or a fuel level sensor DTC is set.
- The ECM is not in fuel cut-off or decel fuel cut-off mode.
- The throttle angle is steady.
- DTCs P0300 through P0306 run continuously when the above conditions exist for at least 1,000 engine revolutions, 200 revolutions after the first occurrence.

Conditions for Setting the DTC

P0300

The ECM detects a crankshaft rotation speed variation indicating a misfire rate sufficient to cause emissions levels to exceed a predetermined value.

P0301, P0302, P0303, P0304, P0305, P0306

The ECM detects a crankshaft rotation speed variation indicating a single cylinder misfire rate sufficient to cause emissions levels to exceed mandated standards.

Action Taken When the DTC Sets

- DTCs P0300, P0301, P0302, P0303, P0304, P0305, and P0306 are Type A (MIL flashing) or Type B1 DTCs.
- The ECM disables the fuel injector of the misfiring cylinder when a catalyst damaging misfire is present.

Conditions for Clearing the DTC

DTCs P0300, P0301, P0302, P0303, P0304, P0305, and P0306 are Type A (MIL flashing) or Type B1 DTCs.

Diagnostic Aids

- A misfire DTC could be caused by an excessive vibration from sources other than the engine. Inspect for the following possible sources:
  - A tire or wheel that is out of round or out of balance
  - Variable thickness brake rotors
  - An unbalanced drive shaft
  - Certain rough road conditions
  - Transmission operation
  - A damaged accessory drive component or belt

- High resistance in the circuits of the injectors could set a misfire DTC without setting an injector DTC. Test the injector circuits of the affected cylinder(s) for a high resistance if you suspect a condition.

Special Tools

J 26792 HEI Spark Tester

Circuit/System Verification

1. Engine idling at the normal operating temperature.

   If there is an abnormal engine noise, refer to Symptoms - Engine Mechanical.
2. Verify that DTC P000A, P000B, P000C, P000D, P0011, P0014, P0021, P0024, P0087, P0088, P0089, P0201-P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P029D, P02A1, P02A5, P02A9, P02AD, P02B1, P0335, P0336, P0338, P0351-P0356, P2088, P2090, P2092, P2094, P2146, P2149, P2152, P2155, P216A, P216D, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 is not set.

   If a DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
3. Observe the scan tool Misfire Current Cyl. 1-6 parameters. The Misfire Current Counters should not be incrementing.
4. Observe the scan tool Circuit Test Status parameters for the various components. Verify the Circuit Test Status parameters for the components that may cause a misfire display OK or Not Run.

5. Engine idling, perform the cylinder power balance test with a scan tool to isolate the misfiring cylinder. The engine speed should change when each injector is disabled.
6. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Verify that the following conditions do not exist:
   - Vacuum hose splits, kinks, and incorrect connections
   - Engine vacuum leaks
   - Crankcase ventilation system for vacuum leaks
   - Fuel pressure that is too low or too high--Refer to Fuel System Diagnosis.
   - Contaminated Fuel--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Exhaust system restrictions

   If you find any of the above conditions, repair as necessary.
2. Ignition OFF, remove the ignition coil of the misfiring cylinder, but leave the electrical connector connected.
3. Inspect the ignition coil boot for the following conditions:
   - Holes
   - Tears
   - Carbon tracking
   - Oil contamination
   - water intrusion

   If you find any of the above conditions, repair as necessary.
4. Remove the fuel pump fuse from the fuse block.
5. Install the J 26792 to the boot of the appropriate ignition coil and ground.

   Note: An erratic or weak spark is considered a no spark condition.

6. Attempt to start the engine and observe the J 26792 . The spark tester should spark.

   If there is no spark, refer to Electronic Ignition (EI) System Diagnosis for diagnosis of the ignition coil.
7. Ignition OFF, remove the spark plug from the misfiring cylinder. Verify that the spark plug does not exhibit the following conditions:
   - Gas, coolant, or oil fouled--Refer to Spark Plug Inspection.
   - Cracked, worn, incorrectly gapped--Refer to Ignition System Specifications.

   If there is a condition with the spark plug, replace the spark plug.
8. Exchange the suspected spark plug with another cylinder that is operating correctly.
9. Engine idling, observe the scan tool Misfire Current Counter parameters. The misfire should not follow the spark plug exchange.

   If the misfire follows the spark plug, replace the spark plug.
10. If all conditions test normal, test or inspect for the following:
    - A lean or rich fuel injector.
    - An engine mechanical condition--Refer to Symptoms - Engine Mechanical.

Repair Instructions

- Spark Plug Replacement
- Ignition Coil Replacement - Bank 1
- Ignition Coil Replacement - Bank 2

Repair Verification

1. If the customer concern was a flashing malfunction indicator lamp (MIL), refer to DTC P0420 or P0430.
2. Clear the DTCs with a scan tool.
3. Turn OFF the ignition for 30 seconds.
4. Start the engine.
5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

   If the DTC fails this ignition, a misfire still exists.

DTC P0300-P0306

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0300: Engine Misfire Detected

DTC P0301: Cylinder 1 Misfire Detected

DTC P0302: Cylinder 2 Misfire Detected

DTC P0303: Cylinder 3 Misfire Detected

DTC P0304: Cylinder 4 Misfire Detected

DTC P0305: Cylinder 5 Misfire Detected

DTC P0306: Cylinder 6 Misfire Detected

Circuit/System Description

The engine control module (ECM) uses information from the crankshaft position (CKP) sensor and the camshaft position (CMP) sensors in order to determine when an engine misfire is occurring. By monitoring variations in the crankshaft rotation speed for each cylinder the ECM is able to detect individual misfire events. A misfire rate that is high enough can cause 3-way catalytic converter damage. The malfunction indicator lamp (MIL) will flash ON and OFF when the conditions for catalytic converter damage are present. DTCs P0301 through P0306 correspond to cylinders 1 through 6. If the ECM is able to determine that a specific cylinder is misfiring the DTC for that cylinder will set.

Conditions for Running the DTC

- DTC P0121, P0122, P0123, P0221, P0222, P0223, P0335, P0336, or P0338 is not set.
- The engine speed is between 420-7,000 RPM and steady.
- The delivered torque signal is greater than 5.5 percent at idle.
- The delivered torque signal is between 6-29 percent with the transmission in drive.
- The intake air temperature (IAT) is greater than -30°C (-22°F).
- The A/C compressor clutch is not changing states.
- The clutch pedal position sensor is not changing states.
- The ECM is not in fuel cut-off or decel fuel cut-off mode.

- The torque management is not active.
- The antilock brake system/traction control system (ABS/TCS) is not active.
- The ECM is not receiving a rough road signal.
- The fuel level is greater than 11 percent.
- The throttle angle is steady.
- DTCs P0300 through P0306 run continuously when the above conditions exist for at least 1,000 engine revolutions.

Conditions for Setting the DTC

DTC P0300

The ECM detects a crankshaft rotation speed variation indicating a misfire rate sufficient to cause emissions levels to exceed a predetermined value for greater than 4 seconds.

DTC P0301, P0302, P0303, P0304, P0305 or P0306

The ECM detects a crankshaft rotation speed variation indicating a single cylinder misfire rate sufficient to cause emissions levels to exceed mandated standards.

Action Taken When the DTC Sets

DTCs P0300, P0301, P0302, P0303, P0304, P0305, and P0306 are Type A (MIL flashing) or Type B1 DTCs.

Conditions for Clearing the DTC

DTCs P0300, P0301, P0302, P0303, P0304, P0305, and P0306 are Type A (MIL flashing) or Type B1 DTCs.

Diagnostic Aids

- A misfire DTC could be caused by an excessive vibration from sources other than the engine. Inspect for the following possible sources:
  - A tire or wheel that is out of round or out of balance
  - Variable thickness brake rotors
  - An unbalanced drive shaft
  - Certain rough road conditions
  - Transmission operation
  - A damaged accessory drive component or belt
- High resistance in the circuits of the injectors could set a misfire DTC without setting an injector DTC. Test the injector circuits of the affected cylinder(s) for a high resistance if you suspect a condition.

Circuit / System Verification

1. Engine idling at the normal operating temperature. There should be no abnormal engine noise.

   If there is an abnormal engine noise, refer to Symptoms - Engine Mechanical .
2. Verify that DTC P0011, P0014, P0021, P0024, P0201-P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0335, P0336, P0338, P0351-P0356, P2088, P2090, P2092, P2094, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 is not set.

   If a DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle .
3. Observe the scan tool Misfire Current Cyl. 1-6 parameters. The Misfire Current Counters should not increment.
4. Engine idling, perform the cylinder power balance test with a scan tool to isolate the misfiring cylinder. The engine speed should change when each injector is disabled.
5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Verify that the following conditions do not exist:
   - Vacuum hose splits, kinks, and incorrect connections

- Engine vacuum leaks
- Crankcase ventilation system for vacuum leaks
- Fuel pressure that is too low or too high--Refer to Fuel System Diagnosis .
- Contaminated Fuel--Refer to Alcohol/Contaminants-in-Fuel Diagnosis .
- Exhaust system restrictions

  If you find any of the above conditions, repair as necessary.

2. Ignition OFF, remove the appropriate ignition coil of the misfiring cylinder, but leave the electrical connector connected.
3. Inspect the ignition coil boot for the following conditions:
   - Holes
   - Tears
   - Carbon tracking
   - Oil contamination
   - Water intrusion

   If you find any of the above conditions, repair as necessary.
4. Remove the fuel pump fuse from the fuse block.
5. Install the *J 26792* HEI Spark Tester to the boot of the appropriate ignition coil and ground.

   Note: An erratic or weak spark is considered a no spark condition.

6. Attempt to start the engine and observe the *J 26792* HEI Spark Tester . The spark tester should spark.

   If there is no spark, refer to Electronic Ignition (EI) System Diagnosis for diagnosis of the ignition coil.
7. Ignition OFF, remove the spark plug from the misfiring cylinder. Verify that the spark plug does not exhibit the following conditions:
   - Gas, coolant, or oil fouled--Refer to Spark Plug Inspection .
   - Cracked, worn, incorrectly gapped--Refer to Ignition System Specifications .

   If there is a condition with the spark plug, replace the spark plug.
8. Exchange the suspected spark plug with another cylinder that is operating correctly.
9. Engine idling, observe the scan tool Misfire Current Counter parameters. The misfire should not follow the spark plug exchange.

   If the misfire follows the spark plug, replace the spark plug.
10. If all conditions test normal, test or inspect for the following:
    - A lean or rich fuel injector--Refer to Fuel Injector Solenoid Coil Test .
    - An engine mechanical condition--Refer to Symptoms - Engine Mechanical

Repair Instructions

Spark Plug Replacement

Repair Verification

1. If the customer concern was a flashing malfunction indicator lamp (MIL), refer to DTC P0420 or P0430 .
2. Clear the DTCs with a scan tool.
3. Turn OFF the ignition for 30 seconds.

4. Start the engine.
5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

   If the DTC fails this ignition, a misfire still exists.

DTC P0324

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0324: Knock Sensor (KS) Module Performance

Circuit / System Description

The knock sensor (KS) is a piezoelectric device that produces an AC voltage of different amplitude and frequency depending on the level of engine mechanical vibration. The KS system monitors the knock sensor in order to determine if detonation or spark knock is present. If the KS system determines that excessive knock is present, the engine control module (ECM) retards the spark timing based on the signal from the KS system. The KS produces an AC signal when specific frequencies are detected. The ECM then retards the timing until knock is controlled.

The ECM tests the functionality of the internal knock sensor signal evaluation circuitry. The KS circuitry within the ECM is responsible for receiving, amplifying, filtering, and evaluating the AC voltage and frequency from the knock sensors. The ECM performs two tests that determine if the internal circuitry within the ECM is functioning correctly.

Test One

The ECM internally turns OFF the knock sensor signal circuits. The ECM then applies different test signals to the internal KS circuitry to verify that each test signal output response is within range. If the ECM detects that any of the test signals are not within range, this DTC sets.

Test Two

The ECM internally turns OFF the knock sensor signal circuits. The ECM then tests for any output response when no test signals are applied. If the ECM detects an output response, this DTC sets.

Test Three

The ECM internally turns OFF the knock sensor signal circuits. The ECM generates an internal test pulse and monitors the return signal. If the return test pulse is less than a calibrated threshold, this DTC sets.

Conditions for Running the DTC

- The ECM is controlling spark.

- The engine coolant temperature is greater than 60°C (140°F).
- DTC P0324 runs continuously once the above conditions are met.

Conditions for Setting the DTC

- The ECM detects an incorrect response to the self tests performed on the internal KS circuitry.
- The condition exists for greater than 1 seconds or for a cumulative of 10 seconds.

Action Taken When the DTC Sets

DTCs P0324 is a Type B DTC.

Conditions for Clearing the DTC

DTCs P0324 is a Type B DTC.

Circuit/System Verification

Note: If you can hear an engine knock, repair the engine mechanical condition before proceeding with this diagnostic.

1. Ignition ON, observe the DTC information with a scan tool. DTC P0335, P0336, or P0338 should not be set.

   If DTC P0335, P0336, or P0338 is set, refer to DTC P0335, P0336, or P0338 for further diagnosis.
2. Clear the DTCs with a scan tool.
3. Turn OFF the ignition for 30 seconds.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. Observe the DTC information with a scan tool.
   DTC P0324 should not set.

   If DTC P0324 failed this ignition, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P0331: Knock Sensor (KS) System Performance Bank 2

DTC P0332: Knock Sensor (KS) Circuit Low Voltage Bank 2

DTC P0333: Knock Sensor (KS) Circuit High Voltage Bank 2

Circuit / System Description

The knock sensor (KS) is a piezoelectric device that produces an AC voltage of different amplitude and frequency depending on the level of engine mechanical vibration. The KS system monitors the knock sensor in order to determine if detonation or spark knock is present. If the KS system determines that excessive knock is present, the engine control module (ECM) retards the spark timing based on the signal from the KS system. The KS produces an AC signal when specific frequencies are detected. The ECM then retards the timing until knock is controlled.

In order to differentiate between normal engine noise and spark knock, the ECM samples the KS signal. The ECM samples the KS signal for a certain length of time under different engine speeds and loads during non-cylinder knock events. This sampling is used to determine a range of acceptable normal engine noise.

Conditions for Running the DTC

P0326, P0327, and P0328

- Before the ECM can report DTC P0326 or P0331 failed, DTCs P0324, P0335, P0336, and P0338 must run and pass.
- DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393 is not set.
- The engine coolant temperature (ECT) sensor is greater than 60°C (140°F).
- The engine speed is greater than 2,200 RPM.

- The increase in engine speed is less than a range of 500-2,300 RPM per second.
- The increase in engine load is less than a range of 50-100 kPa per second.
- DTCs P0326 and P0331 run continuously once the above conditions are met for approximately 20 seconds.

P0331, P0332, and P0333

- Before the ECM can report DTC P0327, P0328, P0332, or P0333 failed, DTCs P0324, P0335, P0336, and P0338 must run and pass.
- DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393 is not set.
- The engine coolant temperature (ECT) sensor is greater than 60°C (140°F).
- The increase in engine speed is less than a range of 500-2,300 RPM per second.
- The increase in engine load is less than a range of 50-100 kPa per second.
- DTCs P0327, P0328, P0332, and P0332 run continuously once the above conditions are met for approximately 20 seconds.

Conditions for Setting the DTC

P0326 and P0331

The ECM detects a KS signal voltage that is not in the range of a predetermined engine noise level in 25 of 250 test samples. The condition exists for greater than 1 seconds or for a cumulative of 10 seconds.

P0327 or P0332

The ECM detects a KS signal voltage that is less than the predetermined minimum engine noise level for greater than 1 second or for a cumulative of 10 seconds.

P0328 or P0333

The ECM detects the KS signal voltage is greater than predetermined maximum engine noise level for greater than 1 second or for a cumulative of 10 seconds.

Action Taken When the DTC Sets

DTCs P0326, P0327, P0328, P0331, P0332, and P0333 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0326, P0327, P0328, P0331, P0332, and P0333 are Type B DTCs.

Diagnostic Aids

- Inspect the KS for physical damage. A KS that is dropped or damaged may cause a DTC to set.

- Inspect the KS for proper installation. A KS that is loose or over torqued may cause a DTC to set. The KS should be free of thread sealant. The KS mounting surface should be free of burrs, casting flash, and foreign material.
- The KS must be clear of hoses, brackets, and engine electrical wiring.
- The normal voltage on the KS signal and low reference circuits is 2.43 volts when the KS is disconnected.

Circuit/System Verification

1. Engine at operating temperature, all accessories OFF. Engine speed greater than 2,000 RPM, observe the appropriate scan tool KS signal voltage parameter. The voltage should be greater than 4 volts.
2. Engine idling, move the related harnesses and connectors for the KS circuits while observing the scan tool KS signal voltage parameters. The voltage should remain steady with no abrupt changes.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate KS.

   Note: If the voltage is not within the specified range on either circuit, test for a wire to wire short, short to ground or voltage between the KS circuits.

2. Ignition ON, test for 2-3 V between the signal circuit terminal 1 and ground.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuits/connections test normal, replace the ECM.

   If greater than the specified range, test the signal circuit for a short to voltage. If the circuits/connections test normal, replace the ECM.
3. Test for 2-3 V between the low reference circuit terminal 2 and ground.

   If less than the specified range, test the low reference circuit for a short to ground or an open/high resistance. If the circuits/connections test normal, replace the ECM.

   If greater than the specified range, test the low reference circuit for a short to voltage. If the circuits/connections test normal, replace the ECM.
4. If all circuits/connections test normal, test or replace the KS sensor.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0335: Crankshaft Position Sensor Circuit Malfunction

DTC P0336: Crankshaft Position Sensor Signal Range/Performance

DTC P0338: Crankshaft Position (CKP) Sensor Circuit High Duty Cycle

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
CKP Sensor Signal	P0335	P0335	P0335	P0336
Low Reference	--	P0335	P0335, P0338	P0336
Shielded Ground	--	--	--	P0336

Circuit/System Description

The crankshaft position (CKP) sensor is located on the rear of bank 1 of the engine block. The CKP sensor produces an AC voltage of different amplitude and frequency depending on the velocity of the crankshaft. The CKP sensor works in conjunction with a 58X reluctor wheel that is attached to the crankshaft. Each tooth on the reluctor wheel are spaced 6 degrees apart with one span having a 12 degree space. The engine control module (ECM) uses the 12 degree space to determine top dead center (TDC) for cylinders 1 and 4. The ECM determines when cylinder 1 is on the compression stroke by monitoring the CKP sensor and the camshaft position (CMP) sensors. The ECM can synchronize the ignition timing, fuel injector timing and spark knock control based on the CKP sensor and the CMP sensor inputs. If the ECM loses the reference position to TDC, or the CKP signal is lost or erratic, one of these DTCs sets.

Conditions for Running the DTC

- The engine is cranking or operating
- The ECM has detected greater than 12 camshaft revolutions
- The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0335

- The ECM does not detect a signal from the CKP sensor. The condition exists for greater than 1 second or for a cumulative time of 10 seconds.

  OR
- The ECM detects a CKP signal without a reference pulse for greater than 3 revolutions.

P0336

- The ECM re-syncs the engine position greater than 6 times during an ignition cycle.

  OR
- The ECM detects 28 or more interruptions in the engine speed signal during an ignition cycle.

P0338

The ECM detects a difference of greater than 8 teeth between reference gap position pulses.

Action Taken When the DTC Sets

DTCs P0335, P0336, P0337 and P0338 are type A DTCs.

Conditions for Clearing the DTC

DTCs P0335, P0336, P0337 and P0338 are type A DTCs.

Diagnostic Aids

The following conditions may also set the DTCs:

- Physical damage to the CKP sensor or the reluctor wheel.
- Incorrect play or looseness of the CKP sensor or the reluctor wheel.
- Incorrect installation of the CKP sensor or the reluctor wheel.
- Foreign material passing between the CKP sensor and the reluctor wheel.
- Incorrect air gap between the CKP sensor and the reluctor wheel.
- The ECM uses the camshaft position sensors to determine engine speed and position when there is a CKP sensor condition.
- The engine will operate with a CKP sensor condition only if the ECM has stored the learned reference position of the camshafts in memory. With a crankshaft position sensor condition the engine will go into a limp home mode after a hard restart. The ECM then calculates engine speed from one of the camshaft position sensors. During a limp home mode the following additional DTCs may set and should be ignored:
  - DTC P0324 Knock Sensor (KS) Module Performance.
  - DTC P1011 Intake Camshaft Position Actuator Park Position Bank 1.
- An intermittent condition in the camshaft position (CMP) sensor circuits can cause a CKP DTC

to set. Inspect the CMP sensor, harness connections, and related wiring, if you suspect this condition.

Circuit/System Verification

1. Ignition ON, Using a scan tool clear all DTCs. Attempt to start the engine, observe the DTC information, DTC P0335, P0336 and P0338 should not set.
2. Move related harnesses/connectors of the CKP sensor and verify the engine does not stumble, stall or change engine speed.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, remove the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
2. Disconnect the harness connector at the CKP sensor.

Notice: Do NOT use a test lamp to test the continuity of the circuit. Damage to the control module may occur due to excessive current draw.

Note: The ECM or the sensor may be damaged if the circuit is shorted to B+ voltage.

3. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
4. Install the fuse that supplies B+ to circuit terminal 56 X2 of the ECM.
5. Ignition ON, measure for 4.8-5.2 V between the 5 volt reference circuit terminal 3 of the CKP sensor and ground.

   If less than the specified range, test the 5 volt reference circuit for a short to ground or an open/high resistance. If the circuits/connections test normal, replace the ECM.

   If greater than the specified range, test the 5 volt reference circuit for a short to voltage. If the circuits/connections test normal, replace the ECM.
6. Measure for 4.8-5.2 V between the signal circuit of the CKP sensor terminal 2 and ground with a DMM.

   If greater than the specified range, test for a short to voltage in the signal circuit of the CKP sensor. If circuit/connections test normal, replace the ECM.

   If less than the specified range, test for a short to ground or an open/high resistance in the signal circuit of the CKP sensor. If circuit/connections test normal, replace the ECM.
7. If all circuits/connections test normal, replace the CKP sensor.

Circuit/System Description

Each camshaft is equipped with a camshaft position (CMP) sensor that the engine control module (ECM) monitors. The CMP sensor is a hall effect switch that works in conjunction with a 4X reluctor wheel. The reluctor wheels are mounted to the camshaft position actuators that are mounted to the end of the camshafts. The ECM uses the CMP sensor signals in order to determine the position of the camshafts. The ECM supplies 5 volts to the CMP sensors on the 5-volt reference circuits and supplies a ground on the low reference circuits. The CMP sensors provide a signal to the ECM on the signal circuits. If the ECM detects extra or missing CMP sensor signal transitions or a signal voltage that is greater or less than the predetermined range within a certain number of crankshaft revolutions, one of these DTCs sets.

Conditions for Running the DTC

- The engine is operating for greater than 1 second.
- The DTCs run continuously once the above condition is met.

Conditions for Setting the DTC

P0341, P0346, P0366, P0391

- The ECM detects a signal from the CMP sensor, but the number of pulses are less than or greater than what is expected for one crankshaft revolution.

  OR
- The CMP sensor does NOT correlate to the crankshaft position.
- Either condition must exist for greater than 1 second, or cumulative of 10 seconds.

P0342, P0347, P0367, P0392

The CMP sensor signal voltage is always low and the ECM detects no pulses from the CMP sensor for greater than 1 second, or cumulative of 10 seconds.

P0343, P0348, P0368, P0393

The CMP sensor signal voltage is always high and the ECM detects no pulses from the CMP sensor for greater than 1 second or cumulative of 10 seconds.

Action Taken When the DTC Sets

DTCs P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392 and P0393 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392 and P0393 are type B DTCs.

Diagnostic Aids

The following conditions can also set the DTC:

- Physical damage to the CMP sensor or the reluctor wheel.
- Incorrect play or looseness of the CMP sensor or the reluctor wheel.
- Incorrect installation of the CMP sensor or the reluctor wheel.
- Foreign material passing between the CMP sensor and the reluctor wheel.
- Incorrect air gap between the CMP sensor and the reluctor wheel.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. DTC P0651, P0652 or P0653 should not be set.

   If a DTC is set, refer to DTC P0641-P0643, P0651-P0653, or P0697-P0699 .
2. Engine idling, observe the DTC information with a scan tool. DTC P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, or P0393 should not set.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, remove the fuse that supplies B+ to terminal 56 X2 of the ECM.
2. Disconnect the harness connector at the appropriate camshaft position (CMP) sensor.

   Note: The control module or the sensor may be damaged if the circuit is shorted to B+ voltage.
3. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance or for a short to voltage. If the circuit/connections test normal, replace the ECM.
4. Install the fuse that supplies B+ to terminal 56 X2 of the ECM.
5. Ignition ON, test for greater than 4.8 V between the 5-volt reference circuit terminal 3 and ground.

   If less than the specified value, test the 5-volt reference circuit for an open/high resistance. If the circuits/connections test normal, replace the ECM.
6. Test for 4.8-5.2 V between the signal circuit terminal 2 and ground.

   If the voltage is greater than specified range, test for a short to voltage in the signal circuit. If circuit/connections test normal, replace the ECM.

   If the voltage is less than the specified range, test for a short to ground or an open/high resistance in the signal circuit. If circuit/connections test normal, replace the ECM.
7. If all circuits/connections test normal, replace the camshaft position (CMP) sensor.

Circuit/System Description

The ignition system on this engine uses individual ignition coils and ignition control (IC) circuits for each cylinder. Ignition voltage is supplied to each bank of ignition coils. The engine control module (ECM) controls the ignition system operation. The ECM controls each coil using the IC circuits. The ECM commands the IC circuit low when a spark event is requested.

The sequencing and timing are ECM controlled.

Conditions for Running the DTC

- The engine is operating.
- The ignition voltage is between 10-18 volts.
- The engine speed is between 400-5,000 RPM.
- The DTCs run continuously once per crankshaft revolution after the above conditions are met for 20 crankshaft revolutions.

Conditions for Setting the DTC

P0351-P0356

The ECM detects the ignition control circuit is open for greater than 4 seconds or a cumulative of 30 seconds.

P2300, P2303, P2306, P2309, P2312, or P2315

The ECM detects the ignition control circuit is shorted to ground for greater than 4 seconds or a cumulative of 30 seconds.

P2301, P2304, P2307, P2310, P2313, or P2316

The ECM detects the ignition control circuit is shorted to voltage for greater than 4 seconds or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, and P2316 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, and P2316 are Type B DTCs.

Diagnostic Aids

- Inspect the ignition coils for aftermarket devices. An aftermarket device connected to the ignition coil circuits, may cause this DTC to set.
- If the condition is intermittent, moving the related harnesses and connectors, with the engine operating, while monitoring the appropriate scan tool Misfire Current Cylinder parameter may help to isolate the condition.

Control Module References for scan tool information

Circuit / System Verification

1. Operate the engine for 30 seconds. Observe the DTC information with a scan tool. DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate ignition coil.
2. Ignition ON, verify that a test lamp illuminates between ignition voltage circuit terminal listed below and ground.
   - Terminal D for LY7
   - Terminal 2 for LLT

   If the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition voltage circuit and replace as necessary.
3. Crank or start the engine. Test for 200-400 mV between the IC circuit terminal listed below and ground.
   - Terminal C for LY7
   - Terminal 1 for LLT

   If less than the specified range, test the IC circuit for a short to ground or an open/high resistance. If the circuit/connection tests normal, replace the ECM.

   If greater than the specified range, test the IC circuit for a short to voltage. If the circuit/connection tests normal, replace the ECM.
4. Connect a test lamp between the each of the ground circuits terminal listed below, and B+. The test lamp should illuminate on each circuit.
   - Terminal A for LY7
   - Terminal 3 for LLT
   - Terminal 4 for LLT

   If the test lamp does not illuminate, test the circuit for an open/high resistance.

   Note: This step only applies to the LY7 engine.
5. Ignition OFF, test for less than 5 Ω between the low reference circuit terminal B and ground.

   If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
6. If all circuits/connections test normal, replace the ignition coil.

Circuit/System Description

The ignition system on this engine uses individual ignition coils and ignition control (IC) circuits for each cylinder. Ignition voltage is supplied to each bank of ignition coils. The engine control module (ECM) controls the ignition system operation. The ECM controls each coil using the IC circuits. The ECM commands the IC circuit low when a spark event is requested.

The sequencing and timing are ECM controlled.

Conditions for Running the DTC

- The engine is operating.
- The ignition voltage is between 10-18 volts.
- The engine speed is less than 6,000 RPM.
- The DTCs run continuously once per crankshaft revolution after the above conditions are met.

Conditions for Setting the DTC

P0351-P0356

The ECM detects the ignition control circuit is open for greater than 4 seconds or a cumulative of 30 seconds.

P2300, P2303, P2306, P2309, P2312, or P2315

The ECM detects the ignition control circuit is shorted to ground for greater than 4 seconds or a cumulative of 30 seconds.

P2301, P2304, P2307, P2310, P2313, or P2316

The ECM detects the ignition control circuit is shorted to voltage for greater than 4 seconds or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, and P2316 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, and P2316 are Type B DTCs.

Diagnostic Aids

- Inspect the ignition coils for aftermarket devices. An aftermarket device connected to the ignition coil circuits, may cause this DTC to set.
- If the condition is intermittent, moving the related harnesses and connectors, with the engine operating, while monitoring the appropriate scan tool Misfire Current Cylinder or IC Circuit Test Status parameter may help to isolate the condition.

Control Module References for scan tool information

Circuit / System Verification

1. Engine idling, observe the DTC information with a scan tool. DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 should not set.
2. Observe the appropriate scan tool Misfire Current Cylinder parameter. Verify the parameter does not increment.
3. Observe the appropriate scan tool IC Circuit Test Status parameters. Verify the parameters display OK or Not Run.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate ignition coil.

   Note: The ignition circuit supplies voltage to other components. Make sure you test all circuits for a short to ground or test all components for being shorted that share the ignition circuit.

2. Ignition ON, verify that a test lamp illuminates between the ignition voltage circuit terminal 2 and ground.

   If the test lamp does not illuminate, test the circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition voltage circuit and replace as necessary.
3. Crank or start the engine. Test for 200-400 mV between the appropriate IC circuit terminal 1 and ground.

   If less than the specified range, test the circuit for a short to ground or an open/high resistance. If the circuit/connection tests normal, replace the ECM.

   If greater than the specified range, test the circuit for a short to voltage. If the circuit/connection tests normal, replace the ECM.
4. Connect a test lamp between the each of the ground circuits terminal 3, and terminal 4, and B+. The test lamp should illuminate on each circuit.

   If the test lamp does not illuminate, test the suspected circuit for an open/high resistance.
5. If all circuits/connections test normal, replace the ignition coil.

DTC P0420 or P0430

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0420: Catalyst System Low Efficiency Bank 1

DTC P0430: Catalyst System Low Efficiency Bank 2

Circuit/System Description

In order to maintain a reasonably low emission level of hydrocarbons (HC), carbon monoxide (CO) and oxides of nitrogen (NOx) a 3-way catalytic converter (TWC) is used. The catalyst within the converter promotes a chemical reaction that oxidizes the HC and CO present in the exhaust gas. This reaction converts the gases into harmless water vapor and carbon dioxide. The catalyst also reduces the NOx , converting the NOx into nitrogen. The engine control module (ECM) monitors this process using the post catalyst heated oxygen sensor (HO2S) signal. The post-catalyst HO2S located in the exhaust stream after the TWC, produces an output signal that indicates the oxygen storage capacity of the catalyst. The oxygen storage capacity (OSC) determines the ability of the catalyst to convert the exhaust emissions effectively. If the catalyst is functioning correctly the post-catalyst HO2S signal will be far less active than the signal produced by the pre-catalyst HO2S.

To determine OSC, the ECM commands a rich air/fuel mixture until all oxygen is removed from the catalyst. The ECM then commands a lean air/fuel mixture and monitors the rear heated oxygen sensors to calculate the oxygen storage capacity. The catalyst is operated in this mode until one of the following conditions occur:

- The oxygen stored in the catalyst exceeds a calibrated threshold, which is determined from the rear HO2S signal.
- The rear HO2S indicates the catalyst to be completely saturated with oxygen, which is determined from the rear HO2S signal.

Conditions for Running the DTC

- Before the ECM can report DTC P0420 or P0430 failed, DTCs P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0053, P0056, P0057, P0058, P0059, P0101, P0102, P0103, P0121, P0122, P0123, P0130, P0131, P0132, P0133, P0135, P0137, P0138, P0140, P0141, P0150, P0151, P0152, P0153, P0155, P0157, P0158, P0160, P0161, P0221, P0222, P0223, P0335, P0336, P0338, P167A, P167B, P2096, P2097, P2098, P2099, P2195, P2196, P2197, P2198, P2232, P2235, P2237, P2240, P2243, P2247, P2251, P2254, P2270, P2271, P2272, P2273, P2297, P2298, P2626 and P2629 must run and pass.

- DTCs P0010, P0011, P0013, P0014, P0020, P0021, P0023, P0024, P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0053, P0056, P0057, P0058, P0059, P0101, P0102, P0103, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0125, P0130, P0131, P0132, P0133, P0135, P0137, P0138, P0140, P0141, P0150, P0151, P0152, P0153, P0155, P0157, P0158, P0160, P0161, P0221, P0222, P0223, P0300, P0301-P0306, P0443, P0458, P0459, P0496, P167A, P167B, P2088, P2089, P2090, P2091, P2092, P2093, P2094, P2095, P2096, P2097, P2098, P2099, P2100, P2101, P2107, P2119, P2122, P2123, P2127, P2128, P2138, P2176, P2177, P2178, P2179, P2180, P2187, P2188, P2189, P2190, P2195, P2196, P2197, P2198, P2232, P2235, P2237, P2240, P2243, P2247, P2251, P2254, P2270, P2271, P2272, P2273, P2297, P2298, P2626 and P2629 are not set
- The air flow into the engine is between 3-28 g/s and is steady within 2 percent.
- The calculated TWC temperature is between 550-900°C (1,022-1,652°F) and steady.
- The engine speed is 1,160-2,440 RPM.
- The engine load is 13-55 percent.
- The calculated TWC temperature does not change greater than 8°C (14°F) in 1 second.
- The engine is operating in Closed Loop.
- The HO2S 2 is at operating temperature for greater than a range of 140-210 seconds.
- The engine intake air temperature (IAT) is greater than -30°C (-22°F).
- The above conditions exist for approximately 17 minutes.
- DTCs P0420 and P0430 run once a drive cycle. The ECM will attempt to run this diagnostic up to 4 times a drive cycle.

Conditions for Setting the DTC

The ECM determines that the efficiency of the catalyst has degraded below a calibrated threshold for greater than 5 seconds.

Action Taken When the DTC Sets

DTCs P0420 and P0430 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0420 and P0430 are Type A DTCs.

Diagnostic Aids

Inspect for the following conditions which may cause a catalytic converter to degrade:

- An engine misfire.
- High engine oil or high coolant consumption.
- Retarded spark timing.
- A weak or poor spark.
- A lean fuel mixture.
- A rich fuel mixture.
- A damaged oxygen sensor or wiring harness.

Circuit / System Testing

1. Observe the DTC information with a scan tool. Verify there are no HO2S, fuel system, or misfire DTCs set.

   If there are any HO2S, fuel system, or misfire DTCs set, diagnosis the applicable DTC before proceeding with this diagnostic procedure. Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
2. Inspect and verify the following:
   - The catalytic converter is an original part
   - The HO2S 2 is secure and the wiring is not damaged, or contacting the exhaust
   - The exhaust system for leaks, damage, or missing hardware

     If a condition is found, repair as necessary.

   Note: Before replacing the catalytic converter, correct any conditions that may have damaged the converter.
3. If a condition is not located, replace the catalytic converter.

Repair Instructions

Perform the Diagnostic Repair Verification .

- Catalytic Converter Replacement - Right Side

DTC P0443, P0458, or P0459

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0443: Evaporative Emission Control System Purge Solenoid Circuit Malfunction

DTC P0458: Evaporative Emission Control System Purge Solenoid Circuit Low Voltage

DTC P0459: Evaporative Emission Control System Purge Solenoid Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0458	P0443	--	--
EVAP Canister Purge Valve Control Circuit	P0458	P0443	P0459	--

Circuit/System Description

The evaporative emission (EVAP) canister purge valve is used to purge fuel vapor from the EVAP canister to the intake manifold. The EVAP canister purge valve is pulse width modulated (PWM). Ignition voltage is supplied directly to the EVAP canister purge valve. The engine control module (ECM) controls the solenoid by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage. If the ECM detects the control circuit voltage is within a predetermined range when the circuit is commanded OFF, this DTC sets.

Conditions for Running the DTC

- The ignition is ON or the engine is operating.
- The engine speed is greater than 80 RPM.
- The ignition voltage is between 10-18 volts.
- The ECM has commanded the EVAP canister purge valve ON and OFF at least once during the ignition cycle.
- The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0443

The ECM detects the EVAP canister purge solenoid control circuit is open. The condition exists for 4 seconds or a cumulative of 30 seconds.

P0458

The ECM detects the EVAP canister purge solenoid control circuit is shorted to ground. The condition exists for 4 seconds or a cumulative of 30 seconds.

P0459

The ECM detects the EVAP canister purge solenoid control circuit is shorted to voltage. The condition exists for 4 seconds or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTC P0443, P0458 and P0459 are type B DTCs.

Conditions for Clearing the DTC

DTC P0443, P0458 and P0459 are type B DTCs.

Diagnostic Aids

If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the circuit status for the component with a scan tool. The circuit status parameter changes from OK or Indeterminate to Fault if there is a condition with the circuit or a connection.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, command the EVAP purge solenoid to 50 percent with a scan tool. You should hear an audible click.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the evaporative emission (EVAP) canister purge solenoid valve.
2. Ignition ON, verify that a test lamp illuminates between the ignition voltage circuit terminal 2 and ground.

   If the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition voltage circuit fuse is open, test all components connected to the ignition voltage circuit and replace as necessary.
3. Connect a test lamp between the control circuit terminal 1 and the ignition voltage circuit terminal 2.

   Note: The control circuit for the EVAP purge solenoid is pulled-up to voltage within the ECM, 2.6-4.6 V on the control circuit is normal.

4. Command the EVAP purge solenoid to 50 percent and then to 0 percent with a scan tool. The test lamp should illuminate or flash and then go OFF.

   If the test lamp is always ON, test the control circuit terminal 1 for a short to ground. If the circuit tests normal, replace the ECM.

   If the test lamp is always OFF, test the control circuit terminal 1 for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
5. Test for 2.6-4.6 V between the control circuit terminal 1 and ground.

   If the voltage is not within the specified range, replace the ECM.
6. If all circuits test normal, test or replace the EVAP purge solenoid.

Component Testing

1. Ignition OFF, disconnect the harness connector at the EVAP purge solenoid.
2. Test for 15-20 Ω between the control terminal 1 and the ignition terminal 2 of the EVAP

purge solenoid.

If not within the specified range, replace the EVAP purge solenoid.

3. Test for infinite resistance between each terminal and the EVAP purge solenoid housing.

   If not the specified value, replace the EVAP purge solenoid.

Repair Instructions

Perform the Diagnostic Repair Verification .

- Evaporative Emission Canister Purge Solenoid Valve Replacement
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P0506, P0507, or P050A

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0506: Idle Speed Low

DTC P0507: Idle Speed High

DTC P050A: Cold Start Idle Air Control (IAC) System Performance

Circuit/System Description

The throttle actuator control (TAC) motor is a DC motor that is part of the throttle body assembly. The TAC motor drives the throttle valve. The engine control module (ECM) controls the TAC motor based on throttle position sensor input. The idle speed is controlled by the ECM based on various inputs. The ECM commands the TAC motor to open or close the throttle valve in order to maintain the desired idle speed. If the ECM detects the actual idle speed and the desired idle speed are not within a predetermined amount, this DTC sets.

Conditions for Running the DTC

P0506 and P0507

- DTC P0111, P0112, P0113, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0221, P0222, P0223, P0442, P0443, P0446, P0455, P0458, P0459, P0496, P0497, or P0700 is not set.
- The intake air temperature (IAT) is greater than -11°C (+13°F).
- The engine coolant temperature (ECT) is greater than -11°C (+13°F).
- The vehicle speed is 0 km/h (0 mph).
- The engine is idling.
- The engine is operating for greater than 4 seconds.
- The evaporative emission (EVAP) system intrusive test is not active.
- A vehicle speed was detected prior to the diagnostic running.
- The DTCs run continuously once the above conditions are met for greater than 10 seconds.

P050A

- DTC P0111, P0112, P0113, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0221, P0222, P0223, P0442, P0443, P0446, P0455, P0458, P0459, or P0700 is not set.
- The vehicle speed is 0 km/h (0 mph).
- The engine is idling.
- The ECT is less than 65°C (149°F) at cold start.
- The cold start idle speed control is enabled.
- The ECT is less than 60°C (140°F) for the duration of the test.
- DTC P050A runs once an ignition cycle when the conditions above have been met for 7 seconds.

Conditions for Setting the DTC

P0506

The actual engine speed is less than the desired idle speed by at least 100 RPM for greater than 4 seconds or for a cumulative of 30 seconds.

P0507

The actual engine speed is greater than the desired idle speed by at least 200 RPM for greater than 4 seconds or for a cumulative of 30 seconds.

P050A

- The actual engine speed is less than the desired idle speed by at least 100 RPM for greater than 4 seconds or a cumulative of 30 seconds, during a cold start.

  OR
- The actual engine speed is less than the desired idle speed by at least 200 RPM for greater than 4 seconds or a cumulative of 30 seconds, during a cold start.

Action Taken When the DTC Sets

DTCs P0506, P0507, and P050A are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0506, P0507, and P050A are Type B DTCs.

Diagnostic Aids

Inspect for a condition in which the throttle valve may have been held open. For example, ice may have formed in the throttle bore.

- Wiring Repairs

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Observe the DTC information with a scan tool.

   If there are any throttle actuator control (TAC), throttle position (TP) sensor, accelerator pedal position (APP) sensor, or fuel rail pressure (FRP) regulator DTCs set, refer to Diagnostic Trouble Code (DTC) List - Vehicle .
2. Operate the engine within the conditions for running the DTCs for 1 minute. DTC P0506, P0507, or P050A should not set.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Engine operating, command the engine speed up to 1,400 RPM, down to 600 RPM, up to 1,400 RPM, and then exit using the scan tool. The engine speed should steadily increase and decrease as commanded.

If the idle does not increase or decrease steadily, verify that one of the following conditions is not present:

- Vacuum leaks
- The throttle valve for the correct operation--A throttle valve that does not close correctly sets this DTC.
- Restricted air intake system
- The throttle body for damage and/or tampering
- Incorrect or malfunctioning PCV system
- Excess deposits in the throttle body

- A parasitic load on the engine--For example, a transmission condition, a belt driven accessory condition

  Repair the condition as necessary.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P0601-P0604, P0606, P0607, P062B, P0167D, P2107, or P2610 (ECM DTC)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0601: Control Module Read Only Memory (ROM)

DTC P0602: Control Module Not Programmed

DTC P0603: Control Module Long Term Memory Reset

DTC P0604: Control Module Random Access Memory (RAM)

DTC P0606: Control Module Internal Performance

DTC P062B: Control Module Fuel Injector Control Performance

DTC P167D: Control Module Ignition Coil Internal Circuit

DTC P2107: Throttle Actuator Control (TAC) Module Internal Circuit

DTC P2610: Control Module Ignition Off Timer Performance

Circuit / System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). This diagnostic also addresses if the ECM is not programmed.

Conditions for Running the DTC

P0601

- The checksum calculation at power down in the last drive cycle was completely finished.
- DTC P0601 runs once an ignition cycle when the condition is met for 30 seconds at ignition OFF.

P0602

The ignition is ON, with the engine OFF. DTC P0602 runs continuously when the ignition is ON for greater than 1 second.

P0603

- The ignition is ON.
- The power down calculation in the last drive cycle was completely finished.
- DTC P0603 runs continuously once the conditions above have been met for greater than 5 seconds.

P0604

The read/write test at power down in the last drive cycle completely finished. DTC P0604 runs once an ignition cycle when the condition is met for 5 seconds at ignition OFF.

P0606

The power down calculation in the last drive cycle was completely finished. DTC P0606 runs continuously with ignition ON or engine operating for greater than 5 seconds.

P062B

- The engine is operating.
- The ignition voltage is between 8-18 volts.
- The engine speed is greater than 80 RPM.
- DTC P062B runs continuously once the conditions above are met.

P167D

- The engine is operating.
- The engine speed is less than 6,000 RPM.
- The ignition voltage is between 10-18 volts.
- DTC P167D runs continuously once the conditions above are met.

P2107

- The vehicle speed is 0 km/h (0 mph).
- The engine speed is less than 40 RPM.
- The accelerator pedal position (APP) is less than 15 percent.
- The ECM is performing the closed throttle test with the ignition ON and the engine OFF.
- DTC P2107 runs once the above conditions are met during the throttle actuator control system initialization.

P2610

- The engine speed is greater than 240 RPM.
- DTC P2610 runs continuously once the engine is operating and the real time clock is active.

Conditions for Setting the DTC

P0601

The ECM detects a read only memory (ROM) checksum error at ECM power up. The error is detected 5 times, then a 5 second delay for MIL ON after the fifth detection.

P0602

The ECM detects that programming is incomplete. The condition exists, then a 5 second delay for MIL ON.

P0603

The ECM detects a reset error of the internal software that operates the throttle actuator control (TAC) system, during the shut down path test. The condition exists, then a 5 second delay for MIL ON.

P0604

The ECM detects random access memory (RAM) errors. The condition exists, then a 5 second delay for MIL ON.

P0606

The ECM detects an internal error of monitoring software for the throttle actuated control (TAC) system. The condition exists, then a 5 second delay for MIL ON.

P062B

The ECM detects a condition with the integrated circuits of the fuel injector driver module for greater than 4 seconds, or a cumulative of 30 seconds.

P167D

The ECM detects a condition with the integrated circuits of the ignition coil driver module for greater than 4 seconds, or a cumulative of 30 seconds.

P2107

The ECM detects the internal TP sensor 1 amplification output does not correlate with the TP sensor 1 signal voltage for more than 4 seconds.

P2610

The ECM detects the engine off timer signal is missing or not valid for greater than 1 second, or a cumulative of 10 seconds.

Action Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, and P0606 are Type A DTCs.
- DTC P167D, and P2610 are Type B DTCs.

Conditions for Clearing the DTC

- DTCs P0601, P0602, P0603, P0604, and P0606 are Type A DTCs.
- DTC P167D, and P2610 are Type B DTCs.

Reference Information

Description and Operation

Engine Control Module Description

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit / System Verification

1. Ignition ON, observe the DTC information with a scan tool. DTC P0602 or P0606 should not set.

   If DTC P0602 failed this ignition, program the ECM. If the DTC resets, replace the ECM.

   If DTC P0606 failed this ignition, clear the DTCs with a scan tool and verify the DTC does not reset. If DTC resets, replace the ECM.
2. Observe the DTC information with a scan tool. DTC P0601, P0603, P0604, P062B, P167D, P2107, or P2610 should not set.

   If a DTC failed this ignition, replace the ECM.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC Descriptor

DTC P0627: Fuel Pump Relay Control Circuit

DTC P0628: Fuel Pump Relay Control Circuit Low Voltage

DTC P0629: Fuel Pump Relay Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Battery Voltage - Relay Switch	1	2	--	--
Fuel Pump Supply Voltage	1	2	3	--
Fuel Pump Relay Control	P0628	P0627	P0629	--
Fuel Pump Ground	--	P0627	--	--
1. The fuel pump fuse opens and the engine cranks but does not run. 2. The engine cranks but does not run. 3. The fuel pump operates continuously and the battery will discharge.				

Circuit/System Description

The engine control module (ECM) provides ignition voltage to the coil side of the fuel pump relay whenever the engine is cranking or running. The ECM enables the fuel pump relay as long as the engine is cranking or running and ignition system reference pulses are received. If no ignition system reference pulses are received the ECM turns OFF the fuel pump. The fuel pump relay control circuit is equipped with a feedback circuit that is pulled up to voltage within the ECM. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

- The engine speed is greater than 80 RPM.

- The ignition voltage is greater than 10-18 volts.
- The ECM has commanded the fuel pump relay ON and OFF at least once during the ignition cycle.
- The above conditions are met for greater than 1 second.
- The DTCs runs continuously once the above conditions are met.

Conditions for Setting the DTC

DTC P0627

The ECM detects the voltage on the fuel pump relay control circuit is within a predetermined range when the control circuit is commanded OFF. The condition exists for a cumulative of 50 seconds.

DTC P0628

The ECM detects the fuel pump relay control circuit voltage is less than 2.21 volts when the control circuit is commanded OFF. The condition exists for a cumulative of 50 seconds.

DTC P0629

The ECM detects the fuel pump relay control circuit voltage is greater than 2.74 volts when the control circuit is commanded ON. The condition exists for a cumulative of 50 seconds.

Action Taken When the DTC Sets

DTCs P0627, P0628 and P0629 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0627, P0628 and P0629 are type B DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

1. Ignition ON, command the Fuel Pump Relay ON and OFF with a scan tool. You should hear an audible click.
2. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records Data List.

Circuit / System Testing

1. Ignition OFF, disconnect the fuel pump relay.
2. Test for less than 5 Ω between the ground circuit terminal 85 and ground.

   If greater than the specified range, repair the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 86 and ground.
4. Ignition ON, command the fuel pump ON and OFF with a scan tool. The test lamp should turn ON and OFF as commanded.

   If the test lamp remains OFF all the time, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If the test lamp remains ON all the time, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
5. Test for 2-3 volts on the control circuit of the fuel pump relay.

   If the voltage is not within the specified range, replace the ECM.
6. If all circuits/connections test normal, test or replace the fuel pump relay.

Component Testing

1. Measure for 70-110 Ω between terminals 85 and 86 of the fuel pump relay.

   If the resistance is not within the specified range, replace the fuel pump relay.
2. Measure for infinite resistance between the following terminals of the fuel pump relay:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If continuity is detected, replace the fuel pump relay.
3. Connect a 15 A fused jumper wire from B+ to relay terminal 86. Connect a jumper wire from ground to relay terminal 85. Test for less than 2 Ω between terminal 30 and 87 of the relay.

   If greater than the specified range, replace the fuel pump relay.

Repair Instructions

Perform the Diagnostic Repair Verification .

- Relay Replacement
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P0638, P2100, P2101, or P2119

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0638: Commanded versus Actual Throttle Position Correlation

DTC P2100: Throttle Control Motor Malfunction

DTC P2101: Throttle Control Position Range/Performance

DTC P2119: Closed Throttle Position Range/Performance

Circuit/System Description

The engine control module (ECM) controls the throttle valve by applying a varying voltage to the control circuits of the throttle actuator control (TAC) motor. The ECM monitors the duty cycle that is required to actuate the throttle valve. The ECM monitors the throttle position (TP) sensors 1 and 2 to determine the actual throttle valve position.

Conditions for Running the DTCs

P0638 and P2101

- The ignition is ON or the engine is operating.
- The ignition 1 voltage is greater than 7 volts.
- DTCs P0638 and P2101 run continuously once the above conditions are met for greater than 5 second.

P2100

- Before the ECM can report DTC P2100 failed, DTC P2101 must run and pass.
- The ignition is ON or the engine is operating.
- DTC P2100 runs continuously once the above conditions are met.

P2119

- DTC P0111, P0112, P0113, P0116, P0117, P0118, P0119, P0700, P2122, P2123, P2127, P2128, or P2138 is not set.

- The ignition is ON.
- The vehicle speed is 0 km/h (0 mph).
- The engine speed is less than 40 RPM.
- The engine coolant temperature (ECT) is between 5-100°C (41-212°F).
- The intake air temperature (IAT) is 5-143°C (41-290°F).
- The ignition voltage is greater than 10 volts.
- The accelerator pedal position (APP) is less than 15 percent.
- DTC P2119 runs once per ignition cycle when the above conditions are met for less than 1 second.

Conditions for Setting the DTC

DTC P0638

- The ECM detects that the commanded duty cycle for the range test high is greater than 80 percent.

  OR
- The ECM detects that the commanded duty cycle for the range test low is greater than 80 percent.
- Either condition exists for greater than 1 second, or a cumulative of 10 seconds.

DTC P2100

- The ECM detects the output circuit for the TAC motor is open, shorted to ground, or shorted to a voltage.
- The condition exists fro greater than 1 second, or a cumulative of 10 seconds.

DTC P2101

- The ECM detects a 4-50 percent difference between the commanded and the actual throttle plate position, dependant upon the rate of commanded throttle movement.
- The condition exists fro greater than 1 second, or a cumulative of 10 seconds.

DTC P2119

- The ECM determines that the throttle valve did not return to the rest position within 1 second.
- The condition exists for greater than 1 second, or a cumulative of 10 seconds.

Action Taken When the DTC Sets

DTCs P0638, P2100, P2101 and P2119 are type A DTCs.

Conditions for Clearing the DTC

DTCs P0638, P2100, P2101 and P2119 are type A DTCs.

Diagnostic Aids

Inspect for a condition in which the throttle valve may have been held open. For example, dirt may have formed in the throttle bore causing the throttle valve not to close.

Special Tools

J 34730-405 Injector Test Lamp

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. Verify DTC P0121, P0122, P0123, P0221, P0222, or P0223 is not set.
   If a DTC is set, refer to DTC P0121, P0122, P0123, P0221, P0222, or P0223 for further diagnosis.
2. Observe the scan tool TP sensor voltage parameters. Verify that TP sensor 1 voltage is between 3.24-3.54 V, and TP sensor 2 voltage is between 1.36-1.86 V.
   If either TP sensor voltage is not within the specified range, refer to DTC P0121, P0122, P0123, P0221, P0222, or P0223 for further diagnosis.
3. Rapidly depress the accelerator pedal from the rest position to the wide open throttle position (WOT) and release the pedal. Repeat the procedure several times. DTCs P0638, P2100,

P2101, or P2119 should not set.

If DTC P0121, P0122, P0123, P0221, P0222, or P0223 set while performing this procedure, refer to DTC P0121, P0122, P0123, P0221, P0222, or P0223 for further diagnosis.

4. Slowly depress the accelerator pedal to WOT and then slowly return the pedal to closed throttle. Repeat the procedure several times. DTC P0638, P2100, P2101, or P2119 should not set.

   If a DTC P0121, P0122, P0123, P0221, P0222, or P0223 set while performing this procedure, refer to DTC P0121, P0122, P0123, P0221, P0222, or P0223 for further diagnosis.
5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Inspect the throttle body for the following conditions:
   - A throttle blade that is not in the rest position.
   - A throttle valve that is binding open or closed.
   - A throttle valve that opens or closes without spring pressure.

   If a condition is found, replace the throttle body.

Note: Disconnecting the throttle body harness connector causes additional DTCs to set.

2. Ignition OFF, disconnect the harness connector of the throttle body.
3. Ignition ON, test for 4.0-4.2 V between the TAC motor control 1 circuit terminal B and ground.

   If voltage is less than the specified range, test the motor control 1 circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If voltage is greater than the specified range, test each of the motor control circuits for a short to voltage. If the circuits tests normal, replace the ECM.
4. Connect a test lamp between the TAC motor control 2 circuit terminal A and B+. The test lamp should NOT illuminate.

   If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
5. Test for greater than 3.5 V between TAC motor control 1 circuit terminal B and TAC motor control 2 circuit terminal A.

   If the voltage is less than the specified value, test the motor control 2 circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
6. Ignition OFF, connect the *J 34730-405* Injector Test Lamp between the TAC motor control 1 circuit terminal B and TAC motor control 2 circuit terminal A of the throttle body harness connector. Observe the injector test lamp while turning the ignition ON for 5 seconds and then OFF. Verify the injector test lamp illuminates brightly and then turns OFF.

   If the injector test lamp does not illuminate, replace the ECM.
7. If all circuits test normal, replace the throttle body.

Repair Instructions

Perform the Diagnostic Repair Verification .

- Throttle Body Assembly Replacement
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P0641-P0643, P0651-P0653, or P0697-P0699 (ECM DTC)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0641: 5-Volt Reference 1 Circuit

DTC P0642: 5-Volt Reference 1 Circuit Low Voltage

DTC P0643: 5-Volt Reference 1 Circuit High Voltage

DTC P0651: 5-Volt Reference 2 Circuit

DTC P0652: 5-Volt Reference 2 Circuit Low Voltage

DTC P0653: 5-Volt Reference 2 Circuit High Voltage

DTC P0697: 5-Volt Reference 3 Circuit

DTC P0698: 5-Volt Reference 3 Circuit Low Voltage

DTC P0699: 5-Volt Reference 3 Circuit High Voltage

Circuit / System Description

The engine control module (ECM) has 3 5-volt reference circuits. The ECM provides the 5-volt reference to various sensors. Each reference circuit provides a 5-volt reference for greater than one sensor. An open, short to ground, or short voltage on one of the 5-volt reference circuits can affect all the components connected to that 5-volt reference circuit. The ECM monitors the voltage on the 5-volt reference circuits.

Conditions for Running the DTC

- The ignition is ON for greater than 2 seconds.
- DTCs P0641, P0642, P0643, P0651, P0652, P0653, P0697, P0698, and P0699 run continuously when the above condition is met.

Conditions for Setting the DTC

The 5-volt reference circuit voltage is above or below a predetermined threshold. The condition exists, then a 5 second delay for MIL ON.

Action Taken When the DTC Sets

DTCs P0641, P0642, P0643, P0651, P0652, P0653, P0697, P0698, and P0699 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0641, P0642, P0643, P0651, P0652, P0653, P0697, P0698, and P0699 are Type A DTCs.

Diagnostic Aids

- The 5-volt reference 1 circuit provides 5 volts to the following sensors:
  - Fuel tank pressure (FTP) sensor terminal C, if equipped
  - Engine oil pressure (EOP) sensor terminal B
- The 5-volt reference 2 circuit provides 5 volts to the following sensors:
  - All four camshaft position (CMP) sensors terminal 3
  - Accelerator pedal position (APP) sensor 1
- The 5-volt reference 3 circuit provides 5 volts to the following sensors:
  - Throttle position (TP) sensor 1 and 2 terminal E
  - Crankshaft position (CKP) sensor terminal 3
  - Accelerator pedal position (APP) sensor 2 terminal 1
  - A/C pressure sensor terminal 1
- If the condition is intermittent, move the related harnesses and connectors with the engine operating. Monitor the scan tool 5-volt Reference Circuit Test Status parameters for the affected components. The circuit test status parameter will change from OK or Not Run to Fault if there is a condition with the circuit or a connection.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. DTC P0641, P0642, P0643, P0651, P0652, P0653, P0697, P0698, or P0699 should not set.
2. Observe the appropriate scan tool 5-volt Reference Circuit Test Status parameter. The parameter should display OK or Not Run.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Note: Additional DTCs will set when disconnecting the components.

1. Ignition OFF, disconnect the harness connector of all appropriate sensors for the applicable DTC. Refer to Diagnostic Aids.
2. Ignition ON, test for 4.6-5.2 V between one of the affected 5-volt reference circuits and ground.

   If the voltage is less than the specified range, test for a short to ground or for an open between the ECM and the circuit splice. If the circuit test normal, replace the ECM.

   If the voltage is greater than the specified range, test for a short to voltage on the 5-volt reference circuit. If the circuit test normal, replace the ECM.

Note: A short to voltage on the signal circuit of certain components may cause this DTC to set.

3. Connect each component associated with the affected 5-volt reference circuit one at a time while monitoring the appropriate scan tool 5-Volt Reference Circuit Status parameter. The parameter should continue to display OK.

   If the parameter displays Fault when a component is connected, test the signal circuit of that component for a short to voltage. If the circuit tests normal, replace the component.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Oil Pressure Sensor and/or Switch Replacement
- Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake
- Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust
- Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake
- Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust

- Accelerator Pedal Position Sensor Replacement
- Throttle Body Assembly Replacement
- Crankshaft Position Sensor Replacement
- Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement
- Control Module References for ECM replacement, setup, and programming

DTC P0650 (with LLT)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0650: Malfunction Indicator Lamp (MIL) Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
MIL Voltage Supply	P0650	P0650	--	--
MIL Control	P0650*	P0650	P0650	--
* The MIL remains ON				

Circuit/System Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC). The MIL informs the driver that an emission system fault has occurred and that the engine control system requires service. The engine control module (ECM) monitors the MIL control circuit for conditions that are incorrect for the commanded state of the MIL. For example, a failure condition exists if the ECM detects low voltage when the MIL is commanded OFF, or high voltage when the MIL is commanded ON.

Conditions for Running the DTC

- The engine speed is greater than 80 RPM.
- The ignition voltage is between 10-18 volts.
- The ECM has commanded the MIL ON and OFF at least once during the ignition cycle.
- DTC P0650 runs continuously once the above conditions are met.

Conditions for Setting the DTC

The ECM detects an open, a short to ground, or a short to voltage on the circuit that controls the MIL.

Action Taken When the DTC Sets

DTC P0650 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0650 is a Type B DTC.

Diagnostic Aids

If the condition is intermittent, move the related harnesses and connectors with the engine operating. Monitor the scan tool Circuit Test Status parameters for the component. The Circuit Test Status parameter will change from OK or Not Run to Fault if there is a condition with the circuit or a connection.

Circuit/System Verification

1. Ignition ON, observe the scan tool MIL Circuit Test Status parameters. Each of the MIL circuit test status parameters should display OK or Not Run.
2. Ignition ON, command the MIL ON and OFF with a scan tool. The MIL should turn ON and OFF as commanded.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. If any other IPC indicators or gages are inoperative, refer to Instrument Cluster Gages Inoperative.
2. Ignition OFF, disconnect the ECM harness connectors. Ignition ON, the MIL should not illuminate.

   If the MIL is illuminated, test the MIL control circuit terminal 21-X2 for a short to ground. If the circuit tests normal, replace the IPC.
3. Ignition ON, connect a 3 A fused jumper wire between the MIL control circuit terminal 21-X2 and ground. The MIL should illuminate.

   If the MIL does not illuminate, test the MIL control circuit for a short to voltage, or an open/high resistance. If the circuit test normal, replace the IPC/bulb.
4. If all circuits/connections test normal, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P0650

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0650: Malfunction Indicator (MI) Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
MIL Voltage Supply	P0650	P0650	--	--
MIL Control	P0650*	P0650	P0650	--
* The MIL remains ON				

Circuit/System Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC). The MIL informs the driver that an emission system fault has occurred and that the engine control system requires service. The engine control module (ECM) monitors the MIL control circuit for conditions that are incorrect for the commanded state of the MIL. For example a failure condition exists if the ECM detects low voltage when the MIL is commanded OFF or high voltage when the MIL is commanded ON.

Conditions for Running the DTC

- The engine speed is greater than 80 RPM.
- The ignition 1 voltage is between 10-18 volts.
- The ECM has commanded the MIL ON and OFF at least once during the ignition cycle.
- DTC P0650 runs continuously once the above conditions are met.

Conditions for Setting the DTC

- The ECM detects an open/high resistance or a short to ground/voltage on the circuit that controls the MIL.
- The condition exists for at least 4 seconds.

Action Taken When the DTC Sets

DTC P0650 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0650 is a Type B DTC.

Diagnostic Aids

If the condition is intermittent, move the related harnesses and connectors with the engine operating. Monitor the scan tool Circuit Test Status parameters for the component. The Circuit Test Status parameter will change from OK or Not Run to Fault if there is a condition with the circuit or a connection.

1. Ignition ON, command the MIL ON and OFF with a scan tool. The MIL should turn ON and OFF as commanded.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. If any other IPC indicators or gauges are inoperative, refer to Instrument Cluster Gages Inoperative.
2. Ignition OFF, disconnect the ECM harness connectors. Ignition ON, the MIL should not illuminate.

   If the MIL is illuminated, test the MIL control circuit for a short to ground. If the circuit tests normal, replace the IPC.
3. Ignition ON, connect a 3 A fused jumper wire between the MIL control circuit terminal 12 X2 and ground. The MIL should illuminate.

   If the MIL does not illuminate, test the MIL control circuit for a short to voltage, or an open/high resistance. If the circuit test normal, replace the IPC.
4. If all circuits/connections test normal, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Instrument Cluster Replacement
- Engine Control Module Replacement.

DTC P0660, P0661, or P0662

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0660: Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit

DTC P0661: Intake Manifold Tuning (IMT) Solenoid Control Circuit Low Voltage

DTC P0662: Intake Manifold Tuning (IMT) Solenoid Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0661*	P0660	--	--
IMT Control Circuit	P0661	P0660	P0662	--
*Opens the fuse that supplies voltage to the IMT solenoid.				

Circuit/System Description

An intake manifold tuning (IMT) valve is used to change the intake manifold plenum configuration. When the IMT valve is open, the intake manifold is configured to one large plenum. When the IMT valve is closed, the intake manifold is configured to two smaller plenums. The IMT valve improves engine performance at low and high engine speeds.

Ignition voltage is supplied directly to the IMT solenoid. The engine control module (ECM) controls the solenoid by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

- The engine is operating.
- The IMT solenoid has been commanded ON and OFF at least once during the ignition cycle.
- The DTCs run continuously once the above condition is met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 4 seconds, or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0660, P0661, and P0662 are Type C DTCs.

Conditions for Clearing the DTC

DTCs P0660, P0661, and P0662 are Type C DTCs.

Diagnostic Aids

If the condition is intermittent, move the related harnesses and connectors with the engine operating. Monitor the scan tool Circuit Test Status parameters for the component. The Circuit Test Status parameter will change from OK or Not Run to Fault if there is a condition with the circuit or a connection.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition On, command the IMT solenoid ON and OFF with a scan tool. You should hear and feel an audible click.
2. Observe the scan tool Circuit Test Status parameter for the IMT. The parameter should display OK or Not Run.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the IMT solenoid.
2. Ignition ON, verify that a test lamp illuminates between the ignition voltage circuit terminal 1 and ground.

   If the test lamp does not illuminate, test the circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition circuit and replace as necessary.
3. Ignition OFF, connect a test lamp between the control circuit terminal 2 and the ignition voltage circuit terminal 1.

   Note: The control circuit for the IMT solenoid is pulled-up to voltage within the ECM, 2.0-3.0 V on the control circuit is normal.
4. Ignition ON, command the IMT solenoid ON and OFF with a scan tool. The test lamp should turn ON and OFF.

   If the test lamp remains ON all the time, test for a short to ground on the control circuit. If circuit/connections test normal, replace the ECM.

   If the test lamp remains OFF all the time, test for a short to voltage or an open/high resistance on the control circuit. If circuit/connections test normal, replace the ECM.
5. Test for 2.0-3.0 V between the control circuit terminal 2 and ground.

   If the voltage is not within the specified range, replace the ECM.
6. If all circuits/connections test normal, replace the IMT solenoid.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0685: Engine Control Ignition Relay Circuit Malfunction

DTC P0686: Engine Control Ignition Relay Circuit Low Voltage

DTC P0687: Engine Control Ignition Relay Circuit High Voltage

DTC P0689: Engine Control Ignition Relay Feedback Circuit Low Voltage

DTC P0690: Engine Control Ignition Relay Feedback Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
B+ Supply Voltage - Coil	P0685	P0685	P0685	--	--
B+ Supply Voltage - Switch	--	P0689	P0689	P0690	--
Relay Control Circuit	P0686	P0685	P0685	P0687	P0685
Ignition 1 Voltage Circuit	--	P0689	P0689	P0690	--

Circuit/System Description

The engine controls (EC) ignition relay or main relay is a normally open relay. The relay switch is held in the open position by spring tension. Battery positive voltage is supplied directly to the relay coil and the switch contact at all times. The engine control module (ECM) supplies voltage to the relay coil control circuit via an internal integrated circuit called an output driver. When the ECM commands the powertrain relay ON, ignition voltage is supplied to several fuses in the underhood fuse block.

The fuse that provides power to terminal 3, 5, or 6 of ECM connector X2 feeds the internal ECM circuits associated with the throttle actuator control (TAC) operation.

Conditions for Running the DTC

DTC P0685, P0686, and P0687

- The battery voltage is between 10-18 volts.
- The engine speed is greater than 80 RPM.
- The powertrain relay has been commanded ON and OFF.
- The DTCs run continuously once the above condition is met.

DTC P0689 and P0690

- The battery voltage is between 10-18 volts.
- The ignition is ON.
- The DTCs runs continuously once the above condition is met.

Conditions for Setting the DTC

P0685, P0686, and P0687

The commanded state of the driver and the actual state of the control circuit do not match for greater than 4 seconds or for a cumulative of 30 seconds.

P0689 and P0690

The ECM detects that powertrain relay feedback voltage is less than 6 volts for greater than 1 second, when the powertrain relay is commanded ON or OFF. The condition exists for 4 seconds, or for a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P0685, P0686, P0687, P0689, and P0690 are Type C DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0685, P0686, P0687, P0689, and P0690 are Type C DTCs.

Diagnostic Aids

- This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to Battery Inspection/Test.
- An open in the relay control circuit will cause no communication with the ECM when the ignition switch is cycled OFF and then ON after the initial failure. The malfunction indicator lamp (MIL) will flash rapidly and other relays can be heard turning on and off with the ignition ON.
- When disconnecting electrical connectors or removing fuses and relays from a fuse block, always inspect the component electrical terminals for corrosion and the mating electrical terminals for tightness.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, you should be able to communicate with the ECM using a scan tool.
2. Ignition ON, view the DTC information with a scan tool. DTC P0685, P0686, P0687, P0689, or P0690 should not set.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the powertrain relay.

   Note: The test lamp is used to load the circuit and may not illuminate.

2. Connect a test lamp between the B+ supply circuit to the coil side of the powertrain relay and the negative terminal of the battery.
3. Ignition ON, test for less than 0.1 V between the B+ voltage circuit of the powertrain relay and the positive battery terminal.

   If greater than the specified value, repair the B+ voltage circuit to the coil side of the powertrain relay for a short to ground or an open/high resistance.

Note: The test lamp is used to load the circuit and may not illuminate.

4. Connect a test lamp between the B+ voltage supply circuit to the switch side of the powertrain relay and the negative terminal of the battery.
5. Ignition ON, test for less than 0.1 V between the B+ voltage circuit of the powertrain relay and the positive battery terminal.

   If greater than the specified value, repair the B+ voltage circuit to the switch side of the powertrain relay for a short to ground or an open/high resistance.
6. Ignition OFF, connect a test lamp between the control circuit of the powertrain relay and the B+ voltage supply circuit to the coil side of the powertrain relay.
7. Ignition ON. the test lamp should turn ON when the ignition switch is cycled ON and OFF when the ignition switch is cycled OFF.

   If the test lamp remains ON all the time, test for a short to ground on the control circuit. If the circuit/connections test normal, replace the ECM.

   If the test lamp remains OFF all the time, test for a short to voltage or an open/high resistance on the control circuit. If circuit/connections test normal, replace the ECM.
8. Connect a 15 A fused jumper wire between the B+ supply voltage circuit and the ignition voltage circuit of the powertrain relay.
9. Attempt to start the engine. The engine should start.

   If the engine does not start, test the ignition voltage circuit between the powertrain relay and the ECM for a short to ground or for an open/high resistance. If the circuit/connections test normal, replace the ECM.
10. If all circuits/connections test normal, test or replace the powertrain relay.

Component Testing

1. Measure for 200-250 Ω of resistance between terminals 85 and 86 of the main relay.

   If the resistance is not within the specified range, replace the main relay.
2. Measure for infinite resistance between the following terminals of the main relay:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If continuity is detected, replace the main relay.
3. Connect a 20 A fused wire from the positive terminal of the battery to relay terminal 85. Connect a jumper wire from the negative terminal of the battery to relay terminal 86. Measure for less than 2 Ω between terminals 30 and 87 of the relay.

   If the resistance measures greater than 2 Ω, replace the main relay.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Relay Replacement.
- Engine Control Module Replacement for engine control module replacement, setup, and programming

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0700: Transmission Control Module (TCM) Requested MIL Illumination

Circuit/System Description

This diagnostic trouble code (DTC) indicates that an emission related transmission DTC set in the transmission control module (TCM). The engine control module (ECM) receives the TCM information over the serial data circuit. The ECM turns ON the malfunction indicator lamp (MIL) when the TCM sends a message over the serial data circuit requesting MIL illumination. The DTC information for the ECM will only display DTC P0700, but the freeze frame/failure records data will display the transmission DTC that set.

Conditions for Running the DTC

- The ignition is ON or the engine is operating.
- DTC P0700 runs continuously.

Conditions for Setting the DTC

The ECM receives a serial data message from the TCM, in order to illuminate the MIL. The condition exists, then a 5 second delay for MIL ON.

Action Taken When the DTC Sets

DTC P0700 is a type A DTC.

Conditions for Clearing the DTC

DTC P0700 is a type A DTC.

Circuit/System Verification

Note: Correct any Engine Controls DTCs before diagnosing TCM DTCs.

1. DTC P0700 is an informational DTC. If there are no Engine Controls DTCs, refer to

Powertrain Diagnostic Trouble Code (DTC) Type Definitions for diagnosis of TCM DTCs.

2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

DTC P0704

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0704: Clutch Switch Circuit

Circuit/System Description

The engine control module (ECM) supplies a 5 volts to the Clutch Switch Circuit. This circuit ensures the engine can only be started when the clutch pedal is fully depressed. When the pedal is full depressed the circuit is earthed through the switch circuit.

Conditions for Running the DTC

- The engine is running.
- The system voltage is between 9-18 volts.

Conditions for Setting the DTC

The ECM detects that 15 gear changes have been performed with less than 3 clutch pedal switch inputs.

Action Taken when the DTC Sets

DTC P0704 is a type C DTC.

Conditions for Clearing the MIL/DTC

DTC P0704 is a type C DTC.

Circuit/System Verification

Ignition ON, While observing the scan tool depress and release the clutch pedal, the scan tool display display should toggle between Inactive to Active when the pedal is depressed.

Circuit/System Testing

1. Ignition OFF, disconnect the Clutch pedal switch at the switch.
2. Ignition ON, verify that a test lamp illuminate between the signal terminal and a known ground.

   If the test lamp does not illuminates, test the signal circuit for a short to ground or an open/high resistance. If circuit tests normal replace the ECM.
3. Connect a 10A fusible link wire between the signal circuit and the earth terminal at the wiring harness connection.

   observe the scan tool active should be displayed.

   If the display still reads inactive, test the earth circuit for a short to ground or an open/high resistance.
4. If all circuits test normal replace the clutch switch.

Repair Instructions

Replace the clutch switch refer to Clutch Pedal Position Switch Replacement

Perform the Diagnostic Repair Verification.

Repair Verification

Ignition ON, While observing the scan tool depress and release the clutch pedal, the scan tool display display should toggle between Inactive to Active when the pedal is depressed.

DTC P1011-P1014

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P1011: Intake Camshaft Actuator Park Position Bank 1

DTC P1012: Exhaust Camshaft Actuator Park Position Bank 1

DTC P1013: Intake Camshaft Actuator Park Position Bank 2

DTC P1014: Exhaust Camshaft Actuator Park Position Bank 2

Circuit / System Description

The camshaft position (CMP) actuator system enables the engine control module (ECM) to change the camshaft timing of all 4 camshafts while the engine is operating. The CMP actuator assembly varies the camshaft position in response to directional changes in oil pressure. The CMP actuator solenoid controls the oil pressure that is applied to advance or retard a camshaft.

The CMP actuator assemblies have an outer housing that is driven by the engine timing chain. Inside the CMP assembly is a wheel with fixed vanes that is attached to the camshafts. The CMP actuator assemblies are also equipped with a locking pin. The locking pin prevents movement between the outer housing and the wheel vane assembly on engine start-ups. The CMP actuator is locked until sufficient oil pressure is available to control the CMP actuator. The locking pin is released by oil pressure before any movement in the CMP actuator assembly takes place.

Conditions for Running the DTC

- DTCs P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094 and P2095 are not set.
- The engine is operating for greater than 1 second.
- The ECM completed the CMP actuator solenoid output driver test.
- The engine speed is greater than 560 RPM.
- DTCs P1011, P1012, P1013 and P1014 only run on an engine start-up.

Conditions for Setting the DTC

- The ECM detects that the average of the actual camshaft angle measurements is greater than 10 degrees of the parked position angle on an engine start-up.

- The condition exists for greater than 4 seconds, or a cumulative of 50 seconds.

Action Taken When the DTC Sets

DTCs P1011, P1012, P1013 and P1014 are type C DTCs.

Conditions for Clearing the DTC

DTCs P1011, P1012, P1013 and P1014 are type C DTCs.

Diagnostic Aids

- Inform the customer that the following actions may cause DTCs P1011, P1012, P1013, or P1014 to set:
  - Turning the engine OFF while the accelerator pedal is pressed
  - Turning the engine OFF while driving
  - Pressing the accelerator pedal to start the engine
- If the customers concern is that the engine is stalling, refer to Symptoms - Engine Controls for further diagnosis.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, clear the DTC information with a scan tool.

   Note: The engine oil level and the oil pressure are critical to the correct operation of the camshaft position (CMP) actuator system. Verify that the engine has the correct oil level and the correct oil pressure before continuing with this diagnostic. Refer to Fluid and Lubricant Recommendations and Oil Pressure Diagnosis and Testing.

2. Start the engine. Verify there is no abnormal engine noise during start up. Observe the DTC information with a scan tool. DTC P1011, P1012, P1013, or P1014 should not set.

   If there is an abnormal engine noise, or a DTC set, replace the appropriate CMP actuator.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Camshaft Position Actuator Replacement - Bank 1 (Right Side) Intake
- Camshaft Position Actuator Replacement - Bank 1 (Right Side) Exhaust
- Camshaft Position Actuator Replacement - Bank 2 (Left Side) Intake
- Camshaft Position Actuator Replacement - Bank 2 (Left Side) Exhaust

DTC P1380

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P1380: Misfire Detected - Rough Road Data Not Available

Circuit/System Description

Correct engine misfire detection is dependent on whether or not the vehicle is experiencing a rough road condition. A rough road condition causes unexpected crankshaft fluctuations. In order to detect a rough road condition, the electronic brake control module (EBCM) communicates a wheel speed signal over the serial data circuit to the engine control module (ECM). The wheel speed sensor information allows the ECM to distinguish if the crankshaft speed variations are caused by a rough road condition or are caused by a true misfire.

Conditions for Running the DTC

- The engine is operating.
- DTC P1380 runs continuously once the above conditions are met for greater than 5 seconds.

Conditions for Setting the DTC

- The ECM detects an engine misfire while the rough road signal is unavailable.
- The condition exists for greater than 4 seconds or a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTC P1380 is a Type C DTCs.

Conditions for Clearing the DTC

DTC P1380 is a Type C DTCs.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

1. Start and idle the engine, observe the DTC information with a scan tool. DTC P1380 should not set.

   Note: If any UXXXX DTCs are set, diagnose those first.

   If DTC P1380 failed this ignition, refer to Symptoms - Antilock Brake System.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P1551

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P1551: Throttle Control Lower Position not Reached during Learning Mode

Circuit/System Description

The engine control module (ECM) controls the throttle valve by applying a varying voltage to the control circuits of the throttle actuator control (TAC) motor. The ECM monitors the duty cycle that is required to actuate the throttle valve. The ECM monitors the throttle position (TP) sensors 1 and 2 to determine the actual throttle valve position.

Conditions for Running the DTC

- The vehicle speed is 0 km/h (0 mph).
- The engine speed is less than 40 RPM.
- The engine coolant temperature (ECT) is between 5-100°C (41-212°F).
- The intake air temperature (IAT) is between 5-143°C (41-290°F).
- The ignition voltage is greater than 8 volts.
- The accelerator pedal position (APP) is less than 15 percent.
- DTC P1551 runs when the conditions above have been met for greater than 4 seconds.

Conditions for Setting the DTC

- The ECM detects the TP sensor angle is less than 11 percent or greater than 39 percent when the throttle actuator control motor is deactivated.
- The condition exists for greater than 1 second or for a cumulative of 10 seconds.

Action Taken When the DTC Sets

DTC P1551 is a type A DTC.

Conditions for Clearing the DTC

DTC P1551 is a type A DTC.

Diagnostic Aids

- The scan tool has the ability to operate the throttle actuator control system using Special Functions. This function operates the throttle through the entire range in order to determine if the throttle body and system operate correctly.
- Inspect for a condition in which the throttle valve may have been held open.
- Inspect for conditions in which ice may have formed in the throttle bore.
- The throttle valve is spring loaded to a slightly open position. This is referred to as the rest position. The throttle valve should not be completely closed, nor should it be open any greater than predetermined amount. The throttle valve should move open and to the closed position without binding under the normal spring pressure. The throttle should NOT be free to move open or closed WITHOUT spring pressure.

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. Verify that DTCs P0121, P0122, P0123, P0221, P0222, P0223, P2100, P2101 or P2119 are not set.

   If a DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

2. Start the engine. Observe the DTC information with a scan tool for 30 seconds. DTC P1551 should not set.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Ignition OFF, disconnect the air intake duct at the throttle body and inspect for the following:

- Throttle valve that is NOT in the rest position.
- Throttle valve that is binding open or closed.
- Throttle valve that is free to move open or closed WITHOUT spring pressure.

If a condition is found, replace the throttle body assembly.

Repair Instructions

Perform the Diagnostic Repair Verification.

Throttle Body Assembly Replacement.

DTC P2072

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P2072: Throttle Actuator Control System - Ice Blockage

Circuit/System Description

The engine control module (ECM) controls the throttle valve by applying a varying voltage to the control circuits of the throttle actuator control (TAC) motor. The ECM monitors the duty cycle that is required to actuate the throttle valve. The ECM monitors the throttle position (TP) sensors 1 and 2 to determine the actual throttle valve position. The ECM performs diagnostics that monitor the voltage levels of both APP sensors, both TP sensors, and the throttle actuator control motor circuit. It also monitors the spring return rate of both return springs that are housed internal to the throttle body assembly. These diagnostics are performed at different times based on whether the engine is running, not running, or whether the ECM is currently in a throttle body relearn procedure. Every ignition cycle the ECM performs a quick throttle return spring test to make sure the throttle plate can return to the 7 percent rest position from the 0 percent position. This is to make sure that the throttle plate can be brought to the rest position in case of an actuator motor circuit failure

Conditions for Running the DTC

- The ignition is ON.
- The speed is less than 40 km/h (25 mph).
- The air intake temperature is greater than 40°C (104°F).

Conditions for Setting the DTC

The actual engine speed is greater than the desired engine speed by at least 200 rpm for longer than 10 seconds or the ECM detects 3 fuel cut off's due to engine over speed while the engine is idling

Action Taken When the DTC Sets

DTC P2072 is a type A DTC.

Conditions for Clearing the DTC

DTC P2072 is a type A DTC.

Circuit/System Verification

1. Start the engine, rapidly move the accelerator pedal from the rest position, to wide open throttle position then back to the rest position. Repeat the procedure a four times. DTC P2072 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Disconnect the harness connector of the ECM. Ignition ON, load test for battery voltage on the ignition circuits at the ECM.

   If less than B+, repair the ignition circuit for an open/high resistance.
2. If all circuits/connections test OK, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification.

Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P2096 or P2098 (with LLT)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P2096: Post Catalyst Fuel Trim System Low Limit Bank 1

DTC P2098: Post Catalyst Fuel Trim System Low Limit Bank 2

Circuit Description

Fuel trim bias is used to keep the post catalyst air/fuel ratio within a predetermined range. This allows optimal catalyst efficiency under light load conditions at a steady cruise. The engine control module (ECM) constantly monitors how lean or rich the fuel trim bias is commanded, to determine if the fuel trim bias is greater than a calibrated amount.

Conditions for Running the DTC

- Before the ECM can report DTC P2096 or P2098 failed, DTCs P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, P0058, P013A, P013C, P013E, P0130, P0131, P0132, P0133, P0135, P0137, P0138, P014A, P0140, P0141, P0150, P0151, P0152, P0153, P0155, P0157, P0158, P0160, P0161, P2232, P2235, P2270, P2271, P2272, and P2273 must run and pass.
- DTC P0100, P0101, P0102, P0103, P0420, P0430, P0442, P0443, P0455, P0458, P0459, P2177, P2178, P2179, P2180, P2187, P2188, P2189 or P2190 is not set.
- The engine speed is 1,280-3,480 RPM.
- The engine load is 17-65 percent and steady.
- The closed loop fuel control is active for greater than 1 second.
- The calculated exhaust gas temperature is greater than 250°C (482°F).
- DTCs P2096 and P2098 run continuously when the conditions above have been met for greater than 130 seconds.

Conditions for Setting the DTC

The lean correction limit for a condition causing a rich air/fuel ratio has been exceeded for greater than 4 seconds or for a cumulative of 30 seconds.

Action Taken when the DTC Sets

DTCs P2096 and P2098 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2096 and P2098 are Type B DTCs.

Diagnostic Aids

An HO2S will not cause this DTC to set without the occurrence of circuit related HO2S DTCs. Do not replace an HO2S to address this DTC.

Circuit/System Verification

1. Ignition ON, observe the scan tool DTC information. Verify there is no other HO2S or fuel trim DTC set.

   If any other HO2S or fuel trim DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Verify that none of the following conditions exist:
   - Rich fuel injectors--Refer to Fuel Injector Solenoid Coil Test.
   - High fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Fuel saturation of the evaporative emissions (EVAP) canister
   - Stuck open or leaking EVAP purge valve
   - Restricted exhaust

- Incorrect PCV system operation

  If you find any of the above conditions, repair as necessary.

Warning: Refer to Road Test Warning in the Preface section.

Note: A road load condition is necessary to obtain closed loop.

3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P2096 or P2098

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P2096: Post Catalyst O2 Sensor Fuel Trim Below Lower Limit Bank 1

DTC P2098: Post Catalyst O2 Sensor Fuel Trim Below Lower Limit Bank 2

Circuit Description

Fuel trim bias is used by the ECM to keep the post catalyst HO2S voltage within a range of 580-665 mV. This allows optimal catalyst efficiency under light load conditions, such as at idle or a steady cruise. The ECM constantly monitors how lean or rich the fuel trim bias is commanded, to determine if the fuel trim bias is greater than a calibrated amount.

Conditions for Running the DTC

- Before the ECM can report DTC P2096, DTCs P0030, P0031, P0032, P0130, P0131, P0132, P0133, P0135, P0137, P0138, P0140, P0141, P2232, P2235, P2270, P2271, P2272, and P2273 must run and pass.
- DTC P0100, P0101, P0102, P0103, P0111, P0112, P0113, P0116, P0117, P0118, P0119, P0420,P0443, P0458, or P0459 is not set.
- The engine speed is 1,080-3,480 RPM.
- The engine load is 17-20 percent and steady.
- The closed loop fuel control is active for greater than 1 seconds.
- The front and rear HO2S are in Closed Loop.
- The calculated exhaust gas temperature is greater than 250°C (482°F).
- DTCs P2096 run continuously when the conditions above have been met for greater than 200 seconds.

Conditions for Setting the DTC

The lean correction limit for a condition causing a rich air/fuel mixture has been exceeded for a predetermined amount of time. The condition exists for greater than 4 seconds or for a cumulative of 30 seconds.

Action Taken when the DTC Sets

DTCs P2096 and P2098 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2096 and P2098 areType B DTCs.

Diagnostic Aids

A failed HO2S will not cause this DTC to set without the occurrence of circuit related HO2S DTCs. Do not replace an HO2S to address this DTC.

Circuit/System Verification

1. Ignition ON, observe the scan tool DTC information. Verify there is no other HO2S or fuel trim DTC set.

   If any other HO2S or fuel trim DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Verify that none of the following conditions exist:
   - Exhaust leaks near the HO2S Exhaust Leakage
   - Engine vacuum leaks
   - Low fuel system pressure--Refer to Fuel System Diagnosis.

- Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
- Lean fuel injectors--Refer to Fuel Injector Solenoid Coil Test.

  If you find any of the above conditions, repair as necessary.

Note: The rear heated oxygen sensor (HO2S) must be in closed loop for this diagnostic to run. A road load condition is necessary to obtain closed loop.

3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the Diagnostic Repair Verification.

DTC P2105

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P2105: Throttle Control Forced Engine Shutdown

Circuit/System Description

The engine control module (ECM) controls the throttle valve by applying a varying voltage to the control circuits of the throttle actuator control (TAC) motor. The ECM monitors the duty cycle that is required to actuate the throttle valve. The ECM monitors the throttle position (TP) sensors 1 and 2 to determine the actual throttle valve position.

Conditions for Running the DTC

- The ECM power down process in the last drive cycle was completely finished.
- DTC P2105 runs continuously once the above condition is met.

Conditions for Setting the DTC

- The ECM detects an incorrect voltage level at the ignition voltage supply circuits.

  OR
- The ECM detects an internal communication error.
- Either condition exists for greater than 1 second, or an a cumulative of 10 seconds.

Action Taken When the DTC Sets

DTC P2105 is a Type A DTC.

Conditions for Clearing the DTC

DTC P2105 is a Type A DTC.

Diagnostic Aids

- If DTC P2105 sets, the engine will stall and not restart until the ignition is cycled OFF and then ON.

- Additional DTCs set when P2105 sets.
- The ignition key will not be able to be removed from the ignition switch until another ignition cycle occurs.

Circuit/System Verification

1. Start the engine. Rapidly move the accelerator pedal from the rest position, to wide open throttle position, back to the rest position. Repeat the procedure a few times. DTC P2105 should not set.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, remove the fuse that supplies voltage to terminal 5 X2 of the ECM. Verify the fuse is OK.

   Note: This DTC will only set if the fuse is open and the circuits are not grounded. The ignition voltage circuits must be tested thoroughly for an intermittent short to ground.

  If the fuse is open, test the ignition voltage circuit between the open fuse and the ECM for an intermittent short to ground.

2. Install the fuse.
3. Disconnect the harness connector of the ECM.
4. Ignition ON, load test for B+ on the ignition circuit terminal 5 X2 at the ECM.

   If less than B+, repair the ignition circuit for an open/high resistance.

5. If all circuits/connections test OK, replace the ECM.

Repair Instructions

Perform the Diagnostic Repair Verification.

Engine Control Module Replacement for engine control module replacement, setup, and programming

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures |
Document ID: 1986437

DTC P2122, P2123, P2127, P2128, or P2138

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P2122: Accelerator Pedal Position Sensor 1 Voltage Low

DTC P2123: Accelerator Pedal Position Sensor 1 Voltage High

DTC P2127: Accelerator Pedal Position Sensor 2 Voltage Low

DTC P2128: Accelerator Pedal Position Sensor 2 Voltage High

DTC P2138: Accelerator Pedal Position Sensor 1-2 Correlation

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance

APP Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating at idle. *Parameter Normal Range:* APP Sensor 1 0%/1 Volts *Parameter Normal Range:* APP Sensor 2 0%/0.5 Volts			
5-Volt Reference	0%/0.00 Volts	0%/0.00 Volts	0%/4.98 Volts
APP Sensor 1 Signal	0%/0.00 Volts	0%/0.00 Volts	0%/4.98 Volts
APP Sensor 2 Signal	0%/0.00 Volts	0%/0.00 Volts	0%/4.98 Volts
APP Sensor 1 Low Reference	--	0%/4.98 Volts	--
APP Sensor 2 Low Reference	--	0%/4.98 Volts	--

Circuit/System Description

The accelerator pedal assembly contains two accelerator pedal position (APP) sensors. The APP sensors are mounted in the pedal assembly and are not serviceable. The APP sensors provide a signal voltage that changes relative to the position of the accelerator pedal. The engine control module (ECM) supplies a separate 5-volt reference and low reference circuit for each of the APP sensors.

The APP sensor 1 signal voltage increases as the pedal is depressed, from approximately 1.0 volt at rest to approximately 4 volts when fully depressed. The APP sensor 2 signal voltage increases as the pedal is depressed, from approximately 0.5 volt at rest to approximately 2 volts with the accelerator pedal fully depressed.

Conditions for Running the DTCs

- The ignition is ON or the engine is operating.
- The ignition voltage is greater than 7 volts.
- The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P2122

The APP sensor 1 voltage is less than 0.74 volts for greater than 1 second, or a cumulative of 10 seconds.

P2123

The APP sensor 1 voltage is greater than 4.82 volts for greater than 1 second, or a cumulative of 10 seconds.

P2127

The APP sensor 2 voltage is less than 0.63 volts for greater than 1 second, or a cumulative of 10 seconds.

P2128

The APP sensor 2 voltage is greater than 4.82 volts for greater than 1 second, or a cumulative of 10 seconds.

P2138

- The ECM detects that the voltage difference between APP sensor 1 and the calculated idle range is greater than 0.25 volts, with a released pedal.
- The ECM detects that the voltage difference between APP sensor 2 and the calculated idle range is greater than 0.31 volts, with a released pedal.
- The ECM detects that the voltage difference between APP sensor 1 and 2 is greater than 0.31 volts with a partially pressed pedal.
- The ECM detects that the voltage difference between APP sensor 1 and 2 is greater than 1.70 volts with a fully pressed pedal.
- The ECM detects that the voltage difference between APP sensor 1 and 2 is greater than 0.04 volts when AAP sensor 1 is greater than 1.17 volts.
- Any of the above conditions exist for greater than 1 second, or a cumulative of 10 seconds.

Action Taken When the DTC Sets

DTCs P2122, P2123, P2127, P2128, and P2138 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P2122, P2123, P2127, P2128, and P2138 are Type A DTCs.

Diagnostic Aids

Test the current output of the 5-volt reference circuits if you suspect high resistance in the circuit. The current output should be greater than 80 mA for APP 1 and greater than 50 mA for APP 2.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. DTC P0651, P0652, P0653, P0697, P0698, or P0699 should not be set.

   If a DTC is set, refer to DTC P0641-P0643, P0651-P0653, or P0697-P0699.
2. Observe the scan tool APP Sensor voltage parameters. Verify both of the APP sensor voltages are between 0.4-4.5 V.
3. Rapidly depress the accelerator pedal from the rest position to the wide open throttle position (WOT) and release pedal. Repeat the procedure several times. DTCs P2122, P2123, P2127, P2128, or P2138 should not set.
4. Slowly depress the accelerator pedal to WOT and then slowly return the pedal to closed throttle. Repeat the procedure several times. DTCs P2122, P2123, P2127, P2128, or P2138 should not set.
5. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, remove the fuse that supplies B+ to terminal 56 X2 of the ECM.
2. Disconnect the harness connector at the accelerator pedal assembly.
3. Test for less than 5 Ω between the appropriate low reference circuit listed below and ground.
   - APP sensor 1 terminal 4
   - APP sensor 2 terminal 5

   If greater than the specified range, test the low reference circuit for a short to voltage, or an open/high resistance. If the circuit/connections test normal, replace the ECM.
4. Install the fuse that supplies B+ to terminal 56 X2 of the ECM.

   Note: The 5-volt reference circuit voltage can be within the specified range with a high resistance in the circuit. If this condition is suspected, refer to Diagnostic Aids.
5. Ignition ON, test for 4.8-5.2 V between the appropriate 5-volt reference circuit listed below and ground.
   - APP sensor 1 terminal 2

- APP sensor 2 terminal 1

  If less than the specified range, test the 5-volt reference circuit for a short to ground or open/high resistance. If the circuit/connections test normal, replace the ECM.

  If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit/connections test normal, replace the ECM.

6. Observe the scan tool APP sensor 1 voltage parameter. Verify the voltage is less than 0.3 V.

   If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit/connections test normal, replace the ECM.

7. Observe the scan tool APP sensor 2 voltage parameter. Verify the voltage is less than 0.3 V.

   If greater than the specified range, test the signal circuit terminal 6 for a short to voltage. If the circuit/connections test normal, replace the ECM.

8. Connect a 3 A fused jumper wire between the APP sensor 1 signal circuit terminal 3 and the 5-volt reference circuit terminal 2. Verify the APP sensor 1 voltage parameter is greater than 4.8 V.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit/connections test normal, replace the ECM.

9. Connect a 3 A fused jumper wire between the APP sensor 2 signal circuit terminal 6 and the 5-volt reference circuit terminal 1. Verify the APP sensor 2 voltage parameter is greater than 4.8 V.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit/connections test normal, replace the ECM.

10. If all circuits/connections test normal, test or replace the accelerator pedal assembly.

Component Testing

1. Connect a 3 A fused jumper wire between the 5-volt reference terminal of the applicable APP sensor terminal 2 or 1 and 5 V. Install a jumper wire between the applicable low reference terminal 4 or 5 and ground.
2. Sweep the sensor through the entire range while monitoring the voltage between the appropriate signal circuit terminal 3 or 6 and the low reference terminal 4 or 5 with a DMM. The voltage for APP 1 should vary between approximately 0.90-4.35 V without any spikes or dropouts. The voltage for APP 2 should vary between approximately 0.40-2.20 V without any spikes or dropouts.

   If the voltage is not within the specified range or is erratic on either APP sensor, replace the accelerator pedal assembly.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Accelerator Pedal Position Sensor Replacement
- Engine Control Module Replacement for engine control module replacement, setup, and programming

DTC P2176

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P2176: Throttle Control Lower Position not Learned

Circuit/System Description

The engine control module (ECM) controls the throttle valve by applying a varying voltage to the throttle actuator control (TAC) motor. The ECM monitors the actual throttle valve position using throttle position (TP) sensor 1 and 2.

Conditions for Running the DTC

- The engine speed is less than 40 RPM.
- The vehicle speed is 0 km/h (0 mph).
- The engine coolant temperature (ECT) is between 5-101°C (41-214°F).
- The intake air temperature (IAT) is between 5-144°C (41-291°F).
- The accelerator pedal position (APP) sensor angle is less than 15 percent.
- The ignition voltage is greater than 10 volts.
- DTC P2176 runs once per igniiton cycle, when the ignition is ON and the above conditions are met for greater than 1 second.

Conditions for Setting the DTC

- The ECM detects that the TP sensor 1 voltage is not between 4.12-4.55 V after the throttle learn procedure, with the throttle at rest.
- The ECM detects that the TP sensor 2 voltage is not between 0.34-0.99 V after the throttle learn procedure, with the throttle at rest.
- The minimum throttle position is not learned after an ECM replacement.
- Either condition exists fro greater than 1 second, or a cumulative 10 seconds.

Action Taken When the DTC Sets

DTC P2176 is a Type A DTC.

Conditions for Clearing the DTC

DTC P2176 is a Type A DTC.

Circuit/System Verification

1. Ignition ON, rapidly depress the accelerator pedal from the rest position to the wide open position (WOT) and release the pedal. Repeat the procedure several times. Observe the DTC information with a scan tool. Verify that DTCs P0121, P0122, P0123, P0221, P0222, P0223, P0638, or P2101 do not set.

   If a DTC is set, refer to DTC P0121, P0122, P0123, P0221, P0222, or P0223 or DTC P0638, P2100, P2101, or P2119.
2. DTC P2176 is an informational DTC. Perform the idle learn procedure, refer to Idle Learn.

   If DTC P2176 resets after performing the idle learn procedure, replace the throttle body.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the Diagnostic Repair Verification.

Throttle Body Assembly Replacement

DTC P2177, P2179, P2187, or P2189

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P2177: Fuel Trim Lean during Cruising/Acceleration Bank 1.

DTC P2179: Fuel Trim Lean during Cruising/Acceleration Bank 2.

DTC P2187 : Fuel Trim Lean during Idling/Deceleration Bank 1.

DTC P2189: Fuel Trim Lean during Idling/ Deceleration Bank 2.

Circuit Description

The engine control module (ECM) controls the air/fuel metering system in order to provide the best possible combination of driveability, fuel economy, and emission control. Fuel delivery is controlled differently during Open and Closed Loop. During Open Loop, the ECM determines fuel delivery based on sensor signals without heated oxygen sensor (HO2S) input. During Closed Loop, the HO2S inputs are added and used by the ECM to calculate short and long term fuel delivery adjustments. If the HO2S indicate a lean condition, fuel trim values will be above 0 percent. If the HO2S indicate a rich condition, fuel trim values will be below 0 percent. Short term fuel trim values change rapidly in response to the HO2S signals. Long term fuel trim makes coarse adjustments in order to maintain an air/fuel ratio of 14.7:1.

Conditions for Running the DTC

P2177 or P2179

- Before the ECM can report DTC P2177 or P2179, failed, DTCs P0008, P0009, P0010, P0011, P0013, P0014, P0016, P0017, P0018, P0019, P0020, P0021, P0023, P0024, P0101, P0121, P0122, P0123, P0133, P0153, P0201, P0202, P0203, P0204, P0205, P0206, P0221, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2068 P2088, P2089, P2090, P2091, P2092, P2093, P2094, and P2095 must run and pass.
- The engine speed is between 1,200-3,400 RPM.
- The mass air flow (MAF) is between 7-83 grams/second.
- The throttle angle is less than 100 percent.
- The engine load is between 17-55 percent.

- The fuel system is in closed loop.
- The engine is not in decel fuel cut-off (DEFCO).
- The long term fuel trim is active.
- The engine coolant temperature (ECT) is greater than 60°C (140°F).
- The intake air temperature (IAT) is less than 61°C (142°F).
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The fuel level is greater than 12 percent.
- The amount of air flow into the engine is greater than 7,000 grams.
- DTC P2177 and P2179 run continuously once the above conditions are met for at least 300 seconds.

P2187 or P2189

- Before the ECM can report DTC P2187 or P2189, failed, DTCs P0008, P0009, P0010, P0011, P0013, P0014, P0016, P0017, P0018, P0019, P0020, P0021, P0023, P0024, P0101, P0121, P0122, P0123, P0133, P0153, P0201, P0202, P0203, P0204, P0205, P0206, P0221, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2068 P2088, P2089, P2090, P2091, P2092, P2093, P2094, and P2095 must run and pass.
- The engine speed is between 480-1,001 RPM.
- The engine load is between 7-32 percent.
- The MAF is between 1-8 grams per second.
- The fuel system is in closed loop.
- The engine is not in decel fuel cut-off (DEFCO).
- The long term fuel trim is active.
- The engine coolant temperature (ECT) is greater than 60°C (140°F).
- The intake air temperature (IAT) is less than 61°C (142°F).
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The fuel level is greater than 12 percent.
- The amount of air flow into the engine is greater than 7,000 grams.
- DTC P2187 and P2189 run continuously once the above conditions are met.

Conditions for Setting the DTC

P2177 or P2179

The Total Fuel Trim Avg. is greater than 23 percent for 4 seconds or for a cumulative of 30 seconds.

P2187 or P2189

The Total Fuel Trim Avg. is greater than 40 percent, or the LT FT Idle/Decel is greater than 6 percent. Either condition exists for 4 seconds or for a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P2177, P2179, P2187 and P2189 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2177, P2179, P2187 and P2189 are Type B DTCs.

Diagnostic Aids

- Observing the LT FT Bn 1 and Bn 2 parameters, while driving the vehicle can determine whether the lean condition is effecting only one bank , or is common to both banks of the engine.
- A fuel system delivery condition causes this DTC to set. Thoroughly inspect all items that cause a lean condition. Refer to.
- Any un-metered air into the engine causes this DTC to set. Thoroughly inspect all areas of the engine for vacuum leaks.
- A MAF sensor condition can cause this DTC without setting a MAF DTC. If there is a MAF sensor condition, the MAF sensor parameters will appear to be within range.
- Inspect the air filter for being the correct one for this application. Make sure that the engine oil fill cap is in place and that it is tight. Verify that the engine oil dip stick is fully seated.

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Observe the DTC information with a scan tool. DTC P2177, P2179, P2187, or P2189 should not be set.

   If there are other DTCs set besides DTC P2177, P2179, P2187 or P2189, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Ignition ON, observe the barometric pressure (BARO) sensor pressure parameter and compare the reading on the scan tool to the barometric pressure table. Refer to Altitude Versus Barometric Pressure.

   If the BARO sensor pressure is not within the range specified for your altitude, refer to DTC P2227, P2228, or P2229.
3. Engine at normal operating temperature, observe the Total Fuel Trim Avg. parameter with a scan tool. The Total Fuel Trim Avg. should be between -22 to +23 percent.

   If not within the specified range, verify none of the following conditions exist:

   - A mass air flow (MAF) sensor signal that is skewed--If the Short Term FT parameters for both banks changes greater than 20 percent when the MAF sensor is disconnected, refer to DTC P0101.
   - The air intake system after the MAF sensor for vacuum leaks
   - Fuel contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis and Fuel System Cleaning.
   - Splits, kinks, or improper connections at the vacuum hoses--Refer to Emission Hose Routing Diagram.
   - The fuel system is operating lean. Refer to Fuel System Diagnosis.
   - Vacuum leaks at the intake manifold or throttle body
   - Leaking crankcase ventilation system
   - The engine control module grounds for being clean, tight, and in the correct locations
   - A high engine oil level condition--A high engine oil level causes oil residue to form on the mass air flow (MAF) sensor, causing a lean indication. The MAF sensor does not need to be replaced.
   - Vacuum leaks that only affect one bank of the engine--For example, the intake manifold, the injector O-rings.
   - Lean injectors--Refer to Fuel Injector Solenoid Coil Test.
   - Missing, restricted, or leaking exhaust components--Refer to Symptoms - Engine Exhaust.
   - The heated oxygen sensor (HO2S) is installed securely and the electrical connector is not contacting the exhaust system.
   - An engine mechanical condition--Refer to Symptoms - Engine Mechanical.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Always perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P2178, P2180, P2188, or P2190

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P2178 : Fuel Trim Rich during Cruising/Acceleration (Bank 1)

DTC P2180 : Fuel Trim Rich during Cruising/Acceleration (Bank 2)

DTC P2188 : Fuel Trim Rich during Idling/Deceleration (Bank 1)

DTC P2190 : Fuel Trim Rich during Idling/Deceleration (Bank 2)

Circuit Description

The engine control module (ECM) controls the air/fuel metering system in order to provide the best possible combination of driveability, fuel economy, and emission control. Fuel delivery is controlled differently during Open and Closed Loop. During Open Loop, the ECM determines fuel delivery based on sensor signals without heated oxygen sensor (HO2S) input. During Closed Loop, the HO2S inputs are added and used by the ECM to calculate short and long term fuel trim fuel delivery adjustments. If the HO2S indicate a lean condition, fuel trim values will be above 0 percent. If the O2S indicate a rich condition, fuel trim values will be below 0 percent. Short term fuel trim values change rapidly in response to the HO2S signals. Long term fuel trim makes coarse adjustments in order to maintain an air/fuel ratio of 14.7:1.

Conditions for Running the DTC

P2178

- Before the ECM can report DTC P2178 failed, DTCs P0008, P0009, P0010, P0011, P0013, P0014, P0016, P0017, P0018, P0019, P0020, P0021, P0023, P0024, P0101, P0121, P0122, P0123, P0133, P0201, P0202, P0203, P0204, P0205, P0206, P0221, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2068 P2088, P2089, P2090, P2091, P2092, P2093, P2094, and P2095 must run and pass.
- The engine speed is between 1,200-3,400 RPM.
- The mass air flow (MAF) is between 7-83 grams/second.
- The throttle angle is less than 100 percent.
- The engine load is between 17-55 percent.
- The fuel system is in closed loop.

- The engine is not in decel fuel cut-off (DEFCO).
- The long term fuel trim is active.
- The engine coolant temperature (ECT) is greater than 60°C (140°F).
- The intake air temperature (IAT) is less than 61°C (142°F).
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The fuel level is greater than 12 percent.
- The amount of air flow into the engine is greater than 7,000 grams.
- DTC P2178 run continuously once the above conditions are met for at least 300 seconds.

P2188

- Before the ECM can report DTC P2188 failed, DTCs P0008, P0009, P0010, P0011, P0013, P0014, P0016, P0017, P0018, P0019, P0020, P0021, P0023, P0024, P0101, P0121, P0122, P0123, P0133, P0201, P0202, P0203, P0204, P0205, P0206, P0221, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2068 P2088, P2089, P2090, P2091, P2092, P2093, P2094, and P2095 must run and pass.
- The engine speed is between 480-1,001 RPM.
- The engine load is between 7-32 percent.
- The MAF is between 1-8 grams per second.
- The fuel system is in closed loop.
- The engine is not in decel fuel cut-off (DEFCO).
- The long term fuel trim is active.
- The engine coolant temperature (ECT) is greater than 60°C (140°F).
- The intake air temperature (IAT) is less than 61°C (142°F).
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The fuel level is greater than 12 percent.
- The amount of air flow into the engine is greater than 7,000 grams.
- DTC P2188 run continuously once the above conditions are met.

Conditions for Setting the DTC

P2178

The Total Fuel Trim Avg. is less than -22 percent. The condition exists for 4 seconds or for a cumulative of 30 seconds.

P2188

The Total Fuel Trim Avg. is less than -40 percent. The LT FT Idle/Decel is less than -6 percent. The condition exists for 4 seconds or for a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P2178 and P2188 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2178 and P2188 are Type B DTCs.

Diagnostic Aids

- A fuel system delivery condition causes this DTC to set. Thoroughly inspect all items that cause a rich condition. Refer to.
- Review the Freeze Frame/Failure Records with a scan tool.

Control Module References for scan tool information

Circuit/System Verification

1. Observe the DTC information with a scan tool. DTC P2178, P2180, P2188, or P2190 should not be set.

   If there are other DTCs set besides DTC P2178, P2180, P2188, or P2190, refer to Diagnostic Trouble Code (DTC) List - Vehicle to diagnosis the applicable DTC.
2. Ignition ON, observe the barometric pressure (BARO) sensor pressure parameter and compare the reading on the scan tool to the barometric pressure table. Refer to Altitude Versus Barometric Pressure.

   If the BARO sensor pressure is not within the range specified for your altitude, refer to DTC P2227, P2228, or P2229.
3. Engine at normal operating temperature, observe the Total Fuel Trim Avg. parameter with a scan tool. The Total Fuel Trim Avg. should be between -22 to +23 percent.

If not within the specified range, inspect for the following conditions:

- A mass air flow (MAF) sensor signal that is skewed. If the Short Term FT parameters for both banks changes greater than 20 percent when the MAF sensor is disconnected, refer to DTC P0101.
- A collapsed air intake duct
- A restricted air filter element--Refer to Air Cleaner Element Replacement.
- The MAF sensor for foreign objects.
- Excessive fuel in the crankcase--Change the oil as necessary.
- Fuel contamination--Refer to Alcohol/Contaminants-in-Fuel Diagnosis and. Fuel System Cleaning.
- The engine control module grounds for being clean, tight, and in the correct locations
- Rich injectors--Refer to Fuel Injector Solenoid Coil Test.
- Restricted exhaust system--Refer to Symptoms - Engine Exhaust.
- An engine mechanical condition--Refer to Symptoms - Engine Mechanical.

4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P2227, P2228, or P2229

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P2227: Barometric Pressure Sensor Range/Performance

DTC P2228: Barometric Pressure Sensor Voltage Low

DTC P2229: Barometric Pressure Sensor Voltage High

Circuit/System Description

The barometric pressure (BARO) sensor responds to changes in altitude and atmospheric conditions. This gives the engine control module (ECM) an indication of barometric pressure. The ECM uses this information to calculate fuel delivery. The BARO sensor has a 5-volt reference circuit, a low reference circuit and a signal circuit. The ECM supplies 5 volts to the BARO sensor on a 5-volt reference circuit, and provides a ground on a low reference circuit. The BARO sensor provides a voltage signal to the ECM on a signal circuit relative to the atmospheric pressure changes. The ECM monitors the BARO sensor signal for a voltage outside of the normal range.

Conditions for Running the DTC

P2227

- Before the ECM can report DTC P2227 failed, DTCs P0100, P0101, P0102, P0103, P0121, P0122, P0123, P0221, P0222, P0223, P2228, and P2229 must run and pass.
- The engine is operating for greater than 20 seconds.
- The mass air flow is greater than 11 g/s.
- The difference between the calculated manifold absolute pressure (MAP) and BARO pressure is less than 1.0 kPa for greater than 3 seconds.
- The evaporative emission (EVAP) leak test is not enabled.
- DTC P2227 runs continuously once the above conditions are met for 2 seconds.

P2228 or P2229

- The engine is operating.
- The DTCs run continuously once the above conditions are met for 2 seconds.

Conditions for Setting the DTC

P2227

- The ECM detects that the BARO pressure is less than 50 kPa or greater than 115 kPa.
- The ECM detects that the BARO pressure changed greater than 5 kPa within 20 seconds.
- The ECM detects that the BARO pressure changed greater than 30 kPa since the last ignition cycle.
- Any of the condition above exist for 4 seconds or for a cumulative of 50 seconds.

P2228

The ECM detects that the BARO sensor voltage is less than 0.20 volt for 4 seconds or for a cumulative of 30 seconds.

P2229

The ECM detects that the BARO sensor voltage is greater than 4.8 volts for 4 seconds or for a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTCs P2227, P2228, and P2229 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2227, P2228, and P2229 are Type B DTCs.

DTC Descriptors

DTC P2232: HO2S Signal Circuit Shorted to Heater Circuit Bank 1 Sensor 2

DTC P2235: HO2S Signal Circuit Shorted to Heater Circuit Bank 2 Sensor 2

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. Or, to detect if the HO2S signal voltage switches at the same rate at which the ECM is commanding the heater ON and OFF.

Conditions for Running the DTC

- The engine is operating.
- The ignition voltage is greater than 10 volts.
- The calculated exhaust gas temperature is less than 800°C (1,472°F).
- The HO2S heater control is enabled for greater than 90 seconds.
- DTC P2232 and P2235 run continuously once the conditions above exist for greater than 10 seconds.

Conditions for Setting the DTC

- The ECM detects that the HO2S signal voltage increases greater than 2 volts within 0.04 second, in 4 out of 6 HO2S heater switch OFF samples.
- The condition exists for greater than 1 seconds, or for a cumulative time of 10 seconds.

Action Taken when the DTC Sets

DTCs P2232 and P2235 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2232 and P2235 are Type B DTCs.

Diagnostic Aids

- The HO2S voltage should be between 350-550 mV with the ignition ON. If the voltage is greater than the specified value, there is a condition with the HO2S circuits. If the voltage does not change after disconnecting the HO2S, the condition is between the sensor and the ECM. If the voltage is between 350-550 mV after disconnecting the sensor, the condition is with the HO2S.
- Inspect the HO2S harness connector for water intrusion. Moisture in a connector may cause voltage to bleed to other circuits within the connector.

Circuit/System Verification

1. Ignition ON, observe the appropriate HO2S voltage parameter. The HO2S voltage parameter should be less than 1,050 mV.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
2. Ignition ON, verify that the HO2S parameter is between 350-500 mV.

   If greater than 500 mV, test the signal circuit of the HO2S sensor for a short to the heater circuit. If the circuit/connections test normal, replace the ECM.
3. If all circuits/connections test normal, replace the applicable HO2S.

DTC Descriptors

DTC P2270: O2 Sensor Lean/Rich Switch Signal Malfunction (Bank 1 Sensor 2)

DTC P2272: O2 Sensor Lean/Rich Switch Signal Malfunction (Bank 2 Sensor 2)

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) high signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. The ECM compares the stored HO2S voltage samples taken within each sample period and determines if the majority of the samples are out of the operating range. The ECM test for the following conditions:

- The ECM monitors the HO2S voltage to determine if the signal voltage goes above a predetermined threshold within a certain amount of time. If the ECM determines that the signal voltage remains below a threshold, the ECM will command the fuel system rich to determine if the HO2S signal voltage can be forced above the threshold within a certain amount of time.
- The ECM monitors the HO2S voltage during power enrichment to ensure that the signal voltage goes above a predetermined threshold during power enrichment.

Conditions for Running the DTC

- Before the ECM can report DTC P2270 or P2272 failed, DTCs P0036, P0037, P0038, P0137, P0138, P0140, P0141, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P0443, P0458, and P0459 must run and pass.
- DTC P0461, P0462, P0463, P2066, P2067, or P2068 is not set.
- The engine is operating.
- The ignition voltage is greater than 10 volts.
- The rear HO2S are at operating temperature for greater than 10 seconds.
- The long term fuel control is enabled.
- The mass air flow (MAF) sensor is greater than 10 g/s.

DTC Descriptors

DTC P2270: HO2S Signal Stuck Lean Bank 1 Sensor 2

DTC P2272: HO2S Signal Stuck Lean Bank 2 Sensor 2

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) high signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. The ECM compares the stored HO2S voltage samples taken within each sample period and determines if the majority of the samples are out of the operating range. The ECM test for the following conditions:

- The ECM monitors the HO2S voltage to determine if the signal voltage goes above a predetermined threshold within a certain amount of time. If the ECM determines that the signal voltage remains below a threshold, the ECM will command the fuel system rich to determine if the HO2S signal voltage can be forced above the threshold within a certain amount of time.
- The ECM monitors the HO2S voltage during power enrichment to ensure that the signal voltage goes above a predetermined threshold during power enrichment.

Conditions for Running the DTC

- Before the ECM can report DTC P2270 or P2272 failed, DTCs P0036, P0037, P0038, P0056, P0057, P0058, P013A, P013C, P013E, P0137, P0138, P014A, P0140, P0141, P0157, P0158, P0160, P0161, P0443, P0458, P0459, P2096, P2098, P2177, P2179, P2187, and P2189 must run and pass.
- DTC P0461, P0462, P0463, P2066, P2067, or P2068 is not set.
- The engine speed is greater than 240 RPM.
- The ignition voltage is greater than 10 volts.
- The HO2S 2 is at operating temperature for greater than 10 seconds.
- The long term fuel control is enabled.
- The mass air flow (MAF) signal is greater than 10 g/s.

- The MAF signal is between 6-33 g/s for greater than 3 seconds during the intrusive test.
- DTCs P2270 and P2272 run continuously when the above conditions are met for approximately 10 minutes, or 20 minutes if the fuel level is less than 12 percent.

Conditions for Setting the DTC

The ECM detects that the HO2S 2 voltage is less than 629 mV for greater than 100 seconds, then an intrusive test is performed. The ECM will enrich the fuel mixture 2 percent per second and then wait for 10 seconds at 20 percent. If the ECM detects that the HO2S 2 voltage is still less than 629 mV during the intrusive test, for greater than 4 second or for a cumulative of 30 seconds the DTC sets.

Action Taken when the DTC Sets

DTCs P2270 and P2272 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2270 and P2272 are Type B DTCs.

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. Verify that DTC P0137, P0138,

P0140, P0157, P0158, or P0160 is not set.

If any of the listed DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

2. Operate the engine above 1,200 RPM for 30 seconds, observe the HO2S voltage parameter. The reading should fluctuate above and below the range of 401-519 mV.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Engine operating, move the related HO2S harnesses for the appropriate HO2S 2 between the HO2S harness connector and the engine control module (ECM) while monitoring the appropriate scan tool HO2S voltage parameter. Verify that the HO2S parameter does not change abruptly while moving the related harnesses.

   If the HO2S parameter does change abruptly while moving the related harnesses repair the circuit as necessary.
2. Ignition OFF, disconnect the harness connector at the appropriate HO2S 2.
3. Ignition ON, verify that the scan tool HO2S 2 parameter is between 401-519 mV.

   If less than the specified range, test the signal circuit terminal B for a short to ground. If the circuit/connections test normal, replace the ECM.
4. Verify that none of the following conditions exist:
   - The vacuum hoses for splits, kinks, and proper connection
   - The air intake system after the mass air flow (MAF) sensor for vacuum leaks
   - Exhaust system leaks
   - Lean fuel injectors--Refer to Fuel Injector Solenoid Coil Test.
   - Water intrusion in the HO2S harness connector
   - Low fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - Contaminated HO2S - Silicon
   - An engine mechanical condition--Refer to Symptoms - Engine Mechanical.

     If you find any of the above conditions, repair as necessary.
5. If all circuits/connections test normal, replace the appropriate HO2S.

DTC Descriptors

DTC P2270: O2 Sensor Lean/Rich Switch Signal Malfunction (Bank 1 Sensor 2)

DTC P2272: O2 Sensor Lean/Rich Switch Signal Malfunction (Bank 2 Sensor 2)

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) high signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. The ECM compares the stored HO2S voltage samples taken within each sample period and determines if the majority of the samples are out of the operating range. The ECM test for the following conditions:

- The ECM monitors the HO2S voltage to determine if the signal voltage goes above a predetermined threshold within a certain amount of time. If the ECM determines that the signal voltage remains below a threshold, the ECM will command the fuel system rich to determine if the HO2S signal voltage can be forced above the threshold within a certain amount of time.
- The ECM monitors the HO2S voltage during power enrichment to ensure that the signal voltage goes above a predetermined threshold during power enrichment.

Conditions for Running the DTC

- Before the ECM can report DTC P2270 or P2272 failed, DTCs P0036, P0037, P0038, P0137, P0138, P0140, P0141, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P0443, P0458, and P0459 must run and pass.
- DTC P0461, P0462, P0463, P2066, P2067, or P2068 is not set.
- The engine is operating.
- The ignition voltage is greater than 10 volts.
- The rear HO2S are at operating temperature for greater than 10 seconds.
- The long term fuel control is enabled.
- The mass air flow (MAF) sensor is greater than 10 g/s.

- The MAF sensor is between 6-33 g/s for greater than 3 seconds during the intrusive test.
- DTC P2270 and P2272 runs continuously once the above conditions are met for approximately 10 minutes when the fuel level is greater than 12 percent.
- DTC P2270 and P2272 runs continuously once the above conditions are met for approximately 20 minutes when the fuel level is less 12 percent.

Conditions for Setting the DTC

The ECM detects that the rear HO2S voltage is less than 650 mV for greater than 100 seconds, then an intrusive test is performed. The ECM will enrich the fuel mixture up to 30 percent and then wait for 10 seconds at 30 percent. The ECM detects that the HO2S voltage is less than 650 mV during the intrusive test for greater than 4 seconds or for a cumulative of 30 seconds, the DTC sets.

Action Taken when the DTC Sets

DTC P2270 and P2272 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTC P2270 and P2272 are Type B DTCs.

Circuit / System Verification

1. Ignition ON, observe the DTC information with a scan tool. Verify that DTC P0137, P0138, or P0140 is not set.

   If any of the listed DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Operate the engine above 1,200 RPM for 30 seconds, observe the HO2S voltage parameter. The reading should fluctuate above and below the range of 350-550 mV.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Engine operating, move the related HO2S harnesses for the appropriate rear sensor between the HO2S harness connector and the ECM, while monitoring the appropriate HO2S voltage parameter. Verify that the HO2S parameter does not change abruptly while moving the related harnesses.

   If the HO2S parameter does change abruptly while moving the related harnesses repair the circuit as necessary.
2. Ignition OFF, disconnect the harness connector of the appropriate HO2S.
3. Ignition ON, verify that the HO2S parameter is between 350-500 mV.

   If less than the specified range, test the signal circuit terminal 4 for a short to ground. If the circuit/connections test normal, replace the ECM.
4. Verify that none of the following conditions exist:
   - Lean fuel injectors - Refer to Fuel Injector Solenoid Coil Test.
   - Water intrusion in the HO2S harness connector.
   - Low fuel system pressure - Refer to Fuel System Diagnosis.
   - The vacuum hoses for splits, kinks and proper connection.
   - The air intake system after the mass air flow (MAF) sensor for vacuum leaks.
   - Exhaust system leaks.
   - Contaminated HO2S - Silicon.
   - An engine mechanical condition. Refer to Symptoms - Engine Mechanical.

     If you find any of the above conditions, repair as necessary.
5. If all circuits/connections test normal, replace the applicable HO2S.

DTC Descriptors

DTC P2271: HO2S Signal Stuck Rich Bank 1 Sensor 2

DTC P2273: HO2S Signal Stuck Rich Bank 2 Sensor 2

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) high signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. The ECM compares the stored HO2S voltage samples taken within each sample period and determines if the majority of the samples are out of the operating range. The ECM test for the following conditions:

- The ECM monitors the HO2S voltage to determine if the signal voltage goes below a predetermined threshold within a certain amount of time. If the ECM determines that the signal voltage remains above the threshold, the ECM will command the fuel system lean to determine if the HO2S signal voltage can be forced below the threshold within a certain amount of time.
- The ECM monitors the HO2S voltage during fuel cut-off to determine if the signal voltage is greater than a predetermined threshold.

Conditions for Running the DTC

- Before the ECM can report DTC P2270 or P2272 failed, DTCs P0036, P0037, P0038, P0056, P0057, P0058, P013A, P013C, P013E, P0137, P0138, P014A, P0140, P0141, P0157, P0158, P0160, P0161, P0443, P0458, P0459, P2097, P2099, P2178, P2180, P2188, and P2190 must run and pass.
- DTC P0461, P0462, P0463, P2066, P2067, or P2068 is not set.
- The engine speed is greater than 240 RPM.
- The ignition voltage is greater than 10 volts.
- The HO2S 2 is at operating temperature for greater than 10 seconds.
- The long term fuel control is enabled.
- The mass air flow (MAF) signal is greater than 10 g/s.

- The MAF signal is between 6-33 g/s for greater than 3 seconds during the intrusive test.
- DTC P2271 and P2273 runs continuously once the conditions above are met for approximately 10 minutes, or 20 minutes if the fuel level is less than 12 percent.

Conditions for Setting the DTC

The ECM detects that the HO2S 2 voltage is greater than 629 mV for greater than 100 seconds, then an intrusive test is performed. The ECM will lean the fuel mixture -2 percent per second and then wait for 10 seconds at -15 percent. If the ECM detects that the HO2S voltage is still greater than 629 mV, for 4 seconds or for a cumulative of 30 seconds the DTC sets.

Action Taken when the DTC Sets

DTCs P2271 and P2273 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2271 and P2273 are Type B DTCs.

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. Verify that DTC P0137, P0138, P0140, P0157, P0158, or P0160 is not set.

If any of the listed DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

2. Operate the engine above 1,200 RPM for 30 seconds, observe the HO2S voltage parameter. The reading should fluctuate above and below the range of 401-519 mV.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Engine operating, move the related HO2S 2 harnesses for the appropriate sensor between the HO2S 2 harness connector and the ECM while monitoring the appropriate scan tool HO2S voltage parameter. Verify that the HO2S parameter does not change abruptly while moving the related harnesses.

   If the HO2S parameter does change abruptly while moving the related harnesses repair the circuit as necessary.
2. Ignition OFF, disconnect the harness connector at the appropriate HO2S.
3. Ignition ON, verify the scan tool HO2S 2 parameter is between 400-520 mV.

   If greater than the specified range, test the signal circuit terminal B for a short to voltage. If the circuit/connections test normal, replace the ECM.
4. Verify that none of the following conditions exist:
   - Rich fuel injectors--Refer to Fuel Injector Solenoid Coil Test.
   - Water intrusion in the HO2S harness connector
   - High fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - A collapsed air intake duct
   - A restricted air filter element
   - Exhaust system restrictions
   - Excessive fuel in the crankcase
   - An engine mechanical condition--Refer to Symptoms - Engine Mechanical.

   If you find any of the above conditions, repair as necessary.
5. If all circuits/connections test normal, replace the appropriate HO2S.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Heated Oxygen Sensor Replacement - Bank 1 Sensor 2
- Heated Oxygen Sensor Replacement - Bank 2 Sensor 2

DTC P2271 or P2273

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P2271: O2 Sensor Rich/Lean Switch Signal Malfunction (Bank 1 Sensor 2)

DTC P2273: O2 Sensor Rich/Lean Switch Signal Malfunction (Bank 2 Sensor 2)

Circuit Description

The engine control module (ECM) supplies a voltage near 450 mV between the heated oxygen sensor (HO2S) high signal circuit and the low reference circuit. The HO2S varies the voltage over a range from about 1,000 mV when the exhaust is rich, down through about 10 mV when the exhaust is lean. The ECM monitors and stores the HO2S voltage information. The ECM evaluates the HO2S voltage samples in order to determine the amount of time that the HO2S voltage was out of range. The ECM compares the stored HO2S voltage samples taken within each sample period and determines if the majority of the samples are out of the operating range. The ECM test for the following conditions:

- The ECM monitors the HO2S voltage to determine if the signal voltage goes below a predetermined threshold within a certain amount of time. If the ECM determines that the signal voltage remains above the threshold, the ECM will command the fuel system lean to determine if the HO2S signal voltage can be forced below the threshold within a certain amount of time.
- The ECM monitors the HO2S voltage during fuel cut-off to determine if the signal voltage is greater than a predetermined threshold.

Conditions for Running the DTC

- Before the ECM can report DTC P2270 or P2273 failed, DTCs P0036, P0037, P0038, P0137, P0138, P0140, P0141, P0341, P0342, P0343, P0346, P0347, P0348, P0366, P0367, P0368, P0391, P0392, P0393, P0443, P0458, and P0459 must run and pass.
- DTC P0461, P0462, P0463, P2066, P2067, or P2068 is not set.
- The engine is operating.
- The ignition voltage is greater than 10 volts.
- The rear HO2S are at operating temperature for greater than 10 seconds.
- The fuel injectors are enabled.
- The long term fuel control is enabled.

- The mass air flow (MAF) sensor is greater than 10 g/s.
- The MAF sensor is between 6-33 g/s for greater than 3 seconds during the intrusive test.
- The accumulated air flow into the engine is greater than 15 grams during the fuel cut-off event.
- DTCs P2270 and P2273 run continuously once the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the rear HO2S voltage is greater than 650 mV for greater than 100 seconds, then an intrusive test is performed. The ECM will lean the fuel mixture up to -7 percent and then wait for 10 seconds at -7 percent. If the ECM detects that the HO2S voltage is still greater than 650 mV, the ECM then tests the HO2S at the next decel fuel cut-off. If the ECM detects the HO2S voltage is greater than 200 mV after 4 seconds or for a cumulative of 30 seconds in decel fuel cut-off, the DTC sets.

Action Taken when the DTC Sets

DTCs P2270 and P2273 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2270 and P2273 are Type B DTCs.

Circuit / System Verification

1. Ignition ON, observe the DTC information with a scan tool. Verify that DTC P0137, P0138, or P0140 is not set.

   If any of the listed DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Operate the engine above 1,200 RPM for 30 seconds, observe the HO2S 2 voltage parameter. The reading should fluctuate above and below the range of 350-550 mV.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Engine operating, move the related HO2S harnesses for the appropriate rear sensor between the HO2S harness connector and the ECM while monitoring the appropriate HO2S voltage parameter. Verify that the HO2S parameter does not change abruptly while moving the related harnesses.

   If the HO2S parameter does change abruptly while moving the related harnesses repair the circuit as necessary.
2. Ignition OFF, disconnect the harness connector of the appropriate HO2S.
3. Ignition ON, verify that the HO2S parameter is between 350-500 mV.

   If greater than 500 mV, test the signal circuit terminal 4 for a short to voltage. If the circuit/connections test normal, replace the ECM.
4. Verify that none of the following conditions exist:
   - Rich fuel injectors - Refer to Fuel Injector Solenoid Coil Test.
   - Water intrusion in the HO2S harness connector.
   - High fuel system pressure--Refer to Fuel System Diagnosis.
   - Fuel that is contaminated--Refer to Alcohol/Contaminants-in-Fuel Diagnosis.
   - A collapsed air intake duct.
   - A restricted air filter element.
   - Exhaust system restrictions.
   - Fuel in the crankcase.
   - An engine mechanical condition. Refer to Symptoms - Engine Mechanical.

     If you find any of the above conditions, repair as necessary.
5. If all circuits/connections test normal, replace the appropriate HO2S.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Heated Oxygen Sensor Replacement - Bank 1 Sensor 2
- Heated Oxygen Sensor Replacement - Bank 2 Sensor 2
- Engine Control Module Replacement for engine control module replacement, setup, and programming.

DTC P2544

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P2544: Transmission Torque Request Circuit

Circuit / System Description

To improve shift feel, the transmission control module (TCM) may request that the engine control module (ECM) reduce engine torque during shift events. When such a request is received, the ECM responds by retarding the ignition timing and notifying the TCM that the request has succeeded. If the ECM is unable to comply with the request, the ECM sends the TCM a message that the request has failed.

Conditions for Running the DTC

- The ignition is ON for greater than 3 seconds.
- The ignition voltage is 10-18 volts.
- The serial data circuit initialized.
- The DTCs run continuously once the above condition is met.

Conditions for Setting the DTC

The ECM detects an invalid signal from the TCM for greater than 4 seconds.

Action Taken When the DTC Sets

DTC P2544 is a Type C DTC.

Conditions for Clearing the DTC

DTC P2544 is a Type C DTC.

DTC P2636

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P2636: Fuel Transfer Pump Flow Insufficient

Circuit Description

The fuel tank on this vehicle is equipped with 2 fuel level sensors, one for each reservoir of the fuel tank. Fuel is transferred from the left side of the fuel tank to the right side of the fuel tank in order to ensure all of the usable fuel volume is available. The fuel pump supplies a small amount of pressurized fuel to the siphon jet pump through the fuel feed pipe. The pressurized fuel creates a venturi action inside the siphon jet pump. The venturi action causes the fuel to be drawn out of the left side of the fuel tank. Fuel is then transferred from the left side of fuel tank to the right side of fuel tank through the internal fuel transfer tube. This diagnostic tests for too large of a difference in fuel level between the left and right side of the fuel tank. The DTC sets if the control module determines that the right side fuel level is less than a predetermined amount of the left side fuel level.

The following table illustrates the difference between temperature, resistance and voltage:

Fuel Level-Right or Left Sensor	Fuel Level Sensor Resistance	Fuel Level Sensor Voltage
Empty	Low	Low
Full	High	High

Conditions for Running the DTC

- Before the engine control module (ECM) can report DTC P2636 failed, DTCs P0462, P0463, P2067, and P2068 must run and pass.
- The engine is operating.
- DTC P2636 runs continuously once the above conditions exist for greater than 4 minutes.

Conditions for Setting the DTC

- The ECM detects that the right side fuel level is less than 11 percent and the left side fuel level is greater than 23 percent.
- The above condition is present for greater than 4 seconds or for a cumulative of 30 seconds.

Action Taken When the DTC Sets

DTC P2636 is a Type C DTC.

Conditions for Clearing the MIL/DTC

DTC P2636 is a Type C DTC.

Diagnostic Aids

Depending on the current fuel level, it may be difficult to locate a malfunctioning fuel level sensor. The condition may only occur when the fuel level is full or near empty. The fuel level sensor unit may need to be removed for further diagnosis. A fuel level sensor that has an intermittent condition causes this DTC to set.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine idling for 5 minutes, observe the DTC information with a scan tool. DTC P2636 should not set.

2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector of the left side fuel level sensor.
2. Ignition ON, verify the scan tool Fuel Level Sensor-Left Tank voltage parameter is at 5.0 V.

   If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the ECM.
3. Install a 3 A fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool Fuel Level Sensor-Left Tank voltage parameter is at 0.0 V.

   If greater than the specified value, test the signal circuit for a high resistance. If the circuit tests normal, replace the ECM.
4. Install a 3 A fused jumper wire between the signal circuit terminal A and the low reference circuit terminal D. Verify the scan tool Fuel Level Sensor-Left Tank voltage parameter is at 0.0 V.

   If greater than the specified value, test the low reference circuit for a high resistance. If the circuit tests normal, replace the ECM.
5. Remove the fuel tank.
6. Remove the fuel tank primary and secondary modules and inspect for the following conditions:
   - A clogged secondary fuel strainer and pick up
   - A clogged or restricted siphon jet pump
   - Broken, clogged or restricted flex tubes, primary fuel tank module
   - Broken, clogged, disconnected, or restricted fuel transfer tube inside tank

   If you find any of the above conditions, repair as necessary.
7. If all circuits/connections test normal, test or replace the left/secondary fuel level sensor.

Component Testing

1. Ignition OFF, remove the left fuel level sender from the fuel tank.
2. Connect a DMM between terminal A and terminal D.
3. Verify the secondary fuel level sender resistance remains within 40-250 Ω and changes smoothly while moving the float arm from stop to stop.

   If the resistance is outside the specified range or changes erratically while moving the float arm from stop to stop, replace the fuel level sender.

Alcohol/Contaminants-in-Fuel Diagnosis (with Special Tool)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Description

Water contamination in the fuel system may cause driveability conditions such as hesitation, stalling, no start, or misfires in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel injection system, and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust or deterioration.

Ethanol concentrations of greater than 10 percent can cause driveability conditions and fuel system deterioration. Fuel with greater than 10 percent ethanol could result in driveability conditions such as hesitation, lack of power, stalling , or no start. Excessive concentrations of ethanol used in vehicles not designed for it may cause fuel system corrosion, deterioration of rubber components, and fuel filter restriction.

Test Procedure

1. Test the fuel composition using J 44175 Fuel Composition Tester and J44175-3 Instruction Manual.
2. If water appears in the fuel sample clean the fuel system, refer to Fuel System Cleaning.
3. Subtract 50 from the reading on the DMM in order to obtain the percentage of alcohol in the fuel sample. Refer to the examples in the Fuel Composition Test Examples table.
4. If the fuel sample contains greater than 15 percent ethanol, add fresh, regular gasoline to the vehicle's fuel tank.
5. Test the fuel composition.
6. If testing shows the ethanol percentage is still greater than 15 percent, replace the fuel in the vehicle. Refer to Fuel Tank Draining.

Fuel Composition Test Examples

--	Frequency (Hz)	Subtract 50	Ethanol Percent
Example A	50 Hz	-50	0
Example B	65 Hz	-50	15
Example C	129 Hz	-50	79

Alcohol/Contaminants-in-Fuel Diagnosis (without Special Tool)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Description

Water contamination in the fuel system may cause driveability conditions such as hesitation, stalling, no start, or misfires in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel rail, and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust, or deterioration.

Alcohol concentrations greater than 10 percent in the fuel can be detrimental to fuel system components. Alcohol contamination may cause fuel system corrosion, deterioration of rubber components, and subsequent fuel filter restriction. Fuel contaminated with alcohol may cause driveability conditions such as hesitation, lack of power, stalling, or no start. Some types of alcohol are more detrimental to fuel system components than others.

Alcohol in Fuel Testing Procedure

The fuel sample should be drawn from the bottom of the tank so that any water present in the tank will be detected. The sample should be bright and clear. If alcohol contamination is suspected then use the following procedure to test the fuel quality.

1. Using a 100 ml (3.38 oz) specified cylinder with 1 ml (0.34 oz) graduation marks, fill the cylinder with fuel to the 90 ml (3.04 oz) mark.
2. Add 10 ml (0.34 oz) of water in order to bring the total fluid volume to 100 ml (3.38 oz) and install a stopper.
3. Shake the cylinder vigorously for 10-15 seconds.
4. Carefully loosen the stopper in order to release the pressure.
5. Re-install the stopper and shake the cylinder vigorously again for 10-15 seconds.
6. Put the cylinder on a level surface for approximately 5 minutes in order to allow adequate liquid separation.

If alcohol is present in the fuel, the volume of the lower layer, that now contains both alcohol and water, will be greater than 10 ml (0.37 oz). For example, if the volume of the lower layer is increased to 15 ml (0.51 oz), this indicates at least 5 percent alcohol in the fuel. The actual amount of alcohol may be somewhat more because this procedure does not extract all of the alcohol from the fuel.

Particulate Contaminants in Fuel Testing Procedure

The fuel sample should be drawn from the bottom of the tank so that any contaminants present in the tank will be detected. The sample should be bright and clear. If the sample appears cloudy or contaminated with water as indicated by a water layer at the bottom of the sample, use the following procedure to diagnose the fuel.

1. Using an approved fuel container, draw approximately 0.5 liter (0.53 qt) of fuel.
2. Place the cylinder on a level surface for approximately 5 minutes in order to allow settling of the particulate contamination.

Particulate contamination will show up in various shapes and colors. Sand will typically be identified by a white or light brown crystals. Rubber will appear as black and irregular particles. If particles are found, clean the entire fuel system thoroughly. Refer to Fuel System Cleaning.

Document ID: 1994298

Backfire (Petrol)

Checks	Action
DEFINITION: The fuel ignites in the intake manifold, or in the exhaust system, making a loud popping noise.	
Preliminary Checks	Refer to Important Preliminary Checks in Symptoms - Engine Controls .
Ignition System Checks	• Remove and inspect the spark plugs for the following conditions: - Wet plugs - Cracks - Wear - Incorrect gap - Burned electrodes - Heavy deposits • Test for correct ignition system operation. • Test for crossfire between spark plugs. Test for spark plug wire failure.
Engine Mechanical Checks	• Inspect the engine for the following: - Intake manifold leaks - Incorrect valve timing - Correct engine cylinder compression - Sticking or leaking intake or exhaust valves - Exhaust system leakage • Inspect the intake and exhaust system for casting flash.
Fuel System Checks	Perform fuel system diagnosis. Refer to Fuel System Diagnosis .
Additional Checks	• Review service bulletins for LPG ECM PCM programming updates. • Verify that the correct LPG software and calibration has been programmed into the LPG ECM. • Test for correct operation of the AFO Enable circuit.

Cuts Out, Misses (Petrol)

Checks	Action
DEFINITION: A surging or jerking that follows engine speed, usually more pronounced as the engine load increases.	
Preliminary Checks	Refer to Important Preliminary Checks in Symptoms - Engine Controls .
Fuel System Checks	• Test for correct fuel system pressures. Refer to Fuel System Diagnosis . • Inspect for correct operation of the LPG fuel injectors. Refer to: Fuel Injector Balance Test with Special Tool • Test the lock-off valves / circuits for correct operation.
Ignition System Checks	• Inspect for fouled spark plugs. If fouled spark plugs are indicated the reason for the fouling must be found and corrected. • Test for faulty spark plug wires. • Test for an open ignition system ground.
Engine Mechanical Checks	Test for correct engine operation by checking for the following: • Correct engine compression • Correct engine valve timing • Worn or incorrect camshafts • Casting flash in the intake or exhaust manifold passages

---

Electronic Ignition (EI) System Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

Ignition 1 voltage is supplied to the ignition coils. The engine Control Module (ECM) provides a ground for the ignition coil (IC) control circuits. When the ECM removes the ground path of the ignition primary coil, the magnetic field produced by the coil collapses. The collapsing magnetic field produces a voltage in the secondary coil which ignites the spark plugs. The sequencing and timing are controlled by the ECM.

Diagnostic Aids

- The ignition coils for each bank are fused separately. If a fuse opens or the ignition 1 voltage circuit opens between the fuse and the splice, all the ignition coils for one bank of the engine would be inoperative. If the ground circuit opens at the engine block, the ignition coils would be inoperative for one bank of the engine
- Inspect the ignition coils for aftermarket devices. An aftermarket device connected to the ignition coil circuits, may cause a condition with the ignition coils.

Circuit / System Testing

> **Note:** Do not perform this diagnostic procedure if you were not sent here from a misfire DTC or the Engine Cranks but Does Not Run diagnostic.

1. Ignition OFF, disconnect the harness connector of the ignition coil.
2. Ignition ON, load test for battery voltage between the ignition voltage circuit terminal 2 and ground.

   If less than B+, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition voltage circuit and replace as necessary.
3. Crank or start the engine. Test for 200-400 mV between the appropriate IC circuit terminal 1 and ground.

   If less than the specified value, test the IC circuit for a short to ground or an open/high resistance. If the circuit/connection tests normal, replace the ECM.

   If greater than the specified value, test the IC circuit for a short to voltage. If the circuit/connection tests normal, replace the ECM.
4. Connect a test lamp between the each of the ground circuits terminal 3, and terminal 4, and B+. The test lamp should illuminate on each circuit.

   If the test lamp does not illuminate, test the suspected circuit for an open/high resistance.
5. If all circuits/connections test normal, replace the ignition coil.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Ignition Coil Replacement - Bank 1
- Ignition Coil Replacement - Bank 2

2009 Cadillac CTS | CTS (VIN D) Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures | **Document ID: 2033132**

Electronic Ignition (EI) System Diagnosis (with LLT)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The ignition system on this engine uses individual ignition coils and ignition control (IC) circuits for each cylinder. Ignition voltage is supplied to each bank of ignition coils. The engine control module (ECM) controls the ignition system operation. The ECM controls each coil using the IC circuits. The ECM commands the IC circuit low when a spark event is requested. The sequencing and timing are controlled by the ECM.

Diagnostic Aids

- The ignition coils for each bank are fused separately. If a fuse opens or the ignition voltage circuit opens between the fuse and the splice, all the ignition coils for one bank of the engine would be inoperative. If the ground circuit opens at the engine block, the ignition coils would be inoperative for one bank of the engine.
- Inspect the ignition coils for aftermarket devices. An aftermarket device connected to the ignition coil circuits, may cause a condition with the ignition coils.

Circuit/System Testing

> **Note:** Do not perform this diagnostic procedure if you were not sent here from a misfire DTC or the Engine Cranks but Does Not Run diagnostic.

1. Ignition OFF, disconnect the harness connector of the ignition coil.
2. Ignition ON, load test for battery voltage between the ignition 1 voltage circuit of the ignition coil and ground.

   If less than B+, repair the ignition 1 voltage circuit of the ignition coil for a short to ground or an open/high resistance.
3. Ignition OFF, test for less than 5 Ω of resistance between the ground circuit of the ignition coil and the negative terminal of the battery.

   If greater than 5 Ω, repair the ground circuit of the ignition coil for an open/high resistance.
4. If all circuits/connections test normal, replace the ignition coil.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Ignition Coil Replacement - Bank 1
- Ignition Coil Replacement - Bank 2

Engine Cranks But Does Not Run

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

This Engine Cranks but Does Not Run diagnostic is an organized approach to identify a condition which causes the engine to crank but not start. This diagnostic directs the technician to the appropriate system diagnosis.

Diagnostic Aids

Inspect for any of the following conditions:

- The engine Control Module (ECM) uses the camshaft position (CMP) sensors to determine engine speed and position when there is a crankshaft position (CKP) sensor condition
- The engine will operate with a CKP sensor condition only if the ECM has stored the learned reference position of the camshafts in memory. With a CKP sensor condition in the signal circuit, the engine will go into a limp home mode after a hard restart. The ECM then calculates engine speed from one of the CMP sensors. During a limp home mode, the following additional DTCs may set and should be ignored:
  - DTC P0324 Knock Sensor (KS) Module Performance
  - DTC P1011 Intake Camshaft Position Actuator Park Position Bank 1
- Insufficient fuel can cause a no start condition. Thoroughly inspect the fuel delivery system for sufficient fuel volume to the fuel injectors. Inspect the fuel supply components for partial blockage or restrictions.
- Fuel injectors with partially blocked and restricted nozzles, or a malfunctioning solenoid, can cause a no start condition. Refer to Fuel Injector Solenoid Coil Test.
- There may be fuel spray at the fuel injectors and the indicated fuel pressure may be correct, yet there may not be enough fuel to start the engine. If the fuel injectors and the injector circuit are OK, and fuel spray is detected, the fuel injector ON time may be inadequate. If the engine Control Module (ECM) receives incorrect inputs from the various information sensors, the fuel delivered by the fuel injectors may be inadequate to start the engine. Check all the engine data parameters with a scan tool and compare the values indicated with the expected values or the values from a known good vehicle
- Check the crankshaft position (CKP) sensor engine reference signal with a scan tool. Observe the Engine Speed parameter while cranking the engine. The scan tool should indicate a steady 200-300 RPM while cranking. If erratic values, such as sudden spikes in the engine speed are displayed, the engine reference signal is not stable enough for the engine to start and run properly
- Inspect the engine for good secure electrical grounds

- If the engine almost starts and then stalls, check for an open in the ground circuits of the CKP sensor and the camshaft position (CMP) sensor
- Water or foreign material in the fuel can cause a no start or engine will not stay running condition. During freezing weather water can freeze inside the fuel system. The engine may start after 30 minutes in a heated repair shop. The malfunction may not recur until parked overnight in freezing temperatures. Extreme weather conditions can cause contaminated fuel to prevent the vehicle from starting
- A vehicle that starts and runs after being brought to the repair shop for a no start condition, may have an ignition system that is susceptible to moisture. Spray water on the ignition system components and the wiring in order to check for an engine starting or will not stay running concern.

Circuit/System Verification

Note: This diagnostic assumes the following:

- The battery is completely charged. Refer to Battery Inspection/Test

- The engine cranking speed is acceptable. Refer to Engine Cranks Slowly
- There is adequate fuel in the fuel tank.

1. Attempt to start the engine. Observe the DTC information with a scan tool. Verify that DTCs P0116, P0118, P0119, P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0335, P0336, P0338, P0351-P0356, P0602 ,P0603-P0606, P0627, P0628, P0629, P1629, P1631, P1632, P167D, P2105, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 do not set.

   If any of the listed DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.
2. Ignition ON, observe the Theft Deterrent parameter with a scan tool. The parameter should display Disabled.

   If Enabled is displayed, refer to Theft Deterrent Control Module Programming and Setup.
3. Test the ignition system for spark. Refer to Electronic Ignition (EI) System Diagnosis.
4. Ignition ON, command the fuel pump ON with a scan tool. You should hear the fuel pump turn ON.

   If the fuel pump does not turn ON, refer to Fuel System Diagnosis.
5. Ignition OFF, install the *AU-338* Fuel Pressure Gage and the *AU-465* Fuel Gauge Adapter Hose . Refer to Fuel Pressure Gage Installation and Removal.

   Note:
   - The fuel pump may need to be commanded ON a few times, in order to obtain the highest possible fuel pressure
   - Do NOT start the engine for this test.
6. Ignition ON, command the fuel pump ON with a scan tool. The fuel pressure should be between 380-410 kPa (55-60 psi).

   If the fuel pressure is not within range, refer to Fuel System Diagnosis.
7. Verify that the following conditions do not exist:
   - Disconnect the MAF sensor. The engine Control Module (ECM) will ignore the MAF sensor and default to the calculated air flow.

     If disconnecting the MAF sensor corrects the condition and the connections are OK, replace the MAF sensor. Refer to Mass Airflow Sensor with Intake Air Temperature Sensor Replacement
   - Collapsed air intake duct to the throttle body
   - Restricted air filter element
   - Spark plugs for being gas or coolant fouled--Refer to Spark Plug Inspection
   - A skewed engine coolant temperature (ECT) sensor--Refer to Temperature Versus Resistance - Engine Coolant Temperature Sensor
   - Exhaust system restricted--Refer to Restricted Exhaust
   - Engine mechanical condition, for example, worn timing chain and gears, low compression--Refer to Symptoms - Engine Mechanical.

     If you find any of the above conditions, repair as necessary.

Fuel Injector Balance Test with Special Tool

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Diagnostic Fault Information

Fuel Injector Balance Test Example

Cylinder	1	2	3	4	5	6
First Reading	360 kPa (52 psi)	360 kPa (52 psi)	360 kPa (52 psi)	360 kPa (52 psi)	360 kPa (52 psi)	360 kPa (52 psi)
Second Reading	195 kPa (28 psi)	138 kPa (20 psi)	195 kPa (28 psi)	195 kPa (28 psi)	235 kPa (34 psi)	195 kPa (28 psi)
Amount Of Drop	166 kPa (24 psi)	222 kPa (32 psi)	166 kPa (24 psi)	166 kPa (24 psi)	125 kPa (18 psi)	166 kPa (24 psi)
Average Range: 156-176 kPa (22.5-25.5 psi)	Injector OK	Fuel Injector - Too Much Pressure Drop	Injector OK	Injector OK	Faulty Injector - Too Little Pressure Drop	Injector OK

Circuit/System Description

The scan tool is first used to energize the fuel pump relay. The fuel injector tester is then used to pulse each injector for a precise amount of time, allowing a measured amount of fuel into the manifold. This causes a drop in system fuel pressure that can be recorded and used to compare each injector.

Diagnostic Aids

- Monitoring the misfire current counters, or misfire graph, may help to isolate the fuel injector that is causing the condition
- Operating the vehicle over a wide temperature range may help isolate the fuel injector that is causing the condition
- Perform the fuel injector balance test within the conditions of the customers concern. A fuel injector condition may only be apparent at a certain temperature, or under certain conditions.

- 7370 Fuel Line Disconnect Tool
- AU-338 Fuel Pressure gauge.
- AU-465 Fuel Gauge Adaptor Hose.

Component Testing

Fuel Injector Balance Test with Special Tool

1. Ignition ON, with a scan tool verify that the engine coolant temperature (ECT) is less than 94°C (201°F).

   If the ECT is greater than 94°C (201°F) allow the engine to cool before proceeding.
2. Ignition OFF, install the fuel pressure gauge. Refer to Fuel Pressure Gage Installation and Removal.
3. Ignition ON, verify the fuel pressure is within 380-410 kPa (55-60 psi).

   If the fuel pressure is not within the specified range refer to Fuel System Diagnosis.
4. Monitor the fuel pressure gage for 1 minute. Verify that the fuel pressure does not drop more than 34 kPa (5 psi).

   If the fuel pressure decreases more than 34 kPa (5 psi) refer to Fuel System Diagnosis.

   Notice: Do Not repeat any portion of this test before running the engine in order to prevent the engine from flooding.

5. Connect a commercially available fuel injector tester to a fuel injector with the amperage supply selector switch on the fuel injector tester to the Balance Test 0.5-2.5 amp position.

6. Command the fuel pump relay ON with a scan tool and record the fuel pressure indicated by the fuel pressure gauge after the fuel pressure stabilizes. This is the first pressure reading.

   Note:

   - Repeat this step for each fuel injector in order to obtain a pressure drop value for each fuel injector
   - The fuel pressure may rise after the fuel injector stops pulsing. Record the fuel pressure value immediately after the fuel injector stops pulsing. DO NOT record the higher fuel pressure value.

7. Energize the fuel injector by depressing the Push to Start Test button on the fuel injector tester. Record the fuel pressure indicated by the fuel pressure gauge after the fuel injector has stopped pulsing. This is the second pressure reading.
8. Add all of the individual pressure drop values in order to calculate the total pressure drop. Divide the total pressure drop by the number of fuel injectors in order to calculate the average pressure drop. The difference between any individual pressure drop and the average pressure drop should not be more than 20 kPa (3 psi).

   If the difference between any individual pressure drop and the average pressure drop is more than 20 kPa (3 psi), replace the fuel injector.

Component Testing

Fuel Injector Balance Test with Special Tool

1. Ignition ON, with a scan tool verify that the engine coolant temperature (ECT) is less than 94°C (201°F).

   If the ECT is greater than 94°C (201°F) allow the engine to cool before proceeding.
2. Ignition OFF, install the fuel pressure gauge. Refer to Fuel Pressure Gage Installation and Removal.
3. Ignition ON, verify the fuel pressure is within 380-410 kPa (55-60 psi).

   If the fuel pressure is not within the specified range refer to Fuel System Diagnosis.
4. Monitor the fuel pressure gauge for 1 minute. Verify that the fuel pressure does not drop more than 34 kPa (5 psi).

   If the fuel pressure decreases more than 34 kPa (5 psi) refer to Fuel System Diagnosis.

   Notice: Do Not repeat any portion of this test before running the engine in order to prevent the engine from flooding.
5. With a scan tool, select the Fuel Injector Balance Test function, within the Special Functions menu. Select a fuel injector to be tested and press Enter in order to prime the fuel system. Record the fuel pressure indicated by the fuel pressure gauge after the fuel pressure stabilizes. This is the 1st pressure reading.

Note:

- Repeat this step for each fuel injector in order to obtain a pressure drop value for each fuel injector
- The fuel pressure may rise after the fuel injector stops pulsing. Record the fuel pressure value immediately after the fuel injector stops pulsing. DO NOT record the higher fuel pressure value.

6. Energize the fuel injector by depressing the Pulse Injector button on the scan tool. This will energize the fuel injector and decrease the fuel pressure. Record the fuel pressure indicated by the fuel pressure gauge after the fuel injector has stopped pulsing. This is the 2nd pressure reading.
7. Press Enter to return to the Select Injector screen.
8. Add all of the individual pressure drop values in order to calculate the total pressure drop. Divide the total pressure drop by the number of fuel injectors in order to calculate the average pressure drop. The difference between any individual pressure drop and the average pressure drop should not be more than 20 kPa (3 psi).

   If the difference between any individual pressure drop and the average pressure drop is more than 20 kPa (3 psi), replace the fuel injector.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

The engine control module (ECM) enables the appropriate fuel injector pulse for each cylinder. The ignition voltage is supplied directly to the fuel injectors. The ECM controls each fuel injector by grounding the control circuit via a solid state device called a driver. A fuel injector coil winding resistance that is too high or too low will affect the engine driveability. A fuel injector control circuit DTC may not set but a misfire may be apparent. The fuel injector coil windings are affected by temperature. The resistance of the fuel injector coil windings will increase as the temperature of the fuel injector increases.

Diagnostic Aids

- Monitoring the misfire current counters, or misfire graph, may help to isolate the fuel injector that is causing the condition
- Operating the vehicle over a wide temperature range may help isolate the fuel injector that is causing the condition
- Perform the fuel injector coil test within the conditions of the customers concern. A fuel injector condition may only be apparent at a certain temperature or under certain conditions.

- The DMM and test leads must be calibrated to 0 Ω in order to prevent mis-diagnosis.

1. Engine coolant between 10-32°C (50-90°F).
2. Test for 1.30-1.73 Ω between the terminals of the fuel injector. The resistance of each fuel injector should be 1.30-1.73 Ω.

   If not within the specified range, replace the fuel injector.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Fuel Injector Replacement

Fuel Injector Solenoid Coil Test (with LLT)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The engine control module (ECM) enables the appropriate fuel injector pulse for each cylinder. The ECM supplies a high voltage control circuit and a low control circuit to each of the fuel injectors. The control module controls each fuel injector control circuit via a solid state device called a driver. A fuel injector coil winding resistance that is too high or too low will affect the engine driveability. The fuel injector coil windings are affected by temperature. The resistance of the fuel injector coil windings will increase as the temperature of the fuel injector increases.

Diagnostic Aids

- Monitoring the misfire current counters, or misfire graph, may help to isolate the fuel injector that is causing the condition.
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the circuit status for the component with a scan tool. The circuit status parameter changes from OK or Indeterminate to Fault if there is a condition with the circuit or a connection.

Note:

- The engine coolant must be within the specified range or mis-diagnosis will occur.
- The resistance test must be performed at the fuel injector or mis-diagnosis will occur.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Component Testing

Verify the resistance of each fuel injector with one of the following methods:

- If the engine coolant temperature (ECT) sensor is between 10-32°C (50-90°F), the resistance of each fuel injector should be 11-14 Ω.

  If the resistance of any fuel injector is not 11-14 Ω, replace the fuel injector
- If the ECT sensor is not between 10-32°C (50-90°F), measure and record the resistance of each fuel injector with a DMM. Subtract the lowest resistance value from the highest resistance value. The difference between the lowest value and the highest value should be equal to or less than 3 Ω

  If the difference is equal to or less than 3 Ω, refer to Fuel Injector Balance Test with Special Tool or Fuel Injector Balance Test with Tech 2

  If the difference is more than 3 Ω, add all of the fuel injector resistance values to obtain a total resistance value. Divide the total resistance value by the number of fuel injectors to obtain an average resistance value. Subtract the lowest, and the highest, individual fuel injector resistance values from the average resistance value. Replace the fuel injector that displays the greatest resistance difference above or below the average.

Repair Instructions

Fuel Injector and Fuel Rail Replacement.

Fuel Pump Electrical Circuit Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

The engine Control Module (ECM) provides a ground to the coil side of the fuel pump relay. When the ignition switch is first turned ON, the ECM turns ON the fuel pump relay, which applies power to the fuel pump. The ECM enables the fuel pump relay as long as the engine is cranking or running, and crankshaft reference pulses are received. If no crankshaft reference pulses are received, the ECM turns OFF the fuel pump relay after about 3 seconds.

Diagnostic Aids

The following conditions may cause the fuel pump fuse to open:

- The fuse is faulty
- There is an intermittent short to ground in the supply voltage circuit of the fuel pump
- The fuel pump has an intermittent internal condition.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

> **Note:** Fuel pump DTCs may set when using the Fuel Pump output control.

1. Ignition ON, command the fuel pump relay ON with a scan tool. You should hear the fuel pump operate for 3-5 seconds and then turn OFF.
2. If the vehicle passes the Circuit/System Verification Test, then operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records Data List.

Circuit/System Testing

1. Ignition OFF, the fuel pump should not be operating.

   If the fuel pump operates continuously, test for a short to voltage in supply voltage circuit of the fuel pump. If the circuit/connections test normal, replace the fuel pump relay.
2. Test the fuel pump fuse. The fuse should not be open.

   If the fuel pump fuse is open, test for a short to ground in the supply voltage circuit of the fuel pump. If the circuit/connections test normal, replace the fuel pump.
3. Ignition OFF, remove the fuel pump relay from the electrical centre.
4. Ignition ON, test for battery voltage between the B+ voltage circuit of the fuel pump relay and known ground.

   If less than B+, repair the B+ voltage circuit of the fuel pump relay for an open/high resistance.
5. Connect a 15 A fused jumper wire between the B+ circuit of the fuel pump relay and the supply voltage circuit of the fuel pump. The fuel pump should operate.

   If the fuel pump does not operate, test for the following conditions:
   - An open/high resistance in the supply voltage circuit of the fuel pump
   - An open/high resistance in the ground circuit of the fuel pump

   If the above circuit/connections test normal, replace the fuel pump.
6. If all circuit/connections test normal, test or replace the fuel pump relay.

Component Testing

1. Measure for 135-185 Ω between terminals 85 and 86 of the fuel pump relay.

   If the resistance is not within the specified range, replace the fuel pump relay.
2. Measure for infinite resistance between the following terminals of the fuel pump relay:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87

   If continuity is detected, replace the fuel pump relay.
3. Connect a 15 A fused jumper wire from the positive terminal of the battery to relay terminal

85. Connect a jumper wire from the negative terminal of the battery to relay terminal 86. Measure for less than 2 Ω between terminals 30 and 87 of the relay.

If the resistance measures more than 2 Ω, replace the fuel pump relay.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Primary Fuel Tank Module Replacement
- Relay Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures |

Fuel System Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

The engine control module (ECM) enables the fuel pump relay when the ignition switch is turned ON. The ECM will disable the fuel pump relay within 3 seconds unless the ECM detects ignition reference pulses. The ECM continues to enable the fuel pump relay as long as ignition reference pulses are detected. The engine control module (ECM) disables the fuel pump relay within 3 seconds if ignition reference pulses cease to be detected and the ignition remains ON.

The fuel system is a returnless on-demand design. The fuel pressure regulator is a part of the primary fuel tank module, eliminating the need for a return pipe from the engine. A returnless fuel system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine to the fuel tank. Reducing the internal temperature of the fuel tank results in lower evaporative emissions.

An electric turbine style fuel pump attaches to the primary fuel tank module inside the fuel tank. The fuel pump supplies high pressure fuel through the fuel filter, past the fuel pressure regulator, and through the fuel feed line to the fuel injection system. The fuel pressure regulator has a T-joint that diverts the needed fuel to the fuel rail with the unused fuel dropping back into the reservoir of the primary fuel tank module. The primary fuel tank module contains a reverse flow check valve. The check valve and the fuel pressure regulator maintain fuel pressure in the fuel feed line and the fuel rail in order to prevent long cranking times.

The primary fuel tank module also contains a primary jet pump and a secondary jet pump. Fuel pump flow loss, caused by vapour expulsion in the pump inlet chamber, is diverted to the primary jet pump and the secondary jet pump through a restrictive orifice located on the pump cover. The primary jet pump fills the reservoir of the primary fuel tank module. The secondary jet pump creates a venturi action which causes the fuel to be drawn from the secondary side of the fuel tank, through the fuel transfer pipe, to the primary side of the fuel tank.

Diagnostic Aids

- A vehicle that runs out of fuel above empty may indicate a condition with the siphon jet pump, or transfer lines between the fuel tanks. Inspect for blockage, foreign objects or restrictions in all related hardware
- A vehicle that runs out of fuel above empty may be caused by an inaccurate fuel level sender. Inspect the float arm for binding, or obstructions.

Electrical Information Reference

Scan Tool Reference

Control Module References.

Special Tools Required

Commercially available Fuel Pressure gauge.

Circuit/System Verification

Note:

- Inspect the fuel system for damage or external leaks before proceeding
- Verify that adequate fuel is in the fuel tank before proceeding
- The fuel pump relay may need to be commanded ON a few times in order to obtain the highest possible fuel pressure
- DO NOT start the engine.

1. Ignition ON, command the fuel pump relay ON with a scan tool. You should hear the fuel pump turn ON and OFF for 3-5 seconds.

   If the fuel pump does not operate, refer to Fuel Pump Electrical Circuit Diagnosis.
2. Ignition OFF, all accessories OFF, install the fuel pressure gauge. Refer to Fuel Pressure Gage Installation and Removal.
3. Ignition ON, command the fuel pump relay ON with a scan tool. Verify the fuel pressure is between 380-410 kPa (55-60 psi) and remains steady for 5 minutes.
4. Operate the vehicle within the conditions of the customers concern while monitoring fuel related parameters with a scan tool.

   If the scan tool parameters do not indicate a lean condition, refer to Symptoms - Engine Controls.

Circuit/System Testing

1. Ignition ON, command the fuel pump relay ON with a scan tool and observe the fuel pressure while the fuel pump is operating. Verify the fuel pressure is between 380-410 kPa (55-60 psi).

   If the fuel pressure is more than the specified range, replace the fuel pump.

   If the fuel pressure is less than the specified range, remove the fuel tank and test/inspect for the following:

   - Restricted fuel feed line
   - Restricted or plugged fuel filter
   - Restricted or plugged strainer
   - Stuck or binding fuel level float
   - Restricted siphon jet pump

- Restricted transfer lines between fuel tanks
- Faulty fuel pressure regulator
- Poor connections at the harness connectors and ground circuits of the fuel pump

If you find a condition, repair as necessary

If all components test normal, replace the fuel pump.

Note: The fuel pressure may vary slightly when the fuel pump stops operating. After the fuel pump stops operating, the fuel pressure should stabilize and remain constant.

2. Verify that the fuel pressure does not decrease more than 34 kPa (5 psi) in 1 minute.

   If the fuel pressure decreases more than the specified value, perform the following procedure:

   2.1. Ignition OFF, relieve the fuel pressure. Refer to Fuel Pressure Relief

   2.2. Install the *J 37287* Fuel Line Shut-Off Adapters between the fuel feed pipe and the fuel rail.

   2.3. Open the valve on the *J 37287* Fuel Line Shut-Off Adapters .

   2.4. Bleed the air from the fuel pressure gage.

   2.5. Close the valve on the *J 37287* Fuel Line Shut-Off Adapters .

   2.6. Verify that the fuel pressure does not decrease more than 34 kPa (5 psi) in 1 minute.

   If the fuel pressure remains constant, replace the fuel pump.

   If the fuel pressure drops, locate and replace the leaking fuel injector.
3. Relieve the fuel pressure to 69 kPa (10 psi). Verify that the fuel pressure does not decrease more than 14 kPa (2 psi) in 5 minutes.

   If the fuel pressure decreases more than the specified value, replace the fuel pump.
4. Remove the *J 37287* Fuel Line Shut-Off Adapters and the *AU-338* Fuel Pressure Gage . Refer to Fuel Pressure Gage Installation and Removal.
5. Operate the vehicle within the conditions of the customer concern while monitoring fuel related parameters with a scan tool.

   If the scan tool parameters indicate a lean condition, test/inspect for the following:

   - Restricted fuel feed line
   - Restricted fuel filter
   - Restricted siphon jet pump
   - Restricted transfer lines between fuel tanks
   - Faulty fuel pressure regulator
   - Poor connections at the harness connectors and ground circuits of the fuel pump

   If all components test normal and the scan tool parameters indicate a lean condition, replace the fuel pump.

Repair Instructions

Perform the Diagnostic Repair Verification.

- Primary Fuel Tank Module Replacement
- Fuel Injector and Fuel Rail Replacement

Fuel Tank Leak Test

Caution: Place a dry chemical (Class B) fire extinguisher nearby before performing any on-vehicle service procedures. Failure to follow these precautions may result in personal injury.

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit / System Description

The fuel tank leak test is used to locate any fuel or fuel vapour escaping the fuel tank area. Fuel vapours escaping above the fuel level will be detected when the evaporative emission (EVAP) leak diagnostic test is completed.

Diagnostic Aids

- Operate the vehicle under the condition of the customer concern. Under high temperature conditions fuel vapours may increase to the point of EVAP canister vapour saturation. Fuel vapours would then be released into the atmosphere. Once the engine is running and the EVAP purge is enabled, all fuel vapour release would be removed.
- Movement of the EVAP pipes or the fuel pipes may help find an intermittent condition.
- If the fuel level is low, a liquid fuel leak may not be evident.

Circuit / System Verification

1. Verify that the fuel tank and the fuel pipes are not damage or leaking.
   If you located a condition, repair as necessary before continuing with diagnostic procedure.
2. Ignition ON, command the fuel pump relay ON with a scan tool. Verify that the fuel pipes are not leaking.
   If you located a condition, repair as necessary before continuing with diagnostic procedure.

   Note: Refer to the J 41413-200 Evaporative Emissions System Tester (EEST) operation manual for detailed instructions.

3. Ignition OFF, install commercially available smoke machine.
4. Command the EVAP vent solenoid closed with a scan tool.
5. Follow manufactures instructions , connect the smoke machine.
   If a leak is located, repair as necessary.

   Note: It may be necessary to partially lower the fuel tank.

6. Using the commercially available smoke machine introduce smoke into the EVAP system. Verify that there are no vapour leaks in any of the following locations:
    - The fuel tank, the fill limiter vent valve, the pressure relief valve, and the grade vent valves
    - The fuel sender housing, the fuel sender seal, the fuel pipe, and the EVAP pipes
    - The fuel tank pressure (FTP) sensor seal
    - The fuel fill pipe and hose.

    If a leak is observed, repair as necessary.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures |

Document ID: 1994281

Hard Start (Petrol)

Checks	Action
DEFINITION: The engine cranks OK, but does not start for a long time. The engine does eventually run, or may start but immediately dies.	
Preliminary Checks	• Refer to Important Preliminary Checks in Symptoms - Engine Controls). • Make sure the vehicle operator is using the correct starting procedure.
Fuel System Checks	• Test for correct fuel relay operation. • Test for correct fuel system pressures. Refer to Fuel System Diagnosis.
Sensor Checks	• Test the ECT sensor for correct operation by performing the following: 1. Allow the engine temperature to reach ambient air temperature by leaving the engine OFF for several hours - overnight for most accurate results. 2. Turn the ignition ON while leaving the engine OFF. 3. Using a scan tool compare the ECT and IAT sensors displayed temperature. The sensors should be within 3°C (5°F) of each other. 4. Replace the ECT sensor or repair the ECT sensor circuit if the ECT is not near the expected value. • Test the TP sensor for correct operation. With the throttle blade fully at rest the monitored TP sensor voltage on a scan tool should be LESS than 0.85 volts. If the TP sensor is not near the expected voltage check for the following conditions: - A faulty TP sensor - A faulty TP sensor circuit - A sticking throttle shaft or linkage/cable assembly • Test for correct operation of the crankshaft position (CKP) sensor. • Test for correct operation of the MAP sensor - if equipped.

Hesitation, Sag, Stumble (Petrol)

Checks	Action
DEFINITION: The vehicle has a momentary lack of response when depressing the accelerator pedal. The condition can occur at any vehicle speed. The condition is usually most severe when attempting to make the vehicle move, as from a stop sign. An extremely severe condition may cause the engine to stall.	
Preliminary Checks	Refer to Important Preliminary Checks in Symptoms - Engine Controls .
Fuel System Checks	• Test for correct fuel system pressures. Refer to Fuel System Diagnosis . Inspect for low pressure during moderate or full throttle acceleration. If the fuel pressure drops below specification, there is possibly a low or regulator fault or a fuel system restriction. • Test for correct EVAP purge system operation.
Sensor Checks	• Test for correct TP sensor operation. A TP sensor that does not respond quickly and accurately to throttle plate movement may cause this symptom. • Test for correct MAP sensor operation. A MAP sensor that does not respond quickly and accurately to manifold pressure changes may cause this symptom.
Ignition System Checks	• Inspect for fouled spark plugs. If fouled spark plugs are indicated the reason for the fouling must be found and corrected. • Test for faulty spark plug wires. • Test for an open ignition system ground.
Additional Checks	• Review service bulletins for module programming updates. • Inspect for manifold or air induction system leaks. • Test for correct generator operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures |

Intake Manifold Tuning Valve Diagnosis

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit / System Description

An intake manifold tuning (IMT) valve is used to change the intake manifold plenum configuration. When the IMT valve is open, the intake manifold is configured to one large plenum. When the IMT valve is closed, the intake manifold is configured to 2 smaller plenums. The IMT valve improves engine performance at low and high engine speeds.

Ignition voltage is supplied directly to the IMT solenoid. The engine control module (ECM) controls the solenoid by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

Diagnostic Aids

- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool circuit status parameters for the component. The circuit status parameters change from OK or Not Run to Fault if there is a condition with the circuit or a connection.
- Inspect the IMT solenoid valve for witness marks that indicate that the valve was hitting the intake manifold. This condition may be temperature related.

Circuit / System Verification

Ignition ON, observe the DTC information with a scan tool. Verify that DTCs P0660, P0661, or P0662 are not set.

If any of the DTCs listed are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

Circuit / System Testing

1. Ignition OFF, remove the intake manifold tuning (IMT) valve from the intake manifold, with the electrical connector connected.
2. Ignition ON, command the IMT solenoid ON and OFF with a scan tool. Verify that the IMT solenoid operates in both directions.

   If the IMT solenoid does not operate in both directions, replace the IMT solenoid.

3. Inspect the inside of the intake manifold for the following conditions:
    - Carbon build-up that limits the movement of the IMT valve
    - Casting flash that limits the movement of the IMT valve
    - Foreign material that limits the movement of the IMT valve

    If a condition is found, repair as necessary.
4. Clean or replace the upper intake manifold.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Intake Manifold Runner Control Solenoid Replacement
- Upper Intake Manifold Replacement

Lack of Power, Sluggishness, or Sponginess (Petrol)

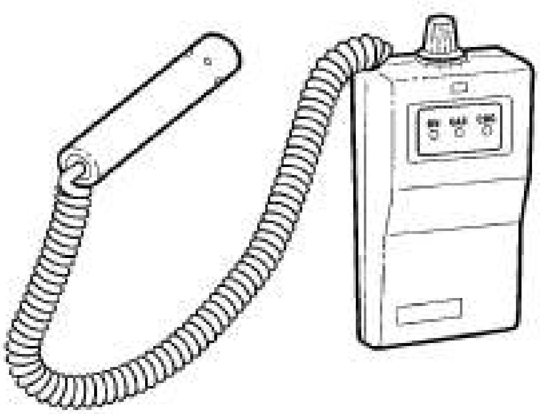
Checks	Action
DEFINITION: The engine delivers less than expected power. There is little or no increase in speed when partially applying the accelerator pedal.	
Preliminary Checks	• Refer to Important Preliminary Checks in Symptoms - Engine Controls . **Important::** Do not compare the power output of the vehicle while operating on LPG to a vehicle operating on petrol. Both fuels have different drive feel characteristics. • Verify the customers concern by comparing the power output of a similarly equipped known good vehicle to the suspect vehicle. • Inspect the air filter for correct type and for dirt or restriction. • Test the transmission for correct shift pattern and downshift operation. • Inspect the LPG ECM for the correct LPG calibration. Program the LPG ECM if necessary.
Fuel System Checks	• Test for correct fuel system pressures. Refer to Fuel System Diagnosis . • Inspect the lock-off filter and LPG fuel filter for restriction. Refer to Fuel Filter Replacement .
Ignition System Checks	**Important::** A higher secondary ignition voltage is required to operate the vehicle on LPG than on petrol. • Test for correct secondary ignition system voltage output using only the combustible gas detector Spark Tester. **Important::** More timing advance is required to operate the vehicle on LPG than on petrol. • Test for correct operation of the Knock Sensor system.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Restrictions can include the following: • A failed catalytic converter • Damaged or collapsed pipes • An internally failed muffler - may show signs of heat distress
Engine Mechanical	Test for correct engine operation by checking for the following:

Checks	• Correct engine compression • Correct engine valve timing • Worn or incorrect camshafts
Additional Checks	• Test for correct A/C operation. A/C that is on all the time may cause this symptom. • Test for correct transmission torque converter clutch (TCC) operation, if equipped. • Test for correct generator operation. • Inspect for correct operation of the accelerator pedal. A stretched accelerator cable may cause this symptom.

Liquefied Petroleum Gas Leak Testing

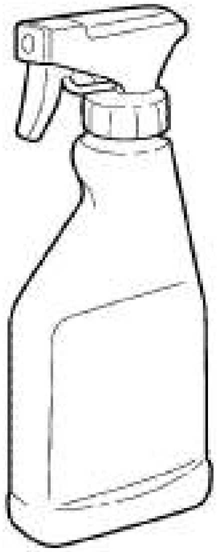
Important: The following leak test is to be performed on the LPG system high-pressure components and is to be performed at each normal maintenance schedule.

Important: The LPG leak test is to be performed in the open air in a well ventilated area, away from any ignition source and prior to bringing the vehicle into the workshop.



Important: LPG is heavier than air so test thoroughly below all components and fittings.

1. If a combustible gas detector is to be used for leak testing of the LPG system, the combustible gas detector should be capable of detecting 25 parts per million (PPM) of LPG in air.
2. It is important to follow the manufacturer's instructions in regard to adjustment and setting the instrument prior to conducting the test.
3. If a leak is present, a detector will signal its existence but not its size, and will indicate its general location, but may not be able to locate it exactly. A proving or follow up check with foam is often desirable.



Important: LPG is heavier than air so test thoroughly below all components and fittings.

4. If foam is to be used, the foaming agent should be a propriety leak test solution, formulated specifically for the purpose, such as Gameco Leak Check.
5. The leak test is performed by directing a spray of solution at each of the possible leak points in the high-pressure side of the system.
6. A leak is indicated by the presence of gas bubbles (foaming) in the solution at the leak source.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures |

Document ID: 1994290

Poor Fuel Economy (Petrol)

Checks	Action
DEFINITION: Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, the current fuel economy is noticeably lower than the vehicle's previous fuel economy, as shown by an actual road test.	
Preliminary Checks	• Refer to Important Preliminary Checks in Symptoms - Engine Controls . • Inspect the air filter for correct type and for dirt or restriction. • Inspect the vacuum hoses for leaks, restrictions and correct connections as shown on the vehicle emission control information (VECI) label. • Review the vehicle operators driving habits for the following items: - The A/C compressor clutch being engaged all the time - Excessive idling or stop and go driving - Correct tyre inflation - Excessively heavy loads being carried - Too much acceleration, too often Advise vehicle operator to fill the fuel tank and recheck fuel economy.
Fuel System Checks	• Test the fuel pressure. Refer to Fuel System Diagnosis • Inspect for fuel system leakage.
Sensor Checks	Test the engine coolant temperature (ECT) sensor for correct operation by performing the following: 1. Allow the engine temperature to reach ambient air temperature by leaving the engine OFF for several hours, overnight for most accurate results. 2. Turn the ignition ON while leaving the engine OFF. 3. Using a scan tool compare the ECT and intake air temperature (IAT) sensors displayed temperature. The sensors should be within 3°C (5°F) of each other. 4. Replace the ECT sensor or repair the ECT sensor circuit if the ECT is not near the expected value.
Ignition System Checks	• Remove and inspect the spark plugs for the following conditions: - Wet plugs - Cracks - Wear - Incorrect gap - Burned electrodes

	- Heavy deposits • Test for an open ignition control (IC) circuit. • Inspect the spark plug wires for the following: - Cracking - Hardness - Correct connections and routing **Important::** More timing advance is required to operate the vehicle on LPG than on petrol. • Test for correct operation of the Knock Sensor system.

Poor Fuel Fill Quality (Petrol)

Checks	Action
DEFINITION: Fuel filling time, as measured against previous filling time, is noticeably longer than expected.	
Fuel System Checks	Inspect for the following conditions: • A contaminated or clogged fill valve filter. A service interval is not specified for the fill valve filter. Its condition depends on fuel quality. Use of LPG with excessive amounts of contaminants will increase the frequency of service. Service if necessary. • A fill line union check valve that is restricted or incorrectly installed. The check valve flow direction arrow should point towards the fuel tank.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Engine | Engine Controls and Fuel - 2.8L, 3.0L, 3.2L, or 3.6L | Diagnostic Information and Procedures |
Document ID: 1994296

Rough, Unstable, or Incorrect Idle and Stalling (Petrol)

Checks	Action
DEFINITION: The engine runs unevenly at idle. If severe enough, the engine or vehicle may shake. The engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.	
Preliminary Checks	Refer to Important Preliminary Checks in Symptoms - Engine Controls .
Sensor Checks	• Test for correct operation and performance of the oxygen sensor. Inspect the oxygen sensor for silicon contamination. Caused by fuel or the use of incorrect engine sealants, the oxygen sensor will have a white, powdery coating. The sensor will output a high, but false signal voltage. This false rich condition may cause the LPG ECM to reduce the amount of fuel to the engine. • Test the ECT sensor for correct operation by performing the following: 1. Allow the engine temperature to reach ambient air temperature by leaving the engine OFF for several hours - overnight for most accurate results. 2. Turn the ignition ON while leaving the engine OFF. 3. Using a scan tool compare the ECT and IAT sensors displayed temperature. The sensors should be within 3°C (5°F) of each other. 4. Replace the ECT sensor or repair the ECT sensor circuit if the ECT is not near the expected value. • Test for correct MAP sensor operation. A MAP sensor that does not respond quickly and accurately to manifold pressure changes may cause this symptom.
Fuel System Checks	• Determine if the condition is rich or lean by performing the following: - Operate the vehicle under the conditions of the concern. - Monitor the oxygen sensor output. • Test for leaking fuel injectors. • Inspect for correct operation of the LPG fuel injectors. Refer to: Fuel Injector Balance Test with Special Tool • Test for correct EVAP Purge system operation. • Test for correct alternative fuel system pressures. Refer to Fuel System Diagnosis .
Additional Checks	• Inspect for manifold or air induction system leaks. • Test the PCV system for correct operation and valve type. • Test for correct engine cylinder compression.

Surges/Chuggles (Petrol)

Checks	Action
DEFINITION: The engine has a power variation under a steady throttle or cruise. The vehicle feels as if speeds up and slows down with no movement of the accelerator pedal.	
Preliminary Checks	• Refer to Important Preliminary Checks in Symptoms - Engine Controls . • Ensure the vehicle operator understands the transmissions torque converter clutch (TCC) operation, if equipped. • Ensure the vehicle operator understands the A/C compressor clutch operation, if equipped.
Sensor Checks	• Test for correct operation of the vehicle speed sensor (VSS). • Test for correct operation and performance of the oxygen sensor.
Fuel System Checks	• Inspect for a lean or rich engine condition. Using a scan tool observe the oxygen sensor output while operating the vehicle under the symptom condition. • Test for correct fuel system pressures. Refer to Fuel System Diagnosis . • Inspect for correct operation of the LPG fuel injectors. Refer to: Fuel Injector Balance Test with Special Tool • Make sure that the manual shut-off valve is fully open. • Inspect for restricted LPG lock-offs or filter. Refer to and Fuel Filter Replacement .

Symptoms - Engine Controls

Symptoms Description

Driveability symptoms do not set DTCs. The driveability symptoms are defined below. Certain conditions can cause multiple symptoms. These conditions are listed together. Additional conditions that may only cause certain symptoms are listed separately. Perform the Symptoms Testing before using the Additional Symptoms Tests.

Symptoms Definition

Backfire: Fuel ignites in the intake manifold or in the exhaust system making a loud popping noise.

Cuts Out, Misses: A steady pulsation or jerking that follows engine speed which is usually more pronounced as the engine load increases. This condition is not normally felt above 1500 RPM or 48 km/h (30 mph). The exhaust has a steady spitting sound at idle or at low speed.

Detonation/Spark Knock: A mild to large ping which usually occurs worse while under acceleration. The engine makes sharp metallic knocks that change with throttle opening.

Dieseling, Run-On: Fuel ignites in the intake manifold or in the exhaust system making a loud popping noise.

Hard Start: Engine cranks OK but does not start for a long time. The vehicle does eventually run or may start but immediately stalls.

Hesitation, Sag or Stumble: Momentary lack of response as the accelerator is pushed down. This condition can occur at any vehicle speed. This condition is usually more pronounced when first trying to make the vehicle move from a stationary position. This condition may cause the engine to stall under some conditions.

Lack of Power, Sluggishness or Sponginess: The engine delivers less than expected power. Little or no increase in speed when the accelerator pedal is pushed down part way.

Poor Fuel Economy: Fuel economy as measured by an actual road test is noticeably lower than expected. Also, the fuel economy is noticeably lower than it was on this vehicle at one time. As previously shown by an actual road test.

Poor Fuel Fill Quality: Difficulty when refuelling the vehicle.

Rough, Unstable, Incorrect Idle and Stalling: The engine runs unevenly at idle. The engine or the vehicle may shake. Engine idle may vary in speed. Either condition may cause the engine to stall.

Surges/Chuggles: Engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal position.

Symptoms Verification

Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure. Verify that all of the following conditions are true:

- The engine Control Module (ECM) and the malfunction indicator lamp (MIL) are operating correctly
- There are no DTCs stored
- The scan tool data is within the normal operating range
- Bulletins are not available for the current symptom
- The ECM grounds are clean, tight and in the correct locations
- The vehicle tyres are correctly inflated and meet original equipment specifications
- The air filter element is not restricted.

Symptoms Testing

1. Test for the following conditions:
    - The fuel system for the following:
        - Correct fuel pressure. Refer to Fuel System Diagnosis
        - Fuel injectors that are leaking or incorrect operation. Refer to Fuel Injector Balance Test with Special Tool or Fuel Injector Balance Test with Tech 2.
    - The ignition system for the following:
        - Spark plugs for incorrect heat range or an abnormal condition. Refer to Spark Plug Inspection.
        - For diagnosis of coolant or oil fouled spark plugs. Refer to Loss of Coolant or Oil Consumption Diagnosis.
        - Wet down the secondary ignition system with water from a spray bottle. Wetting down the secondary ignition system may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as the water is applied.
        - Weak spark using a commercially available Spark Tester. Refer to Electronic Ignition (EI) System Diagnosis.
    - The operation of the transmission torque converter clutch (TCC) The scan tool should indicate an engine speed drop when the TCC is commanded ON
    - The A/C changing state
    - Items that can cause an engine to run lean or rich. Refer to DTC P2178, P2180, P2188, or P2190
    - The crankshaft position (CKP) sensor for the correct resistance-The CKP sensor resistance may be out of range after a hot soak. The resistance should be between 700-1200 Ω
    - The engine for the following mechanical failures. Refer to Symptoms - Engine Mechanical.
        - Oil in the combustion chamber or leaking valve seals.
        - Incorrect cylinder compression.
        - Sticking or leaking valves.
        - Worn camshaft lobes.
        - Incorrect valve timing.
        - Broken valve springs.
        - Carbon buildup in the combustion chambers-Clean the chambers with top engine cleaner. Follow the instructions on the can.

    - Incorrect engine parts.
- Emission/Vacuum hoses for splits or kinks. Verify that the routing and connections are as shown on the Vehicle Emission Control Information label
- Knock sensor (KS) system for incorrect spark retard activity. Refer to Knock Sensor (KS) System Description.
- The exhaust system components for the following:
    - Physical damage or possible internal failure.
    - The three-way catalytic converters for a restriction
    - For more information, refer to Symptoms - Engine Exhaust.
- Electromagnetic interference (EMI) on the reference circuit can cause a misfire condition. You can usually detect EMI with a scan tool by monitoring the engine speed parameter. A sudden increase in the engine speed parameter with little change in actual engine speed indicates that EMI is present. Inspect the high voltage components near the ignition control circuit if a condition exists.
- Inspect the positive crankcase ventilation (PCV) system and all connections for leaks or restrictions.
- Evaporative emission (EVAP) canister purge solenoid that is stuck open.
- The engine cooling system for the following conditions:
    - The thermostat is the correct heat range-Refer to Thermostat Diagnosis.
    - Proper engine coolant level-Refer to Cooling System Draining and Filling.

2. If the above conditions do not address the symptom, refer to the additional symptoms tests.

Additional Symptoms Tests

Detonation/Spark Knock: Test the engine for an overheating condition. Refer to Engine Overheating.

Poor Fuel Economy: Inspect for foreign material accumulation in the throttle bore and for carbon deposits on the throttle plate and shaft. Also inspect for throttle body tampering.

Rough, Unstable or Incorrect Idle and Stalling: Inspect the engine mounts. Refer to Engine Mount Inspection

Surges/Chuggles: Test the heated oxygen sensors (HO2S). The HO2S should respond quickly to a change in throttle position. If the HO2S do not respond to different throttle positions inspect for contamination from fuel, silicon or the incorrect use of RTV sealant. The sensors may have a white powdery coating and result in a high but false signal voltage which gives a rich exhaust indication. The ECM reduces the amount of fuel delivered to the engine causing a driveability condition.

Hard Start

- Test the engine coolant temperature (ECT) sensor. Compare the ECT sensor value to the intake air temperature (IAT) sensor value on a cold engine. The ECT and IAT sensor values should be within ± 3°C (5°F). If the ECT sensor is out of range with the IAT sensor test the resistance of the ECT sensor. Refer to Temperature Versus Resistance - Engine Coolant Temperature Sensor for resistance specifications. Replace the ECT sensor if the resistance is not within specification. Refer to Engine Coolant Temperature Sensor Replacement in Engine Controls - 3.6L. If the sensor is within the specification, test the ECT circuits for a short to ground open/high resistance.

- Test the fuel pump relay operation. The fuel pump should turn ON for 2 seconds when the ignition is turned ON. Refer to Fuel Pump Electrical Circuit Diagnosis.

Hesitation, Sag, Stumble

- Test the fuel pressure. Refer to Fuel System Diagnosis.
- Test the generator. Refer to Symptoms - Engine Electrical. Repair the charging system if the generator output voltage is less than 9 V or more than 16 V.

Poor Fuel Economy

- Heavy loads being carried or towed
- Acceleration rate too much or too often
- Inspect for foreign material accumulation in the throttle bore, for carbon deposits on the throttle plate and shaft. Also inspect for throttle body tampering.

Poor Fuel Fill Quality

Test for the following conditions that is applicable to the current symptom.

Difficult to Fill

- Restricted vent lines
- The evaporative emission (EVAP) vent valve is stuck closed
- High fuel temperature
